

Annual Program Summary and Monitoring Report

for
Fiscal Year 2006

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interest of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

ANNUAL PROGRAM
SUMMARY

and

MONITORING REPORT
FISCAL YEAR 2006

Public Input to this Document

Although the Annual Program Summary gives only a very basic and brief description of the programs, resources and activities in which the Klamath Falls Resource Area (KFRA) is involved, the report does give the reader a sense of the enormous scope, complexity and diversity involved in management of the Klamath Falls Resource Area public lands and resources. The managers and employees of the Klamath Falls Resource Area take pride in the accomplishments described in this report. Public input on this Annual Program Summary and Monitoring Report will assist us in making this document more understandable and easy to read for the public in future years.

You may provide comments via email at: or014mb@blm.gov or send written comments to the following address:

Bureau of Land Management
Klamath Falls Resource Area
c/o Planner
2795 Anderson Avenue, Building #25
Klamath Falls, OR 97603

Comments, including names and street addresses of respondents, will be available for public review at the above address during regular business hours (8:00 a.m. to 5:00 p.m.), Monday through Friday, except holidays, [and may be published as part of (the EA, the EIS, or other related documents)]. Individual respondents may request confidentiality. If you wish to withhold your name or street address from public review or from disclosure under the Freedom of Information Act, you must state this prominently at the beginning of your written comment. Such requests will be honored to the extent allowed by law. All submissions from organizations or businesses, and from individuals identifying themselves as representatives or officials of organizations or businesses, will be made available for public inspection in their entirety.

Thank you for taking the time to review this document.

KLAMATH FALLS RESOURCE AREA ANNUAL PROGRAM SUMMARY

Fiscal Year 2006

1.0 Introduction

The Annual Program Summary is a review of the programs on the Klamath Falls Resource Area, Bureau of Land Management for the period of October 1, 2005 through September 30, 2006. The Klamath Falls Resource Area encompasses the southwestern portion of the Lakeview District, in southern Oregon (see Figure 1). The Annual Program Summary addresses the accomplishments of the Klamath Falls Resource Area and provides information concerning the Klamath Falls Resource Area budget, timber receipt collections, and payments to Klamath County. Included with this Annual Program Summary is the Monitoring Report for the Klamath Falls Resource Area in FY 2006. The Monitoring Report compiles the results and findings of implementation monitoring for fiscal year 2006, the eleventh full fiscal year of implementation of the Klamath Falls Resource Area Resource Management Plan (RMP). These reports are a requirement of the Klamath Falls Resource Area Record of Decision and Resource Management Plan, designed to report to the public and local, state and federal agencies a broad overview of activities and accomplishments for fiscal year 2006 (FY 2006).

The Record of Decision for Amendments to Forest Service and Bureau of Land Management Planning Documents within the Range of the Northern Spotted Owl - referred to as the Northwest Forest Plan (NFP) - was signed in April 1994. With the signing of this document began the implementation of the Northwest Forest Plan. Subsequently in June 1995, the Klamath Falls Resource Area began implementation of the Resource Management Plan, which incorporates all aspects of the Northwest Forest Plan, with the signing of the RMP Record of Decision (ROD). The ROD established a new allowable harvest level effective October 1, 1994, which is the beginning of fiscal year 1995, so related activities during the entire fiscal year 1995 are included in the accomplishments reported for fiscal year 1995. The results of the FY 2006 Annual Program Summary show that the Klamath Falls Resource Area is fully and successfully implementing the Northwest Forest Plan.

2.0 Summary of Accomplishments

The manner of reporting accomplishments differs between the various programs. Some resource programs lend themselves well to a statistical summary of activities while others are best summarized in short narratives. Table 2.1 provides a summary of the accomplishments for some resource activities for fiscal year 2006. These accomplishments are compared against cumulative accomplishments for 1995-2006. Further details concerning individual programs on the Klamath Falls Resource Area may be obtained by contacting the Klamath Falls Resource Area Office.

Table 2.1 – Klamath Falls Resource Area, Fiscal Year 2006 Summary of Resource Management Actions, Directions, and Accomplishments

| <u>RMP Resource Allocation/ Management Practice/Activity</u> | <u>Activity Units</u> | <u>FY 2006 Accomplishments</u> | <u>FY 95-06 Cumulative</u> | <u>Projected Practices Twelve Years</u> |
|---|----------------------------------|---|---------------------------------------|--|
| <u>Forest and Timber Resources</u> | | | | |
| Regeneration harvest | Acres | 0 | 227 | 1,968 |
| CT/Density Management (HLB)* | Acres | 985 | 15,293 | 13,164 |

| Hazardous material sites identified | Sites | 0 | 5 | NA |
| Hazardous material sites remediated | Sites | 0 | 5 | NA |

3.0 Budget and Employment

In fiscal year 2006, the Klamath Falls Resource Area had a total appropriation of approximately \$5.3 million. This included \$59,000 for Jobs-in-the-Woods program; \$782,000 for Management of Lands and Resources (MLR); \$1,450,000 for Oregon and California Railroad Lands (O&C); \$648,000 for Forest Ecosystem Health and Recovery; \$1,886,000 for prescribed fire; \$289,000 for Pipeline Recreation; and \$201,000 for Pipeline Timber. See Table 3.1.

In fiscal year 2006, there were 37 permanent employees on the resource area. The number of temporary (22) and term (19) employees varied throughout the year with a total peak employment of 78.

Table 3.1 - Resource Area Budget Fiscal Year 2006

| <u>Budget Source</u> | <u>FY 2006 Dollars</u> |
|--|------------------------|
| Management Land and Resource | \$782,000 |
| O&C Lands | \$1,450,000 |
| Forest Ecosystem Health and Recovery | \$648,000 |
| Jobs in the Woods | \$59,000 |
| Recreation Pipeline | \$289,000 |
| Timber Sale Pipeline | \$201,000 |
| Fire (Hazardous Fuels Reduction Program) | |
| Fuels Reduction Contracts | \$1,146,000 |
| <u>Urban Interface Fuels Reduction</u> | <u>\$740,000</u> |
| Total Resource Area Budget | \$5,315,000 |

4.0 Land Use Allocations within the Klamath Falls Resource Area

There are approximately 224,900 acres of public land administered by the BLM within the Klamath Falls Resource Area. The Klamath Falls Resource Area is divided into “Westside” and “Eastside” lands. The Westside lands are further separated into key and non-key watersheds as stipulated in the Northwest Forest Plan. The Resource Management Plan approved in June of 1995 specified different land management allocations on different portions of the resource area. These allocations provide the emphasis for which activities may occur on each land area. Not all land use allocations and resource programs are discussed individually in a detailed manner in this Annual Program Summary because of the overlap of programs and projects. A detailed discussion of the various land use allocations or resource programs is not given in this Annual Program Summary, but can be found in the Resource Management Plan Record of Decision and supporting Environmental Impact Statement. For a listing of specific projects on the Klamath Falls Resource Area, see the Planning Updates that are generally published quarterly. These documents are available at the Klamath Falls Resource Area Office.

Late-Successional Reserves and Assessments

The Klamath Falls Resource Area does not contain any mapped Late Successional Reserves (LSRs). The closest mapped Late Successional Reserve is to the north on the adjoining Winema National Forest. The Klamath Falls Resource Area contains fifteen unmapped Late Successional Reserves (UMLSRs), three District Designated Reserves (DDRs), and one Special

Area (an Environmental Education Area), all designated for old-growth values. Each reserve is approximately 100 acres in size for a total of approximately 1,900 acres in reserves designated for late-successional values. Unmapped LSRs function as habitat patches that provide connectivity between larger areas of old-growth habitat within mapped LSRs.

In FY 1997, vascular plant and non-vascular cryptogam (moss, liverworts, lichens, and fungi) inventories were conducted using a combination of cursory and intuitive survey methods to assess the biodiversity of each reserve. The inventory included collection, identification, photographing, and curing of selected specimens. In FY 1997, forest stand conditions in all 19 reserves were sampled using an adaptation of the procedures on the "Forest Survey Handbook, BLM Manual Supplement, Handbook 5250-1". Along with historical descriptions and past harvest data, this information served as a basis for written assessments of stand conditions in each reserve. A Late Successional Reserve Assessment (LSRA) was prepared in FY 2003 to assess all 19 of the reserves in the resource area. The LSRA was submitted to the Regional Ecosystem Office (REO) for review and approval in March of 2003. In a memorandum dated September 27, 2004, the Regional Ecosystem Office, based upon the final review of the LSR Assessment by the LSR Work Group, concurred with the Klamath Falls Resource Area in its findings and consistency with the Standards and Guidelines (S&Gs) under the Northwest Forest Plan (NWFP). In FY 2006, the KFRA completed environmental analysis for treatments within the Tunnel Creek DDR and continued analysis for treatments within the Surveyor DDR.

Matrix

The NFP/ROD (page C-44) and Klamath Falls Resource Area RMP ROD (page 56) require that the BLM and USFS provide for the retention of late-successional/old-growth fragments in the matrix, where little remains. The standards and guidelines are to be applied to any fifth field watershed in which federal forest lands are currently comprised of 15 percent or less late-successional forest, considering all land allocations. In preparing watershed analysis documents, the Resource Area completed an initial screening of watersheds including lands managed by the BLM-Redding Field Office, BLM-Alturas Field Office, BLM-Medford District Office, Klamath National Forest, Modoc National Forest, Rogue River National Forest, Winema National Forest, and the Fish and Wildlife Service, for compliance with the 15 percent retention standards and guidelines. Results from this analysis were reported in watershed analysis documents. Klamath Falls Resource Area FY 1995 to FY 2006 sales sold under the NFP have complied with the 15 percent rule using the analysis.

A joint BLM/FS Instruction Memorandum was issued on September 14, 1998. This provided the final guidance for implementing the 15 percent standards and guidelines throughout the area covered by the NFP. Implementation of this guidance is required for all actions with decisions beginning October 1, 1999. A final 15 percent analysis was completed in 1999. The Lower Klamath Lake and Butte Creek fifth field watersheds have less than 15 percent late-successional forest. Regeneration harvest in these two watersheds will be deferred until the 15 percent standard is met.

5.0 Aquatic Conservation Strategy

The Aquatic Conservation Strategy (ACS) was developed to restore and maintain the ecological health of watersheds and aquatic ecosystems. A set of Aquatic Conservation Strategy objectives was developed in the Northwest Forest Plan, to guide the review and implementation of management activities. The four components of the strategy - Riparian Reserves, Key Watersheds, Watershed Analysis, and Watershed Restoration - are designed to work together to maintain and restore the productivity and resiliency of riparian and aquatic ecosystems.

Riparian Reserves

Riparian Reserves are areas where riparian-dependent resources receive primary emphasis and where special standards and guidelines from the Northwest Forest Plan (NFP) Record of Decision (ROD) apply. Riparian Reserves are established adjacent to perennial and intermittent streams, springs, lakeshores, wetlands, and reservoirs. In FY 2006, approximately 35 acres of Riparian Reserves adjacent to intermittent streams were delineated within the planned Walter's Cabin Timber Sale units. No riparian reserve areas were harvested in timber sales active during FY 2006.

Watershed Analysis and Key Watersheds

Watershed analysis is required (NFP ROD) prior to implementing activities in Key watersheds. Watershed analyses should also be conducted in other watersheds as a basis for ecosystem planning and management. The primary purpose is to provide decision makers with an understanding of the ecological structure, functions, processes, and interactions occurring in a watershed along with the wide spectrum of human uses.

This information is obtained from a variety of sources including field inventory and observation, agency records, old maps and photos, and survey records and will be utilized in *National Environmental Policy Act* (NEPA) documentation for specific projects and to facilitate compliance with the *Endangered Species Act* (ESA) and *Clean Water Act* (CWA) by providing additional information for consultation with other agencies.

Watershed analyses include:

- Analysis of at-risk fish species and stocks, their presence, habitat conditions and restoration needs;
- Descriptions of the landscape over time, including the impacts of humans, their role in shaping the landscape, and the effects of fire;
- The distribution and abundance of species and populations throughout the watershed;
- Characterization of the geologic and hydrologic conditions of the watershed.

To date, watershed analyses have been completed for almost eighty percent of the resource area including all lands covered by the NFP. The remaining lands within the resource area are scattered parcels where resource management issues will be addressed on a case-by-case basis.

Watershed Restoration

Roads

Watershed restoration through road treatments ranges from obliteration to upgrading. Road treatments are identified during restoration planning or as part of other projects. When road-related resource concerns (such as habitat connectivity, water quality, diversion of flow paths, etc.) are identified, road treatments are developed to ensure that concerns are addressed in a way that accounts for current and future transportation needs while striving to meet ACS objectives

With the large amount of mixed ownership in the forested lands, coordination with private landowners and other land management agencies is crucial to the success of any proposed road projects. Watershed analyses, road inventory data, and coordinated planning efforts like the Spencer Creek Coordinated Resource Management Plan (CRMP) provide a framework for road treatment decisions.

During FY 2006, one-tenth of a mile of road was improved, approximately seven miles of road were closed, and three stream crossings were improved (Spencer Creek culvert replacement, Campbell Reservoir drainage, and the Wood River Bridge project). Objectives include: improved large woody debris transport and fish passage, reduced erosion and sediment delivery to streams, and improved vehicle access. For a complete summary of road treatments, refer to Section 24.0 - Transportation and Roads and Table 24.1.

Riparian Habitat Enhancement

Treatments that help maintain large conifers in Riparian Reserves are an important component of watershed restoration. Silvicultural practices have been implemented within riparian reserves to control stocking, reestablish and manage stands, and acquire desired vegetation characteristics needed to attain aquatic conservation strategy objectives. Silvicultural prescriptions are written to maintain uneven aged stands and to maintain and improve the health and resiliency of the shade intolerant species (ponderosa pine, sugar pine, and Douglas fir). Understory reduction prescriptions are used to reduce the density of shade-tolerant species under the tree canopy for the purpose of reducing fire risk and enhancing the health of desired overstory trees. The thinning of densely stocked young stands and the reforestation of shrub-dominated stands with conifers are also used to enhance riparian habitat. Where juniper encroachment has occurred in riparian areas, treatments such as hand-cutting are being implemented to enhance riparian characteristics.

Riparian thinning and juniper treatments were implemented in FY 2006 to meet riparian management objectives. Forty nine acres of riparian thinning at Grenada West was completed. As part of the Alkali, East Fork, and Bug Springs Vegetation Treatments, approximately 81 acres of juniper were hand cut in riparian areas. In addition, ten acres of juniper were treated in the riparian area in Campbell as part of the Gerber Stewardship. Juniper treatment within the South Bly WUI project was also implemented.

Stream Restoration

Instream restoration projects are necessary when passive restoration will not meet resource goals in the short-term. Such projects are designed to restore instream habitat complexity, and can include bank stabilization, channel realignment, or addition of boulders and large woody debris. Potential instream projects are identified during watershed analysis or RMP development. In FY 2006, culvert replacement along Spencer Creek was implemented to improve fish passage.

6.0 Air Quality

The air quality program is mostly related to smoke impacts from natural and prescribed fires. The resource area has adopted the concept that the prescribed fire program is an integral part of ecosystem management under the RMP. Special care is taken to ensure that all prescribed fire projects are implemented in compliance with the Oregon Smoke Management Plan. Air quality considerations for the prescribed fire program include: burning when good smoke dispersal exists, and prompt mop-up of burned units to reduce residual smoke. There are no Class 1 airsheds on the resource area and no smoke intrusions are known to have occurred in designated areas.

7.0 Water and Soils

Water - Project Implementation

As discussed in the Watershed Restoration and Roads sections, numerous road-related projects that will benefit water resources were completed in FY 2006. Approximately 25-30 miles of riparian related fencing was inspected, repaired, maintained, or reconstructed in FY 2006. The riparian fencing around Ben Hall Creek, Antelope Riparian Pasture, Barnes Valley Riparian Pasture, Tunnel Creek, Surveyor Campground, Hayden Creek (upper), and Dixie enclosures all received significant additional rebuilding or rehabilitation during FY 2006. (Refer to the discussion of fences in the Rangeland Resources/Grazing Management section.)

Soils – Project Implementation

As discussed in the Rangeland Resources/Grazing Management section of this document, a new riparian enclosure fence around one half mile of Pankey Creek was constructed, the Upper Long Branch Creek riparian enclosure was extended, and the Van Meter Flat waterhole enclosure was expanded and reconstructed. Studies continued to monitor the effectiveness of the Boundary Springs Temporary Electric Fence to facilitate or accelerate improvement in vegetation and soil conditions following removal of juniper.

State-listed Clean Water Act 303d Streams

Section 303(d) of the *Clean Water Act* (CWA) requires states to submit to the Environmental Protection Agency (EPA) a list of those waters which do not meet water quality standards as a result of either point or non-point sources, and which are in need of a total maximum daily load (TMDL) calculation. The TMDL is a target for water quality standards. The Oregon 303(d) list was updated for 2004-2006. Table 7.1 lists nine streams in the KFRA identified as water-quality limited streams by the Oregon Department of Environmental Quality (ODEQ).

Table 7.1 - KFRA Clean Water Act 303(d) Water Bodies

| <u>Stream Name</u> | <u>Basin/Sub-basin</u> | <u>Criteria for listing</u> | <u>TMDL completed(?)</u> |
|---------------------|------------------------|---------------------------------|--------------------------|
| Barnes Valley Creek | Klamath/Lost River | Temperature - Year round | No |
| Long Branch Creek | Klamath/Lost River | Temperature - Year round | No |
| Miller Creek | Klamath/Lost River | Temperature - Summer | No |
| Antelope Creek | Klamath/Lost River | Temperature - Summer | No |
| Ben Hall Creek | Klamath/Lost River | Temperature - Year round | No |
| Clover Creek | Klamath/Upper Klamath | Sediment | No |
| | | Temperature - No defined season | No |
| Johnson Creek | Klamath/Upper Klamath | Temperature - Summer | No |
| Miners Creek | Klamath/Upper Klamath | Sediment | No |
| | | Temperature - Year round | No |
| Spencer Creek | Klamath/Upper Klamath | Sediment | No |
| | | Temperature - Year round | No |

Water - Inventory and Monitoring

Spring discharge and temperature was measured monthly at ten springs in the Gerber Block during FY 2006 (Table 7.2). This was the fifth year of a long-term monitoring effort, the

primary objectives of which are to collect baseline data and to assess the effect of vegetation treatments on spring discharge. In addition to spring discharge, vegetation and cover were monitored at Caseview Spring in FY 2006

In FY 2006, water temperature was monitored at 28 sites in 13 streams and five sites in Agency Lake throughout watersheds that include portions of the resource area.

