VITAL STATISTICS OF THE UNITED STATES, 1975

VOLUME III-MARRIAGE AND DIVORCE

A brief summary of the contents for each section is listed below for the convenience of the reader. A complete table of contents is shown at the beginning of each section and is identified by a narrow black edge which can be located easily by fanning the pages. Each section is paged independently, using the section number as the identifying prefix.

Section 1. Marriages

For the United States:

National trend data.

Marriage totals and rates for each State, division, and region.

Marriage totals for each county or county equivalent.

Monthly marriage totals for each State, division, and region.

For the marriage-registration area:

Marriages classified by major demographic characteristics of bride and groom and by characteristics of marriage performed in each participating State; marriage rates specific for sex, age, and previous marital status.

Section 2. Divorces

For the United States:

National trend data.

Divorce totals and rates for each State, division, and region.

Divorce totals for each county or county equivalent.

Trend of national totals of children involved in divorce.

For the divorce-registration area:

For each participating State, divorces classified by major demographic characteristics of husband and wife, characteristics of their marriage, and number of children.

Section 3. Puerto Rico and Virgin Islands (U.S.)

Marriage and divorce totals for each county or county equivalent.

Marriages classified by major demographic characteristics of bride and groom.

For Virgin Islands only, divorces and annulments classified by characteristics of husband and wife, duration of marriage, and number of children.

Section 4. Technical Appendix

Historical and contemporary sources of marriage and divorce statistics, design of the samples of marriages and divorces and annulments, variability of sample estimates, and uniformity and completeness of the reporting forms and the collected data. Tables of the population estimates used as bases for rates.

Sampling Variability of the Marriage Statistics

In the tables which present statistics based on data from probability samples of marriage records, small frequencies have high sampling variability, which limits their usefulness. The sampling errors are shown in table 4-6 in the Technical Appendix. It is suggested that any number smaller than those shown be interpreted simply as "small" rather than as any more precise value. The true number would very probably be within 60 percent of the figure shown below. Figures for States shown as "zero" indicate that all records were tabulated and thus data are not subject to sampling variability.

¹"Districts" shown are election districts, the nearest equivalent to counties.

²Divisions are parishes.

³Marriage licenses issued.

⁴Independent cities have the same status as counties and are listed after counties.

⁵On January 1, 1974, Mansfield merged with the independent city of Suffolk; marriages for Mansfield have been included with those for Suffolk.

Sampling Variability of the Divorce Statistics

In the tables which present statistics based on data from probability samples of divorce records, small frequencies have high sampling variability, which limits their usefulness. The sampling errors are shown in table 4-8 in the Technical Appendix. It is suggested that any number smaller than those shown below be interpreted simply as "small" rather than as any more precise value. The true number would very probably be within 60 percent of the figure shown below. Figures for States shown as "zero" indicate that all records were tabulated and thus data are not subject to sampling variability.

1Figure includes estimates.

2Districts shown were county equivalents prior to 1960 (then named "Judicial Divisions"). Data are not available for election districts, the nearest equivalents of counties beginning with 1960.

3Data are incomplete.

4Divisions are parishes.

5Independent cities have the same status as counties and are listed after counties.

6Covington (city) figures included with Allegheny County.

7Bedford (city) figures included with Bedford County.

8Galax (city, part) figures included with Carroll County.

9Fairfax (city) and Falls Church (city) figures included with Fairfax County.

10Galax (city, part) figures included with Grayson County.

11Emporia (city) figures included with Greensville County.

12South Boston (city) figures included with Halifax County.

13On January 1, 1974, Nansemond merged with the independent city of Suffolk; divorces for Nansemond have been included with those for Suffolk.

14Lexington (city) figures included with Rockbridge County.

15Harrisonburg (city) figures included with Rockingham County.

16Franklin (city) figures included with Southampton County.

17Norton (city) figures included with Wise County.

NOTES

Reporting areas

Marriage data are shown for both Puerto Rico and the Virgin Islands. Divorce totals are shown for both Puerto Rico and the Virgin Islands and detailed divorce statistics for the Virgin Islands only.

Geographic classification

Data are shown by place of occurrence. Totals are shown for the local areas St. Croix Island and St. Johns and St. Thomas Islands (the latter two combined) in the Virgin Islands and for the primary geographic subdivisions, "municipios," in Puerto Rico. Courts empowered to grant divorces are located only in a few municipios in Puerto Rico; residents of other municipios obtain divorces in these courts.

