RATE TABLES

Table I.—Crude death rates (number of deaths per 100,000 enumerated population) for selected causes of death, by place of residence: United States, each division, and each State, 1940 ---- 18

Table II.—Crude birth and death rates by place of residence: each State, county, and city, 1940 ---- 20

GENERAL NATALITY AND MORTALITY TABLES

Table 1.—Live births by sex of child, age of mother, race, and parent nativity of white: United States and each State, 1940 ---- 56

Table 2.—Live births by age of mother, population-size groups, and race: United States and each State, 1940 ---- 69

Table 3.—Live births by age of mother, race, and number of child: United States and each State, 1940 ---- 89

Table 4.—Live births by number of child and by race, and for white by nativity of mother: United States and each State, 1940 ---- 104

Table 5.—Live births by age of parents: United States and each State, 1940 ---- 110

Table 6.—Live births of residents, by place of occurrence: each State, 1940 ---- 116

Table 7.—Births of residents of each State, county, and city, and births occurring in each State, county, and city, by person in attendance: 1940 ---- 119

Table 8.—Deaths of residents, by place of occurrence: each State, 1940 ---- 175

Table 9.—Deaths by age, sex, race, and population-size groups: United States and each State, 1940 ---- 178

Table 10.—Deaths from selected causes, by sex, race, and population-size groups: United States and each State, 1940 ---- 210

Table 11.—Deaths from selected causes by race and by each city of 10,000 or more in 1940: 1940 ---- 252

Table 12.—Deaths from selected causes, by age, race, and population-size groups: United States, 1940 ---- 292

Table 13.—Deaths of residents of each State and county, and of each city of 10,000 or more in 1940, by institution: 1940 ---- 297

Table 14.—Deaths under 1 year of age from selected causes, by population-size groups, and for all causes by race: United States and each State, 1940 ---- 325

VITAL STATISTICS OF THE UNITED STATES

PART II. GEOGRAPHIC CLASSIFICATION BY PLACE OF RESIDENCE

Introduction

This volume—Vital Statistics of the United States, Part II—contains additional official statistical tabulations of natality and mortality data for the calendar year 1940. In part II, the tables consist of tabulations of births and deaths classified according to the place of residence of the mother of the child, or the place of residence of the decedent. The natality data are classified by geographic area; race, nativity, and age of parents; sex and number of child; and type of attendance. The mortality data are classified by geographic area, cause of death, age, sex, race, and institution. These tabulations are compiled from the same source material as the tables published in part I, both being derived from transcripts of original birth and death certificates received from registration officials of States, cities, and of the outlying territory and possessions of the United States.

This volume was prepared under the direction of Dr. Halbert L. Dunn, Chief Statistician for Vital Statistics, and Dr. Forrest E. Linder, Assistant Chief Statistician for Vital Statistics. The tabulations and introductory material were prepared under the immediate supervision of Dr. Robert D. Grove, Social Science Analyst, and Dr. Iwao M. Moriyama, Associate Biometrician.

REVISION OF ANNUAL VITAL STATISTICS VOLUMES

The present volume continues the new series of annual publications started in 1937. It presents natality and mortality data based upon the place of residence of the mother of the child, or the place of residence of the decedent. Data compiled on a place-of-occurrence basis are published in a volume entitled "Vital Statistics of the United States, Part I."

The publication in 1937 of a combined volume of natality and mortality data tabulated by place of residence marked an important change in the compilation of vital statistics by the Bureau of the Census. The tabulations by place of residence were expanded considerably for 1939 and 1940. This volume presents, on a residence basis, detailed Nation-wide statistics of births by age of mother and number of child. Similarly, detailed data on deaths by cause and age by place of residence are given. In succeeding years, more of the tabulations will be made according to place of residence. The published resident tables will be expanded and revised from time to time to meet the needs of users of vital statistics.

The tables given in part II should be interpreted with some caution since several factors enter into the determination of the place of residence. The place of birth or death, in most cases, is clear-cut and definitely determinable. To determine the place of residence is much more difficult because it is dependent upon the definitions of residence and the completeness of the information given on the certificate. It has, therefore, been necessary to adopt a set of arbitrary rules for the proper coding in each instance. The data obtained by a reallocation of nonresidents are obviously dependent upon these rules and cannot be correctly interpreted unless the rules are exactly and clearly stated.

THE VALUE OF VITAL STATISTICS TABULATED BY PLACE OF RESIDENCE

Tabulated vital statistics may be used for many purposes, each requiring data classified by different groupings or according to different definitions. Many of these uses relate to public-health work, such as an assay of the problems confronting public-health agencies or the measurement of the results of public-health programs. Other uses relate to maternal- and infant-welfare activities, problems of population research, analysis of fertility trends, actuarial investigations, medical research, et cetera. For some purposes, such as a study of the hospital load carried by a given community, the proportion of births attended by physicians, or the simple ranking of causes of death, it is possible to use tabulated natality and mortality data without relating them to other statistical data. But for the most part, vital statistics take on their full value only when related to population figures by the computation of birth or death rates. For deaths, these rates, in their simplest form, consist of ratios of the number of deaths occurring in a specified place during a specified time to the number of persons exposed to the risk of death at that place and time. It is obvious that such a rate can be correctly computed and interpreted only when the population figure in the denominator and the mortality figure in the numerator are compiled on a comparable basis. In other words, the population figure must represent a certain group that is exposed to the risk of death, and the death figure must include all of this group that died. Although the birth rate is interpreted in a different manner, similar considerations apply to it.

For the United States, as a unit, there is little difficulty in securing adequate comparability between vital statistics and population figures. For individual cities or counties or for population-size groups, there are several disturbing factors. In the population census, each person is counted as a part of the population of the geographic unit in which he has his "usual place of residence." Therefore, the enumerated population of a city is a count of all the persons who usually live in that city, excluding persons who are temporarily in the city at the time of the census and including residents of the city who are at some other place during the time of the population enumeration.

The crude death rate for the residents of any area must be based on the total resident population of that area and the total number of deaths occurring in this total resident population. It is essential to include the deaths of residents no matter where the death occurred, and to exclude deaths of nonresidents occurring in that area.

The occurrence of a large number of births and deaths "away from home" results from the movement of the people, facilitated by convenient methods of transportation, and from the increasing use of hospitals during confinement and illness. Seasonal movement to and from resort States, seasonal migration in search of employment, and the movement of people to some other area for hospital facilities not available in their usual place of residence, are several of the factors that contribute to the number of nonresident births and deaths.

Inasmuch as the registration laws of each State specify that births and deaths be registered at the place of birth or death, the compilation of vital statistics according to place of occurrence is the most direct and usual method. Rates computed on this basis may be called recorded rates, since all the births or deaths recorded in each area are included in the computation. The compilation of natality and mortality data on the same geographic basis as the population census requires a complete reallocation of births and deaths to the place of residence. When this reallocation has been made, it is then possible to compute resident rates. Since resident death rates are ratios of the number of deaths to the number of persons exposed to the risk of death, they indicate more accurately the force of mortality affecting a given population and can therefore be interpreted in terms of relative health conditions. Resident birth rates are interpreted somewhat differently, but similar considerations apply to them. Of course, in such interpretations, cognizance must be taken of other factors, such as the age, sex, and race distributions of the exposed populations.

