Pennsylvania's Address Compare Process

When an address is received via any electronic interface, an extensive compare process occurs prior to loading the incoming data into PACSES. PACSES has several screens where active, historical and potentially active data is displayed.

PACSES primary address screen is called MADD (Member Address). This is a list of all addresses that have been used for that member. Only one address is allowed to be active at a time and "begin" and "end" dates have to be consecutive-not overlapping nor beginning in the future.

Potentially active address information is displayed on LADR (Locate Address Response screen). This is a "suspense" screen as the data is not permanently written to the data base at this point. The screen shows the address information for a member that was received for a member. This screen will automatically generate a Postal Verification form to verify the address (with the exception of addresses received from FPLS). A worker will make a decision as to whether the address is valid and current based on the results of the postal verification form and from historical information in PACSES. A worker can delete this record, confirm it and have it "roll up" to the MADD screen automatically or discard the information in order to be used in the address compare process.

The last screen used in the address compare process is the XADR (Excluded Address screen). When a worker decides to discard an address from the LADR screen, the information gets written to XADR screen so it can be used to compare future address information for this member thus reducing duplicate information.

Here's the step by step process that address information from all interfaces go through:

Step 1. PACSES will do a character, by character compare of any address on XADR that has a "Discard Date" of less than 12 months. If an exact match is found, the new address will not be processed and deleted. If no match is found PACSES goes to Step 2 for further comparing. (note: exact character match means exactly that, 6th St is not a match with Sixth St or 6th Street. Even an extra "space" in the address will prevent an exact match)

Step 2 PACSES will do a character by character compare of any address on LADR. If a match is found, the new information is not processed and is deleted. If not a duplicate, PACSES will move to Step 3 of the compare process.

Step 3 PACSES will do a character by character compare of any address on MADD that is end dated with an end date of less than 12 months. If a match is found, the new information is not processed and deleted. If a match is not found, PACSES will then look at the open MADD record (if there is an open MADD) and do a character by character compare of that address. If there is a match then the new information is not process and deleted. If there not a match, then a new LADR record is created, postal verification form generated (via batch) and a MAIL alert will be issued in 30 days if the new LADR record is not disposed of before the 30 day wait period. If the LADR is disposed of within the 30 day wait period no MAIL alert will be generated

Below is a flow chart of the process