Race and color

For 1975, brides and grooms are not shown by color for either Puerto Rico or the Virgin Islands. Husbands and wives divorced in 1975 are classified as white or All other for the Virgin Islands.

Section 4—the Technical Appendix—includes information about the sample specifications, sampling errors, and completeness of reporting for these statistics from Puerto Rico and the Virgin Islands.

SECTION 4 - TECHNICAL APPENDIX

SOURCES OF DATA

Marriage and divorce statistics in this volume are based on information from three sources: (1) Complete counts of events obtained from all States, (2) samples of marriage and divorce certificates from States meeting specified reporting criteria, and (3) precoded machine-readable data for all marriages and all divorces occurring in States participating in the Federal-State-Local Co-operative Health Statistics System (CHSS).

State and local officials annually provide complete counts of marriages and divorces by county of occurrence and marriages by month of occurrence. From these counts, marriage and divorce totals are derived and rates are computed for each State, geographic division, region, and the United States. For marriages a total is also derived for the marriage-registration area.

Sample records are obtained by the National Center for Health Statistics (NCHS) from microfilm copies of the original certificates received from the registration offices of States and areas comprising the marriage-registration area (MRA) and the divorce-registration area (DRA). The statistical information on these records, including data on the characteristics of marriages and divorces and of the persons involved in them, is edited, classified, transferred to tape for computer processing, and tabulated in NCHS. Exceptions to this procedure are statistics from those States in the MRA or DRA that submit precoded machine-readable data to NCHS through CHSS. For both marriages and divorces, statistical data for 1975 were provided through CHSS by the following six States: Missouri, Nebraska, New York (except for New York City marriages), Rhode Island, South Carolina, and Vermont. For marriages, Florida has submitted precoded data since 1972, and Maine and New Hampshire provided precoded data for 1975.

The marriage totals for the MRA and each participating State derived from sample data differ slightly from the totals obtained from the complete count described above. The two published divorce totals for each State in the DRA also vary slightly. Only one total is published for the DRA, and it is based on sample data.

Marriage and divorce statistics for the United States, for the registration areas, and for individual States are limited to events occurring during the year and registered within the specified area. All tabulations are by place of occurrence and include events occurring to non-residents. Marriages or divorces of members of the

Armed Forces or other U.S. nationals that occur outside the United States¹ are excluded. *United States* refers to the 50 States and the District of Columbia. Alaska has been included in the U.S. tabulations since 1959 and Hawaii, since 1960. Data for Puerto Rico and the Virgin Islands were compiled for 1975 and preceding years except 1966-69 and 1972. Data for these areas were processed separately from the rest of the MRA and DRA and appear in Section 3 of this volume.

Sources of marriage and divorce data since 1867 are shown in table 4-1; a description of these sources can be found in Section 7, Volume III, *Vital Statistics of the United States, 1960*.

Nationwide counts

In 1975 the total counts of marriages by State and county were furnished from central files of marriage records for the 47 States maintaining them and for the District of Columbia. Counts for the five boroughs of the city of New York were supplied by the registration officials of Manhattan. In the States without central files counts were obtained from the counties by the States or, in some instances, by NCHS. State officials reported for Arizona and Oklahoma. NCHS obtained county totals directly from county officials in New Mexico.

Total counts of marriages performed were requested from each county registration official. However, in prior years a small number of counties have reported the number of marriage licenses issued rather than the number of marriages performed. The number of marriage licenses issued is usually 1 or 2 percent greater than the number of marriages performed. (See page 2-1, Section 2, Volume I, *Vital Statistics of the United States, 1959*.)

Total counts of divorces by State and county included decrees of absolute divorce and of annulment as well as decrees of marriage dissolution newly introduced in many States. These counts were furnished from central files of the 46 States maintaining them and from the District of Columbia. Although Louisiana maintains central files, counts for some parishes of Louisiana were obtained by NCHS directly from local officials. For the four States without central files of divorce records, county totals were obtained from local officials. NCHS obtained county totals directly from local officials in Indiana and New Mexico; State officials in Arizona and

SECTION 4 - TECHNICAL APPENDIX

Oklahoma obtained the county totals and forwarded them to NCHS.

Divorces and annulments were not reported for one county or more in the following States: Arkansas (11), Indiana (11), and Louisiana (20). The national and regional totals of divorces include estimates for the 11 counties in Indiana and the 20 counties in Louisiana. The estimates prepared by NCHS assume that the rate in nonreporting areas of the State was the same as that observed for the reporting areas. The number of divorces for some counties in Indiana is based on the

number of petitions filed, rather than on the divorce decrees granted.