From some points of view it may seem incorrect to allocate deaths purely on a place-of-residence basis without taking into account the city or county responsible for the causes resulting in death. For example, a resident of one city may be killed in an automobile accident in another city. In such a case it may seem unreasonable to allocate that death to the city of residence if the accident was caused by traffic hazards of the city where the death occurred. However, even if desirable, the reallocation of deaths from most causes to the area responsible for the conditions resulting in death would be a highly speculative and difficult task. Furthermore, admitting the possibility of making such an assignment of deaths, it then becomes necessary to devise an "exposed-to-risk" figure quite different from an enumerated population.

Tabulations of vital statistics by place of occurrence are valuable and necessary for certain purposes. Tabulations by place of residence and the computation of resident birth and death rates provide data of greater value and meaning for many uses. However, resident data cannot be directly interpreted for every purpose. No single method of tabulation could be devised that would provide statistics compiled in the manner necessary for all possible problems.

PREVIOUS TABULATIONS BY PLACE OF RESIDENCE[1]

The first nonresident tabulations made by the Bureau of the Census were published in the volume of "Mortality Statistics" for 1914. These tabulations included deaths, but not births, and consisted merely of a separation of the nonresident deaths from the total deaths for each area. However, discovery of serious deficiencies in the place-of-residence information given on the death certificate resulted in the omission of nonresident tabulations from the published volumes from 1915 to 1917, inclusive. By 1918 it was believed that sufficient progress had been made with the basic data to resume publication of nonresident statistics.

In 1918 the nonresident mortality tabulations were revised so as to provide a complete allocation of deaths by place of residence within the limits of the then incomplete registration area. A decedent in the registration area whose place of residence was outside the registration area could not be reallocated to his place of residence. Similarly, deaths of residents of the registration area could not be included in the figures for this area if the deaths had occurred outside the registration area.

Tables showing the number of deaths by place of residence were published for each year from 1918 to 1930, inclusive. The rules for residence allocation remained essentially unchanged during this period. In 1931 the tabulation of nonresident deaths was discontinued as an economy measure, and for the years 1931 to 1934, inclusive, no data on this important subject are available.

The completion of the birth- and death-registration areas in 1933 made possible, for the first time, a Nation-wide reallocation of nonresidents to the place of residence. When the nonresident reallocation was resumed in 1935, the definition of a nonresident was revised and more detailed rules for allocation were formulated. In addition, compilation by place of residence was extended to birth statistics. Previous to 1935, no reallocation of births to place of residence of the child's mother had been made by the Bureau of the Census.

Since 1935, the natality and mortality tabulations by place of residence have been gradually developed and extended. Eventually, most of the tabulations for individual cities and counties and for the population-size groups will be transferred to this basis.

Resident tabulations for 1935 and 1936 were not published in the annual volumes—"Birth, Stillbirth, and Infant Mortality Statistics" or "Mortality Statistics"—but have been released in the series of "Vital Statistics—Special Reports."[2]

[1] For a more detailed account of previous resident tabulations, see "Vital Statistics of the United States, Part II," p. 2, 1937.

[2] For a list of these reports containing resident tabulations for 1935 and 1936, see "Vital Statistics of the United States, Part II," p. 2, 1937.

NONRESIDENT TABULATIONS BY STATE OFFICES

Since vital statistics tabulations by place of residence are important in public-health administration, many State departments of health compile natality and mortality data on this basis. A survey by the Bureau of the Census in 1935 revealed that 11 States made rather complete resident reallocations and 8 States published tables showing the number of deaths for cities and counties including and excluding deaths of nonresidents. A survey was made in 1938 by a Committee on Residence Allocation under the auspices of the Vital Statistics Section of the American Public Health Association. This survey indicated that 24 States were making regular tabulations involving the reallocation of nonresidents.

Answers to a questionnaire sent to the States by the Bureau of the Census in 1941 indicated that 35 States and the District of Columbia were making some resident tabulations, while 13 States were not making any. In 4 States, these tabulations were limited to the separation of residents and nonresidents with no allocation to place of residence. In 13 States, the tabulations excluded nonresidents from other areas within the State and included residents who were born or who died elsewhere within the State; however, the tabulations in these States did not exclude nonresidents from other States or include residents of the State who were born or who died in another State. Nineteen States made complete place-of-residence tabulations excluding all nonresidents and including all residents within and outside the State.

In many States the resident tabulations are based solely on a reallocation of nonresidents within the State. In other words, these States do not include in their tabulations the deaths (or births) of residents of that State occurring in other States. For State totals, the allocation of interstate nonresidents is, in most cases, numerically unimportant. However, for areas near a State border, interstate reallocation may be very important since many deaths (or births) of residents of the area may occur in the adjacent State.

To assist the States in obtaining records of births or deaths of their residents in other States, the Vital Statistics Section of the American Public Health Association adopted, in 1931, a resolution requesting the Bureau of the Census to act as a clearing house in the exchange of such records. Since 1933, most States have sent to the Bureau of the Census copies of birth and death certificates for out-of-State nonresidents and these have been forwarded to the State of residence. Although this interstate exchange has been of considerable value to the individual States, it has not solved all of the difficulties met by State agencies in making a complete reallocation.

Differences of opinion exist regarding the principles on which the definition of a nonresident and the rules used for coding should be based. For this reason the interstate transfer is not on a strictly uniform basis for all States. Some indication of the amount of variation among States can be seen in table A. In this table the number of nonresidents of each State, according to the Bureau of the Census definitions, is compared with those identified by the separate State offices. Table A shows for both births and deaths the number of nonresident transcripts to be subtracted from the tabulations of each State, and the number of resident transcripts to be added. A study of the figures in this table, and particularly of the ratios between Federal and State figures, will indicate the existence of many differences in State procedures. While State tabulations fulfill an important need, it is obviously desirable for some central agency, operating with a uniform although arbitrary set of rules, to make Nation-wide tabulations.

One significant comment should be made regarding the differences between resident tabulations made by State agencies and those made by the Bureau of the Census. Because of the large number of transcripts involved in national tabulations, the coding rules used by the Bureau of the Census must be designed and simplified to facilitate mass production. Furthermore, the Bureau of the Census does not have access to the detailed local information necessary for certain types of allocation. For these reasons, it is not practicable to introduce

all possible coding refinements or to use different sets of rules for various causes of death. Many State offices, having special local problems or interests to meet, wish to use special coding rules for certain groups of data. For example, some States either allocate deaths in custodial institutions to the place of prior residence or consider these institutions as separate tabulation areas. Some States prefer to allocate deaths from infectious diseases to the area where the infection presumably originated; deaths from accidents, to the place of accident; deaths from homicide, to the place of homicide; et cetera.