In cooperation with the USGS, the BLM completed the data collection phase of the water quality monitoring effort at the Wood River Wetland. Components of this effort include characterizing water-quality conditions within the wetland, developing a preliminary water budget for the wetland, and developing a preliminary nutrient budget for the wetland. A final report from USGS describing the study findings in relation to the management of the Wood River Wetland is scheduled for completion in FY 2007.

In cooperation with the Rocky Mountain Research Station and the Fremont-Winema National Forest, the BLM completed the final year of data collection for the road sediment trap study in the Gerber watershed. Data was collected to quantify sediment production from roads at 15 monitoring stations in FY 2006 within the Gerber Watershed, another 15 sites were maintained within the Spencer Creek Watershed.

In FY 2006, bank erosion was measured at five sites on Pitch Log Creek as part of a long-term monitoring effort. This data will be used to measure changes in the streambank over time.

Riparian vegetation and soils monitoring data were collected at established sites post-treatment in FY 2006 along two creeks in the Norcross Spring Vegetation Treatments project. The data collected from these sites will be compared to data collected pre-treatment (FY 2005) and in subsequent years to determine potential changes in riparian vegetation and soils due to juniper treatments. Streambank stability ratings were measured on Ben Hall Creek.

Riparian photo point monitoring was completed along streams and springs in FY 2006. Photos were taken at 70 points along nine streams. The Gerber Block accounted for 53 sites, Spencer Creek log placement sites (re-read) accounted for 13 sites, Spencer Creek riparian thinning sites (re-read) accounted for 2 sites, Grenada West accounted for one site, and Buck Lake tributary accounted for 1 site.

Table 7.2 - Watershed Activity Fiscal Year 2006

| <u>Monitoring</u> | <u>FY2006</u> | <u>FY95-06**</u> |
|--|----------------------|-------------------------|
| Streams measured for Proper Functioning Condition (miles) | 0* | 87.6 (through FY97) |
| Riparian Classification and Mapping (miles) | 0 | 16.4 (FY03-05) |
| Streams monitored for water temperature | 13 | 15 |
| Springs monitored for water temperature | 10 | 14 |
| Streams measured for streamflow | 0 | 2 |
| Springs measured for flow (Gerber Block) | 10 | 14 |
| Sites measured for water chemistry | 0 | 27 |
| Sediment sampling stations (monitoring of road sediment) | 15 | 30 |
| Completed water rights applications with Oregon Water Resources | 0 | 0 |
| Streams monitored for physical reference conditions (permanent reference pts) | 0 | 6 |
| Sites measured for bank erosion | 5 | 5 |
| Streams monitored for riparian vegetation and soils in juniper treatment areas | 2 | 2 |
| Springs monitored for riparian vegetation and soils in juniper treatment areas | 1 | 1 |

*For the past four years, the KFRA has used Riparian Classification and Mapping in place of PFC measurements.

**Figure represents maximum number of sites monitored and does not reflect cumulative totals for repeated data collection.

Soils – Inventory and Monitoring

In FY 2006, post-treatment soil compaction/disturbance monitoring was completed in the Norcross Stewardship Juniper Treatment area.

Klamath River Hydroelectric Facility Relicensing

In FY 2006, hydrology and fisheries resource staff continued to coordinate with state and federal agencies non-governmental organizations, and tribes on the proposed relicensing of the PacifiCorp Klamath River Project (FERC License 2082). Preliminary conditions for the license were completed and disputed issues of material fact were presented during the Energy Policy Act Trial Type Hearings. Final conditions are expected to be complete in 2007.

RMP Best Management Practices

Best Management Practices are identified and required by the CWA as amended by the *Water Quality Act* of 1987. Best Management Practices are defined as methods, measures, or practices to protect water quality or soil properties. Best Management Practices are selected during the interdisciplinary environmental review process on a site specific basis to meet overall ecosystem management goals. The Klamath Falls Resource Area Record of Decision and Resource Management Plan lists Best Management Practices for various projects or activities that may be considered during the design of a project. During FY 2006, Best Management Practices were implemented on a number of different projects, ranging from thinnings to fuels reduction projects.

8.0 Terrestrial Species and Habitat Management

Threatened/Endangered Species

Northern Spotted Owl

The Klamath Falls Resource Area currently contains 21,260 acres of suitable northern spotted owl habitat. Of this, 6,676 acres are reserved or maintained as owl habitat. The reserves include 100-acre core areas near and/or surrounding nesting owls plus other district-designated reserves(DDRs). Riparian areas and preferred habitat areas are also managed to maintain owl habitat.

In 2006, the Bureau of Land Management worked cooperatively with the National Council of the Paper Industry for Air and Stream Improvement (NCASI), Inland Fiber Group (IFG), U.S Forest Service (USFS) and Oregon State University (OSU) to continue the northern spotted owl monitoring program. Territories monitored are located on BLM, USFS and private lands but monitored cooperatively due to the overlap of land ownership within the owl's home range.

Under an existing Memorandum of Understanding (MOU) between the BLM and NCASI, and working cooperatively with IFG, USFS, OSU and Boise Cascade Timber Co., ten spotted owl sites were incorporated into a five-year telemetry study that was initiated in the spring of 2002 and will end in 2007. The goal is to evaluate the response of these owls to timber management practices. Currently, ten owls are radioed at seven sites.

In addition to the telemetry study, general surveys of suitable northern spotted owl habitat were conducted for the West Spencer and Cold Onion proposed timber sales as well as monitoring on five historic territories. Two northern spotted owls (one male and one female) were detected in the West Spencer timber sale area which is adjacent to a historic site. Night time detections of northern spotted owls did occur at three historic sites, although the owls were not relocated on following visits.

Of the fifteen sites surveyed/monitored, five were occupied with northern spotted owl pairs and three had single male owls detected. One pair was confirmed nesting, but the nest failed. Barred owls were documented on two northern spotted owl nest territories. As part of the telemetry study, two barred owls are radioed to monitor interactions with northern spotted owls in the study area.

Bald Eagle (Threatened)

Bald eagle nest territories and winter roost areas are known to occur on BLM lands within the Klamath Falls Resource Area (KFRA). In 2006, 17 of the 18 nest territories were occupied with at least one adult eagle. Nest sites were monitored cooperatively with Oregon Cooperative Fish & Wildlife Research Unit, OSU and Inland Fiber Group. Four bald eagle winter roost areas have been documented on the KFRA.

Fuels reduction treatments continued within a bald eagle nest territory in FY 2006. Treatments included piling of juniper within the nest stand. This fuels reduction treatment is in preparation for future prescribed fire activities and nest stand protection in the event of a wildland fire. The juniper was utilized for chip material. Midwinter surveys for bald eagles were again conducted this year. The counts are conducted annually in the month of January to monitor trends of wintering populations of bald eagles.

Special Status Species-Animals

Peregrine Falcon (Bureau Sensitive)

In 1999, the peregrine falcon was de-listed from the Endangered Species list according to the Endangered Species Act (ESA). A peregrine falcon specialist was contracted to analyze potential peregrine falcon habitat for the Lakeview District. The KFRA has four areas rated as high for nesting potential. All of these areas were surveyed in 2006. No peregrine falcons were observed. Future surveys and monitoring will continue at these sites to help ascertain the presence/absence of peregrine falcons within the resource area.

Yellow Rails (Bureau Sensitive)

BLM policy directs that our actions should avoid contributing to the need to list these species as threatened or endangered. The yellow rail was thought to be extirpated from the western U.S., until it was rediscovered in the Wood River Valley in 1982. The BLM's Fourmile Creek wetland harbors one of the largest breeding populations in Oregon. The resource area participated in a cooperative agreement between The Nature Conservancy (TNC), Winema National Forest, and the Oregon Department of Fish and Wildlife (ODFW) to conduct a study of breeding yellow rails on the Fourmile area and Wood River Wetland from 1996-2002. No further surveys were conducted in FY 2006.

Bats (One Bureau Sensitive, Three Bureau Assessment)

In 2006, eight locations in the Willow Valley watershed and one site at the Wood River Wetland were surveyed for bats in coordination with the Oregon Bat Grid project. Survey support was provided by personnel from the Lakeview Resource Area BLM and the Willamette National Forest and USFWS. Potential foraging and roosting areas were surveyed using a variety of methods. Surveys were conducted at nine sites and nine species were documented. Of these,

eight species have special status listing: Yuma myotis (*Myotis yumanensis*), silver-haired bat (*Lasionycterus noctivagans*), hoary bat (*Lasiurus cinereus*), California myotis (*Myotis californicus*), long-legged myotis (*Myotis volans*), western small-footed myotis (*Myotis ciliolabrum*), long-eared myotis (*Myotis evotis*) and Brazilian free-tailed bat (*Tadarida brasiliensis*).

Under the RMP, the resource area is to minimize human disturbance to the maternity colony of Townsend's big-eared bats (*Corynorhinus townsendii*) at Salt Caves on the Klamath River. A seasonal closure is in place from May 1 through September 15 at this site. In 2003, a Decision Record for the Cave Management Plan EA was prepared which included recommendations for long-term adaptive management and monitoring.

Northern Goshawk (Bureau Sensitive)

In 2006, one pre-disturbance survey was conducted in suitable habitat for northern goshawks in the Bryant Mountain sale area on the east side of the resource area. No goshawks were detected during this survey. The area will be surveyed again in 2007. Known goshawk nests are monitored for occupancy, nesting, and reproductive success. Ten historic goshawk nest sites were monitored and three of these nest sites were occupied and produced young. One other territory was occupied, but no nest was found.

Oregon Spotted Frog (Candidate Species)

The Oregon spotted frog is known to exist at three locations (Buck Lake, Wood River Wetland, and Fourmile Creek) within the KFRA. In 2006, the Wood River Wetland area was surveyed in March and April for egg masses. The wetland was also surveyed for adult spotted frogs in July and August in cooperation with the USGS. Buck Lake and Fourmile Creek were also surveyed for egg masses and adult spotted frogs in cooperation with USGS. In FY 2006, Oregon spotted frog adults and egg masses were found at three sites in similar habitats and in similar numbers as in FY 2003, FY 2004, and FY 2005. Bullfrog tadpoles and subadults have increased in numbers since 2000 at the Wood River Wetland. Although bullfrogs are considered a potential threat to spotted frogs, it is not yet known whether they are having a negative affect on the spotted frog population at the Wood River Wetland.

Sage Grouse (Bureau Sensitive)

This species is ranked as a Bureau Sensitive species and was considered for listing under the Endangered Species Act. The KFRA continued monitoring four historic lek sites in FY 2006; no birds were seen using the lek sites. Potential habitat improvement projects around these historic lek sites continue. Historic lek sites will continue to be monitored, especially in those areas that habitat improvement treatments are conducted.

Mollusks (Survey and Manage)

Surveys have been conducted since 1999 for terrestrial and aquatic mollusks on the KFRA under the Survey and Manage (S&M) program. Six species of S&M mollusks are suspected or documented on the KFRA. Three species that have been documented within KFRA are: evening field slug (*Deroceras hesparium*), Klamath pebblesnail (*Fluminicola* sp. nov. 1), and diminutive pebblesnail (*Fluminicola* sp. nov. 3). Evening field slugs are found in wet meadows and streamside riparian areas. Pebblesnails are aquatic mollusks found in streams and springs. Three species suspected, but not documented, on the resource area are: Crater Lake tightcoil (*Pristiloma arcticum crateris*), Klamath sideband (*Monadenia chaceana*), and *Fluminicola* sp. nov. 16.

In 2006, surveys were conducted within timber sale areas and fuels reduction projects where suitable habitat occurs for terrestrial and aquatic mollusk species. No special status mollusk species were located. Known sites of S&M mollusks will continue to be managed and protected.

Great Gray Owl (Survey and Manage)

The great gray owl (GGO) is listed as a Survey and Manage species. Since 1996, the KFRA has conducted surveys for great gray owls in areas where ground-disturbing events are planned. In 2006, surveys were conducted in the Cold Onion and West Spencer timber sale areas. No detections occurred. Surveys will continue in these areas in 2007.

In 2006, the KFRA wildlife staff monitored seventeen great gray owl artificial nest boxes installed in FY 2002 within riparian buffers on private timberlands. These nest boxes were established where the greatest concentration of great gray owls have been consistently located and in habitat that provides good foraging conditions, but may lack suitable nesting structure. No owls nested in the platforms in FY 2006.

Special Status Species - Plants

Approximately 6,353 acres of systematic inventory for botanical resources were conducted on the resource area during FY 2006. Several new sites of green flowered ginger (*Asarum wagneri*), a Bureau sensitive species, were documented. Inventory was accomplished with both BLM resource specialists and consultants through an IDIQ contract. (Refer to Table 8.1.c.)

Other Species of Concern

Neotropical Migratory Landbirds

Baseline surveys and monitoring for landbirds is a requirement under the Upper Klamath Basin and Wood River RMP/EIS. Other sampling on the resource area is being conducted to collect baseline data on presence/absence and trends of bird species in grazing allotments, within habitats where there are management concerns or threats, or for projects such as the relicensing of the hydropower operations on the Klamath River.

Other umbrella documents that recommend landbird surveys within certain priority habitats are published by Partners in Flight, and include "*Management, Research and Monitoring Priorities for the Conservation of Neotropical Migratory Landbirds that Breed in Oregon*", and "*Birds in a Sagebrush Sea: Managing Sagebrush Habitats for Bird Communities*".

Project work continued under cooperative agreement with the Klamath Bird Observatory and the Pacific Southwest Research Station of the U.S. Forest Service. Partners in this project included the World Wildlife Fund, Winema National Forest, Klamath Basin National Wildlife Refuge, and Point Reyes Bird Observatory. Demographic stations are set up in riparian areas in the Klamath River Canyon within the boundaries of the J.C. Boyle Hydropower Project, in grazing allotments, and other areas of concern, including portions of the Wood River Wetland. This data will also be used for BLM's evaluation of the FERC relicensing of the power project on the Klamath River and grazing allotments. Data from this study is in the analysis phase.

Terrestrial Habitat Management

For a narrative discussion of specific habitat elements (such as Green Tree Retention, Snag Recruitment, and Coarse Woody Debris) refer to the Monitoring Report portion of this document, specifically the Matrix Implementation Monitoring section. See also Table 8.2.

Nest Sites, Activity Centers, and Rookeries

For information on Nest Sites, Activity Centers, and Rookeries see Table 8.3.

Table 8.1a - BLM /KFRA Special Status Species* Designations Summary - Animals

| <u>Designation</u> | <u>Code</u> | <u># of species</u> | <u># of species/taxa group</u> |
|----------------------|-------------|---------------------|---|
| Federally Endangered | FE | 0 | None |
| Federally Threatened | FT | 2 | 2 birds |
| Federally Proposed | P | 0 | None |
| Federal Candidate | C | 3 | 1 amphibian, 1 mammal, 1 invertebrate |
| BLM Sensitive | BS | 22 | 1 mammal, 1 reptile, 11 birds, 9 mollusks |
| BLM Assessment | BA | 11 | 4 mammals, 5 birds, 2 amphibian |
| BLM Tracking | BT | 43 | 11 mammals, 4 reptiles, 26 birds, 2 amphibians, 2 invertebrates |

*This list is comprised of species either documented or suspected to occur in the KFRA.

Table 8.1b - BLM (KFRA) Special Status Species Designations Summary - Plants

| <u>Designation</u> | <u>Code</u> | <u># of species (sites)</u> | <u># of species/taxa group</u> |
|----------------------|-------------|-----------------------------|---|
| Federally Endangered | FE | 0 | |
| Federally Threatened | FT | 0 | |
| Federally Proposed | P | 0 | |
| Federal Candidate | C | 0 | |
| BLM Sensitive | BS | 8 (190) | 7 vascular plant species, 1 fungi |

| Great Grey Owl | Nest Structures | 18 | 0 occupied | 0 |
| Northern Spotted Owl | Nest Territories | 15 | 7 occupied | 0 |
| Peregrine Falcon | High Potential Nest Sites | 4 | 0 occupied | 0 |

Big Game Habitat

Cooperative road closures continue to be maintained for deer, elk and other big game management both on the Eastside and the Westside of the resource area. Gates and other closures continue to be maintained. Additional road closures are planned in future years to reduce open road density closer to the management goal described in the RMP of 1.5 miles per section. Thermal clumps were designed into timber sales (see Timber Management section) during the preparation phase in 2005 to provide adequate escape and thermal cover within the timber harvest units. This is especially important in the winter range areas.

Elk and Mule-deer Habitat

Continued habitat improvement for big game was coordinated with the fuels reduction programs. Biologists prioritized selected fuels units and helped set objectives where the treatments could enhance big game habitat. Several juniper thinning projects were completed in winter range areas (Gerber and Willow Valley watersheds, Stukel Mountain). Approximately 42,000 bitterbrush and mountain mahogany seedlings were planted in the Klamath Hills as part of a wildfire rehabilitation project.

9.0 Aquatic Species and Habitat Management

Planning and consultation of projects in the resource area included Federal Energy Regulatory Commission (FERC) relicensing, Wood River Restoration, (see Wood River section), Spencer Creek channel treatments (Refer to Table 9.1 for information on aquatic habitat and fish passage). Fisheries resources, including Federally endangered suckers were monitored at Wood River Wetland ACEC and Gerber area grazing allotments.

Table 9.1 - Aquatic Habitat / Fish Passage Management

| <u>Management Activity</u> | <u>FY2006</u> | <u>FY95-06</u> |
|--|---------------|----------------|
| Instream Fish Habitat Improvement (miles of stream treated) | 0 | 8.5 |
| Fish Passage protected/improved - total miles of stream benefited | 0 | 4 |
| Irrigation diversions | 0 | 2 |
| Culverts inventoried | 0 | 40 |
| Culverts removed | 0 | 4 |
| Flumes created | 0 | 0 |
| Road crossings removed | 0 | 1 |
| Road crossings improved | 1 | 10 |
| Riparian Fish Habitat Improvement (acres treated/stream miles affected) | 0 | 4 |
| Roads improved - drainages, upgrades, stabilization, resurfacing (miles) | 0 | 24.8 |
| Roads relocated (miles) | 0 | 8.3 |
| Roads decommissioned and/or closed (miles) | 4 | 28.2 |
| Roads obliterated (miles) | 0 | 5.4 |
| Freshwater wetlands created (acres) | 0 | 400* |
| Freshwater wetlands maintained (acres) | 3,400 | 3,400* |
| Freshwater wetlands restored (acres) | 0 | 3,000* |

*There is a total of 3,400 acres of wetland in the Resource Area, most or all of which are treated each year.