Marriages and marriage rates with seasonal adjustments

For all years appearing in table 1-4 the number of marriages and the marriage rates have been adjusted for large seasonal fluctuations and for the effect of the number of Fridays and Saturdays in each month. Prior to 1970 adjustments were also made for Lent, but they were discontinued because of the lessening influence of

Lent on marriages. Most religious denominations have relaxed or abolished their rules against marriage during that period.

Registration areas

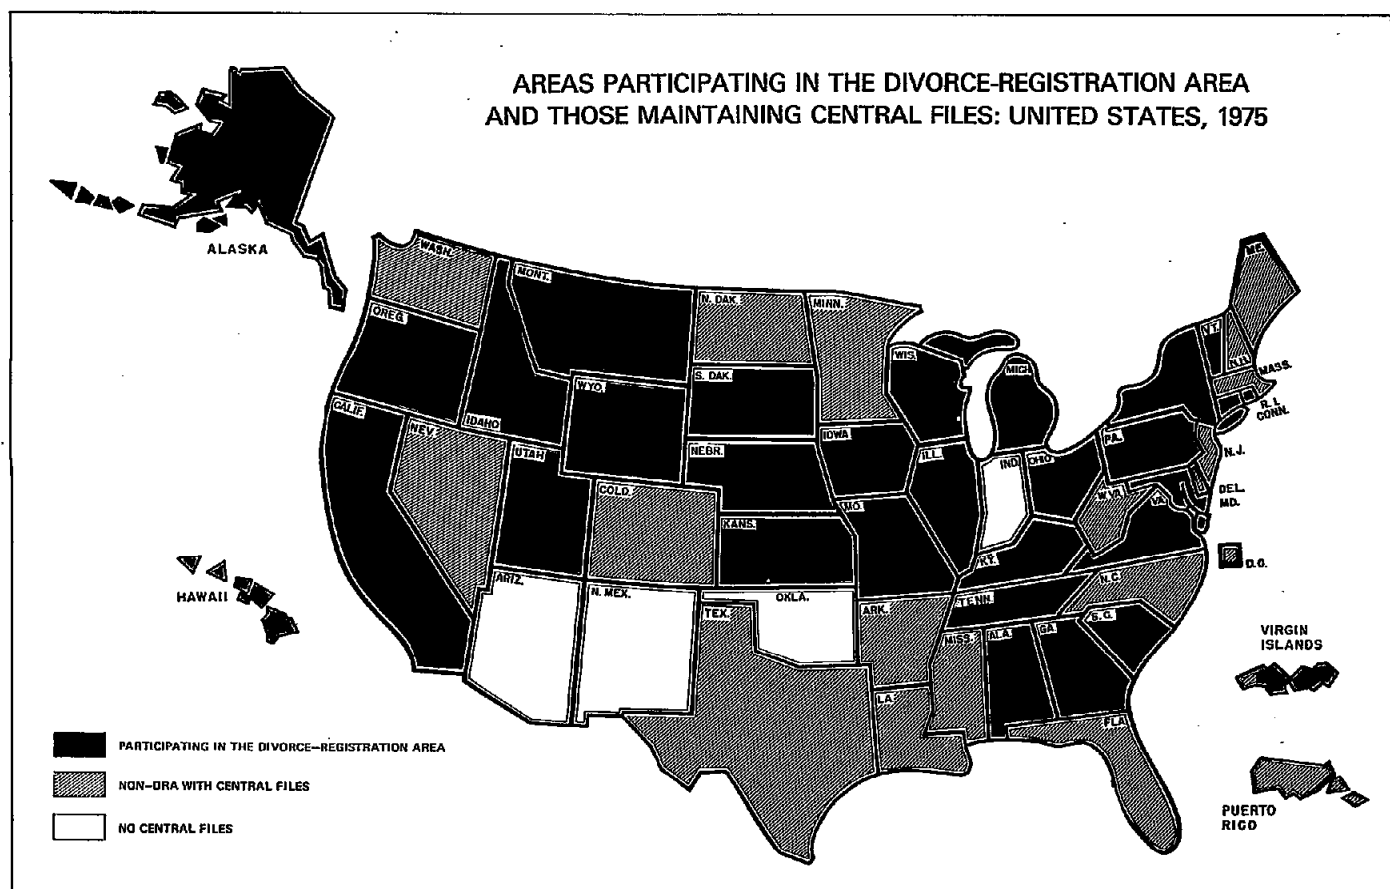

Registration areas for the collection of marriage and divorce statistics were established in 1957 and 1958, respectively. The registration areas include States with adequate programs for collecting marriage and divorce statistics. Criteria for participation in the registration areas are

1. A central file of marriage or divorce records

2. A statistical report form conforming closely in content to the Standard Certificate of Marriage (figure 4-1) or Standard Certificate of Absolute Divorce or Annulment (figure 4-2)
3. Regular reporting to the State office by all local areas in which marriages or divorces are recorded
4. Tests for completeness and accuracy of marriage or divorce registration carried out in cooperation with NCHS.