The desirability of these special types of tabulation should be emphasized, but they often require detailed information available only in local offices and involve operating rules feasible only for a relatively small volume of work. Therefore, while it is desirable for a central agency to make national tabulations, these national uniform tabulations do not replace those made by the separate State agencies.

TABLE A.—FEDERAL AND STATE INTERCHANGE OF BIRTH AND DEATH NONRESIDENT TRANSCRIPTS BETWEEN STATES: 1940

(Exclusive of stillbirths)

AREA	BIRTHS						DEATHS					
	Nonresident transcripts to be subtracted			Resident transcripts to be added			Nonresident transcripts to be subtracted			Resident transcripts to be added		
	By Federal allocation	By State interchange	Ratio of State interchange to Federal allocation	By Federal allocation	By State interchange	Ratio of State interchange to Federal allocation	By Federal allocation	By State interchange	Ratio of State interchange to Federal allocation	By Federal allocation	By State interchange	Ratio of State interchange to Federal allocation

[3] Births and deaths of nonresidents from other States were incompletely reported.

DEFINITIONS OF NONRESIDENTS AND RULES FOR CODING

The reallocation of births and deaths to place of residence is based on information somewhat different and collected in a manner different from that obtained in the enumerated population census. It is obviously not possible to use identical rules for both compilations. The tabulation of vital statistics on a place-of-residence basis requires that the information given on the certificate be interpreted in such a way as to result in classifications comparable with the population census figures. The necessity for such interpretation introduces arbitrary and controversial factors into the procedure of allocation. It can hardly be expected that the geographic classification by place of residence can be as direct and simple as the classification by place of occurrence.

In addition to difficulties in the definition of residence, there are several factors in the original collection of birth and death information that may produce errors or discrepancies in resident tabulations. The place of birth or death is usually obvious or easily learned by the person filling out the original certificate. On the other hand, the original informant or the State office may have to make an inquiry to determine the place of residence, particularly in the case of nonresident births or deaths. Since it is sometimes difficult to ascertain the precise geographic location of the place of residence, errors may be made occasionally. Because of these difficulties of residence designation and because of incomplete understanding of the importance of residence data, the residence information may be omitted or incompletely reported on birth and death certificates for certain areas. In addition, the residence data on the original certificates may, in some cases, be incompletely transcribed in the State office.

In view of these considerations, errors in the residence tabulations for certain areas may be expected. It is believed that errors of a significant size are restricted to a small number of areas and will decrease as the meaning and importance of residence data become more widely understood.

Nation-wide adoption of the new standard birth, stillbirth, and death certificates recommended by the Bureau of the Census will greatly facilitate the collection of accurate residence information. The part of the new standard death certificate devoted to information concerning place of death and place of residence is reproduced below:

State of _____

1. PLACE OF DEATH:	2. USUAL RESIDENCE OF DECEASED:
(a) County _____	(a) State _____ (b) County _____
(b) City or town _____ (If outside city or town limits, write RURAL)	(c) City or town _____ (If outside city or town limits, write RURAL)
(c) Name of hospital or institution: _____ (If not in a hospital or institution, give street number or location)	(d) Street No. _____ (If rural give location)
(d) Length of stay: In hospital or institution _____ (Specify whether	
In this community _____ years, months or days)	(e) If foreign born, how long in U. S. A.? _____ years.

The new standard birth and stillbirth certificates are essentially the same with respect to these items. The item of residence has been given much greater prominence and more space. Separate lines are allowed for each part of the geographic location—State, county, city or town, and street. The specific request for county of residence is perhaps the most important new information on residence made available by the new certificates.

The new certificates were used by a few States during the latter part of 1939. In 1940 a large majority of births and deaths throughout the country were reported on the new forms. Therefore, it may be expected that tabulations by place of residence for 1940 and succeeding years will be more complete and accurate than for earlier years.

Relation of geographic code to the identification of nonresidents.—Whether or not a person is classified as a nonresident depends somewhat upon the size of the area under consideration. A resident of Maine may die in California, yet this fact may be ignored when only totals for the United States are concerned. For State totals, only those persons who cross State lines need be considered in a reallocation of place of residence, since any movement within the State is irrelevant. On the other hand, for the study of mortality conditions within a city (for individual census tracts or wards), it is necessary to use a much finer definition of a nonresident. In such cases it may be necessary, for example, to define as a nonresident a person who lived on one side of a street and died in a hospital on the other side of the same street.

In whatever way the place of residence may be defined, the size of the tabulation or coding unit will partially determine the number of identified nonresidents. If the coding unit—assuming the use of a punch-card system in which geographic areas are given numerical codes—is a whole county, obviously it is impossible to determine, from a tabulation of the cards, the number of persons who moved about within the county. If the coding unit is a single registration district, it will be possible to identify persons moving from one district to another within the county, but it will not be possible to measure the movement within districts.

The tabulations given in this volume are based on a geographic code that identifies each city having a population of over 10,000 in 1940 and each county excluding these cities. The code for the county (exclusive of the cities of 10,000 or more) is subdivided into two codes, one for all incorporated places of 2,500 to 10,000 as a group, and another for all villages under 2,500 and rural areas as a group. In coding the place of residence, movement from an incorporated place or city of 2,500 population or more to another place or city of 2,500 or more, in the same or a different county, is identified. Similarly, any population movement from one county to another is identified, including movement to or from rural areas in different counties. However, movement from a village under 2,500 or from a rural area to another village under 2,500 or rural area within the same county is not identified.

Another limitation should be mentioned. If, for example, the nonresident deaths for each city and county within a State are tabulated, it is not possible to add these figures together and obtain the number of nonresidents of the whole State. Such addition will give the number of persons in the State who died in a tabulation-unit area other than the area of their residence, but it will not give the number of nonresidents of the State since a nonresident in a city may be a resident of some rural area or some other city in the same State. Therefore, the term "nonresident" may have one of two meanings. In reference to the smallest unit of tabulation (in this report, a city or county), a nonresident is a person who died within that unit but whose usual place of residence was in some other unit. In reference to a consolidation of separate geographic units (for example, a whole State), the term refers to the number of persons dying therein who are nonresidents of the particular place of death but are not necessarily nonresidents of the consolidated area. Furthermore, since the nonresidents of one area are necessarily residents of some other area, it is necessary to apply both terms to the same data when considered in different aspects. In order to avoid confusion, the tables given in this volume include headnotes or footnotes when additional explanation seems necessary.

Rules for the allocation of deaths.—The allocation of deaths to the place of residence is based on the following main rules:

1. General principle: Mortality data should be compiled so as to correspond with enumerated populations on which rates are to be based. Each death should be assigned to the area in which the decedent had his "usual place of residence."
2. With certain exceptions and qualifications, a decedent is defined as a nonresident if the place of residence stated on the certificate is different from the place of death.
3. Decedents who at the time of death had been living more than 1 year in a community are considered residents of that community even though some other place of residence is stated.
4. Decedents in general hospitals, tuberculosis sanatoriums, et cetera, are reallocated to the usual place of residence.
5. Decedents in mental institutions, et cetera, are not reallocated to the place of prior residence.