Threatened/Endangered Species

Lost River and Shortnose Suckers

Lost River suckers (*Deltistes luxatus*) and Shortnose suckers (*Chasmistes brevirostris*) occupy lakes as adults and spawn in streams during the spring and early summer. Both species spawn

in the Wood River and are thought to spawn in the Wild & Scenic section of the Klamath River in the resource area. The Wood River and Four Mile Creek are designated as proposed critical habitat for both species even though suckers are not currently found in Four Mile Creek. Four Mile Creek is historic habitat and the BLM portion of the stream is in properly functioning condition. Fish cannot enter the stream because of downstream barriers. The tributaries to Gerber Reservoir are proposed critical habitat and contain shortnose suckers.

Construction of the Wood River fish screen was completed in FY 2003. Screening the diversion water will prevent entrainment of listed suckers to the inner wetland cells of the project. The Wood River Fish Screen was operated for a little over one month, between September and October of 2006. The fish screen allowed the BLM to divert approximately 500 acre feet of water from the Sevenmile Canal to the wetland without entraining listed suckers.

The BLM continues to work with ODFW, Tribal Biologists, Klamath fishing guides, and other resource management organizations to coordinate a fish-monitoring program in Upper Agency Lake that would meet fisheries monitoring objectives.

Bull Trout

The resource area does not currently administer lands known to contain bull trout (*Salvelinus confluentus*) populations. In early FY 2003, the USFWS proposed critical habitat for bull trout (50 CFR 17) including the Klamath Basin (Unit i). In FY 2004, USFWS designated critical habitat for bull trout in the Klamath Basin (69 FR 59995-60076, October 6, 2004). No critical habitat was specifically designated on BLM lands administered by the KFRA. No surveys were conducted by BLM staff for bull trout in FY 2006.

Endangered Species Act Consultation

Section 7 Endangered Species Act Consultation is being continued on individual projects that have the potential to affect endangered suckers. The proposed critical habitat administered by the BLM for the listed sucker species is predominantly on the eastside of the resource area and Wood River Wetland. There is also limited critical habitat administered by the BLM for endangered sucker species on the westside of the resource area in the mainstem of the Klamath River. The BLM completed a programmatic consultation on fuels project categorical exclusions (CX).

Aquatic Habitat Restoration

Roads

Road activities to improve water quality continue to be a focus for reducing sediment impacts to aquatic habitat. In FY 2006, a road sedimentation study was completed in the Gerber watershed and continued in the Spencer Creek watershed (see Water and Soils Monitoring section).

A contract was awarded and construction completed on the replacement of a large culvert on the Spencer Hookup Access Road. This project will alleviate a barrier for upstream fish passage, particularly for young rearing trout. The project improves water, sediment, and wood debris transport capacity and lowers the risk of culvert blockage and subsequent environmental damage. An additional 6 miles of Spencer Creek now has improved upstream passage.

Fish Habitat

Large wood debris (LWD) was placed in Spencer Creek in cooperation with Timber Resource Services LLC to improve aquatic conditions in four miles of Spencer Creek for redband trout and Klamath smallscale suckers in FY 2005. Large wood debris in streams provides for important ecological processes in streams systems providing cover, gravel retention, and pool development. In FY 2006, photo monitoring of the placement sites was conducted following

several large flood events that occurred that winter. The results of the monitoring revealed that the structures functioned as anticipated. There was some movement of the placed logs however, they generally remained in the same location, trapping smaller logs and forming complex stream habitat features. New gravel patches suitable for trout spawning formed and new pools were scoured under and around the debris structures.

Fisheries Management

In cooperation with Oregon Department of Fish and Wildlife, a harmful population of yellow perch was removed from Upper Midway Reservoir in preparation for re-stocking with largemouth bass and crappie. The reservoir was stocked with catchable and fingerling bass in the summer of 2006. It is expected that it may take 2 to 3 years for this population to mature into a quality bass fishery. Before yellow perch were introduced, this reservoir provided an outstanding bass and crappie fishery.

Klamath River Hydroelectric Facility Relicensing

Fisheries resource staff continued to coordinate with state, federal, and tribal agencies on the proposed relicensing of the PacifiCorp Klamath River Project (FERC License 2082). Resource area staff is coordinating with the USFWS, Bureau of Reclamation, NMFS, state agencies, and Tribal organizations on project fisheries impacts affecting BLM administered lands. The Final License Application was submitted by PacifiCorp to FERC in February of 2004.

10.0 Pathogen, Disease, and Pest Management

At present there are no serious, large-scale pest problems like Sudden Oak Death or Swiss Needle Cast on the Resource Area. However, this situation can change with environmental conditions, especially with forest insects. Endemic levels of insects such as fir engraver, western pine beetle, and mountain pine beetle that exist on the resource area can explode to epidemic levels during prolonged droughts when host trees are stressed and vulnerable.

11.0 Weed Management

The objective of the noxious weed management program in the Klamath Falls Resource Area is to contain or reduce noxious weed infestations using an integrated pest management approach. Integrated pest management includes manual, mechanical, chemical, and biological control methods which are used in accordance with the Klamath Falls Resource Area Integrated Weed Control Plan (IWCP) and Environmental Assessment (EA)(OR-014-93-09), which is tiered to the Northwest Area Noxious Weed Control Program Environmental Impact Statement (EIS) (December 1985) and Supplement (March 1987).

Inventories

The Klamath Falls Resource Area continues to survey BLM-administered land for noxious weeds by including noxious weeds in project clearance surveys, and through systematic inventories conducted through contracts. During FY 2006, approximately 6,353 acres of systematic inventory for noxious weeds was conducted on the resource area. Noxious weed species with new populations found included only a few populations of St. John's wort (*Hypericum perforatum*). Inventory was accomplished with both BLM resource specialists and consultants through an IDIQ contract.

Control

Two hundred seventy-five noxious weed infested sites covering approximately 32 acres spread over approximately 1,280 acres of BLM lands were chemically and manually treated by the Oregon Department of Agriculture (ODA) noxious weed treatment crew supervised by the ODA weed management specialist according to the annual operations plan and resource area priorities.

Table 11.1 - Managed Weed Species

| <u>Species Name</u> | <u>Common name</u> |
|---|---------------------------|
| <i>Acrotilon repens</i> | Russian knapweed |
| <i>Cardaria draba</i> | hoary cress |
| <i>Carduus nutans</i> | musk thistle |
| <i>Centaurea diffusa</i> | diffuse knapweed |
| <i>Centaurea maculosa</i> | spotted knapweed |
| <i>Centaurea solstitialis</i> | yellow starthistle |
| <i>Cirsium arvense</i> | Canada thistle |
| <i>Cytisus scoparius</i> | Scotch broom |
| <i>Euphorbia esula</i> | leafy spurge |
| <i>Euphorbia myrsinites</i> | myrtle spurge |
| <i>Hypericum perforatum</i> | St. John's wort |
| <i>Isatis tinctoria</i> | dyer's woad |
| <i>Lepidium latifolium</i> | perennial pepperweed |
| <i>Linaria genistifolia</i> spp. <i>dalmatica</i> | Dalmatian toadflax |
| <i>Onopordum acanthium</i> | Scotch thistle |
| <i>Salvia aethiopsis</i> | Mediterranean sage |
| <i>Senecio jacobaea</i> | tansy ragwort |
| <i>Xanthium spinosum</i> | spiny clotbur |

12.0 Special Areas/Management

Wild and Scenic Rivers

The upper Klamath River is designated as a Wild and Scenic River in the national Wild and Scenic river system. The designated river in the resource area, is an 11-mile segment, extending from just below the J.C. Boyle powerhouse to the Oregon-California state line. This same portion of the river is designated as an Area of Critical Environmental Concern (ACEC). Wild and Scenic rivers are to be managed to protect their outstandingly remarkable values (ORVs) and to maintain and enhance the natural integrity of river related values. All proposed management actions, or commercial activities, in the Wild and Scenic river corridor, are evaluated by Resource Area specialists to ensure that the ORVs are not degraded. If there are impacts associated with a project, adequate mitigation must be included to maintain or enhance resource values.

The upper Klamath River is quite popular for summer recreation, particularly whitewater rafting, camping, and fishing. In FY 2006, approximately 4,500 people floated the upper Klamath in rafts and kayaks, the majority of them traveled with one of the 21 commercial guides and outfitters permitted by the BLM. BLM recreation staff provided visitor assistance at the Spring Island launch site on every weekend from mid June through mid September. River rangers conducted seven river patrols by raft to provide visitor assistance, monitor resource conditions, and maintain remote recreation sites along the river.

BLM recreation staff meets periodically with upper Klamath River outfitters and guides, and staff members from PacifiCorp that operates the hydroelectric plants above and below the designated Wild & Scenic segment. In FY 2006, a preseason meeting was held in April to coordinate management activities, and included discussions regarding the timing, volume, and duration of water releases during the peak rafting season.

A draft Upper Klamath River Management Plan/EIS, released for public comment in April 2003, addressed options for managing the outstandingly remarkable values of this Wild and Scenic River. The preparation of the final Upper Klamath River Management Plan/EIS is on hold pending completion of the proposed relicensing effort for the PacifiCorp Klamath River Project (FERC License 2082).

Wilderness

There is one Wilderness Study Area (WSA) in the Klamath Falls Resource Area, the Mountain Lakes WSA. There are 334 acres within the WSA boundary. The WSA borders the eastside of the Mountain Lakes Wilderness Area. The WSA is managed under the interim wilderness management policy to protect its wilderness values. Interim protection measures include routine patrols, monitoring and restriction of vehicles to existing roadways.

Areas of Critical Environmental Concern

The Klamath Falls Resource Area has five Areas of Critical Environmental Concern (ACEC) and Research Natural Areas (RNA) totaling approximately 12,140 acres; three Special Botanical/Habitat Areas totaling 570 acres; and two Environmental Education Areas totaling 180 acres. One additional area has been proposed as an ACEC, which is 1,196 acres in size. Table 12.1 lists all Special Areas in the resource area. Only those special areas that received some specific management activities in FY 2006 are discussed below.

Upper Klamath River ACEC

A draft Upper Klamath River Management Plan/EIS, released for public comment in April 2003, evaluated the expansion of the existing ACEC (from J.C. Boyle Powerhouse to J.C. Boyle Dam). The preparation of the final Upper Klamath River Management Plan/EIS is on hold pending completion of the proposed relicensing effort for the PacifiCorp Klamath River Project (FERC License 2082).

Old Baldy Research Natural Area

The Old Baldy RNA was designated for the shrub community, dominated by snow brush and manzanita. A prescribed fire planned in the Frosty Too timber sale was intentionally allowed to burn into the Old Baldy RNA/ACEC in FY 2003. Up to 400 acres were burned within the RNA. Pre-treatment fire effects monitoring plots were established in 1999 according to protocols developed by the National Park Service, and pre-burn data were collected by a researcher from the Oregon Natural Heritage Program (ONHP). Data from a sub-sample of the plots were collected in 2001 to verify the validity of that pre-burn data. Additional prescribed fire effects monitoring plots were established in the fall of 2001 to measure dead and downed fuel loads before the burn. In the summer of 2002, vegetation transects were installed at 10 locations to describe cover of species. Nine stand exams were installed to get pre burn data on tree condition and age. Post-burn data were collected on all of the plots in FY 2003 and FY 2004. Tree mortality data were collected in FY 2005 and FY 2006 in several plots.

Wood River Wetland ACEC

Activities occurring on the 3,200 acre Wood River Wetland located in the Klamath Falls Resource Area are guided by a separate management plan entitled the Upper Klamath Basin

and Wood River Wetland RMP/EIS, completed in July of 1995. Restoration work at the wetland is coordinated with several partners, including the Klamath Tribes, Oregon Trout, and Ducks Unlimited. A monitoring report, specific to the Wood River Wetland, is prepared and distributed separately. Copies of this report are available on request.

FY 2006 Wood River Wetland Accomplishments

Planning

- Collected monitoring data. Continued partnership projects with Klamath Bird Observatory, Oregon Department of Fish and Wildlife, and U.S. Geological Survey.

Funding

- Klamath Tribes and the Klamath Basin Rangeland Trust monitored water quality and contributed to cultural resource survey.
- USGS continued groundwater and wetland water quality monitoring and is completing a preliminary water and nutrient budget for the wetland.

Tours/Presentations

- Chiloquin Elementary School
- OIT (Oregon Institute of Technology) applied environmental sciences class
- Keno Elementary School
- Henley High School
- Klamath Outdoor Science School (KOSS)
- Klamath Tribes

Project Implementation

- Oregon spotted frog population monitoring
- Initiated amphibian skin contamination study with USGS.
- Completed eleventh year of monitoring.
- Bat population monitoring
- Levee and road maintenance.
- Waterfowl/waterbird brood surveys
- Rebuilt Wood River Bridge - new deck construction
- Parking area maintenance
- Fish screen operation
- Completed side channel closure.
- Installed beaver resistant culvert cages.

FY 2007 Planned Projects

- Surface rock on dike road from Wood River Bridge to the fish screen.
- Complete design and install the second phase of the interpretive display project.
- Complete planning and design for a gathering and staging area for environmental education activities and wetland presentations.
- Continue nutrient study in cooperation with USGS.
- OIT cooperative study of songbird use of nest boxes
- OIT cooperative study of Canada goose production
- Oregon spotted frog population monitoring study with USGS

Environmental Education Areas

The Klamath Falls Resource Area contains two Environmental Education Areas that total approximately 180 acres. Interpretive education uses at the Clover Creek and Surveyor Forest Environmental Education Areas receive substantial numbers of local visitors each year.

Table 12.1 - Special Management Areas

| <u>Name of Area</u> | <u>Designation</u> | <u>Status</u> | <u>Acres</u> | <u>Management Plan</u> |
|------------------------|------------------------------|---------------|---------------|------------------------|
| Upper Klamath River | ACEC | Designated | 5,700 | In progress |
| Wood River Wetland | ACEC | Designated | 3,200 | Ongoing |
| Miller Canyon | ACEC | Designated | 2,000 | No |
| Yainax Butte | ACEC | Designated | 720 | No |
| Fourmile Creek | ACEC | Potential | 1,196 | No |
| Old Baldy | RNA | Designated | 520 | No |
| Bumpheads | Special Botanical Area | Designated | 50 | No |
| Tunnel Creek | Special Botanical Area | Designated | 280 | No |
| Alkali Lake | Special Habitat Area | Designated | 240 | No |
| Clover Creek | Environmental Education Area | Designated | 30 | No |
| <u>Surveyor Forest</u> | Environmental Education Area | Designated | <u>150</u> | No |
| TOTAL | | | 14,086 | |

13.0 Cultural Resources

The cultural resource program identifies and manages cultural resources on BLM administered lands. This program ensures that the BLM complies with federal and state laws governing cultural resources preservation and works with the State Historic Preservation Officer to enhance the management of cultural resources under the BLM's jurisdiction. Primary responsibilities include performing archaeological inventories prior to implementing projects with the potential to impact cultural resources, and consulting with Tribes as per Section 106 of the National Historic Preservation Act (NHPA).

Surface inventories were conducted to BLM Class III standards. Class III inventory is a continuous, intensive survey of an entire target area by walking close interval transects (<30 meters) until the area has been thoroughly examined, aimed at locating and recording all archaeological properties that have surface indication. FY 2006 surveys were completed by two in-house archaeologists assisted by a student intern and several volunteers. A total of 248 acres were surveyed in-house.

An additional 10,384 acres were inventoried by a contractor prior to fuels reduction project implementation and a Historic Landscape Overview of the Klamath River Canyon was completed. A total of 92 newly discovered sites were documented and an additional 79 sites were monitored and found to be in stable condition. One prehistoric site was protected by the installation of a fence. The history of inventory activities on the Resource Area is displayed in Table 13.1.

Table 13.1 - Cultural Resources Management - FY 2006

| | FY 06 | FY95-06 |
|---|--------------|----------------|
| Number of sites evaluated | 0 | 0 |
| Acres inventoried | 10,632 | 126,124 |
| Number of archaeological sites discovered | 92 | 759 |
| Sites nominated to National Registry of Historic Places | 0 | 0 |

14.0 Visual Resources

Project proposals within the Klamath Falls Resource Area were reviewed to assure that proposed activities would meet designated visual resource management (VRM) classes.

15.0 Rural Interface Areas

The BLM assisted Klamath Falls and Klamath County develop Community Wildfire Protection Plans (CWPP). The Healthy Forests Restoration Act places priority on treatment areas identified by communities themselves in a CWPP. This provides the included communities with a tremendous opportunity to influence where and how federal agencies implement fuel reduction projects on federal & nonfederal land. The CWPP also includes local forest and range conditions, values-at-risk, and priorities for action. The CWPP is a tool that gives communities greater input on fuels treatments and suppression response.

Keno 5 Juniper Thinning was completed in preparation for the Keno 5 Prescribed Fire. This project is designed, in part, to decrease wildfire hazard to the nearby Worden and Dorris communities, including Bear Valley Road, Owens Road, and Hidden Valley Road. The 292 acre Keno 5 project is the southernmost of the Keno WUI units (CX 04-07) treated to date. The other major interface project treated residual timber sale landing piles north of Dorris. A total of 8,739 tons of material was chipped and utilized as a biomass product. Cutting, piling, and burning of hazardous fuels continued near Bonanza, Dairy, Dorris, Keno, Klamath Falls, Bly, and Merrill. A total of 5,321 acres of Wildland Urban Interface (WUI) were treated on the Resource Area in FY 2006.

South Bly WUI thinning piles before yarding and chipping - photograph by Mike Bechdolt

16.0 Socioeconomic Conditions

The Klamath Falls Resource Area contributes to local, state, national and international economies through monetary payments, sustainable use of BLM-managed lands/resources, use of innovative contracting/implementation strategies, and providing amenities such as recreational facilities/opportunities and fish/wildlife habitat to enhance the local community as a place to live, work, and visit. The direction of BLM district management is to support and assist the State of Oregon Economic Development Department's efforts to help rural, resource-based communities develop and implement alternative economic strategies as a partial substitute for declining timber-based economies.

Monetary Payments

One of the ways the Bureau of Land Management contributes directly to local economies is through monetary payments including: Payments in Lieu of Taxes, O&C Payments, and Coos Bay Wagon Road (CBWR) Payments. Payments of each type, described below, were made in FY 2006 as directed in current legislation.