In 1975 the MRA (figure 4-3) comprised 41 States, the District of Columbia, Puerto Rico, and the Virgin Islands. The DRA (figure 4-4) included 29 States and the Virgin Islands. Table 4-2 shows when States and

FIGURE 4-4

Characteristics of marriages and divorces

Each year statistical information on characteristics of marriages and divorces is provided by the States participating in the registration areas.

The items processed for marriages in the MRA for 1975 and shown in this volume were State of marriage; month and day of week of marriage; type of ceremony, civil or religious; and the following items relating to characteristics of bride and groom: State of birth, date of birth or age, nativity status, residence status, race, number of this marriage, previous marital status, and education.

For divorces (including absolute divorces, annulments, and decrees of marriage dissolution) the items processed for 1975 and shown in this volume were State in which divorce was granted, number of children under 18 years of age, month and year of marriage (from which duration of marriage and age at marriage are obtained), month and year of separation (from which duration of marriage to separation is obtained), place of marriage, and the following items relating to husband

and wife: Date of birth or age, race, number of this marriage, and education.

Most of the items tabulated for marriages and divorces in 1975 were on the corresponding certificates of nearly all the reporting areas in the MRA or in the DRA. For marriages, items on age at marriage or date of birth and State of residence were included by every MRA State and the District of Columbia and were well reported. For divorces, date of marriage, place of marriage, and number of children were included by every State in the DRA and were well reported.

Information about previous marriages of the bride and groom is obtained from two items: Number of this marriage and previous marital status. For the District of Columbia and the 36 States that requested both items on their marriage certificates, first marriages and remarriages could be identified if either item was stated. Idaho, Maryland, and Oregon requested only the item on previous marital status. For these States the number of not stated cases for the missing item (number of this marriage) was reduced by the number of cases assumed to be first marriages because previous marital status was

stated as single. Michigan, Ohio, and South Carolina requested only "number of times previously married." Not stated cases for the missing item (previous marital status) were reduced by the number of persons assumed to be single because they had been previously married "0" times.

All of the States in the DRA except Nebraska request reporting of the number of this marriage on their divorce certificates. Not stated cases for the missing item (number of this marriage) have not been adjusted where it is stated that no prior marriage ended in death or divorce, because the latter item has been included on the certificates of only 15 States in the DRA and has been poorly reported in most of those States.

Race is generally not well reported on either marriage or divorce certificates. The item appears on the marriage forms of all States in the MRA except California, Maryland, Massachusetts, Michigan, New York, and Ohio. The District of Columbia no longer reports race on its marriage certificates. Race was not reported for 13,066 (1.1 percent) of the marriage certificates issued by the 35 other States which had the item on their certificates in 1975. Overall, race or color of bride and groom was not available for 585,294, or 34 percent, of the 1,718,641 marriages from the entire MRA. Race appears as an item on the divorce certificates of all States in the DRA except Michigan and Ohio. Race was not reported for 32,204 (6.1 percent) of the husbands on divorce certificates issued by the other 27 States in the DRA. Overall, race or color of husband was not available for 125,774, or 20 percent, of the husbands in the 625,676 divorces from the entire DRA. Figures for wives in divorces are very similar.

Beginning with this volume, tables are presented for educational attainment of brides and grooms in marriages and of husbands and wives in divorces for selected States which report education with a satisfactory level of completeness. Also presented in this volume for the first time are tables showing divorces by duration of marriage to separation and by duration of separation to decree for marriages ending in divorce. These data were prepared for selected States which report date of separation on their divorce certificates with satisfactory completeness.

Tables 4-3, 4-4, 4-9, and 4-10 show which items appear on the records of the registration States and how well they are reported by each State.