For the purpose of coding mortality transcripts, these rules have been expanded into definite coding instructions that state the procedure followed in each case. These coding instructions have been published in the Instruction Manual of the Division of Vital Statistics and are reprinted here.

Rules for determining place of residence for deaths.— The following statements define the meaning of residence:

1. There should be an entry on every transcript for place of residence. If no entry is made, the transcript is coded a resident transcript and queried. The practices of the State transcribers may differ. If inconsistencies occur in transcribing this item, consult the verifier and, if necessary, the supervisor before querying.

2. If the place of residence is stated as unknown, the transcript is a resident transcript.

3. In any case in which a place of residence is stated, but the coder is unable to determine the complete correct code for the stated place of residence, code as resident and query for additional information. If the necessary information is not obtained, the transcript is considered to be a resident transcript.

4. If the place of residence is given as a foreign country, or as a United States possession outside the United States, the transcript is a resident transcript. In such cases, a copy is made of the transcript for interchange with other countries.

5. If the county of residence is not given, but a rural route is stated as the place of residence, query for additional information. If the name of the county is not obtained, code as resident of the county in which the R.F.D. post office is located. If an unincorporated place is given as the place of residence and the county of residence is not stated and cannot be determined, code as resident of the place of death, and query for additional information. If the place of residence is a rural route of a city which is coextensive with a county, and the county of residence is not stated, query for additional information.

6. Whenever the place of residence is a community or a postal substation within an incorporated city, but the county of residence is not given, code as resident, if place of occurrence is given as that city, even though the community name may appear elsewhere as an incorporated place. If the place of occurrence is other than the city containing the community name, the item should be queried.

7. Deaths are coded according to the place of residence of the deceased except in case of death of a newborn infant. When infants are born at other than the place of residence of the mother, and die before return to mother's residence, the residence of the mother is considered the residence of the child.

8. If the place of residence is stated to be different from the place of death, and if the "length of stay" in the place of death is less than 1 year, the place of residence as stated is coded. If the "length of stay" is not stated, code place of residence as given. If the "length of stay" is more than 1 year, the decedent is coded as a resident of the place of death. This rule applies in all cases except those provided for in rule 9.

9. The inmates and employees of penitentiaries; prisons; reformatories; hospitals for the insane, epileptic, and feeble-minded; orphanages; homes for the blind, the deaf, the indigent or aged; are considered residents of the city, town, or county in which the institution is located. This rule applies even when some other place of residence is stated, and applies regardless of the "length of stay." The rule applies to inmates of institutions coded as 8 or 9 for type of institution.

10. Patients or inmates and employees of surgical or medical hospitals, tuberculosis sanatoriums, and jails, are usually only temporary inmates and are considered nonresidents of the place in which the institution is located, if residence at some other city, town, or county is stated. No exception to rule 8 is made for these cases. This rule applies to inmates of institutions coded 1, 2, 3, 4, 6, and 7 for type of institution.

11. In general, a transcript is a nonresident transcript if the geographic code for place of residence differs in any respect from the geographic code for place of death. Under this definition:

(a) A transcript for a death occurring in a city of 10,000 or more is a nonresident transcript if the place of residence is in any other city, any other county, or any other part of the same county.

(b) A transcript for a death occurring in a rural city (2,500 to 10,000) is a nonresident transcript if the place of residence is in any other city, any other county, any other rural city, or the rural part of the same county.

(c) A transcript for a death occurring in the rural part (under 2,500) of a county is a nonresident transcript if the place of residence is in any city, any rural city, or in the rural part of any other county.

In addition, if a death occurs in one rural city, and the place of residence is in another rural city of the same county, the transcript is to be coded as a nonresident, even though the geographic code is the same for both place of death and place of residence.

Rules for the allocation of births.— The allocation of births is made according to the same general principles as the allocation of deaths. In the case of births, however, the residence of the mother is considered to be the place of residence of the child. The following rules have been used in coding place of residence for births.

Rules for determining place of residence for births.— The following statements define the meaning of residence:

1. The residence of the mother (item 2) is considered the residence of the child.

2. There should be an entry on every transcript for place of residence. If no entry is made, the transcript is coded as resident and queried. The practices of the State transcribers may differ. If inconsistencies occur in transcribing this item, consult the verifier and, if necessary, the supervisor before querying.

3. If the place of residence is stated as unknown, the transcript is a resident transcript.

4. In any case in which the place of residence is stated, but the coder is unable to determine the complete correct code for the stated place of residence, code as resident and query for additional information. If the necessary information is not obtained, the transcript is considered to be a resident transcript.

5. If the place of residence is given as a foreign country, or as a United States possession outside the United States, the transcript is a resident transcript. In such instances a copy is made of the transcript for interchange with other countries.

6. If the county of residence is not given, but a rural route is stated as the place of residence, query for additional information. If the name of the county is not obtained, code as resident of the county in which the R.F.D. post office is located. If an unincorporated place is given as the place of residence and the county of residence is not stated and cannot be determined, code as resident of place of birth, and query for additional information. If the place of residence is a rural route of a city which is coextensive with a county, and the county of residence is not stated, query for additional information.

7. Whenever the place of residence is a community or a postal substation within an incorporated city, but the county of residence is not given, code as resident, if place of occurrence is given as that city, even though the community name may appear elsewhere as an incorporated place. If the place of occurrence is other than the city containing the community name, the item should be queried.

8. In general, a transcript is a nonresident transcript if the geographic code for place of residence differs in any respect from the geographic code for place of birth. Under this definition:

(a) A transcript for a birth occurring in a city of 10,000 or more is a nonresident transcript if the place of residence is in any other city, any other county, or any other part of the same county.

(b) A transcript for a birth occurring in a rural city (2,500 to 10,000) is a nonresident transcript if the place of residence is in any other city, any other county, any other rural city, or the rural part of the same county.

(c) A transcript for a birth occurring in the rural part (under 2,500) of a county is a nonresident transcript if the place of residence is in any city, any rural city, or in the rural part of any other county.

In addition, if a birth occurs in one rural city, and the place of residence is in another rural city of the same county, the transcript is to be coded as a nonresident, even though the geographic code is the same for both place of birth and place of residence.

Change in nonresident coding.—One very important change in the rules for coding nonresident births and deaths was made in 1939 and continued in 1940. In preceding years, if a person died in a rural city (2,500 to 10,000) but had resided in another rural city in the same county, the death transcript was coded as resident, even though the place of residence was not the same as the place of death. The same rule applied in the case of births. In order to secure more complete information on the volume and direction of the nonresident movement, the coding rules for 1939 and 1940 were changed, so as to identify as nonresident any movement from one rural city to another within the same county.

This revision of the rules for nonresident coding affects significantly statistics of residents and nonresidents for cities of 2,500 to 10,000 and for rural areas. Therefore, resident statistics for these areas in 1939 and 1940 are not strictly comparable with those for preceding years. Also, the total number of nonresidents tabulated for a county, State, or the United States tends to be increased by this change in procedure.