Payments in Lieu of Taxes

"Payments in Lieu of Taxes" (or PILT) are Federal payments made annually to local governments that help offset losses in property taxes due to nontaxable Federal lands within their boundaries. The key law that implements the payments is Public Law 94-565, dated October 20, 1976. This law was rewritten and amended by Public Law 97-258 on September 13, 1982 and codified as [Chapter 69, Title 31 of the United States Code](#). The Law recognizes that the inability of local governments to collect property taxes on Federally-owned land can create a financial impact.

PILT payments help local governments carry out such vital services as firefighting and police protection, construction of public schools and roads, and search-and-rescue operations. These payments are one of the ways that the Federal government can fulfill its role of being a good neighbor to local communities. This is an especially important role for the BLM, which manages more public land than any other Federal agency. The specific amounts of PILT payments to counties in FY 2006 are displayed in Table 16.1.

Payments to Counties

Payments to counties are currently made under "*The Secure Rural Schools and Community Self-Determination Act of 2000*." The purpose of the act is "*To restore stability and predictability to the annual payments made to States and counties containing National Forest System lands and public domain lands managed by the BLM for use by the counties for the benefit of public schools, roads and other purposes.*" For the purpose of this act, the public domain lands managed by the BLM refers to Oregon and California Revested Grantlands (O&C) and Coos Bay Wagon Road Lands (CBWR). The O&C lands include approximately 2.5 million acres of federally-owned forest lands in 18 western Oregon counties and 74,500 acres of Coos Bay Wagon Road Lands in the Coos Bay and Roseburg BLM Districts.

Fiscal Year 2006 was the sixth year that payments were made to western Oregon counties under the Secure Rural Schools and Community Self-Determination Act of 2000 (P.L. 106-393). Counties made elections to receive the standard O&C and CBWR payment as calculated under the Act of August 28, 1937 or the Act of May 24, 1939, or the calculated full payment amount as determined under P.L. 106-393. Klamath County elected to receive payments under the new legislation. Beginning in Fiscal Year 2001 and continuing through 2006 payments are to be made based on historic O&C payments to the counties. Table 16.2 displays the statewide payments made under each Title of P.L. 106-393 as well as the grand total.

Title I payments are made to the eligible counties based on the three highest payments to each county between the years 1986 and 1999. These payments may be used by the counties in the same manner as previous 50-percent and “safety net” payments.

Title II payments are reserved for the counties in a special account in the Treasury of the United States for funding projects providing protection, restoration and enhancement of fish and wildlife habitat, and other natural resource objectives as outlined in P.L. 106-393. BLM is directed to obligate these funds for projects selected by a local Resource Advisory Committee and approved by the Secretary of Interior or her designee.

Title III payments are made to the counties for uses authorized in P.L. 106-393. These include: 1) search, rescue, and emergency services on Federal land, 2) community service work camps, 3) easement purchases, 4) forest-related educational opportunities, 5) fire prevention and county planning, and 6) community forestry.

Table 16.1 - Total Payments in Lieu of Taxes and Acres by County for FY 2006

| <u>County</u> | <u>Payment</u> | <u>Total Acres</u> | <u>BLM Acres</u> |
|-----------------------|--------------------|--------------------|-------------------|
| Baker County | \$367,039 | 1,020,642 | 366,881 |
| Benton County | \$4,108 | 20,301 | 5,134 |
| Clackamas County | \$105,832 | 522,983 | 25,713 |
| Clatsop County | \$7,611 | 1,348 | 42 |
| Columbia County | \$0 | 1 | 1 |
| Coos County | \$13,670 | 67,553 | 9,586 |
| Crook County | \$190,183 | 939,816 | 496,649 |
| Curry County | \$119,684 | 591,437 | 31,262 |
| Deschutes County | \$289,911 | 1,432,636 | 458,797 |
| Douglas County | \$192,091 | 949,242 | 35,264 |
| Gilliam County | \$48,218 | 34,616 | 28,793 |
| Grant County | \$354,585 | 1,752,233 | 171,392 |
| Harney County | \$600,090 | 4,465,166 | 3,884,027 |
| Hood River County | \$41,641 | 205,773 | 180 |
| Jackson County | \$93,214 | 460,631 | 42,129 |
| Jefferson County | \$60,119 | 297,088 | 27,268 |
| Josephine County | \$70,839 | 350,063 | 53,136 |
| Klamath County | \$437,002 | 2,159,510 | 238,065 |
| Lake County | \$600,090 | 3,703,245 | 2,483,735 |
| Lane County | \$277,201 | 1,369,828 | 12,164 |
| Lincoln County | \$37,326 | 184,449 | 11,173 |
| Linn County | \$96,328 | 476,021 | 2,390 |
| Malheur County | \$1,474,780 | 4,298,133 | 4,259,282 |
| Marion County | \$41,363 | 204,378 | 197 |
| Morrow County | \$38,628 | 149,960 | 1,609 |
| Multnomah County | \$15,365 | 75,930 | 0 |
| Polk County | \$0 | 435 | 117 |
| Sherman County | \$76,763 | 53,672 | 51,438 |
| Tillamook County | \$18,802 | 92,913 | 10,005 |

| O&C | \$116,092,631.54 |
| TOTAL | \$117,105,151.91 |

Jobs-in-the-Woods

The Jobs-in-the-Woods program was established to help mitigate the economic and social impacts on communities from reduced timber harvesting due to direction in the Northwest Forest Plan. This program was designed to provide jobs and incomes while investing in the ecosystem. Fiscal Year 2006 was the eleventh year of this program. Projects included juniper woodland restoration, bitterbrush planting, recreation maintenance, and fuel reduction. Refer to Table 16.3 for information on the Jobs-in-the-Woods program.

Table 16.3 - Jobs in the Woods Program - FY 2006

17.0 Environmental Justice

Executive Order 12898 of February 11, 1994, “*Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*” directs all federal agencies to “...*make achieving environmental justice part of its mission by identifying and addressing ...disproportionately high and adverse human health or environmental effects of its programs, policies and activities.*”

New projects with possible effects on minority populations and/or low-income populations will incorporate an analysis of Environmental Justice impacts to ensure any disproportionately high and adverse human health or environmental effects are identified, and reduced to acceptable levels if possible.

18.0 Recreation

Outdoor enthusiasts find a wide variety of recreation opportunities on the public lands managed by the Klamath Falls Field Office. Some of the more popular activities are camping, fishing, sightseeing, whitewater rafting, and birding. The resource area manages five campgrounds, a 3,200-acre wetland restoration project, river access points in the upper Klamath River canyon, and a number of dispersed, semi-developed camps.

The resource area issues and administers a number of Special Recreation Permits for activities such as guided whitewater rafting, guided hunting and fishing, and special events (Table 18.1).

Table 18.1 - Recreation Statistics Fiscal Year 2006

| | <u>FY 2006</u> | <u>FY95-06 (Total)</u> | <u>FY95-06 (Average)</u> |
|---|----------------|------------------------|--------------------------|
| Number of Recreation Visits | 134,000 | 1,913,000 | 159,417 |
| Campground Permits Issued | 1,454 | 14,927 | 1,244 |
| Campground Fees Collected | \$9,000 | \$102,300 | \$8,525 |
| Pavilion Use Permits Issued | | Not Applicable | |
| Pavilion Use Fees Collected | | Not Applicable | |
| Number of Special Recreation Permits | 23 | 312 | 26 |
| Special Recreation Permits Fees Collected | \$16,250 | \$173,150 | \$14,429 |
| Total hours volunteered | 6,545 | 85,880 | 7,157 |
| Total value volunteer wor | \$114,865* | \$1,183,180 | \$98,598 |

*Value of volunteer hours are based on an hourly pay rate of \$17.55/hr.

Recreation Pipeline Restoration Funds

This Congressional funding was appropriated for the completion of backlogged recreation projects in western Oregon, including BLM managed lands in Klamath County. The intent of this funding is to do facility or site backlog maintenance at existing recreation sites. New construction of recreation projects that address critical visitor safety or recreation management needs are also prioritized. During FY 2006, the eighth year of this funding, the Klamath Falls Resource Area received \$68,000 to upgrade the boat ramp at the Topsy recreation site, continue construction of the Miller Creek-Potholes trail, and install a double vault toilet at the Gerber Recreation Site.

Recreation Projects

Gerber Recreation Site

FY 2006 Projects Completed

1. Continued construction of Miller Creek-Potholes trail.
2. Installed a replacement double vault toilet in the South Campground.

FY 2007 Projects Planned

1. Patch and chip seal campground access roads.
2. Continue construction of Miller Creek-Potholes trail.
3. Install barriers and gravel camp site access (Miller Creek, Potholes, Stan H. Spring)

Wood River Wetland

FY 2006 Projects completed

1. Maintenance of existing trails and crossings.

FY 2007 Projects Planned

1. Replace existing picnic tables with maintenance free tables.
2. Replace three-panel interpretive display at entrance area.

Upper Klamath River

FY 2006 Projects Completed

1. Maintained existing facilities.

FY 2007 Projects Planned

1. Maintain existing facilities.
2. Road maintenance work at Spring Island and Stateline river accesses.
3. Road repair work on Topsy road at the Kerwin Ranch.

Topsy and Surveyor Recreation Sites

FY 2006 Projects Completed

1. Topsy boat ramp extension.
2. Campsites graveled and new firerings and vehicle barriers installed at two campsites in Surveyor campground.

FY 2007 Projects Planned

1. Chip seal Topsy Road in front of campground.
2. Install new restroom at Surveyor Campground.
3. Install barriers and gravel camp site access at Surveyor Campground.

Recreation Fee Demonstration Project

Prior to 1998, all recreation fees were combined with other revenue sources from public O&C lands and allocated between the U.S. Department of the Interior and the O&C counties. Recreation facilities were wholly dependent on the funding provided through the Congressional appropriations process for operations and maintenance funding.

In March of 1998, The Klamath Falls Resource Area was added to the BLM-wide Recreation Fee Demonstration pilot program. This program allows the resource area to retain collected recreation fees to be used for maintenance of recreation sites and areas from which they were collected. A special account has been established for each recreation site and program.

The Association of O&C Counties supported the retention of all recreation fee revenues under the Fee Demonstration Pilot authority to help operate the BLM's recreation facilities and programs.

In FY 2006, a total of \$25,250 in fees were collected at the three participating recreation sites. The revenue from the Recreation Fee Demonstration program is used to fund visitor services and a number of minor maintenance projects associated with the recreation program. Fees generated from these recreation sites and applied to the Fee-Demo program are shown in Table 18.2. Revenues collected in FY 2006 are used to pay for projects in future years.

Table 18.2 - Recreation Fee Demonstration Project Fiscal Year 2006

| Recreation Fee Demo Program | FY05 Revenue | FY06 Amount Invested Back Into Sites | Cumulative Revenue* |
|---|---------------------|---|----------------------------|
| Klamath River OR-14 | \$16,250 | \$7,000 | \$108,920 |
| Klamath Falls Resource Area OR-15 (Topsy and Gerber Campgrounds) | \$9,000 | \$32,000 | \$69,350 |
| Total Recreation Fee Demo Funds | \$25,250 | \$39,000 | \$178,270 |

* Since Year of Initiation (1998)

Status of Recreation Plans

- Pacific Crest National Scenic Trail Special Recreation Management Area (SRMA) - Recreation Area Management Plan to be coordinated by Medford District. Completed August of 1998.
- Klamath River SRMA Plan to be evaluated, updated and incorporated into the Klamath River Management Plan - A draft river plan/environmental impact statement was released in April 2003. The final KRMP/EIS is on hold.
- Klamath River Scenic Waterway Plan - The BLM and the State of Oregon signed a memorandum of understanding (12/31/97) for joint management of the Wild and Scenic River/State Scenic Waterway. A separate chapter of the Klamath River Management Plan/Environmental Impact Statement will address State Scenic Waterway issues. The administrative rules (management plan) for the Klamath River Scenic Waterway were adopted by the Oregon Parks and Recreation Department Commission on September 25, 2002 and became effective on October 3, 2002.
- Hamaker Mountain SRMA - An analysis of recreation issues and projects were completed during the Topsy/Pokegema Landscape Analysis, July 1996 (OR #014-98-01). Further project planning is ongoing for future recreation project developments. Project implementation is contingent upon adequate funding.
- Stukel Mountain SRMA - No recreation planning or watershed analysis has occurred. However, a local county advisory group (Stukel Road Task Force) completed a preliminary assessment of recreation issues in FY99. This information will be incorporated into future planning and project implementation. Project implementation is contingent upon adequate funding.
- Site-specific planning for recreation pipeline restoration funding projects is ongoing at several facilities, including Gerber recreation site, Topsy Recreation Site and Wood River Wetland.
- The KFRA entered into a joint planning effort with the Fremont-Winema National Forests to inventory all existing Off Highway Vehicle trails and routes. This information will be used by the KFRA to prepare the OHV related sections of the BLM-Western Oregon Plan Revision (WOPR)

Volunteer Activities

In FY 2006, volunteers contributed approximately 6,544 total hours of time and labor to nearly every resource program in the Klamath Falls Resource Area. Volunteers continue to provide substantial assistance to the recreation, wildlife, and cultural resources programs, as well as several of the resource area's community outreach events. Volunteer positions vary widely, ranging from summer campground hosting and park maintenance, to promoting International Migratory Bird Day, to monitoring wildlife in the winter. Approximately 175 individuals, including six campground hosts, volunteered their efforts and services to the Klamath Falls Resource Area.

In September 2006, the Klamath Falls Resource Area held its sixth annual National Public Lands Day event. This nationally sponsored event was held at the Veteran's Park in downtown Klamath Falls this year, in partnership with a number of local, state, and federal agencies.. Approximately 75 community volunteers and twenty agency volunteers brushed out trails, installed interpretive sign displays, and installed bird boxes in local park areas. Volunteers from the Klamath Four Runners 4-Wheel Drive Club prepared lunch for all of the participants

Tourism

The BLM is a member of the *Klamath/Lake/Modoc/Siskiyou Outdoor Recreation Working Group*, a consortium of government and private recreation and tourism entities from several counties within Oregon and California. The working group continues an active role in promoting tourism by providing pamphlets and brochures that show scenic byway travel routes, towns and cities, and areas of interest to visitors. The BLM participates in *The Answer People Group*, an informal informational sharing group for front line public contact representatives from public service and private tourism related businesses.

19.0 Forest Management and Timber Resources

The Klamath Falls Resource Area manages approximately 224,900 acres of land located in Klamath County. Approximately 51,230 acres of commercial forest land is located west of Klamath Falls and within the Northwest Forest Plan area. Approximately 23,550 acres (50%) of the commercial forest land on the Westside are available for timber harvest. On the Eastside, there are approximately 16,200 acres of commercial forest land of which approximately 8,800 acres (50%) are available for harvest. The Resource Management Plan provides for a sustainable timber harvest, known as the Allowable Sale Quantity (ASQ), from the Klamath Falls Resource Area. On the Westside, the ASQ is 5.91 MMBF (million board feet). On the Eastside, the ASQ is 0.40 MMBF.

Silvicultural Prescriptions

To meet the ASQ commitment, the Klamath Falls Resource Area to date has used primarily two types of silvicultural treatments or prescriptions: Density Management and Mortality Salvage. The KFRA has also implemented approximately 227 acres of Regeneration Harvest.

Density Management

Density Management treatments are designed to improve or maintain forest health and are proactive efforts to improve stand resiliency by reducing stand densities and fuel loads. Density Management prescriptions include thinning from below to reduce competition to under-represented species as well as to improve the resiliency of the large-tree component.

Approximately 20-30 percent of the trees are generally removed under a Density Management prescription. Small (five acres or less) patch cuts are included as part of the Density Management treatment. These are used in areas to regenerate the less shade-tolerant and under-represented species (pines and Douglas-fir). Excess trees of sub-merchantable size are sometimes cut and removed concurrently, and logging slash is treated or removed, which significantly reduces wildfire hazard and prepares the site for prescribed burning. In fiscal year 2006, the KFRA offered for sale approximately 3.53 MMBF of timber on 985 acres where Density Management prescriptions were applied.

Regeneration Harvests

In FY 2006, no acres of Regeneration Harvest were sold. Per KFRA RMP guidelines, an average of 16-25 large green trees per acre are required to be left in Regeneration Harvest units. This prescription is primarily used in older stands, in decadent stands, and in stands where there is a need to initiate and/or enhance the development of seedlings and saplings in the understory while still maintaining an overstory component.

Mortality Salvage

The other primary type of harvest prescription, Mortality Salvage, is used to remove scattered dead and dying trees. As a result of continuing local insect infestations and high winds in localized areas, the Klamath Falls Resource Area was able to meet part of its ASQ by offering and negotiating salvage sales to capture the scattered mortality. In FY 2006, the Klamath Falls Resource Area sold 1.0 MMBF of mortality salvage from approximately 125 acres.

Timber Sale Planning

The timber sale process, including the planning, watershed analysis, environmental analysis, consultation, and the biological and cultural surveys, is a two to four year process. The public is given the opportunity to comment on proposals during the planning and scoping phase. Notices are printed in the local newspaper requesting comments during the environmental analysis period. In addition, when public tours are given, they are announced ahead of time. Once the layout, cruising, and appraisal is completed and the contract is prepared, the timber sale is ready to be offered and a final decision appears in the local newspaper stating when the sale will be auctioned. Below is a list of the tables that relate to the timber sale program:

| | |
|------------|---|
| Table 19.1 | Timber Sale Volume and Timber Sale Acres - FY 2006 |
| Table 19.2 | Timber Volume Sold in fiscal year 2006 |
| Table 19.3 | Harvest Activity in FY 2006 |
| Table 19.4 | Timber Sales planned for fiscal year 2007 & 2008 |
| Table 19.5 | Status of all sold and awarded sales since signing of the RMP |
| Table 19.6 | Summary of Volume Sold |

Cumulative Status of Timber Sale Volume and Acres

Refer to Table 19.1 for a summary, by land use allocation, of timber volume and acreage that has been harvested in the KFRA since October 1, 1994. A similar table (M-7) in the Monitoring Report also compares the volume and acres with RMP/EIS assumed average and percent of assumed average. Discrepancies between actual treatments and assumed averages are discussed in the monitoring section. All KFRA Westside lands are in the Southern General Forest Management Area (SGFMA), described in the Northwest Forest Plan.