SAMPLE DESIGN

Obtaining the records

Each year the States and areas participating in the MRA and the DRA prepare microfilm copies of their

records, which are purchased by NCHS. Further processing, including the selection of samples of certificates from microfilm copies and the code-punching, verification, and tabulation of statistical data from the sample records, is carried out by NCHS. As noted above, exceptions to this procedure occur for those States in the MRA or DRA which submit precoded machine-readable data tapes to NCHS through CHSS. These precoded computer tapes contain statistical data on all marriages or divorces occurring in those MRA or DRA States providing data through CHSS.

For marriages the records refer to all marriages performed in 1975 within the 41 MRA States, the District of Columbia, Puerto Rico, and the Virgin Islands. For divorces the records refer to all decrees of absolute divorce, dissolution of marriage, and annulment that were granted during 1975 within the 29 DRA States and the Virgin Islands.

Interlocutory divorce decrees or decrees "nisi" (which grant that the divorce takes permanent effect at a specific time in the future if the couple does not reconcile in the meantime) are included among the records of the States that grant them, usually for the year in which they were granted.

The sampling of marriage and divorce records for States in the registration area was initiated in 1960. For earlier years data on characteristics had been compiled from predesigned tables completed on the basis of all events and submitted by the States.

Sampling procedures

The marriage sample was designed to yield estimates of State totals as well as frequency distributions by characteristics of the bride and groom. These estimates were made for the total MRA and each State in the MRA. A sampling rate was designated for each of the MRA States so that the selected sample for it would consist of at least 2,500 records. Five different sampling rates were used: All records, 1/2, 1/5, 1/10, and 1/20. All records were automatically included in the total MRA sample for States submitting precoded marriage data through CHSS. Overall, about 29 percent of all marriages in the MRA were included in the sample for 1975.

Sampling procedures for the divorce sample parallel those for the marriage sample. A sampling rate was selected so that the sample for each DRA State would contain at least 1,000 records. Four different sampling rates were used: All records, 1/2, 1/5, and 1/10. All records were included in the total DRA sample for the CHSS States. Overall, about 27 percent of all divorces in the DRA were included in the sample for 1975.

The sampling rates, number of events, and sample cases by State for 1975 are shown in tables 4-5

(marriages) and 4-7 (divorces). States participating in CHSS for either marriages or divorces are footnoted.

ESTIMATING PROCEDURES

Area totals

The figures obtained from complete counts of events furnished by the State and local offices differ slightly from the estimated totals based on sample data. When possible, major differences between the totals estimated from the sample and those based on independent counts for each reporting State are reconciled before the sample data are weighted and tabulated. However, even in States where 100 percent of the records are sampled, the sample estimate may differ from the State count because of differences between NCHS and State cutoff dates in accepting records.

The sample estimate of marriages in the MRA differed from the complete count by 0.2 percent. It differed by less than 1 percent in all States except Alabama (a difference of 1.1 percent), Illinois (4.1 percent), and the District of Columbia (11.8 percent). In the District of Columbia, some certificates were obtained too late for inclusion in the sample.

The sample estimate of divorces in the DRA differed from the complete count by 0.02 percent. The only State where the difference exceeded 1 percent was in Utah, with the sample estimate 3.9 percent below the count. The Utah sample excluded annulments, which were included in the final count.

Frequencies

Procedures for estimating frequency distributions for various characteristics from the marriage and divorce samples involve two steps.

1. Each sample case was assigned a weight which was the reciprocal of the sampling ratio used to select the case. If a marriage record was selected from a State with a sampling ratio of 1/10, that record was assigned a weight of 10; if 100 percent of the records were processed from a State, each such record was assigned a weight of 1.
2. Tabulated counts consisted of summing the records multiplied by their assigned weights. Thus each frequency distribution, such as age at marriage of first-married brides, is a sum of the weighted sample cases included.

The weights for all sample records are identical within each State. However, as shown in tables 4-5 and

4-7, the weights vary among the registration States from 1 to 20 for marriage records and from 1 to 10 for divorce records. Therefore, for the MRA and DRA, any two approximately equal frequencies may have different sampling errors, varying with the proportion of cases from each stratum included in the estimate.

Percents and rates

Rates for 1940, 1950, 1960, and 1970 are based on the population enumerated as of April 1 in the censuses of those years. Rates for all other years are based on the estimated midyear (July 1) population for the respective years. Rates are based on population estimates including Armed Forces stationed in the United States but excluding Armed Forces abroad, except divorce rates for 1941-46 which are based on populations including Armed Forces abroad.

