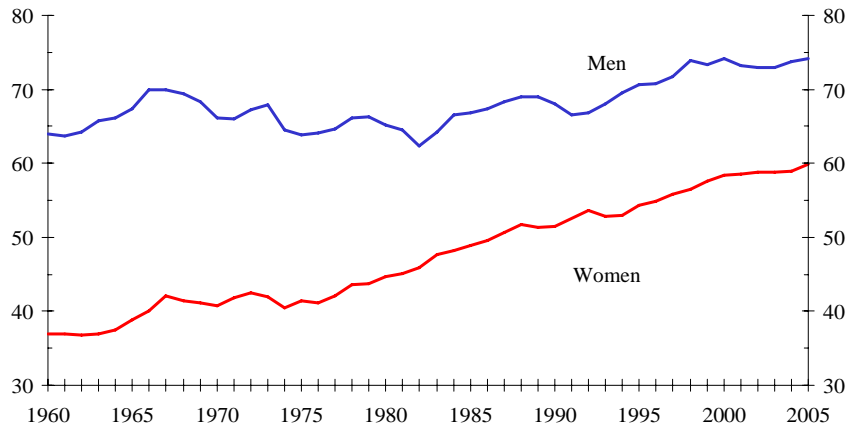

## Chart 5-6. Year-round, full-time work has trended up

---

- Among women who work at some time during the year, the proportion working year round (50-52 weeks) and full time (35 hours or more per week) has grown over the past several decades. In part, this trend reflects women's movement into occupations that are typified by year-round, full-time work.
- The proportion of men working year round and full time—which is considerably higher than that for women—showed little definite movement until the early 1980s. Since then, it has trended upward.