FY 2006 Timber Sale Accomplishments

Timber Sold in FY 2006

The Klamath Falls Resource Area offered two sales in 2006; Walter's Plantation (Westside) and Walter's Cabin. A number of timber sale modifications to existing contracts were also executed. The Adobe East Timber Sale, which was offered in August of 2005 and initially went no-bid, was reoffered in December of 2005 and sold. A protest of the Chew Timber Sale, which was offered in August of 2005, was denied in February of 2006. No appeal was filed and the sale was subsequently approved. The Walter's Planatation Timber Sale, which initially was part of the of Walter's Cabin Timber Sale, was negotiated in October of 2006. The Klamath Falls Resource Area was able to obtain valuable logging cost and marketability data as a result of the negotiated timber sale. Part of the volume in 2006 came from the Gerber Stew Stewardship Contract. A 20-40 year old plantation was thinned under the Gerber Stew Stewardship contract resulting in approximately 461 MBF of timber. Including modifications to existing timber sales and stewardship contracts, approximately 4.566 MMBF of timber from about 1,110 acres were sold (Table 19.2). The total price of these sales plus modifications to existing sales in FY 2006 was valued at \$543,387.82. The Annual Sale Quantity (ASQ) for the Klamath Falls Resource Area is approximately 6.4 MMBF per year. In addition to sawlog volume, approximately 9,507 tons of biomass was removed from residual landing piles on the westside of the resource area under the Gerber Stew Stewardship Contract. On the eastside, approximately 1,553 tons of biomass was removed, primarily from western juniper treatment areas. Table 19.2 also shows the approximate amount of juniper that was removed in FY 2006 under the Gerber Stew Stewardship Contract.

Harvest Activity in FY 2006

During FY 2006, harvest activity occurred on seven sales (Table 19.3). Approximately 9.9027 MMBF of timber from approximately 1,765 acres valued at \$1,149,618.05 was removed from these sales. Approximately 216 acres of western juniper was harvested for sawlogs in FY 2006, approximately 411 acres was harvested for chips, Also in 2006, under the Gerber Stew Stewardship Contract, approximately 9,507 tons of hog fuel was removed and transported to different biomass energy facilities in the region. (Table 19.3).

FY 2006 Timber Sales Planned

The annual timber sale plan (Table 19.4) may be changed, altered, or amended by the authorized officer. None of the proposed sales are set-asides.

Westside - One or two timber sales are planned on the Westside in FY 2007 (Table 19.4).

Status of Sold/Awarded Klamath Falls RMP Timber Sales

Table 19.5 lists the status of Klamath Falls Resource Area sales that have been sold and awarded since signing of the RMP in June of 1995. As shown, the KFRA presently has fifteen completed timber sale contracts and eleven active contracts. Seven timber sales have been monitored, three of which have involved the Regional Ecosystem Office (REO) review team, and all have involved the resource area interdisciplinary team. The results from the monitoring are discussed in the Monitoring Report. Tables 19.6, 19.7, 19.8 and 19.9 summarize sale activity from 1995 to 2006.

Table 19.1 - Klamath Falls Timber Sale Volume (MBF) and Acres FY 2006

Table 19.4 – Planned Timber Sales (FY 2006 & 2007)

| <u>FY Sale Name</u> | <u>Location</u> | <u>W/E</u> | <u>Date</u> | <u>MMBF</u> | <u>Acres</u> | <u>Harvest Rx</u> |
|---------------------|-----------------------------|------------|---------------|-------------|--------------|-------------------|
| 07 Thin Sheep | T39S, R5E, 17,21,29,31,33 | W | November 2006 | 3.3 | 590 | DM |
| 07 Buck 13 | T38, R5E, Section 13 | W | August 2007 | 0.5 | 35 | RH |
| 08 Buck Again | T38S, R6E, S.15, 23, 26, 36 | W | November 2007 | 4.5 | 800 | DM/RH/MS |
| 08 Cold Onion | T38S, R5E, Secs. 17 - 21 | W | June 2008 | 4.5 | 900 | DM/RH/MS |

Notes: The sales listed above do not include small negotiated sales such as Right-of-Ways.

W/E : W = Westside Sale (West of Klamath Falls) E = Eastside Sale (East of Klamath Falls)

DM = Density Management sales are designed primarily to improve forest health conditions. Silvicultural prescriptions are written to maintain uneven aged stands and also maintain and improve the health and resiliency of primarily the shade intolerant species: ponderosa pine, sugar pine and Douglas-fir. They are also designed to reduce stand densities, fuel loads, and risk of stand replacing wildfires.

MS = Mortality Salvage sales are designed to capture the immediate but scattered mortality (dead or dying trees) occurring over the Resource Area. This primarily involves only the removal of the recent mortality within the stand. Normally, less than 10% of the volume removed is live trees in the mortality salvage sales. Some thinning does occur beneath the old growth pines. Failure to remove the immediate mortality results in wood deterioration and complete loss of commercial value within approximately two years.

UR = Understory Reduction - Part of the objective of the sale is to reduce the density of primarily submerchantable (3"-7" diameter) shade tolerant species in the understory to reduce fire risk and ladder fuels as well as to enhance health of overstory trees.

RH = Regeneration Harvest - Designed primarily to initiate and to enhance the development of seedlings and saplings in the understory while still maintaining an overstory component. Per KFRA RMP requirements, of an average of 16-25 large green trees per acre will be left in Regeneration Harvest Units.

Table 19.5 – Status of Sold and Awarded Timber Sales

| 1998 | USFWS Bear Valley (W) | Bear Valley Wildlife Refuge | 6/97 | 1.0 | 245 | DM/UR | 100% (2000) |
| 2003 | USFWS Bear Valley 2 (W) | Bear Valley Wildlife Refuge | 6/03 | 2.6 | 1,040 | DM | 100% |

NOTES: The sales listed above do not include small, negotiated sales such as Right-of-Ways.

*W = Westside Sale (West of Klamath Falls). E = Eastside Sale (East of Klamath Falls).

**Prescription abbreviations as follows:

DM = Density Management sales are designed primarily to improve forest health conditions. Silvicultural prescriptions are written to maintain uneven aged stands and also maintain and improve the health and resiliency of primarily the shade intolerant species: ponderosa pine, sugar pine and Douglas-fir. They are also designed to reduce stand densities, fuel loads, and risk of stand replacing wildfires.

MS = Mortality Salvage sales are designed to capture the immediate but scattered mortality (dead and/or dying trees) occurring over the Resource Area. This primarily involves only the removal of the recent mortality within the stand. Normally, less than 10% of the volume removed in the mortality salvage sales is live trees. Some thinning does occur beneath the old growth pines. Failure to remove the immediate mortality results in wood deterioration and complete loss of commercial value within approximately two years.

UR = Understory Reduction - Part of the objective of the sale is to reduce the density of primarily submerchantable (3"-7" diameter) shade tolerant species in the understory to reduce fire risk and ladder fuels as well as to enhance health of overstory trees.

RH = Regeneration Harvest - Designed primarily to initiate and to enhance the development of seedlings and saplings in the understory while maintaining an overstory component. Per KFRA RMP requirements, an average of 16-25 large green trees per acre will be left in Regeneration Harvest Units.

USFWS – Bear Valley – The first proposed timber sale within the Bear Valley National Wildlife Refuge. The sale is designed to maintain and improve forest health within the refuge by thinning overstocked stands. Designed mainly to thin understory trees beneath eagle roosting trees and also to reduce fuel loads and risk of stand replacement wildfires.

¹ (FY 1995 - FY 2004) See Table R-1 of KFRA Record of Decision and RMP.

Forest Development Activities

Data on Forest Development Activities are displayed in Table 19.10. Overall, for the first twelve years of the KFRA RMP, silvicultural treatments implemented through timber sales, have focused on salvaging drought-related mortality and windthrow, and thinning overstocked stands. This forest health-driven prescription has resulted in fewer regeneration cuts than projected and a reduced need for associated reforestation and development treatments that would follow.

Brushfield Conversion

In the RMP, no conversion acreage was identified for commercial forest lands, and no conversion treatments are expected.

Site Preparation

Accomplishments total 18% of projected levels on the westside of the resource area, and 9% on the eastside, which results from the emphasis on thinning for forest health, as opposed to regeneration harvesting.

Planting (regular stock)

Tree planting is 38% of projected levels on the westside and 72% on the eastside. Westside planting is expected to increase due to implementation of patch and regeneration cuts in some areas.

Planting (improved stock)

No improved stock has been used to date. Potentially available stock is sugar pine and white pine, and possibly ponderosa pine and lodgepole pine from private sources. The use of

genetically improved stock is expected to be well below projected levels, due to the smaller planting program.

Vegetation Control

This includes vegetation control treatments like brush cutting, grass grubbing, and paper mulching of seedlings. For the westside, treatments are 112% of projected levels, while eastside treatments completed are 80% of projected levels.

Precommercial Thinning (PCT)

Treatment levels through FY 2006 are 374% of projected levels on the westside, and 135% of projected levels on the eastside. Depending upon funding, westside treatments could continue to exceed projected levels for the rest of the decade.

Restoration Thinning/Understory Reduction

These treatments have usually been performed as part of timber sale operations or as part of fuels reduction treatments in commercial forest stands. Understory treatment benefits include reduced fuel loads and improved forest health. Westside treatments are 239% of projected, and eastside treatments are 62% of projected. Treatment needs are expected to continue at previous levels on the Westside, while Eastside treatments are expected to increase.

Pruning

On the westside, 200% of projected work has been completed to date and 0% on the eastside. The eastside pruning acre targets are small and can easily be elevated to RMP projected levels under one service contract, assuming funding is available.

Fertilization

To date, no fertilization treatments have been implemented on either side of the resource area. The small areas projected for the decade could be done under one service contract.

Animal Damage Control

On the KFRA, animal damage control is usually porcupine or pocket gopher control. Treatments to date are 21% of projected on the westside and 13% of projected on the eastside. Limited regeneration harvests have reduced the need for these treatments. In addition, many older plantations are growing in size and are less vulnerable to gopher damage.

Stewardship Contracting

The BLM received Stewardship Contracting authority in 2003 under Section 323 of Public Law 108-7. The legislation authorizes trading goods for services and multi-year contract authority greater than five years but not to exceed ten years. The BLM is authorized to enter into contracts or agreements for services to achieve land management goals as well as meet local and rural community needs. A source for performance under a contract must be selected on a best value basis. When designing stewardship projects, the BLM is directed to consider projects that will involve treatments and techniques available to make forests, woodlands, and rangelands more resilient to natural disturbances such as fire, insects, disease, wind, and flood. Stewardship contracting projects are to be designed to accomplish one or more of the goals noted below:

- Road and trail maintenance or obliteration for improved water quality;
- Soil productivity, habitat for wildlife and fisheries, or other resource values;
- Setting of prescribed fires to improve composition, structure, condition, and health of stands or to improve wildlife habitat;
- Removing vegetation or other activities to promote healthy forest stands, reduce fire hazards or achieve other land management objectives;
- Watershed restoration and maintenance;
- Restoration and maintenance of wildlife and fish habitat; and
- Control of noxious and exotic weeds and reestablishing native plant species.

In FY 2004, the KFRA awarded the Gerber Stew Stewardship Contract to Quicksilver Contracting. The contract was designed as a long-term contract to implement up to 10,000 acres of primarily restoration treatments on forest land, juniper woodlands, rangelands, riparian areas, and roads. This contract is designed to treat BLM administered lands in the KFRA that meet the appropriate criteria over the next ten years. Since 2004, the KFRA has issued 14 task orders implementing the following treatments:

| Treatments Tasked to Date | Units Completed |
|---|------------------------|
| Manual Cut, Pile, and Cover (Western Juniper) | 346 Acres |
| Mechanical Cutting/Piling (Western Juniper) | 240 Acres |
| Mechanical Cut (Western Juniper/Mixed Conifer) | 1,220 Acres |
| Mechanical Yarding (Western Juniper/Mixed Conifer) | 1,220 Acres |
| Grinding Timber Sale Landing Piles for Biomass Energy | 9,000 Tons |
| Seeding | 944 Acres |
| Road Maintenance | 960 Stations* |
| Road Obliteration | 75 Stations |
| Road Blocking | 3 |
| Spot Rocking (hauling and processing) | 356 Stations |
| Fencing | 3,500 Feet |
| Slashbusting/Mastication | 300 Acres |

*One Station = 100 linear feet

As well as the service work tasked above, the following products have been scheduled for removal:

| Product Removed/to be Removed | Estimated Units |
|--|------------------------|
| Clean Chips for Hardboard Processing (Western Juniper) | 4,962 Tons |
| Clean Chips for Hardboard Processing (Ponderosa Pine) | 4,050 Tons |
| Sawlogs | 753 MBF |
| Biomass for Energy Production | 9,000 Tons |

20.0 Special Forest Products

The district sold a variety of special forest products as shown in Table 20.1. The more popular special forest products that the KFRA is selling are firewood, Christmas trees, and boughs. Occasional permits for mushrooms, mosses, and transplants have also been issued. The KFRA issued 326 permits in FY 2006 for a total receipt value of \$14,784.00. The sale of special forest products follows the guidelines contained in the Oregon/Washington Special Forest Products Procedure Handbook. There are no estimates or projections in the RMP ROD or FEIS that need to be compared to the sold quantities shown.

21.0 Energy and Minerals

There were no mining plans of operations or mining or energy notices submitted during FY 2006. There are no leases of oil, gas or geothermal resources within the Klamath Falls Resource Area, although there are several known geothermal resource areas and most of the public lands are prospectively valuable for oil and gas. No new mining claims were filed in FY 2006. In FY 2006, the resource area sold 1,000 cubic yards of volcanic cinders to individuals and provided rock for crushing free of charge to local governments. Refer to Table 21.1 for Energy and Minerals program information.

Table 21.1 - Energy and Minerals Management - FY 2006

| Total Oil leases | 0 | 0 |
| Total Gas leases | 0 | 0 |
| Total Geothermal leases | 0 | 0 |

22.0 Land Tenure Adjustments

Since completion of the RMP, 2,690 acres have been sold (see Table 22.1). The land was sold to offset losses to Klamath County's tax base that resulted from the Wood River Wetland acquisition.

Since the RMP was completed, 1,160 acres originally identified for sale have been re-evaluated and determined suitable for disposal only by exchange. An additional 5,680 acres originally evaluated for sale was determined appropriate to be retained in Federal ownership. Resource values, including, but not limited to, wildlife habitat, timber, and cultural resources found on these lands justify retention in public ownership. In a plan amendment, Appendix I was updated to reflect the work accomplished over the first 4 years in evaluating public lands for sale or exchange.

Public Law 105-321 requires that, when selling, purchasing and exchanging land, the Bureau of Land Management may neither, 1) reduce the total acres of O&C or CBWR lands, nor, 2) reduce the number of O&C, CBWR, and Public Domain lands that are available for timber harvest below what existed on October 30, 1998. Since 1996, we have sold approximately three acres of public domain "timberland" in order to address unintentional trespass and other land and access situations. To date, there have been no opportunities to acquire timberland to replace these three acres.

An amendment to the RMP on Unintentional Encroachments and Survey Hiatuses was completed in FY 99. The plan amendment allowed a 1.01-acre tract of land to be moved from Land Tenure Zone 1 to Land Tenure Zone 3, which allows for sale. The amendment added the following provision to the Land Tenure Adjustment - Management Actions/Direction for All Land Use Allocations section: "*Where survey hiatuses and unintentional encroachments*

on public lands are discovered in the future that meet disposal criteria, the lands may be automatically assigned to Zone 3 for disposal.” The disposal criteria to be used are those defined in Appendix I of the Klamath Falls Resource Area Record of Decision and Resource Management Plan, June 1995.

Table 22.1 - Land Use Tenure Adjustments Fiscal Year 2006

| | <u>FY 2006</u> | <u>FY 95-06</u> |
|--|----------------|-----------------|
| Amount of land acquired (acres) | 0 | 0 |
| Amount of land exchanged (acres) | 0 | 120 |
| Amount of land sold (acres) | 520 | 2,689.55 |
| Amount of land easement acquired (#/acres) | 0 | 4/7.71 |
| Leases/permits issued (number) | 1 | 2 |
| Unauthorized uses identified/resolved, (number/number) | 4/3 | 15/13 |
| Withdrawals completed (number/acres) | 0 | 1/1 |
| Withdrawals revoked (number/acres) | 0 | 11/11,281 |

23.0 Access and Rights-of-Way

The summary table in the front of this document summarizes some of the various realty actions accomplished in the eleven years since implementation of the RMP. Applications for rights-of-way have been received and processed at a moderate and consistent rate. New authorizations are predominantly for commercial use of existing roads to haul timber and other forest products. Rights-of-way were issued for timber haul roads, communications sites, and power lines.

24.0 Transportation and Roads

Approximately 520 miles of BLM controlled roads are within the Klamath Falls Resource Area. The BLM maintained approximately 83 miles of these roads in FY 2005. Additional road maintenance was performed by those authorized to use BLM roads under timber sale contracts and road use permits. Refer to Table 24.1 for a summary of road treatments completed in FY 2005. (For additional discussion of road treatments specific to watershed restoration, refer to Section 5.0 - Aquatic Conservation Strategy.)

A Transportation Management Plan (TMP) was completed for O&C lands west of Highway 97 in 1996. A TMP is being developed for Eastside lands and will be completed sometime in the future. Transportation Management Objectives (TMOs) for each BLM road are completed. If management changes over time, TMO's will also be revised.

Table 24.1 - Roads and Transportation Management Fiscal Year 2006

| | <u>FY 2006</u> | <u>FY 95-06</u> |
|---|----------------------|-----------------|
| Roads maintained (estimated miles) | 79 | 742 |
| Roads decommissioned (miles) | 0 | 11.6 |
| Roads closed - year round (miles) | 7.35 | 23.98 |
| Roads closed - seasonally (miles) | 0 | 18 |
| New roads constructed (miles) | 0 | 8.34 |
| Road improvements (miles) | 0.1 | 24.67 |
| Transportation Plan for O&C land west of HWY 97 | Completed in FY 1996 | |
| Transportation Plan for Eastside KFRA | To be determined | |

25.0 Hazardous Materials

No suspected or known releases of hazardous wastes were identified on public lands in fiscal year 2006. (See Table 25.1.) One solid waste site was identified. The responsible party is currently unknown.