Allocation

On the computer tapes containing sample marriage records, values were allocated for missing ages of bride and groom. Reporting of these items has been almost 100 percent complete since 1960; in 1975 both items were more than 99.8 percent complete. Race was also allocated on those sample marriage records where the race of one of the spouses was stated. Because States in the DRA vary radically in the completeness with which items are reported on the divorce records, no allocations were made prior to tabulation of the divorce data.

Children involved in divorces

To obtain national estimates for 1970 through 1975, the average number of children under 18 years of age per decree for the DRA was multiplied by the national divorce total. From 1965 to 1969 the average number of children per decree was computed for the 16 States that had reported children with a satisfactory degree of completeness in 1965 (Alaska, Hawaii, Idaho, Iowa, Kansas, Michigan, Missouri, Montana, Nebraska, Ohio, Oregon, South Dakota, Tennessee, Virginia, Wisconsin, and Wyoming) and the national divorce total was multiplied by this average. This method was also used to revise figures for the years 1961-64 originally estimated by using a different method. Consequently data for 1961-64 shown in table 2-9 differ from figures appearing in Volume III, *Vital Statistics of the United States* prior to the 1965 issue. In 1960 the estimate was based on sample data for the United States. For earlier years total counts from States reporting the number of children were used to estimate the children involved in divorce for the United States.

SAMPLING ERRORS

Statistics for States where all records were used have no sampling error. For other States each statistic has a sampling error (or standard error) denoted by $\hat{\sigma}(x)$. The sampling error is primarily a measure of variation that occurs by chance because a sample of records is surveyed rather than the entire population. The sampling error can be computed because within each State or registration area the probability that a record will be chosen for the sample is known (either all records, 1/2, 1/5, 1/10, or 1/20, as shown in tables 4-5 and 4-7). For about 68 percent of all possible samples of equal size the estimate from the sample would differ from the value obtained from a complete count by less than the standard error. For about 95 percent of all samples the difference would be less than twice the standard error.

Sampling errors are shown in table 4-6 for marriages and table 4-8 for divorces. To facilitate comparisons among registration States with widely varying totals of marriages or divorces, the sampling errors for the registration areas and participating States are shown for frequencies expressed as percents of State or of registration area totals. For example, table 1-18 shows 344,006 brides 18-19 years of age in the MRA for 1975. This estimated frequency is about 20 percent of all brides in the MRA (1,718,641). In table 4-6 under the column "20 or 80" in the row for the total MRA we find the sampling error 1,802. Thus, chances are about 68 out of 100 that the actual number of marriages to brides 18-19 years of age is within one standard error of the estimate from this particular sample (344,006 \pm 1,802, or between 342,204 and 345,808). The interval from 342,204 to 345,808 is called a 68-percent confidence interval for the actual number of brides 18-19 years of age. The sampling error of a given frequency of marriages or divorces in a particular State can be calculated from the formula

$$\hat{\sigma}(x_{ij}) = \sqrt{\frac{N_i(N_i - n_i)p_{ij}q_{ij}}{n_i - 1}}$$

where

- i = a State or registration area
- j = a subclass, such as an age group of brides
- N_i = the final count of events reported by State i (tables 1-6 and 2-2)
- n_i = the number of sample records in State i (tables 4-5 and 4-7)
- p_{ij} = estimated proportion of all cases with the characteristic j to be studied for State i (shown in the spread margin of tables 4-6 and 4-8 as percent under "1 or 99," "2 or 98," "3 or 97," etc.)

$$q_{ij} = 1 - p_{ij}.$$

x_{ij} = $N_i p_{ij}$, the estimated frequency of the characteristics under study.

In this formula we see that when the number of sample records, n_i , is the same as the total marriages, N_i , the numerator becomes zero, and there is no sampling error for States that have all their records processed. We also see that because the values of p_{ij} and q_{ij} are complementary, their product ($p_{ij}q_{ij}$) remains the same if their values are reversed. For instance, the estimated sampling error for an estimate of 5 percent is the same as the sampling error for 95 percent. Therefore the sampling error for both values is listed in one column in table 4-6 and 4-8 under the heading "5 or 95."

For example, to calculate the sampling error for previously widowed Alabama brides

N_i = 45,349, the final count of Alabama marriages (table 1-6)

n_i = 2,243, the number of sample records for Alabama (table 4-5)

x_{ij} = 2,500, the estimated frequency of previously widowed Alabama brides (table 1-26)

p_{ij} = the number of previously widowed Alabama brides expressed as a percent of all marriages: 2,500/45,349 = .06 or 6 percent

$q_{ij} = 1 - p_{ij} = .94$ or 94 percent

and,

$$\hat{\sigma}(2,500) = \sqrt{\frac{45,349(43,106)(.06)(.94)}{2,242}} = 222.$$

So, the chances are 68 out of 100 that the actual number of previously widowed Alabama brides is between 2,278 and 2,722 (2,500 \pm 222).