RELATION OF INSTITUTIONS TO NONRESIDENT CODING

An important feature of the rules used in coding nonresident transcripts of death certificates is the distinction between two types of institutions. The first type of institution consists of surgical and medical hospitals and other institutions in which the length of stay is usually not long. These institutions are referred to as "nonresident institutions" since decedents here are considered as nonresidents of the place in which the institution is located, if residence in some other city, town, or county is stated. The second type consists of those institutions in which the length of stay is usually long and includes penitentiaries, hospitals for the insane, homes for the indigent and aged, et cetera. These institutions are referred to as "resident institutions" because decedents here are considered residents of the place in which the institution is located, even though some other place of residence may be stated on the death certificate.

The practice of the Bureau of the Census, in considering all decedents in "resident" institutions to be residents of the area in which the institution is located, is not consistent with the practice of some individual State agencies. Some States prefer to allocate these deaths to the place of prior residence. The reallocation of these deaths has the effect of reducing the total death rates of the areas that contain institutions since it is not always possible to distribute the population of the institution in a comparable manner before computing rates.

INSTITUTION CODE: TYPE OF INSTITUTION

NONRESIDENT INSTITUTIONS			NONRESIDENT INSTITUTIONS			RESIDENT INSTITUTIONS		
Extended code	Abbreviated code		Extended code	Abbreviated code		Extended code	Abbreviated code	
		General hospitals and combinations (except with resident institutions)	41	4	Tuberculosis and convalescent and rest	90	9	Other resident institutions Blind and deaf
			42	4	Tuberculosis and isolation	91	9	Incurable
00	0	General and cancer	43	4		92	9	
01	0		44	4	Tuberculosis and orthopedic	93	9	Prisons, reformatories, and industrial homes (some are classified by the American Medical Association as institutional)
02	0		45	4				
03	0	General and isolation	46	4				
04	0		47	4				
05	0	General and orthopedic	48	4	Other combinations (except with general)	94	9	
06	0	General and tuberculosis			Unspecified	95	9	Homes for aged and poor, county homes, farms and infirmaries, homes for soldiers and sailors
07	0		49	4	Other types of hospitals of nonresident type			
08	0	General and other combinations

37	3	Orthopedic, orthopedic and neurological	81	8	Feeble-minded	90	9	Government—Federal and local
			82	8	Mental defective or mental	91	9	Government—Federal with nonprofit
38	3	Surgical and emergency, surgical and eye, ear, nose, and throat	83	8	Neurological and mental or nervous and mental	92	9	Government—Federal with proprietary
			84	8		93	9	Local with nonprofit
39	3	Miscellaneous	85	8		94	9	Local with proprietary
			86	8		95	9	Nonprofit with proprietary
		Tuberculosis hospitals and sanatoriums	87	8		98	9	Unknown
			88	8		99	9	Miscellaneous
40	4	Tuberculosis and cancer	89	8	Nervous, miscellaneous			

While the tabulations in this volume have been based on reallocation according to usual place of residence, regardless of previous residence, it is desirable to have, for some purposes, mortality figures for cities and counties exclusive of deaths in resident institutions. Table 13 gives, with other data on institutional deaths, the number of deaths in resident institutions for each geographic area. These figures may be subtracted from city and county "Total deaths of residents" given in the same table, to obtain the number of deaths of residents of each area exclusive of all deaths occurring in this type of institution.

Since only the name of the hospital or institution is given on the death certificate, it is not possible to determine directly the type of institution. To facilitate the work of coding, an institution index listing the name and type of each known institution has been developed by the Bureau of the Census with the assistance and cooperation of the Americal Medical Association. While the primary purpose of the index is to classify institutions for the purpose of coding place of residence, each institution is also classified according to "Type of institution (service)" and "Type of control." These classifications are consistent with those used by the American Medical Association in the list of registered hospitals published in the annual hospital number of the Journal of the American Medical Association.

There are certain problems involved in the correct location and classification of hospitals and other institutions named on death certificates. Several different names may be given at different times for the same hospital, or the name may be abbreviated so as to cast doubt upon its identity. Also, errors in location may occur where the hospital is just inside or outside the limits of an incorporated town or city. In addition, it is possible that in a few areas the name of the hospital may be omitted from some of the certificates. Significant errors of these types are believed to be few and will not vitiate the value of the institutional statistics presented for the large majority of areas.

The preceding outline shows the system of classifying institutions and gives an extended and abbreviated code symbol.

DEATHS ALLOCATED TO PLACE OF RESIDENCE

Summary.— In 1940 there were 1,417,269 deaths registered in the United States, of which 209,176 (14.8 percent) were of nonresidents of the city or county in which death occurred. Most of the nonresidents in any State are residents of some other part of the same State and do not, therefore, represent population movement between States. In the United States there were 29,811 interstate nonresident deaths. These comprise 14.3 percent of all nonresident deaths and only 2.1 percent of all deaths.

A summary of the reallocation of deaths to place of residence is given in table B. This table shows the total number of deaths occurring in each State, the number of these that were of nonresidents, the number of deaths of residents occurring in other areas, and the total number of deaths of residents wherever occurring. For example, 80,270 deaths were recorded in California in 1940. Of this total number of recorded deaths, 15,630 occurred in a city or county of which the decedent was not a resident. In 14,344 instances the decedent was a resident of some other area of California, and in 1,286 instances the decedent was a resident of some other State. Considering next the deaths of residents of California, the table shows that 15,102 residents of California died in some city or county other than their usual place of residence. Of these, 14,344 died in some other area of California, and 758 California residents died in some other State. Altogether, a total of 79,742 residents of California died in 1940, irrespective of the place of death.

An inspection of table B shows relatively small differences between the total number of deaths occurring in a State and the total number of deaths of residents of the State. This indicates that interstate nonresident deaths are a small proportion of the total deaths and that in most cases the number of residents leaving a State and dying in other States approximately balances the number of residents of other States dying within the State. Even in States where a large number of out-of-State nonresidents are to be expected, reallocation does not greatly change the State totals. In Florida the difference between the number of recorded deaths and the number of resident deaths is 6.1 percent of the number of resident deaths; in Arizona, 4.7 percent; and in California, only 0.7 percent. These figures demonstrate that for State totals it is unnecessary in most cases to reallocate deaths to the place of residence. It is only for individual areas within the State that reallocation is important. However, to obtain correct figures for areas near State borders, it is probably necessary that this reallocation be on an interstate as well as an intrastate basis.

TABLE B.—DEATHS OF NONRESIDENTS IN EACH STATE AND DEATHS OF RESIDENTS IN OTHER STATES: 1940

(Exclusive of stillbirths)

AREA	Total deaths in area	DEATHS						Total deaths of residents
		Of nonresidents in area			Of residents in other areas

[1] Deaths of nonresidents from other States were incompletely reported.

