

Tupper 4pm seminar

Tue, Jun 12, seminar speaker will be Andrés Mora, ICP-ECOPETROL
Late Cenozoic climatic forcing of geologic processes in the eastern Cordillera of Colombia

Paleo-Talk

Wed, Jun 13, Paleo-Talk speaker will be Alexander Correa, at 4pm, Center for Tropical Paleoecology & Archaeology (CTPA),
Humidity changes inferred from a Holocene record from Peru

BDG

The Behavior Discussion Group will meet with Adam Smith on Tue, Jun 12, 2pm, at the LMR, Tupper Center
Ecology and neurobiology of the facultatively social bee *Megalopta*: work in progress

Bambi seminars

Wed, Jun 13, Bambi seminar speaker will be Daniela Reetz, University of Potsdam
Fractions of organic and inorganic phosphates in soils of BCI

Thu, Jun 14, Bambi seminar speaker will be Michael Kaspari, University of Oklahoma

Toward a biogeography of brown food webs

Arriving next week

Martin Facundo and Martín Ramírez, to apply DNA barcode technique to the rapid estimation of megadiverse groups in biodiversity hot spots: the arthropods of the Isthmus of Panama, in Fortuna.

June 8, 2007

Panama's *Gaceta Oficial* published Law No. 18 of May 31, 2007, designating the Las Perlas Archipelago a special coastal-marine management zone. The special zone is located in the district of Balboa and will be incorporated into the *Programa de Manejo Costero Integral* [Integral coastal management program] to protect its marine and coastal resources, increase its productivity and maintain the biodiversity of its ecosystems, and to improve the quality of life in the communities that depend upon these resources.

Several studies were conducted in Las Perlas under the leadership of STRI's Héctor Guzmán and James Mair from Heriot-Watt University, both working on a grant funded for five years by the Darwin Initiative, to provide support to the legal process that

culminated with the designation of special management zoning throughout this important Panamanian marine ecosystem, an essential part of the Marine Biological Corridor of the Tropical Eastern Pacific.

The law was possible thanks to the unconditional support from the Archipelago's community, the Major's Office, the Municipal Council of the District of Balboa; the British Government, Panama's National Assembly's Commission for Population, Environment and Development; officials from *Autoridad de Recursos Acuáticos de Panamá* [Panama's Authority for Aquatic Resources, or ARAP]; the civil society and all the organizations that helped in the various phases of the project.

The polygon that defines the special management zone is

Panama designates Las Perlas Archipelago special management zone

—Darwin Project achieves its initial aim

located in the Gulf of Panama. It includes 168,771 hectares (ha) divided into 33,153 ha of insular area including all islands and islets of the Archipelago, and 135,618 ha of surrounding waters, part of the Continental Shelf. The new law, including the coordinates of the special management zone, can be downloaded from:

Javier Mateo Vega to Sao Paulo, Brazil, to attend the conference and meet with Gamawater.

biodiversidad de sus ecosistemas, para mejorar la calidad de vida de las comunidades que dependen de dichos recursos.

Varios estudios se llevaron a cabo en Las Perlas bajo el liderazgo de Héctor Guzmán, de STRI y James Mair, de Heriot Watt University, ambos con fondos de la Iniciativa Darwin para ofrecer apoyo al proceso legal que culminó con la designación de Zona Especial de Manejo. Esta zona especial es un importante ecosistema marino de Panamá, que forma

parte del Corredor Biológico Marino de Pacífico Oriental Tropical.

La ley fue posible gracias al apoyo incondicional de la comunidad del Archipiélago, la Alcaldía, el Consejo Municipal del Distrito Balboa, el Gobierno Británico, la Comisión de Población, Ambiente y Desarrollo de la Asamblea Nacional, funcionarios de la Autoridad de Recursos Acuáticos de Panamá (ARAP), la sociedad civil y las organizaciones que ayudaron en diversas fases del trabajo.

El polígono que define la zona especial de manejo está localizada en el Golfo de Panamá. Este incluye 168,771 hectáreas (ha) divididas en 33,153 ha de área insular abarcando todas las islas e islotes del Archipiélago y 135,618 ha de agua circundante, parte de la Plataforma Continental.

La nueva ley, incluyendo las coordenadas de la zona especial de manejo, se encuentra en: <http://129.171.91.238/gacetada/gaceta.pdf>

CTFS' latest activities

As part of the new initiative to expand STRI's Center for Tropical Forest Science (CTFS) forest dynamics plots into Global Earth Observatories, the Center plans to broaden the scientific research conducted at the plots.

One research focus is studying plant-animal interactions by censusing animal populations in the plots and studying biotic and abiotic interactions between plants and animals.