The estimated sampling error for the MRA can be computed from the formula

$$\hat{\sigma}(x_j) = \sqrt{\frac{\sum_{k=1}^{42} N_k(N_k - n_k)}{n_k - 1} p_{kj} q_{kj}}$$

where

- 42 refers to the 41 States and the District of Columbia in the MRA
- N_k = the final count of events reported by the k-th MRA State
- n_k = the number of sample records in the same State
- p_{kj} = the estimated percent of all cases in State k with the characteristic j
- $q_{kj} = 1 - p_{kj}$.

Using the same formula, sampling errors for the DRA shown in table 4-8 were computed by summing over the 29 States in the DRA.

Many of the tables in this volume show percent distributions rather than frequencies. The sampling error for such a percent can be computed by dividing the sampling error found in tables 4-6 or 4-8 by the estimated total number of events for the area. For example, table 1-10 shows that 4.7 percent of all Maryland brides were previously widowed. In table 4-6 under the spread margin "5 or 95" the Maryland sampling error is 201. Divide 201 by 44,680, the estimated number of marriages in Maryland as shown in the stub margin of the same table. The result is 0.4 percent, the sampling error for an estimated 5 percent of 1974 Maryland marriages. Thus, chances are about 68 out of 100 that the actual percent of previously widowed Maryland brides is 4.7 ± 0.4 , or between 4.3 and 5.1 percent.

The following formula is used to compute a sampling error for the proportion of events in a subclass of a subgroup, where the number of events in the subgroup is also subject to sampling error:

$$\hat{\sigma}(x/y) = (1/y) \sqrt{\hat{\sigma}^2(x) - (x/y)^2 \hat{\sigma}^2(y)}$$

where

- y = the estimated frequency of the subgroup
- x = the estimated frequency of the subclass of the subgroup
- $\hat{\sigma}(y)$ = the sampling error of y from table 4-6 or 4-8
- $\hat{\sigma}(x)$ = the sampling error of x from table 4-6 or 4-8

To illustrate, if we wanted the sampling error for the proportion of all perviously married Louisiana brides who were 20-24 years of age, let

- x = 1,800 previously married Louisiana brides who were 20-24 years of age (table 1-19)
- y = 9,170 perviously married Louisiana brides
- x/y = 0.1963
- $\hat{\sigma}(x)$ = $\hat{\sigma}(1,800) = 126$ from table 4-6 under "5 or 95" since x is approximately .05 of all Louisiana brides ($x/N = 1,800/37,310 = .05$)
- $\hat{\sigma}(y)$ = $\hat{\sigma}(9,170) = 251$ from table 4-6 under "25 or 75" since y is approximately .25 of all Louisiana brides ($y/N = 9,170/37,310 = .25$)
- $\hat{\sigma}(x/y) = (1/9,170) \sqrt{(126)^2 - (.1963)^2 (251)^2} = .012$ or 1.26 percent.

So chances are 68 out of 100 that the actual proportion of previously married Louisiana brides who were 20-24 years of age was $.1963 \pm .0126$, or between 18.37 percent and 20.89 percent.

The significance of the difference between two proportions may be determined by the following formula:

$$\frac{(x_1/y_1) - (x_2/y_2)}{\sqrt{\hat{\sigma}^2(x_1/y_1) + \hat{\sigma}^2(x_2/y_2)}}$$

where the x 's and y 's represent the same subgroups as above, but of two populations, and where the denominator, under the square root sign, represents the sampling error of the difference between the proportions x_1/y_1 and x_2/y_2 shown in the numerator of the formula. If the above ratio is 2 or larger, the difference between proportions is considered significant at the .95 level of confidence.

For example, 19.63 percent of previously married brides in Louisiana were 20-24 years of age, with a sampling error of 1.26 percent. Using the same procedure for previously married grooms in Ohio, .1005 or 10.05 percent were 20-24 years of age, with a sampling error of .0092 or .92 percent. By the above formula:

$$\frac{.1963 - .1005}{\sqrt{(.0126)^2 + (.0092)^2}} = \frac{.0958}{.0156} = 6.1.$$

Since the difference in proportion divided by the sampling error is larger than 2, this difference of 9.58 percentage points between brides and grooms is expected to occur by chance no more than once in 20 times; the difference is statistically significant at the .05 level.