Table 25.1 - Hazardous Materials Management Fiscal Year 2006

| | <u>FY 2006</u> | <u>FY 95-06</u> |
|--|----------------|-----------------|
| Number of Hazardous materials site evaluations | 0 | 9 |
| Number of Environmental Site Assessments completed for realty acquisitions | 0 | 7 |
| Number of facility assessments for corrective actions | 0 | 24 |
| Number of abandoned hazardous sites found | 0 | 4 |
| Hazardous waste incidents requiring emergency response | 0 | 0 |
| Removal actions | 0 | 5 |

26.0 Wildfire/Fuels Management

The BLM/Klamath Falls Resource Area is one of the leading Federal agencies in the field of prescribed fire and fuels management. Prescribed fire is used to reduce hazardous fuels accumulations so that wildfires are reduced in size and intensity when they do occur. Another benefit of prescribed fire is to mimic natural wildfire in a mosaic pattern to benefit the total ecosystem (plants, animals, fish, soils, trees, and human uses). On the Klamath Falls Resource Area in FY 2006 there were fifteen wildfires, burning 51 acres (see Table 26.1).

The public was notified of proposed prescribed burning activities via news releases to local newspapers, television and radio stations as well as legal notices published in the Herald and News.

Table 26.1 - Fire and Fuels Management Fiscal Year 2006

| | <u>FY 2006</u> | <u>FY 95-06</u> |
|---|----------------|-----------------|
| Number (acres) of prescribed fires | 22 (5,586) | 168 (60,143) |
| Number (acres) of mechanical fuel treatment | 31 (7,962) | 140 (34,503) |
| Number (acres) of On-Resource Area wildfires: | | |
| - number human caused wildfires (acres) | 0 (0) | 16 (677.3) |
| - number lightening or natural caused wildfires (acres) | 17 (51) | 61 (1,198) |
| Number of assignments to on-Resource Area wildfires | 10 | 159 |
| Number of personnel assigned to off-Resource Area wildfires | 31 | 614 |

27.0 Law Enforcement

The Klamath Falls Resource Area has a full time BLM Ranger along with the services of a Klamath County Deputy Sheriff (through a law enforcement agreement with Klamath County) for law enforcement duties. The Ranger works cooperatively with the Lakeview BLM District Ranger, Oregon State Police, Lake County Sheriff's Office, Lakeview and Klamath Falls Police Departments, National Park Service, U.S. Forest Service, and U.S. Fish and Wildlife Service. Investigative support is provided by BLM Special Agents from the Oregon State Office.

Law enforcement efforts are focused on protecting natural resources and property while providing for public and employee safety. Educating the public in the safe and proper use of public lands is accomplished by patrol, investigation of criminal activity, issuance of verbal or written citations, and making arrests where appropriate.

There were 48 incidents and violations recorded in the Klamath Falls Resource Area in 2006 (see Table 27.1). These included theft of Federal property, forest products theft, vandalism to public or private property, Archaeological Resource Protection Act (ARPA) violations, weapons violations, search and rescue, human-caused wildfire, camping or day-use violations, vehicle abandonment and improper disposal of household trash. The table below summarizes the law enforcement activity within the Klamath Falls Resource Area since 1995.

Table 27.1 - Law Enforcement Fiscal Year 2006

|--------------------------------------|----------------|-----------------|
| Number of full-time Rangers | 1 | 1 |
| Number of Law Enforcement Agreements | 1 | 1 |
| Number of Incidents or Violations | 48 | 672 |
| Number of warnings issued | 48 | 231 |
| Number of citations issued | 14 | 62 |

28.0 Rangeland Resources/Grazing Management

Overview

The rangeland management program administers livestock grazing activities on most of the lands in the Klamath Falls Resource Area (approximately 208,000 of the KFRA's 224,900 acres). Grazing licenses are issued yearly, authorizing up to approximately 13,000 Animal Unit Months (AUMs) on 95 individual grazing allotments (see Table 28.1). A percentage of the grazing fees (37.5%) go to the U.S. Treasury. The remaining fees are returned to the district and resource area for rangeland improvement projects to benefit wildlife and watershed resources while enhancing livestock grazing systems.

Existing projects such as water holes, spring developments, and fences are monitored and maintained, as necessary, either by range staff personnel or by the grazing users. Grazing use supervision is constantly performed during the grazing season to ensure compliance with approved grazing authorizations, with the efforts concentrated on resource priority allotments. The range program also collects vegetation inventory data, rangeland condition and trend information, actual livestock use information, and monitors vegetation utilization levels on high priority allotments. This information is evaluated - both formally and informally - to determine whether allotment goals and objectives are being met. Monitoring data is being utilized in an ongoing effort to assess efforts to meet the Standards for Rangeland Health on all grazing lands.

As required by BLM policy, a Range Program Summary (RPS) is published periodically to update the public on implementation of the RMP. This summary typically includes information on the season-of-use and forage allocation by allotment. Since the original RPS, which was included as part of the June 1995 Klamath Falls Resource Area RMP/Record of Decision (Appendix H), there have not been enough significant changes in the range program to warrant publishing a full, independent update (i.e. recounting all of the information for all of the KFRA grazing allotments). As the resource area allotments are assessed (see next section) and other

changes in grazing management take place, the public will be updated via this Annual Program Summary and Monitoring Report for the KFRA. This APS will fulfill the requirement for the RPS.

Table 28.1 – Range Resources Management Fiscal Year 2006

| | <u>FY 2006</u> | <u>FY 95-06</u> |
|--|----------------|-----------------------------|
| Number of acres administered grazing | 207,552 acres | 207,552 acres |
| Number livestock operators | 83 | 83 (average/year) |
| Number of allotments | 95*** | 95*** |
| Number of AUMs | 10,717 | ~11,000 (average/year) |
| Number of permits leases renewed/transferred | 12 | 116 |
| Billings issued/fees collected | 75/\$16,718 | ~80/\$15,000 (average/year) |
| Number of allotments/acres assessed (RHSAs*) | 8/10,173 acres | 57/176,614 acres |

| Wild Horse and Burro Adoption Events** | 0 | 4 |
| Number of horses/burros placed | 0 | 56 |

* Rangeland Health Standards Assessments

** Does not include yearly raffle of individual horse at the Klamath County Fair.

***One grazing allotment (Flesher [0820] – 160 acres) was entirely transferred to private ownership (i.e. sold) during FY 2006

Fiscal Year 2006 Summary

Rangeland Health Standards Assessments

Eight (8) KFRA grazing allotments had Rangeland Health Standards Assessments (RHSAs) completed during FY 2006: Swan Lake Rim (0858), Brenda (0810), Jeld-Wen (0824), Two Mile (0806), Harpold Ridge (0851), McFall (0896), Harpold Canyon (0895), and SE 80 (0805). These eight allotments contain a total of 10,173 acres and comprise about 5% of the KFRA's grazed acres. Since the Assessment process began in 1999, 85% of the KFRA's grazed acres have been assessed. All of the eight allotments assessed in 2006 were found to have met all the Standards for Rangeland Health, or were making significant progress toward meeting them with current grazing management.

Rangeland Health Standards Assessments compare accumulated rangeland monitoring data against the five Standards for Rangeland Health. These standards address watershed function in uplands; watershed function in riparian areas; ecological processes; water quality; and native, threatened and endangered, and locally important species. These assessments also compare the rangeland monitoring data against other pertinent objectives (i.e. land use plan, ESA Section 7 consultations, etc.) to see if current grazing use is meeting them. (Note: These Assessments only address grazing management - not other uses of the public lands.) On November 13, 1998, the Klamath Provincial Advisory Committee (PAC) approved the KFRA Plan for the Implementation of Standards and Guidelines. The KFRA Plan is the local plan to implement the policies and guidance stemming from the broad direction contained in the August 12, 1997 "Standards for Rangeland Health - Oregon/Washington Standards and Guidelines for Livestock Grazing Management for Public Lands Administered by the Bureau of Land Management in the States of Oregon and Washington".

The entire assessment process for the resource area is scheduled to be completed in 2010 - a total of 12 years (1999-2010). This is an adjustment (extension) of the original schedule listed in the 2002 APS. This schedule extension is necessary in order to collect adequate information on many of the KFRA's smaller and lower priority allotments - most of which have never had basic rangeland resource information collected on them - so that a proper Assessment can be prepared.

Endangered Species Act Section 7 Consultation

Three grazing allotments in the Gerber Reservoir area (Horsefly, Pitchlog, and Dry Prairie) are subject to formal consultation under Section 7 of the Endangered Species Act. These allotments in combination comprise over 20% of the KFRA. The existing Biological Opinion (BO) covering these allotments expired after the 1998 grazing season and was in need of renewal. All three were fully re-evaluated and re-consulted on in FY 99. Subsequent to the re-evaluation the USFWS issued a memorandum (1-10-99-I-47) that indefinitely extended the existing BO, with some very minor modifications, primarily dealing with monitoring requirements. An end-of-year grazing report for the 2005 grazing season was prepared for these allotments and submitted to the USFWS during early FY 2006, as required by the BO. The BO was reaffirmed for the 2006 grazing year by USFWS memorandum. The grazing report for the 2006 grazing year is pending at the time of providing input into this APS.

Grazing Leases and Fees

Twelve grazing permits/leases were renewed or transferred during FY 2006. This process included appropriate NEPA review/documentation. Approximately seventy-five licenses or billings were issued authorizing approximately 10,717 AUMs in grazing use and collecting approximately \$19,000 in grazing fees.

Range Improvements

Lower Klamath Hills Fence Reconstruction

This project entailed the substantial rebuild of an existing fence, substantially impaired during a wildfire during the summer of 2005, by KFRA range staff during 2006 with post-fire rehab funds. The rebuild was necessary since this fence forms the south boundary to an allotment which has ever increasing numbers of residences being built just south of this boundary along Lower Lake Road.

Riparian Fence Maintenance

Range staff personnel continued to maintain all riparian enclosure and pasture fencing. This included the inspection and repair of approximately 25-30 miles of riparian related fencing within the resource area. The riparian fencing around Ben Hall Creek, Antelope Riparian Pasture, Barnes Valley Riparian Pasture, Tunnel Creek, Surveyor Campground, upper Hayden Creek, and Dixie enclosures all received significant additional rebuilding or rehabilitation during FY 2006.

Monitoring of Grazing Allotments

Monitoring of grazing use, and effects of that use, continued on priority allotments in accordance with the KFRA's *Coordinated Monitoring and Evaluation Plan for Grazing Allotments*. At least 16 high priority allotments had various monitoring data collected on them. These rangeland studies monitor utilization, ecological condition, vegetation trends, actual grazing use, and other resource attributes. As is typical of all grazing years, at least 100 grazing use supervision checks of high priority allotments were performed.

Fiscal Years 1996-2006 Summary

Rangeland Health Standards Assessments

The acreage of Assessments completed to date (FY 1999 to 2006) is 176,614 acres, or 85% of the KFRA grazing allotted acres, which includes all of the high priority resource concern allotments in the resource area. The remaining 15% of the KFRA grazing lands are low priority, fragmented public lands which will be assessed gradually over the next three to four years as information becomes available (see next section).

Rangeland Ecological Site Inventory

Ecological Site Inventory (ESI): An ESI was completed for the entire Gerber Block (Eastside of the resource area) in FY97 and FY98. The Gerber Block is approximately 110,000 acres. Ecological Site Inventory, the BLM's rangeland vegetation survey method, allows for classification and comparison of the current vegetation to its potential. It also provides the Bureau information which assists in setting proper, achievable objectives for resource management. An Ecological Site Inventory also includes an Order 3 soil survey. The soil mapping for the Gerber ESI was done by a soil scientist from the BLM's Lakeview District ESI crew. The vegetation mapping was done by resource area range management specialists.

Beginning in late FY 2002 and continuing through 2006, the ESI is being performed on the fragmented public lands located between Klamath Falls and the Gerber Block. The purpose of this survey is to acquire baseline, ecologically based, vegetation condition information on fragmented BLM administered lands that have never been rangeland vegetation inventoried. The soils were previously classified as part of the south Klamath County soil survey in the 1960's and 70's. The ESI information collected will be used to complete Rangeland Health Standards Assessments on these allotments over the next three to four years, tentatively. A total of 10,173 acres of ESI were completed during FY 2006. It is expected that this ESI survey will be performed intermittently by existing rangeland management staff members over the next two to three years (FY 2007-2009) and will eventually classify a total of 55,000 additional acres.

Monitoring of Grazing Allotments

Rangeland monitoring studies were completed during FY 1996-2006 in accordance with KFRA's *Coordinated Monitoring and Evaluation Plan for Grazing Allotments*. This directs the most monitoring emphasis on high priority (management category "I") allotments; in particular the three previously mentioned allotments that are under Section 7 Consultation. This includes various rangeland condition, trend, and utilization studies; riparian condition and photo trend studies; actual grazing use supervision and information; and other rangeland monitoring studies as needed.

Wild Horse Management

The Klamath Falls Resource Area has one designated wild horse herd and herd management area, the Pokegama Herd Management Area (HMA). This HMA is located in the western portion of the resource area, west and north of the Klamath River Canyon, south of Highway 66, and east of Jenny Creek, overlapping the border between California and Oregon.

In 1996, 20 head of horses were removed from the HMA and adopted to the public via the BLM's Adopt-a-Horse program. No removals were done in FY97, FY98, or FY99. Based on aerial and ground counts of the wild horse herd made during FY 2000, the herd size was 55 horses. This herd size was above the upper end of the Appropriate Management Level (AML) of 30-50 animals. This AML was initially established in the Klamath Falls Resource Area RMP (June 1995) and has been evaluated and reaffirmed in the Lakeview District Wild Horse Gather EA (OR-010-95-10) and again in the 1996 Topsy/Pokegama Landscape Analysis. Since the herd was above AML in FY 2000, a total of 18 horses were removed. These horses were transported to the Burns Wild Horse corrals and placed in the Adopt-a-Horse program. No additional removals have been done since FY 2000. The most recent aerial census (February 2002) counted 22 head in the HMA. Based on this census and multiple yearly ground counts, the actual total herd number is believed to be currently 30 to 35 head.

A major portion of the KFRA's wild horse program consists of performing compliance checks of wild horses and burros adopted by residents of Klamath County. Compliance checks of adopted horses and their maintenance facilities is required to assure that adopters properly execute their responsibilities as required by the *Private Maintenance and Care Agreement* that

adopters sign when adopting an animal. Adopters are eligible to receive title to the animal after one year of appropriate care. In FY 2006, KFRA completed on site inspections of 100% of the recently adopted and untitled local horses and burros. Six horses/burros were inspected for adopter compliance. One Hundred and twenty-four horses/burros have been inspected for compliance since 1997. Prior to FY 1997, compliance checks were not required.

Starting in 1999, the Klamath Falls Resource Area teamed up with the local 4H & FFA equestrian clubs to promote wild horse awareness and education and to provide scholarships for deserving young students. Every year since then – including 2006 - the Klamath Falls 4-H members sell raffle tickets to people who qualify for horse adoption. The drawing is held at the Klamath County fair in August and has generated an average of \$1,500 per year in donations for a scholarship fund for eligible equestrian members.

29.0 Cadastral Survey

The Oregon State BLM office provides cadastral support to the resource area. During FY 2006, no official cadastral survey was completed in the resource area and no progress made on the ongoing remonumentation survey (see Table 29.1).

Table 29.1 - Cadastral Survey Summary Fiscal Year 2006

| | <u>FY2006</u> | <u>FY95-06</u> |
|--|----------------------|-----------------------|
| Number of survey groups/projects completed | 0 | 1 |
| Number of projects ongoing* | 0 | 1 |
| Number of monuments set | 0 | 15 |
| Number of miles surveyed | 0 | 1 |
| Number of miles of federal boundary posted | 0 | 1 |

*Remonumentation for individual projects.

30.0 Education and Outreach

This fiscal year, the Klamath Falls Resource Area sponsored several community outreach events and played an active role in many others. Most of the events focused on public education about natural resources management, stewardship practices on public land, BLM programs and mission, and creating partnerships with private landowners and service organizations committed to improving conditions for all living things. KFRA employees presented programs to both school children and adults. Topics discussed included wetland biology, wildland fire suppression and prescribed fuels treatments, forest health practices, archeology, wildlife biology, rangeland ecology, as well as careers in natural resources. (Refer to Tables 30.1, 30.2 and 30.3.)

For the past several years the resource area has hired one to three high school students in the Apprentice in Science and Engineering Program. The program is designed to introduce sophomore and junior students to natural resource management professions. This year two students were hired; one in archeology and one in forestry. Each student was also given a general overview of the many professions and specialties employed by the BLM.

Annual Horse Packing & Wilderness Skills Clinic

In May, BLM sponsored a booth, complete with a corral, where people could get a close-up look at “Cookie”, a wild horse from the Palomino Buttes Herd Management Area. Students from local 4-H organizations sold raffle tickets to raise money for college scholarships.

Employees handed out brochures and answered questions regarding the Wild Horse and Burro Adoption Program, and BLM recreational opportunities. This event, which draws people from throughout the northwest, was held at the Klamath County Fair Grounds Event Center. There were over 5,000 visitors at this year's event.

Annual International Migratory Bird Day Celebration

This marks the 6th year that the Klamath Falls Resource Area has participated in the International Migratory Bird Day (IMBD) event held in Klamath Falls. The IMBD is the hallmark outreach event for Partners in Flight, which focuses on migratory birds. Other sponsors in this local event included the U.S. Fish and Wildlife Service, Oregon State University Klamath County Extension Service, Winema National Forest, and community volunteers. The main outreach event included guided bird walks along the Lake Ewana trail, mist netting demonstrations, art and photographic displays, a variety of hands-on educational activities for children, and participation from community organizations.

RAP (Resources and People) Career Camp

Designed for High School students ages 15 and older, the week long RAP Camp focuses on educating students about the region's vast array of natural resources and how they are all inter-related. Sessions focus on hands-on learning, with a wide variety of demonstrations and field trips throughout the week. Several agencies participate in the event including, KFRA, Winema National Forest, Modoc National Forest, USFWS, various private organizations, and private citizens.

Fun With Fungi

Forty people joined local BLM and USFS staff on an autumn field trip to the Lake of the Woods. Besides the beautiful scenery, participants observed many varieties of fungi as well as other native plants and grasses. The event was cosponsored by the KFRA, the Winema National Forest, and the Native Plant Society of Oregon.

Klamath County Fair

The BLM provided an information booth on wild horses and burros at the Klamath County Fairgrounds in August 2006. Each year a KFRA range technician volunteers time to halter break a wild horse which is then raffled at the fair. This successful event has been a mainstay at the Klamath County Fair since 1994. Prior to 1999, the "fair horse" was raffled with free tickets to anyone who met the BLM requirements for adoption. For the last seven years, the BLM has worked in partnership with local 4-H Equestrian clubs selling raffle tickets to raise money for a scholarship fund. Each year, a scholarship is awarded to a member of the participatory clubs. Since 1999, over ten thousand dollars has been raised through this effort. This year's fair horse, Cookie, was won by a local family who is giving her lots of care and affection.