Number of nonresident deaths.—The proportion of nonresident deaths to all deaths for each State in 1940 is given in table C. This table shows the total number of deaths occurring in each State and the number and percent of these that are of nonresidents of the particular area in which death occurred. For the entire United States the nonresident deaths constituted 14.8 percent of all deaths, but in individual States this proportion ranged from 9.8 percent in New York to 25.6 percent in Nevada. A frequency distribution of States showing the percent of total recorded deaths that are of nonresidents is given in table D.

TABLE C.—DEATHS OF NONRESIDENTS AND PERCENT OF TOTAL RECORDED DEATHS: EACH STATE, 1940

(Exclusive of stillbirths)

TABLE D.—FREQUENCY DISTRIBUTION OF STATES BY PERCENT OF NONRESIDENTS AMONG TOTAL RECORDED DEATHS: 1940

(Exclusive of stillbirths)

PERCENT NONRESIDENTS	NUMBER OF STATES
5-9	1
10-14	20
15-19	20
20-24	7
25-30	1

TABLE E.—PERCENT OF NONRESIDENTS AMONG TOTAL RECORDED DEATHS BY POPULATION-SIZE GROUPS: 1940

(Exclusive of stillbirths)

POPULATION-SIZE GROUP	PERCENT NONRESIDENTS
UNITED STATES	14.8
Cities of 100,000 or more	10.8
Cities of 10,000 to 100,000	23.4
Cities of 2,500 to 10,000	24.3
Rural	9.9

Since the movement to cities for hospitalization is an important factor contributing to the number of nonresident deaths, it is reasonable to suppose that the proportion of nonresident deaths will be greater in cities than in rural areas. As may be seen in table E showing the urban-rural distribution of nonresident deaths, the percent of nonresident deaths in cities is higher than in rural areas. However, it is of interest to note that the proportion of nonresident deaths in cities of 100,000 or more is lower than that for the United States and considerably below the percentages for cities of 2,500 to 10,000 and 10,000 to 100,000.

CHANGES IN DEATH STATISTICS FOR POPULATION-SIZE GROUPS

The allocation of deaths to the place of residence of the decedent affects the mortality rates for cities of various population sizes, as indicated in table F. This table shows for each population group the total number of deaths of residents wherever occurring and the total number of deaths occurring in each area. The corresponding death rates are also shown. From these data it is apparent that there are decreases in the death rates for cities and increases in the death rates for rural areas when the deaths are tabulated on a residence basis. This again illustrates the effect of population movement on mortality statistics tabulated according to the place of death.

TABLE F.—RESIDENT AND RECORDED DEATHS, AND DEATH RATES, BY POPULATION-SIZE GROUPS: UNITED STATES, 1940

(Exclusive of stillbirths)

POPULATION-SIZE GROUP	TOTAL DEATHS OF RESIDENTS		TOTAL DEATHS IN AREA	
	Number	Rate per 1,000 population	Number	Rate per 1,000 population
UNITED STATES	1,417,269	10.8	1,417,269	10.8
Cities of 100,000 or more	427,633	11.3	449,271	11.8
Cities of 25,000 to 100,000	168,876	11.4	189,311	12.8
Cities of 10,000 to 25,000	112,820	11.3	126,488	12.7
Cities of 2,500 to 10,000	145,481	12.4	152,608	13.0
Rural	562,459	9.8	499,591	8.7

The number of resident deaths, recorded deaths, and their corresponding death rates are shown in table G for individual cities having populations of 100,000 or more in 1940. It may be seen that in all but nine of the large cities the recorded death rates were higher than the resident death rates. Most of these exceptions are cities located near other cities with large hospital facilities.

TABLE G.—RESIDENT AND RECORDED DEATHS AND DEATH RATES: CITIES OF 100,000 OR MORE, 1940

(Exclusive of stillbirths)

AREA	TOTAL DEATHS OF RESIDENTS		TOTAL DEATHS IN AREA

Residence allocation of deaths by cause.—The death rates for selected causes of death in 1940 based on data allocated to the place of residence are given for each State and each geographic division in table I, on p.18. These rates may be compared with the corresponding rates computed on the basis of the place of occurrence, as given in table XII of "Vital Statistics of the United States, 1940, Part I."

In general, the difference between the recorded and resident death rates is not great for any of the causes for a large majority of the States. However, there are substantial differences to be noted in the rates for certain States. For example, the death rate for tuberculosis of the respiratory system in Arizona in 1940 was 162.8 per 100,000 population when computed on a place-of-occurrence basis and only 135.0 when on a place-of-residence basis. Another example is the death rate for motor-vehicle accidents. The death rate for this cause in Nevada in 1940 was 78.0 per 100,000 population by place of occurrence compared with 63.5 by place of residence. Differences of this kind more generally occur in States noted as health or summer and winter resorts. Also, States with sanatoriums or specialized hospital facilities tend to show higher rates for certain causes on a place-of-occurrence basis.

Table H shows for three population-size groups in the United States the number of resident and recorded deaths and death rates for selected causes. Except for tuberculosis of the respiratory system, the resident death rate for each selected cause was lower than the corresponding occurrence rate in cities of 10,000 or more. In cities of 2,500 to 10,000, the resident death rate was lower than the recorded death rate for all of the selected causes except tuberculosis of the respiratory system, syphilis, acute poliomyelitis and polioencephalitis, cancer and other malignant tumors, and cirrhosis of the liver. In the rural areas the opposite is true, the resident death rate being higher than the corresponding rate by place of occurrence for every selected cause of death except tuberculosis of the respiratory system.

These differences between the resident and recorded death rates for the population-size groups show that an erroneous impression of health conditions of an area may be received from inspection of death rates based upon place of occurrence. Place-of-death data for some areas are so heavily weighted by nonresident deaths occurring in hospitals and institutions that they do not always give a correct description of the mortality experience of the resident population. For example, tuberculosis death rates by place of occurrence suggest that the rural death rate is considerably higher than the rate for cities. Actually, it indicates only that tuberculosis sanatoriums are located predominantly in rural areas.

INFANT MORTALITY BY POPULATION-SIZE GROUPS

Table J shows the infant mortality rates by population-size groups and by race for the United States on a place-of-residence basis. The rate in 1940 ranged from 39.3 deaths under 1 year per 1,000 live births for cities of 100,000 or more to 53.4 for cities of 2,500 to 10,000. The differences between areas are much greater for persons of "All other races" than for white persons. It is of interest to note that compared with the corresponding figures for the preceding year, the rates for larger cities (cities having populations over 10,000) in 1940 showed greater decreases than those for cities under 10,000 and the rural areas.

DEATHS IN HOSPITALS AND INSTITUTIONS

In 1940, 39.0 percent of all deaths occurred in institutions as compared with 37.7 percent for the preceding year. There is a large difference between the proportions of urban and rural residents dying in institutions. Whereas, 48.0 percent of all deaths of residents of cities of 10,000 or more occurred in institutions, the corresponding figure for residents of smaller cities and rural areas was only 30.0 percent. For individual States, the proportion of resident deaths occurring in institutions ranged from 20.7 percent in Arkansas and Mississippi to 56.9 percent in Nevada.