NONSAMPLING ERRORS

In addition to the sampling errors described above, there are several other sources of variation that are little affected by the size or design of the sample.

Incomplete reporting

Nonresponse errors in marriage and divorce data may arise from any of these three sources: (1) The item is not on the certificate of a particular reporting area. For example, the item "color" was removed from the 1971 revision of the Massachusetts marriage record; (2) sometimes when a State revises its form to include additional items, copies of the old form are still used extensively by registration offices until a supply of the old version is exhausted; or (3) although the item may be on the form, there may be no response, or the response may be illegible or unusable. Items on some forms are badly worded and do not elicit responses sufficiently precise to be classified.

Items not answered for any of these three reasons are tabulated as "not stated." Tables 4-9 and 4-10 show the proportions of not stated cases for specified characteristics of marriages and divorces for 1975. Footnotes

to entries identify the specific State where an item was not on the certificate form (not reportable). A major proportion of the not stated cases for marriages were due to the absence of items on some of the reporting forms (not reportable). In contrast, the majority of not stated items on records of divorce or annulment arose from unanswered items (not completed). On the divorce records, personal information (age, race, etc.) typically has been less completely reported than information about the dissolved marriage or about the type of decree.

Other sources of error

Inconsistent responses.—Occasionally, for both marriages and divorces, the responses to related items are inconsistent. For example, the previous marital status of the bride or groom, as shown on the marriage certificate, may not be consistent with the stated number of times married or number of this marriage. Such differences are reconciled before tabulation.

Ambiguous wording of items.—Some of the items are worded so that they do not yield information easily classified in standardized categories. This often leads to errors in classification, more frequently of geographic place names (residence, place of marriage, and place of birth) and of previous marriages.

Microfilm errors.—Errors in the arrangement of the records received on microfilm in NCHS sometimes occur when numbers on the records are out of sequence, missing, or duplicated, or when records that are not part of the universe being sampled are erroneously included in the file.

Processing errors.—Errors may arise in coding, punching, or tabulating of records. However, all sample coding was verified 100 percent; data already on computer tape were edited for impossible codes and for inconsistencies. Instances of impossible codes and inconsistencies in information about previous marriages were rechecked to the records.

In general, for most of the data available from 1960 onward, the completeness and year-to-year consistency are evidence of the basic reliability and coverage of the marriage- and divorce-registration systems.

Totals for each State by county also tabulated in each State. These and totals estimated from samples were checked for consistency.
1961-69	Statistics prepared in the National Center for Health Statistics for the MRA and each MRA State from probability samples of the marriage records collected by each MRA State. Pretabulated totals of marriages or marriage licenses by county and by month, reported for all States, used to compute totals for the United States, four regions, and nine geographic divisions; also, for MRA States, checked for consistency with totals estimated from sample records.	Statistics prepared in the National Center for Health Statistics for the DRA and each DRA State from probability samples of the records of absolute divorces and annulments collected by each DRA State. Pretabulated totals by county, reported for all States, used to compute totals for the United States, four regions, and nine geographic divisions; also, for DRA States, checked for consistency with totals estimated from sample records.
1970	Statistics prepared in the National Center for Health Statistics for the United States (excluding Arizona, New Mexico, and Oklahoma), the MRA, each MRA State, and eight nonregistration States from probability samples of the marriage records collected by each MRA State and each of the eight nonregistration States. Pretabulated totals of marriages or marriage licenses by county and by month, reported for all States, used to compute totals for the United States, four regions, and nine geographic divisions. For MRA States and the eight nonregistration States, these totals were checked for consistency with totals estimated from sample records.	Same as for 1961-69.
1971	Same as for 1961-69.	Same as for 1961-69.
1972-7	Same as for 1961-69 except for Florida. In 1972, 1973, and 1974 Florida sent a computer tape of items precoded for all marriages in that State.	Same as for 1961-69.
1975	Same as for 1961-69 except for Florida, Maine, Missouri, Nebraska, New Hampshire, New York (excluding New York City), Rhode Island, South Carolina, and Vermont. These States sent tapes of items precoded for all marriages.	Same as for 1961-69 except for Missouri, Nebraska, New York, Rhode Island, South Carolina, and Vermont. These States sent tapes of items precoded for all divorces.

¹Includes reported annulments.