National Public Lands Day

On September 30, 2006 the resource area celebrated National Public Lands Day. Approximately seventy people from the community, plus five employees participated in the event which was held at Veteran's Park in Klamath Falls. Activities included installing interpretive signs, building and installing bird boxes, maintaining trails, and preparing sites for tree planting.

Klamath County School Forestry Tour

The Klamath Falls Resource Area provided information at one of eight education stations at the Klamath County School Forestry Tour held in September at the Clover Creek Environmental Educational Area. The tour is for all Klamath County Sixth graders and their teachers. This year approximately 1,800 students and teachers attended the tour. The Forestry Tour provides students with a natural resource career awareness and appreciation of forest resources. The School Forestry Tour is coordinated by the Oregon State Extension Service with participation from the Oregon Department of Forestry, U.S. Forest Service, Oregon State Fish and Game,

U.S. Fish and Wildlife Service, Henley High School forestry Club, USDA Natural Resources Conservation Service, Klamath County Soil and Water District, and others. The tour was first presented in 1963.

31.0 Research

Profuse-flowered Mesa Mint

Profuse-flowered mesa mint (*Pogogyne floribunda*) was considered a rare annual mint (family Lamiaceae) endemic to the Modoc Plateau area of northeastern California, scattered among a few sites in Shasta, Lassen, and Modoc counties. Research initiated in 2003 is the basis for the development of a conservation strategy that will focus on (1) the reproductive biology and fecundity of Oregon populations, (2) their potential response to disturbance (including hydrologic alterations), and (3) possible interactions with noxious and other weeds. In addition, comparisons are made between the northern populations recently discovered in Oregon, and those from the previously known range in California. The final conservation strategy and biological evaluation was submitted and accepted in FY 2006.

Neotropical Migratory Landbirds

A study of Neotropical migratory birds is being conducted in cooperation with Klamath Bird Observatory, Pacific Southwest Research, PacifiCorp, Winema National Forest, and Point Reyes Bird Observatory. On BLM lands, there are 44 point-count stations and four constant effort mist-netting sites in a variety of habitats.

Spotted Frogs

A USGS study on occurrence and effects of a skin disease that affects spotted frogs and other amphibians includes the Wood River Wetlands as one of several study sites. Chytridiomycosis is a fairly recently described disease that affects the skin of amphibians, and may partially explain some of the observed amphibian die offs. The suspected infecting agent are chytrids (water molds), which are primitive fungi. Chytridiomycosis induces behavioral and morphological changes that put the individual at greater risk to environmental stresses and to predators.

Ground Water

An ongoing study is being conducted by the US Geological Survey. Artesian wells at Wood River Wetland are being monitored as part of a larger Klamath basin ground water study. Information on origin, water levels and discharge is being collected.

32.0 Coordination and Consultation

Federal Agencies

During the period of June 1995 through September 2002, BLM has increased its cooperative efforts with other federal agencies. The BLM has been very involved with the U.S. Fish and Wildlife Service, U.S. Forest Service, Environmental Protection Agency, U.S. Geological Survey, Bureau of Reclamation, and National Resource Conservation Service on projects such as watershed analysis, water quality improvement projects, and the Wood River Wetland Restoration Project. In addition, personnel from these agencies have been involved in planning, conflict resolution, and Section 7 consultation under the Endangered Species Act.

The Regional Interagency Executive Committee, Klamath Provincial Advisory Committee, Klamath Basin Ecosystem Restoration Office, and the Regional Ecosystem Office, established under the Northwest Forest Plan, have increased BLM's interagency role as well.

U.S. Fish and Wildlife Service

Bear Valley National Wildlife Refuge

The first forest health treatment in the Bear Valley National Wildlife Refuge was completed in November of 1999. The first treatment was a 245 acre timber sale that focused primarily on maintaining and improving bald eagle nesting and roosting habitat. The treatment consisted of thinning primarily the overstocked understory trees to improve the resiliency of the remaining trees and reduce the risk of stand replacing wildfires. The first follow-up prescribed burn was implemented in the fall of 1999 in areas that had been harvested to reduce remaining fuel loads. In addition to the habitat treatments, some road improvements and road decommissioning occurred along with replacement of an access bridge. In FY 2003, a second timber sale of 1,040 acres was sold. This treatment was completed in June of 2005. Post-treatment stand exam monitoring is scheduled in FY 2006.

Wood River Wetland

The USFWS and the BLM, through a memorandum of understanding, have shared staff to complete both restoration work in the refuge as well as restoration work at the Wood River Wetland.

Klamath Basin Ecosystem Restoration Office

The Ecosystem Restoration Office (ERO) is an interagency office, which is operated cooperatively by the U.S. Fish and Wildlife Service, Bureau of Reclamation, U.S. Forest Service and the BLM. This interagency office provides funding, technical assistance, and monitoring for watershed restoration projects which are proposed by private landowners, private and public organizations and agencies, and the Upper Klamath Basin Working Group. The ERO works closely with the Klamath Basin Provincial Advisory Committee and watershed councils within the Klamath Basin. BLM has helped support this office since 1997.

State of Oregon

The Klamath Falls Resource Area has continued its long term working relationship with Oregon Department of Forestry, Oregon Department of Fish and Wildlife, Oregon Department of Agriculture, Oregon Parks and Recreation Department, State Historic Preservation Office, and the Oregon Department of Environmental Quality. BLM has participated with these agencies in diverse activities such as recreation and timber sale planning, fish habitat inventory, water quality monitoring and TMDL development, noxious weed management, hazardous material cleanup, air quality maintenance, and wildfire suppression.

Counties

The Klamath Falls Resource Area (KFRA) is located within Klamath County. There is frequent communication between the KFRA and county commissioners and other county staff. This communication involves BLM proposed projects, county projects that may affect BLM lands, water quality issues, noxious weeds and other issues. County Commissioners receive copies of all major publications, project updates and project proposals.

Cities

The KFRA works with staff from the City of Klamath Falls and other outlying communities (Bonanza, Bly, Lorella, Keno, etc.) in the areas where BLM lands adjoin city limits. On a regular basis, personnel from the Klamath Falls Resource Area attend a ten month long Leadership Klamath training which gives participants an overview of the history, workings, and interrelationships of city and county government and reviews services and relationships to private, state, and federal agencies.

Tribes

The KFRA contacts the Klamath Tribes directly for coordination of many projects by presenting projects to the Tribal Council and by meeting bimonthly with the Klamath Tribes Culture and Heritage Department. The BLM is working with numerous tribes on FERC relicensing and development of the Klamath River Management Plan. Tribes are represented on the Southeast Oregon Provincial Interagency Executive Committee, which coordinates activities within the province.

Watershed Councils

There is ongoing participation with the Klamath Watershed Council and associated Working Groups. The BLM is represented on the Councils' Technical Advisory Committee and participates in cooperative activities that can benefit public lands. The council is active in coordinating watershed and water quality enhancement projects on private lands.

Upper Klamath Basin Working Group

The BLM is also involved in the Upper Klamath Basin Working Group. The working group was appointed by Senator Mark Hatfield in 1995 and authorized by Congress under the Oregon Resource Conservation Act. The senator's charge for the group was to identify short and long term solutions to issues in the Upper Klamath Basin. Specifically he asked the group to address:

- Ecosystem restoration and water quality
- Economic stability
- Reducing drought impacts

The working group was designed to be citizen-led. Two non-agency members serve as co-chairs. The membership totals 33, including representatives from — the Klamath Tribes (3 members), the city of Klamath Falls, Klamath County, Oregon State government (2 members), the Soil and Water Conservation district, Oregon Institute of Technology, the environmental community (4 members including a California representative with refuge interests), local businesses (4 members including the wood products industry and commercial and recreational fisheries), the ranching and farming community (4 members), and the local community (4 members). In addition, there are representatives from eight federal agencies – U.S. Fish and Wildlife Service, the Bureau of Reclamation, the Bureau of Land Management, the Bureau of Indian Affairs, the U.S. Forest Service, the Natural Resource Conservation Service, and the National Marine Fisheries Service. The working group meets regularly to address issues, and propose and seek out grants for projects that promote ecosystem restoration.

Chartered Advisory Groups

Klamath Provincial Advisory Committee

The purpose of the Klamath Provincial Advisory Committee (PAC) is to advise Federal agency representatives on implementation of the Record of Decision for Amendments to the Forest Service and Bureau of Land Management Planning Documents Within the Range of the Northern Spotted Owl (ROD) of April 13, 1994. The agencies represented make up the Provincial Interagency Executive Committee (PIEC) that facilitates the successful implementation of the ROD. The PIEC consists of representatives of some or all of the following Federal agencies: the Forest Service, Bureau of Land Management, Fish and Wildlife Service, National Marine Fisheries Service, Bureau of Indian Affairs, National Park Service, and Environmental Protection Agency. The PAC provides advice regarding implementation of a comprehensive ecosystem management strategy for Federal land within the Klamath province (from the Klamath Basin to the California coast). The PAC provides advice and recommendations to promote better integration of forest management activities among Federal and non-Federal entities to ensure that such activities are complementary.

Southeast Oregon Resource Advisory Council

The Council's objectives and scope are to provide representative citizen counsel and advice to the Bureau of Land Management (BLM) and the U.S.D.A. Forest Service (USFS) line managers concerning the planning and management of the public land and national forest resources located in whole or in part within the Vale, Burns, and Lakeview Districts of the BLM and the Fremont, Deschutes, Ochoco, and Malheur National Forests. The actual jurisdictional boundary includes the Middle Snake/Boise, Oregon Closed Basins, and Goose Lake Hydrologic Units, as described by the United States Geological Survey. This area includes most of Malheur, Harney, and Lake Counties and very small portions of Klamath, Deschutes, Crook, Grant, and Baker Counties. Although none of the resource area lands are within the boundaries of the RAC, project coordination occurs at the Lakeview District level.

Medford District Resource Advisory Committee

The BLM makes "Payments in Lieu of Taxes" and O&C Payments to states that in turn distribute the money to county governments. Public Law 106-393, the Secure Rural Schools and Community Self-Determination Act of 2000, signed October 30, 2000 established a new formula for calculating payments, which is based on selecting the highest three years in the eligibility period (1986-1999). The law also allows for annual increases in the payment based on Consumer Price Index information. Klamath County elected to receive payments under the new legislation. Beginning in Fiscal Year 2001 and continuing through 2007 payments are to be made based on historic O&C and CBWR payments to the counties. Proposals are submitted to the county by BLM and/or the public to fund projects on federal and/or private lands. The Medford District Resource Advisory Committee meets to evaluate and prioritize projects and distribute funding.

Other Local Coordination and Cooperation

Klamath-Lake Forest Health Partnership

A partnership was created in 1995 to promote forest health in Klamath and Lake Counties. This included private industrial and nonindustrial landowners, The Nature Conservancy, Chiloquin Visions in Progress, Klamath Ecosystem Education Partnership, consulting foresters, county, state, and federal agencies who work together on problem solving, sharing science and information, and providing assistance to small woodland owners. The KFRA is a member of this active partnership that meets monthly.

Klamath-Lake-Modoc-Siskiyou Outdoor Recreation Working Group

This working group was formed in 1991. This is a multi-county organization, which covers portions of southern Oregon and northern California. This working group provides a forum where private businesses, city, county, state, and federal agencies communicate, plan, and implement recreational and tourism activities. BLM is an active participant.

Major accomplishments have been the development of 19 outdoor recreation brochures, the construction of 50 highway rest stop displays in locations in California and Oregon, and developing tear-off sheet maps that highlight outdoor recreational activities and the Klamath Basin Birding Trail. The brochures and tear-off maps are used in motels, restaurants, and other businesses to promote outdoor recreation and tourism in the four-county area. Representatives from this group also meet quarterly with the county commissioners from each county to share information and receive new ideas.

Klamath Basin Water Adjudication Resolution Process

The Oregon Water Resources Department (OWRD) initiated the Klamath Basin Adjudication in 1975. The Klamath Adjudication is an Oregon general water claim adjudication in which the final decree will be issued by the Klamath County Circuit Court. All Adjudication claims were filed with the OWRD by April 1997. The Adjudication is the first Oregon general water adjudication in which complex federal claims have been filed.

Given the complexity of the Adjudication and other water allocation issues in the Klamath Basin, the OWRD has initiated a voluntary alternative dispute resolution process to provide a forum to address Adjudication claim issues and other matters related to water supply and demand in the Klamath Basin. The BLM is an active participant in the adjudication process.

Coordinated Resource Management Plans (CRMP)

Coordinated resource management planning involves resource owners, managers, users, and specialists, concurrently formulating and implementing plans for the management and use of all natural resources and ownerships within a specific area. The group established through the planning effort provides a forum to help resolve resource conflicts. The KFRA is involved in four Coordinated Resource Management Planning areas: the Yainax, Spencer Creek, Rock Creek and Gerber-Willow Valley areas.

Yainax CRMP

The Yainax Butte CRMP was originally completed in 1974 in conjunction with the United States Forest Service (USFS), Oregon Department of Fish and Wildlife (ODFW), Oregon Department of State Lands (ODSL), Oregon Department of Transportation (ODOT), Klamath County Extension Service, Natural Resource Conservation Service (NRCS), Weyerhaeuser, and the common grazing permittee. In 1993, the plan was completely revised with the same group of organizations and a new grazing permittee. The revised plan is still in effect and being followed by the current grazing permittee (different than in 1993) and the successor

to Weyerhaeuser - US Timberlands. The Yainax Butte CRMP addressed a myriad of issues including grazing, forestry, recreation, wildlife, T&E species, private land and cultural issues. The CRMP coordinates the management of the area to accomplish a broad range of resource goals and uses.

Spencer Creek CRMP

This CRMP was developed in 1990 and was updated in 1994. The planning group is made up of county, state, and federal agency personnel and private landowners who coordinate watershed enhancement and other projects within the Spencer Creek Watershed.

Rock Creek CRMP

The BLM's Rock Creek allotment is included in the broader Warm Springs Coordinated Allotment Management Plan. This plan was originally completed in 1983 with the Modoc National Forest (NF), Fremont National Forest, and the common permittee, and establishes resource objectives and institutes a grazing system to address the resource issues. The Warm Springs Coordinated Plan is in the process of being revised with the Modoc NF taking the lead, as they are the majority land administrator.

Gerber/Willow Valley CRMP

Development of this plan began in FY 2000. The first objective is to complete a joint watershed analysis on two 5th field watersheds (Gerber and Willow Valley) with BLM, Forest Service and private landowners participating. Federal agencies involved are the Klamath Falls Resource Area, Fremont National Forest, and Modoc National Forest (California). The watershed analysis was completed in FY 2003. Efforts to complete a coordinated resource management plan are on hold.

Pokegama Working Group

This working group was formed in 1991 to coordinate projects to improve habitat in big-game winter range and reduce harassment of wildlife during critical winter months. This group has been active in informing and educating the public of the critical habitat needs for deer and elk. Members of this group include US Timberlands, PacifiCorp, Oregon Department of Fish and Wildlife, and the BLM.

Intermountain West Joint Venture (IWJV)

The IWJV was formed in 1995 and covers eastern Oregon and parts of nine other western states. This group meets quarterly and has written an area plan with input by local Federal and State agencies, and private organizations to determine conditions of wetlands and identify opportunities to improve habitat. Oregon Wetlands Group hired a private consultant to write the plan that focuses on the Klamath Basin eco-region. This plan, as well as other eco-region plans within the ten western states, follows the guidelines outlined under the North American Wetlands Conservation Act of 1989. The representatives for the Klamath Basin eco-region are BLM, Ducks Unlimited, Oregon Department of Fish and Wildlife, U.S. Fish and Wildlife Service, Modoc National Forest, California Fish and Game, and Oregon Joint Venture. Wood River Wetland restoration is part of the completed plan.

Table 32.1 - Challenge Cost Share Fiscal Year 2006

| <u>Project Name</u> | <u>BLM Contribution</u> | <u>Partner Contributions</u> |
|---------------------------------------|-------------------------|------------------------------|
| Landbird Assessment - Klamath Basin | \$46,000 | \$25,000 |
| Northern Spotted Owl Telemetry Survey | \$60,000 | \$85,000 |
| TOTALS | \$106,000 | \$ 110,000 |

33.0 National Environmental Policy Act Analysis and Documentation

NEPA documentation

The review of the environmental effects of a proposed management action can occur in any of four ways: administrative determination, categorical exclusion, environmental assessment, or environmental impact statement.

An administrative determination is made when NEPA documentation previously prepared by the BLM fully covers a proposed action and no additional analysis is needed. This procedure is often used in conjunction with a plan conformance determination. If a proposed action is fully in conformance with actions specifically described in the RMP and analyzed in the RMP/FEIS or a subsequent environmental assessment, a plan conformance determination may be made and no additional analysis is needed. This determination is documented in a “*Documentation of Land Use Plan Conformance and NEPA Adequacy (DNA)*”.

Some projects may qualify for a categorical exclusion from further NEPA documentation. Numerous types of projects have been determined that the nature and scope of the proposed activities do not individually or cumulatively have significant environmental effects on the environment. Specific categories of projects may therefore be exempt from requirements to prepare an environmental analysis. Categorical exclusions (CX) are covered specifically by Department of Interior and BLM guidelines.

An environmental assessment (EA) is prepared to assess the effects of actions that are not exempt from NEPA, are not categorically excluded, and are not covered by an existing environmental document. An EA is prepared to determine if a proposed action or alternative will significantly affect the quality of the human environment. A Finding of No Significant Impact (FONSI) is prepared to document the determination that actions proposed will not create significant effects. Once the authorized officer (KFRA Field Manager) decides to implement actions proposed and analyzed in an environmental assessment, a decision record (DR) is prepared to document that decision.

Major proposals that could significantly affect the environment, and have not been previously analyzed through an environmental impact statement (EIS), require that an EIS be prepared. A Record of Decision (ROD) is prepared to document the decision of the authorized officer (Lakeview District Manager) to implement actions analyzed in the EIS.

In FY 2006, twenty-three categorical exclusions, thirteen Plan Conformance/Determinations of NEPA adequacy, and six environmental assessments were completed. The BLM did not participate as a cooperating agency on preparation of any draft EIS, final EIS, or Record of Decision in FY 2006. Table 33.1 shows the number of NEPA documents completed since FY 1995.