Table K shows the proportion of resident deaths in institutions for urban and rural areas of each State.

Table L gives a frequency distribution of States according to the percent of resident deaths that occurred in institutions in 1940. In 12 States less than 30 percent of all resident deaths occurred in institutions; and in 5 States and the District of Columbia, 50 percent or more of these deaths occurred in institutions.

TABLE H.—RESIDENT AND RECORDED DEATHS FROM SELECTED CAUSES, AND DEATH RATES, BY POPULATION-SIZE GROUPS: UNITED STATES, 1940

(Exclusive of stillbirths. Numbers after causes of death are those of the 1938 revision of the detailed International List)

CAUSE OF DEATH	CITIES OF 10,000 OR MORE				CITIES OF 2,500 TO 10,000				RURAL			
	Deaths of residents		Deaths in area		Deaths of residents		Deaths in area		Deaths of residents		Deaths in area

Delaware	100.0	38.8	61.2
Cities of 10,000 or more	100.0	45.2	54.8
Rural	100.0	34.4	65.6
District of Columbia	100.0	55.3	44.7

The "institutional" grouping in tables K and L is based on the institution index, and all types of hospitals, et cetera, are included under the broad term "institution." For deaths, the institutions are, for the most part, general hospitals. Table M shows for 1940 the number of deaths in the United States and the percent of these deaths occurring in each broad class of institution. Of the total number of deaths, 31.0 percent did not occur in an institution, 29.6 percent occurred in general hospitals, and 9.4 percent occurred in other types of hospitals and institutions. Reference should be made to the code outline on page 6 for the classification of specific types of institutions.

TABLE K.—PERCENTAGE OF RESIDENT DEATHS OCCURRING IN INSTITUTIONS: EACH STATE, CITIES OF 10,000 OR MORE, AND RURAL, 1940—Continued

Nonresident institutions	15,726	1.1
Mental institutions	43,542	3.1
Other resident institutions	24,860	1.8

BIRTHS ALLOCATED TO PLACE OF RESIDENCE

Summary.—Of a total of 2,360,399 live births registered in the United States for 1940, 1,859,481 occurred in the city or county in which the mother of the child usually resided, and 500,918 (21.2 percent) were nonresident births. The proportion of total births that were of nonresidents is greater than the proportion of nonresident deaths (14.8 percent). A large proportion of these nonresident births were to mothers who lived in rural areas or small cities and gave birth in more populous areas. As might be expected, this movement from rural areas or small cities to larger urban places is largely an intrastate movement as only 31,690 (6.3 percent) of all nonresident mothers crossed State lines. However, in the case of deaths, 29,811 (14.3 percent) of all nonresidents crossed State lines.

TABLE N.—BIRTHS OF NONRESIDENTS IN EACH STATE AND BIRTHS OF RESIDENTS IN OTHER STATES: 1940

[1] Births of nonresidents from other States were incompletely reported.

A summary of births by place of occurrence and by place of residence is given for States in table N. This table shows, for each State, the number of births registered as occurring within the State; the total number of nonresident births within the State, that is, the number of births occurring in cities or counties of which the mother is not a resident; the number of these occurring to nonresident mothers who live in some other part of the same State; and the number to mothers living in other States. This table also shows the number of births to residents of each State occurring in other areas, and the total number of births to residents wherever occurring. For all States, except Maryland and Virginia, the total number of births occurring within the State is approximately equal to the total number of births to residents wherever occurring. In the District of Columbia, the number of births occurring in the area is substantially greater than the number of births to residents of the area.

TABLE Q.—PERCENT OF NONRESIDENTS AMONG TOTAL RECORDED BIRTHS BY POPULATION-SIZE GROUPS: 1940

(Exclusive of stillbirths)

POPULATION-SIZE GROUP	PERCENT NONRESIDENTS
UNITED STATES	21.2
Cities of 100,000 or more	18.1
Cities of 25,000 to 100,000	34.3
Cities of 10,000 to 25,000	40.4
Cities of 2,500 to 10,000	40.1
Rural	7.9

Number of nonresident births.—Although for the entire United States the nonresident births are 21.2 percent of all births, this proportion varies widely among States. In 1940, it ranged from 6.0 percent in Kentucky to 44.4 percent in

New Jersey. Table O gives the total number of births occurring in each State and the number and percent that occurred in a city or county of which the mother was not a resident. The frequency distribution of these percentages for States is given in table P. In 5 States less than 10 percent of the births were to nonresidents, while in 11 States 30 percent or more of the births were to nonresidents.

The proportion of nonresident births varies greatly for different population-size groups. Since many births are nonresident because of the use of urban hospitals by residents of rural areas, it is to be expected that there will be a high proportion of nonresident births in cities. Table Q, which gives the proportion of nonresident births for each population-size group, indicates that the proportion of nonresident births is greatest for cities having populations below 100,000. Large cities having populations of over 100,000 have a slightly lower proportion of nonresident births than the total United States, while rural areas have a much smaller proportion.

Changes in birth statistics for population-size groups.—Table R shows the number of births to residents of each population-size group and the number of births occurring in each group with the corresponding birth rates. All of the urban groups have lower rates by place of residence than by place of occurrence, whereas rural areas have a much higher rate when the births are allocated to place of residence.

The number of births and birth rates by place of residence and by place of occurrence are given in table S for each city having a population of 100,000 or more in 1940. The resident rates are lower than the occurrence rates for every city except Chicago, Reading, and Somerville. Since many factors contribute to the number of nonresident births occurring in a community, a careful study of local conditions is necessary to explain the varying differences observed between residence and occurrence rates. Important factors are: the number and location of hospitals in suburbs surrounding a given city; the density of population in adjacent rural areas and the distance to other cities; the extent to which hospital facilities are available within the given city, et cetera.

BIRTHS IN HOSPITALS

The use of hospitals for confinements by the inhabitants of any area is more correctly indicated by data reallocated to place of residence than by data based on place of birth. This information for States and certain population-size groups is given in table T, which shows the proportion of resident births of each area occurring in hospitals and the proportion of the recorded births in each area occurring in hospitals. For State totals, reallocation to place of residence does not greatly change the proportions; but for cities of 10,000 or more as a group and for cities of 2,500 to 10,000 and rural areas as a group, as shown in table T, there are marked changes. Although much greater changes can be observed for certain States, the general effect of reallocation can be seen from the national figures. Tabulated by place of occurrence, 83.7 percent of the births in cities of 10,000 or more and 25.1 percent of the births in cities of 2,500 to 10,000 and rural places, were hospital births. When the data are reallocated to place of residence, 80.5 percent of the births to residents of cities of 10,000 or more and 36.5 percent of the births to residents of cities of 2,500 to 10,000 and rural areas, occurred in hospitals.

By States the proportion of resident births occurring in hospitals ranged from 14.2 percent for Mississippi to 90.9 percent for Connecticut. For cities of 2,500 to 10,000 and rural areas, the proportion ranged from 8.8 percent in Kentucky to 88.9 percent in Connecticut. For cities of 10,000 or more, the proportion ranged from 51.8 percent in South Carolina to 96.9 percent in Nevada.

