

There's something you can do today that may help treat Alzheimer's disease tomorrow.

If you or family members are living with the beginning stages of Alzheimer's disease, you can help untangle its mystery. Researchers are looking for people with mild to moderate Alzheimer's disease to help discover whether an experimental drug may help treat memory loss. You'll help advance the understanding of Alzheimer's disease through a clinical trial, called the RI Study, carefully monitored by a team of doctors and nurses at a research center near you. Call now—the action you take today could help treat Alzheimer's disease tomorrow.

Call 1-800-438-4380 for more information about the RI Study
or go to www.nia.nih.gov/Alzheimers/

The RI Study is an industry-sponsored study being conducted by the Alzheimer's Disease Cooperative Study (ADCS), a consortium of leading researchers supported by the National Institute on Aging (NIA), part of the National Institutes of Health (NIH).