A workshop to discuss what taxa to monitor, possible research strategies, and sampling methodologies, took place at STRI on May 25 through 27, with a field trip to BCI on May 28.

STRI's Office of BioInformatics (OBIO) reports that the rainfall for May on BCI set a new record of 696mm

Como parte de la nueva iniciativa de expandir las parcelas de dinámica de bosques del Centro de Ciencias Forestales del Trópico (CTFS) de STRI a Observatorios Globales de la Tierra, el Centro planea ampliar las investigaciones científicas que se llevan a cabo en las parcelas.

Uno de los enfoques de investigación será el estudio de las interacciones entre plantas y animales, mediante censos de la

población animal en las parcelas y el estudio de las interacciones bióticas y abióticas entre plantas y animales.

Un taller para discutir los grupos taxonómicos a monitorear, estrategias de investigación y metodología de muestreo se llevó a cabo en STRI del 25 al 27 de mayo, incluyendo un viaje al campo a Barro Colorado, el 28 de mayo.

From OBIO

beating the previous record of 622mm set in 1971.

Furthermore, the total rainfall for the year, to date, 1039mm, is the second greatest amount ever recorded. In the record year, 1981, the total from January to May was 1300mm. For more information, please contact Steve Paton at:

patons@si.edu

La Oficina de BioInformática de STRI informa que la precipitación pluvial de mayo

en la Isla de Barro Colorado estableció un nuevo récord de 696mm superando el récord de 622mm establecido en 1971.

Más aún, la precipitación pluvial en lo que va del año, de 1039mm, le sigue a la mayor a cantidad registrada en el año récord, 1981. El total de enero a mayo en el 81 fue de 1300mm. Para mayor información escribir a Steve Paton a:

PNAS: "Early maize from Mexico's dry forests"

"Studies of the origins of agriculture are revealing how human culture and civilizations developed in the past 10,000 years.

Dolores Piperno *et al.* report that maize and its sister plant, squash, were probably cultivated at the edges of tropical lakes in southwestern Mexico, their postulated homeland, by at least 8,000 years ago."

The results [published online in the *Proceedings of the National Academy of Sciences*] corroborate previous work showing that, in tropical America, drier kinds of tropical forest, not rainforest, supported early agriculture, and give further insight into how agriculture originated and spread throughout Mexico.

The authors analyzed three lakes and a swamp in the Iguala Valley, located between Mexico City and Acapulco, for pollen, phytoliths, and charcoal in sediments up to 17,000 years old. They found that, when the ice age ended, rainfall increased, the climate warmed, and the

Dolores Piperno, 2006

lakes filled and became loci for plant cultivation.

Signs of significant clearing for agriculture in the forests surrounding the lakes are apparent by 7,200 years ago.

The authors also found more evidence of extensive drying 1,800 to 900 years ago, which coincides with the decline of the Classic Mayan civilization and shows that this major drying event and its possible consequences for prehistoric societies were not limited to the Maya region. — P.D."

Ants are one of the most dominant groups on this planet and are especially diverse in the tropics.

Ant dominance and diversity are attributed to their social lifestyle, marked by a system of division of labor in which an individual specializes in the performance of specific tasks.

The social organization in ants has allowed them to exploit almost all terrestrial environments and to have a cosmopolitan distribution.

Although science is beginning to understand how ant division of labor is organized, little is known about the physiology of individual ants and how physiological changes and/or specialization of individuals control their behavior.

Marc Seid, STRI researcher working in the Neurobiology Laboratory led by William T. Wcislo, focuses his research on how the behavioral repertoire of individual ants changes according to age and colony needs. Seid correlates differences in repertoire size and composition to the neurochemistry and neuroanatomy of individual ants.

Las hormigas son uno de los grupos de organismos más

dominantes sobre este planeta. En los trópicos, son especialmente diversas.

La dominancia y diversidad de las hormigas se atribuye a su estilo de vida social, caracterizado por la división de labores en donde un individuo se especializa en llevar a cabo tareas específicas.

La organización de las hormigas les ha permitido explotar casi todos los ambientes terrestres y tener una distribución cosmopolita.

Aunque la ciencia está empezando a comprender cómo es la organización de la división del trabajo de las hormigas, poco se sabe sobre la fisiología de las hormigas individualmente y cómo los cambios fisiológicos y/o la especialización de los individuos controlan su comportamiento.

Marc Seid, investigador de STRI que trabaja en el Laboratorio de Neurobiología liderado por William T. Wcislo, enfoca sus estudios en conocer cómo el repertorio del comportamiento individual de las hormigas cambia de acuerdo a la edad y las necesidades de la colonia. Seid correlaciona las diferencias en la extensión y composición del repertorio con la química y anatomía neurológica de las hormigas, individualmente.

The chemistry of change