Table U gives a frequency distribution of the States according to the proportion of resident births occurring in hospitals, In 4 States less than 20 percent of the resident births occurred in hospitals, while in 10 States resident births in hospitals were 80 percent or more of all resident births.

The hospital coding and classification for birth statistics is not based on the institution code used for mortality. The births are coded with a simple code that indicates only whether or not the birth took place in a hospital or other institution.

Detailed statistics of births by type of attendance are given in table 7. The total number of births by place of occurrence and by place of residence are shown for each city and county of each State. Four types of attendants are distinguished in these tabulations, namely, physician in a hospital, physician not in a hospital, midwife, and other or unspecified attendant.

TABLE T.—PERCENTAGE OF RESIDENT BIRTHS AND RECORDED BIRTHS, OCCURRING IN HOSPITALS: EACH STATE, CITIES OF 10,000 OR MORE, AND RURAL, 1940

(Exclusive of stillbirths. The term "Rural" used in this table includes cities of 2,500 to 10,000 as well as rural parts of the State)

TABLE II.—CRUDE BIRTH AND DEATH RATES BY PLACE OF RESIDENCE: EACH STATE, COUNTY, AND CITY, 1940

(Exclusive of stillbirths. Data in this table are shown for each county subdivided into urban places having populations of 10,000 or more in 1940 and into rural part, which includes places under 10,000 and the remainder of the county. All towns, townships, or districts having populations of 10,000 or more and population densities of 1,000 or more per square mile are classified as urban. Arlington County, Va., is classified as urban under this rule. All rates in this table have been computed without regard to the size of the numbers of births or deaths on which the rates are based. Rates based on fewer than 20 births or deaths are indicated by an asterisk (*). The corresponding numbers of births and deaths (not classified by race) for each area are given in tables 7 and 13)

[8] Cities of Virginia are independent, each having the same status as a county. Cities having populations of 10,000 or more include: Alexandria, Arlington County,[9] Charlottesville, Danville, Fredericksburg, Lynchburg, Martinsville, Newport News, Norfolk, Petersburg, Portsmouth, Richmond, Roanoke, Staunton, Suffolk, and Winchester.

[9] Classified as urban under special rule. See headnote, p. 20.

[10] Includes data for Bristol, Va., only.

Yellowstone National Park (part)	(1)	(1)
Yellowstone National Park (total)	*21.8	*0

[1] Rate not computed for part of area.

NOTE.—Certain cities listed in this table are located in more than one county. In these cases, figures for the county include only the figures for that part of the city in the county. Total figures and rates for each of these cities are shown under the county containing the larger proportion of the city's population. Totals for Amarillo, Tex., are shown under Potter County; Atlanta, Ga., under Fulton County; Bethlehem, Pa., under Northampton County; Centralia, Ill., under Marion County; Elgin, Ill., under Kane County; Ellwood City, Pa., under Lawrence County; Fostoria, Ohio, under Seneca County; Huntington, W. Va., under Cabell County; Joplin, Mo., under Jasper County; Rocky Mount, N.C., under Nash County; St. Cloud, Minn., under Stearns County; Watertown, Wis., under Jefferson County; and Youngstown, Ohio, under Mahoning County. Likewise total figures for Yellowstone National Park are shown under Wyoming.

White and all other races are shown separately for minor areas in a State only when the 1940 population of all other areas in that State exclusive of cities of 100,000 or more formed at least 5 percent of the total or numbered 100,000 or more. Each city of 100,000 or more is also shown by race when the 1940 population of all other races formed at least 10 percent of the total or numbered 20,000 or more.

[1] The figures given in the row opposite each State in the stub show the number of births of residents of that State which occurred in each State named at the top of the column.

[2] Births in South Dakota of residents from other States were incompletely reported.

TABLE 7.—BIRTHS OF RESIDENTS OF EACH STATE, COUNTY, AND CITY, AND BIRTHS OCCURRING IN EACH STATE, COUNTY, AND CITY, BY PERSON IN ATTENDANCE: 1940

(Exclusive of stillbirths. Data in this table are shown for each county subdivided into urban places having populations of 10,000 or more in 1940 and into rural part, which includes places under 10,000 and the remainder of the county. All towns, townships, or districts having populations of 10,000 or more and population densities of 1,000 or more per square mile are classified as urban. Arlington County, Va., is classified as urban under this rule)

NOTE.—Certain cities listed in this table are located in more than one county. In these cases, figures for the county include only the figures for that part of the city in the county. Total figures for each of these cities are shown under the county containing the larger proportion of the city's population. Totals for Amarillo, Tex., are shown under Potter County; Atlanta, Ga., under Fulton County; Bethlehem, Pa., under Northampton County; Centralia, Ill., under Marion County; Elgin, Ill., under Kane County; Ellwood City, Pa., under Lawrence County; Fostoria, Ohio, under Seneca County; Huntington, W. Va., under Cabell County; Joplin, Mo., under Jasper County; Rocky Mount, N. C., under Nash County; St. Cloud, Minn., under Stearns County; Watertown, Wis., under Jefferson County; and Youngstown, Ohio, under Mahoning County. Likewise total figures for Yellowstone National Park are shown under Wyoming.

TABLE 13.—DEATHS OF RESIDENTS OF EACH STATE AND COUNTY, AND OF EACH CITY OF 10,000 OR MORE IN 1940, BY INSTITUTION: 1940

(Exclusive of stillbirths. Data in this table are shown for each county subdivided into urban places having populations of 10,000 or more in 1940 and into rural part, which includes places under 10,000 and the remainder of the county. All towns, townships, or districts having populations of 10,000 or more and population densities of 1,000 or more per square mile are classified as urban. Arlington County, Va., is classified as urban under this rule)

NOTE.—Certain cities listed in this table are located in more than one county. In these cases, figures for the county include only the figures for that part of the city in the county. Total figures for each of these cities are shown under the county containing the larger proportion of the city's population. Totals for Amarillo, Tex., are shown under Potter County; Atlanta, Ga., under Fulton County; Bethlehem, Pa., under Northampton County; Centralia, Ill., under Marion County; Elgin, Ill., under Kane County; Ellwood City, Pa., under Lawrence County; Fostoria, Ohio, under Seneca County; Huntington, W. Va., under Cabell County; Joplin, Mo., under Jasper County; Rocky Mount, N. C., under Nash County; St. Cloud, Minn., under Stearns County; Watertown, Wis., under Jefferson County; and Youngstown, Ohio, under Mahoning County.

TABLE 14.—DEATHS UNDER 1 YEAR OF AGE FROM SELECTED CAUSES, BY POPULATION-SIZE GROUPS, AND FOR ALL CAUSES BY RACE: UNITED STATES AND EACH STATE, 1940

(Exclusive of stillbirths. Numbers after causes of death are those of the 1938 revision of the detailed International List)