Table 33.1 - NEPA Analyses and Documentation Fiscal Year 2006

| | <u>FY 2006</u> | <u>FY 95-06</u> |
|--|----------------|-----------------|
| Categorical Exclusions | 23 | 270 |
| Plan Conformance and Determinations of NEPA Adequacy | 13 | 177 |
| Environmental Assessments/FONSI | 6 | 54 |
| Decision Records | 5 | 56 |
| Environmental Impact Statements | 0 | 1 |
| Activity Level Plans | 0 | --- |
| Record of Decision | 0 | 1 |
| Resource Management Plan Amendments | 0 | 1 |

Protests and Appeals

The Klamath Falls Resource Area received a protest involving a proposed timber sale late in FY 2005. In FY 2006, the KFRA provided a response to that protest which addressed each of the issues and explained why the authorized officer felt the original decision was not in error. No appeal was filed.

34.0 Plan Evaluations

Third Year Evaluation

Periodic evaluations of land use plans and environmental review procedures are required by the Bureau's planning regulations (43 Code of Federal Regulations (CFR), Part 1610.4-9) to determine the status of ongoing plan implementation, conformance and monitoring. The BLM performed a third year evaluation of implementation of the RMP. An executive summary of the resource area evaluation is available, free of charge, upon request, or is accessible "on-line" at the Klamath Falls Resource Area website: <http://www.or.blm.gov/Lakeview/kfra/index.htm>.

The third year evaluation of the Klamath Falls Resource Area Resource Management Plan by Oregon State Office staff has been completed. The purpose of the third year evaluation was to determine whether there is cause for an amendment or a revision to the resource management plan. This evaluation includes reviewing cumulative monitoring results and accomplishments, determining if the plan's goals or objectives are being met, determining whether goals and objectives were realistic and achievable in the first place, and determining whether changed circumstances or new information have altered activities or expected impacts. Evaluations are usually done after the third year of implementation under the RMP, but because of unforeseen problems, release of the third year evaluation for years 1995-1998 was delayed, and not released until 2001.

On July 31, 2001, the Oregon/Washington State Director, Bureau of Land Management (BLM), released the following findings based on the Third Year Plan Evaluation for the Lakeview District (Klamath Falls Resource Area).

"Based on this plan evaluation which included information through Fiscal Year 1998, I find that the Klamath Falls Resource Area RMP goals and objectives are being met or are likely to be met, and that the environmental consequences of the plan are similar to those anticipated in the RMP FEIS, and that there is no new information, as of September 30, 1998, that would substantively alter the RMP conclusions. Therefore, a plan amendment or plan revision of the RMP is not warranted. This document meets the requirements for a plan evaluation as provided in 43 CFR 1610.4-9."

Eighth Year Evaluation

A second formal Resource Management Plan evaluation was completed in fiscal year 2004. The evaluation served as a review of cumulative progress for the composite fiscal year period of 1995 through 2003 and assessed the progress of implementation and meeting the objectives of the RMP. The evaluation team found that 90-100% of planned RMP actions are being implemented, to fully meet plan objectives. The RMP/Record of Decision varies in program detail, but is fully adequate for the dominant programs with clearly established and described desired outcomes. Monitoring and planning update reports have documented staff effectiveness in making good progress towards achieving those desired outcomes.

The RMP decisions have been found to be correct since RMP approval, however, an EIS-level analysis, proposed to amend portions of the RMP to address Wild and Scenic River and Area of Critical Environmental Concern values for the Upper Klamath River is in progress.

In general, there are no major changes in the officially approved or adopted, natural resource related plans, programs and policies of Indian tribes, State or local governments or other federal agencies which would immediately affect the RMP. Where changes were made or are expected, the resource sections identify those opportunities for greater interagency or intergovernmental consistency.

Although supplemental data are continually being developed, there are no available new data or analyses that affect the existing plan's validity. Any new data can be incorporated through plan maintenance and used in ongoing implementation action decision making. RMP maintenance or amendments to incorporate new conservation strategies, recovery plans or management guidance for species will be needed as they become available. No unmet needs or new opportunities that can only be met through an RMP amendment or revision were identified. No critical or immediate new inventories are warranted, although some potential program or resource specific inventories or updating of data bases for the existing management situation would be recommended as part of any RMP revision. With a few potential exceptions, there were no identified new legal or policy mandates as a result of new statues, proclamations, executive orders or court orders not addressed in the plan which cannot be addressed through plan maintenance (e.g., newly listed streams with water quality issues) or considered and documented in ongoing implementation actions (e.g., adverse energy impacts). Local review of the revised National Fire Plan and Healthy Forests Restoration Act requirements could trigger some change in fuels management strategies in the Wildland Urban Interface, but would not require changes in the plan.

35.0 Plan Maintenance

The Klamath Falls Resource Area Management Plan Record of Decision was approved in June of 1995. Since that time, the Klamath Falls Resource Area has implemented the plan across the entire spectrum of resources and land use allocations. As the plan is implemented it sometimes becomes necessary to make minor changes, refinements or clarifications of the plan. Potential minor changes, refinements or clarifications in the plan may take the form of maintenance actions.

Maintenance actions respond to minor data changes and incorporation of activity plans. This maintenance is limited to further refining or documenting a previously approved decision incorporated in the plan. Plan maintenance will not result in expansion of the scope of resource uses or restrictions or change the terms, conditions and decisions of the approved resource management plan. Maintenance actions are not considered a plan amendment and do not require the formal public involvement and interagency coordination process undertaken for plan amendments.

Important plan maintenance will be documented in the Klamath Falls Resource Area Annual Program Summary and Monitoring Report. Examples of possible plan maintenance issues that would involve clarification may include the level of accuracy of measurements needed to establish riparian reserve widths, measurement of coarse woody debris, etc. Much of this type of clarification or refinement involves issues that have been examined by the Regional Ecosystem Office and contained in subsequent instruction memos from the BLM Oregon State Office. Depending on the issue, not all plan maintenance issues will necessarily be reviewed and coordinated with the Regional Ecosystem Office or Provincial Advisory Committee. Plan maintenance is described in the Klamath Falls Resource Area Management Plan Record of Decision.

Plan Maintenance for Fiscal Year 1995

- REO memorandum dated 10/13/94: Memo reviewing BLM's interpretation of Coarse Woody Debris requirements.

- REO Memorandum dated 3/22/95: Memo reviewing BLM site potential tree height determination.
- REO Memorandum dated 4/7/95: Clarifies access for key watersheds, how to meet S&G for no net increases in roads where third parties have access rights.
- REO Memorandum dated 7/5/95: Interagency memo exempting certain silvicultural activities from LSR assessment requirements.
- BLM IM OR-95-123, dated 7/5/95: Memo clarifying when watershed analysis is and is not required for activities in Riparian Reserves.
- REO Memorandum dated 7/24/95: Memo changing status of dwarf mistletoe in Table C-3 of the ROD.
- REO Memorandum dated 8/31/95: Memo on LSR boundary adjustments.

Plan Maintenance for Fiscal Year 1996

- REO Memorandum dated 12/15/95: Memo clarifying REO review of LSR assessments.
- Memo on protocols for Survey & Manage amphibians (BLM IB-OR-96-006, dated 3/19/96).
- REO Memorandum dated 4/26/96: Additional Guidance on LSR assessment reviews.
- REO Memorandum dated 6/11/96: Memo changing provisions regarding management of the lynx.
- Memo implementing Regional Ecosystem Office memo on management of lynx (BLM IM-OR-96-97, dated 6/28/96)
- Memo on plan maintenance (OR IB-OR-96-294, dated 7/5/96)
- REO Memorandum dated 7/9/96: Memo exempting certain commercial thinning projects in LSRs and MLSAs from REO review.
- Internal Memorandum No. OR-96-108 (dated July 26, 1996) instructed the Klamath Falls Resource Area to remove *Buxbaumia piperi*, a moss that was erroneously listed as a species considered at risk in the Northwest Forest plan. This removal was deemed necessary. *B. piperi* is not considered to be rare, therefore the standards and guidelines from the Northwest Forest Plan were applied in error.
- Memo on dwarf mistletoe (BLM IB-OR-95-443, dated 8/15/96)
- REO Memorandum dated 9/6/96: Draft memo limiting surveys for certain arthropods to southern range.
- REO Memorandum dated 9/30/96: Memo amending commercial thinning exemption in LSRs.

Plan Maintenance for Fiscal Year 1997

- BLM IM-OR-97-007, dated 11/1/96: Interagency Memo clarifying implementation of S&M component 2 species; contains definitions of S&G terms such as “ground disturbing” and “implemented”.
- Memo directing changes in surveys for arthropods (BLM IB-OR-97-045, dated 11/8/96).
- Memo on implementing Coarse Woody Debris Standard & Guide (BLM IB-OR-96-064, dated 11/19/96).
- Memorandum dated November 8, 1996: Northwest Forest Plan Record of Decision (ROD). The sentence “Understory and forest gap herbivores” (page 61) was changed to be specific to the south range.
- Northwest Forest Plan, Adjustments in the Great Gray Owl (GGO) Survey Protocol. These adjustments were recommended by the Research and Monitoring Committee subsequent to findings and recommendations of a science panel. The six recommendations for the 1997 survey season were incorporated into the May 12, 1995 version of the protocol. In addition, habitat occupancy are to be located in habitat with the highest likelihood of supporting nesting Great Gray Owls. Methods, locations, and timing of habitat occupancy surveys are at the discretion of the resource area. Among the recommendations is one acknowledging that, using the onset of snowmelt to determine the start of the survey season, may not allow completion of all four visits prior to May 15. However, there should still be a good faith effort put forth to complete the four visits between March 15 and May 15, even if they go past the specified time period. A total of six visits is still required. In southwestern

Oregon, some Great Gray Owls have been found below 3,000 feet elevation. Although not a requirement at this time, surveys below 3,000 feet (but otherwise according to protocol) will both assist in maintaining species viability and provide important data for evaluation of the GGO Record of Decision requirements. Field offices should assess which, if any, lower elevation locations would be priority areas to survey given the existing workload, staffing, and funding.

- In 1997, the Klamath Falls Resource Area developed some criteria to use to select the “16-25 large green trees per acre...” for retention in a harvest unit. As of 1997, the Klamath Falls Resource Area was still trying to determine which prescription/harvest unit this standard and guideline was intended for (Density Management, Regeneration Harvests, Commercial Thinnings, Patch Cut, etc.). (See 1999 Plan Maintenance for clarification).
- The 1997 APS stated: Klamath Falls Resource Area RMP, Timber Resources, Page 56, Unscheduled Harvests, 4th paragraph, “On the Westside, retain 16 to 25 large green trees per acre in harvest units”. This plan maintenance clarifies that harvest units, prescription units, and treatment units are the same thing. For each prescription unit, stand exams will be conducted to determine existing stand structure. Unit reports will show, by species: basal area, crown closure, and the average number of trees per acre by diameter class. The number of snags and amount of coarse woody debris will also be determined. A prescription unit average of at least 16 green trees from the larger size classes present within the unit will be retained. Criteria for retention will be:
 - Species:** Tree species naturally adapted to the site, especially those species presently under-represented (usually ponderosa pine, Douglas-fir, and sugar pine).
 - Condition:** Vigorous trees and other trees in any condition having special habitat characteristics. This mix, will ideally supply overstory structure, as well as a variety of a snags and logs in a various decay classes over an extended time period.
 - Size:** Trees from the larger size classes of a given unit. (The size and density of trees vary tremendously, however. The largest trees in some units do not exceed 14 inches DBH; others have many trees over 30 inches DBH).

Plan Maintenance for Fiscal Year 1998

- *Guidance on Implementation of the 15 percent retention Standard & Guideline:* Joint BLM/Forest Service final guidance, which incorporated the federal executives’ agreement, was issued on September 14, 1998, as BLM-Instruction Memorandum No. OR-98-100. The memorandum emphasizes terminology and intent related to the Standards and Guidelines, provides methods for completing the assessment for each fifth field watershed, dictates certain minimum documentation requirements, and established effective dates for implementation. This Instruction memorandum is adopted in its entirety as RMP clarification.
- *Survey Protocols for Survey and Manage Species:* Final protocols were issued during FY98 for Component 2 lichens, the fungus *Bridgeoporus nobillissimus*, terrestrial mollusks, and aquatic mollusks. These protocols are adopted in their entirety as RMP clarification.
 - Environmental Justice: Executive Order 12898 of February 11, 1994: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations directs all federal agencies to “...make achieving environmental justice part of its mission by identifying and addressing...disproportionately high and adverse human health or environmental effects of its programs, policies and activities.”
 - New projects with possible effects on minority populations and/or low-income populations will incorporate an analysis of Environmental Justice impacts to ensure any disproportionately high and adverse human health or environmental effects are identified and reduced to acceptable levels, if possible.
 - Copies of the Executive Order, the accompanying Memorandum for the Heads of All Departments and Agencies, and Council on Environmental Quality Guidance on Environmental Justice issued February 1998 can be requested from the Klamath Falls BLM office.

Plan Maintenance for Fiscal Year 1999

- Correction of numerous errors or updates to Appendix H - "Grazing Management and Rangeland Program Summary" of the KFRA ROD/RMP (pages H-1 through H-77).
 - Page H-5, Chase Mountain Allotment (0101); Page H-7, Edge Creek Allotment (0102) and Buck Mountain Allotment (0103); Page H-10, Dixie Allotment (0107); Page H-11, Dry Lake Allotment (0140); and H-13, Grubb Springs Allotment (0147). Under the "Constraints" sections, change "Weyerhaeuser Company" to "U.S. Timberlands, Inc.". This reflects the 1986 change in ownership for all of these private, intermingled lands.
 - Page H-26, JELD-WEN allotment (0824). Due to land exchanges, the "Public Acres" should be changed from 360 to 240. Also, the "Active Preference", "Total Preference", and "Total" under the "Grazing Administration Info (AUMs)" column should be changed from 36 to 24.
 - Page H-32, *Ketcham* allotment (0835). Name should be spelled **Ketcham**.
 - Page H-51, Campbell allotment (0878). "Suspended nonuse" should be 13 AUMs instead of 12; "Total Preference" should be 60 AUMs instead of 59.
 - Page H-56, Dry Prairie allotment (0885). "Exchange of Use" AUMs should be changed from 275 AUMs to the "30 AUMs permanent AUMs, although the total number is variably higher depending on private land leases in the Dry Prairie pasture".
- "Corrections of errors or updates to Klamath Falls Resource Area RMP Appendix H, Grazing Management....."
 - Page H-56, Dry Prairie allotment (0885). Under "Grazing Administration Info. (AUMs)" the "Active Preference" should be changed from 608 to 642 AUMs, and the "Suspended Nonuse" should be changed from 392 to 358 AUMs. This change reflects the transfer of state lands to public ownership in 1988 that was not previously reflected on the grazing permits.
- Additional information to the Grazing Management section of the ROD/RMP dealing with the recently implemented Standards for Rangeland Health.
 - KFRA ROD/RMP, Page 62-63, "Grazing Management", "Management Actions/ Direction", "General" section. The following should be added after the 5th paragraph (one on Standards and Guidelines): Recently (August 12, 1997), the "Standards for Rangeland Health and Guidelines for Livestock Grazing Management for Public lands Administered by the Bureau of Land Management in the States of Oregon and Washington" was implemented. This and related guidance requires that all grazing lands be assessed to see if the grazing use meets the 5 Standards for Rangeland Health. These standards address watershed function in uplands; watershed function in riparian areas; ecological processes; water quality; and native, threatened and endangered, and locally important species. This guidance will be effected in accordance with the KFRA's "Plan for the Implementation of Standards and Guidelines" dated October 29, 1998 (available upon request).
- Additional support for the Appropriate Management Level (AML) of 30-50 head for the Pokegama Herd Management Area (HMA).
 - KFRA ROD/RMP, Page 64, "Wild Horse Management", "Management Actions/ Directions" section. Additional support information should be added after the second paragraph as follows:
 - The Lakeview District Wild Horse Gather Environmental Assessment (OR-010-95-10) and the Topsy-Pokegama Landscape Analysis (July 1996) both affirmed that the wild horse herd should be kept within the 30-50 head AML as proposed in the ROD/RMP. This level is necessary to "...ensure a thriving natural ecological balance... and protect the range from deterioration associated with overpopulation" as stated in this plans objectives for Wild Horse Management and required by the Wild Free-Roaming Horse and Burro Act of 1971. 20 head were removed from the HMA in 1996 in order to get the herd number down within the AML.
- Klamath Falls Resource Management Plan, Appendix K, Water and Soils, Page K-8, Implementation Monitoring Question #12 is not stated correctly. Add the word "coordinated" before the word "watershed-based". Thus, the first part of the question should read: "What is the status of cooperation with other agencies in the development of coordinated watershed-based Research Management Plans and other cooperative agreements

- to meet Aquatic Conservation Strategy Objectives?”
- In the RMP dated June 1995, The section on energy and minerals refers to restrictions listed in appendix “G” located in volume II of the Final KFRA RMP & EIS. **This should refer to appendix “K” in Volume II.**
 - Appendix “G”, pages 12-13 in the Final KFRA RMP/ROD, dated September 1994, failed to give exact distant measurement for the buffers associated with the timing limitations for bald and golden eagles, osprey and sage grouse leks. **The sentence should read** “ Surface occupancy and use is prohibited . . . , within 1/4 mile of known . . . sites.
 - Appendix G, KFRA/ROD, pages 12 and 13 **Add:** Timing Limitation, Resource: Wildlife - Northern Spotted Owl, Stipulation: Surface occupancy and use is prohibited from March 1 to August 15, within 1/4 mile of known Northern Spotted Owl nest sites and nesting habitat.
 - In same document and same appendix on page G-15, the controlled surface use for the Upper Klamath River - segment 2 should also state “1/4” mile.
 - Change in specific provisions regarding management of the great gray owl. The NFP Record of Decision page C-21; Klamath Falls Resource Area RMP Record of Decision pages 39-40.
 - The NFP states the following with regard to management: “Specific mitigation measures for the great gray owl, within the range of the northern spotted owl, include the following: provide a no-harvest buffer of 300 feet around meadows and natural openings.....”
 - For the Topsy/Pokegama Landscape Analysis Area, the Klamath Falls Resource Area wrote a Late Successional Reserve Assessment (LSRA) which addressed a variety of habitat manipulations for the long-term enhancement of great gray owl nesting habitat within the 300-foot buffers required around meadows and natural openings. These habitat manipulations were proposed in areas where the following conditions are present: 1) marginally suitable as great gray owl habitat, 2) at risk of decline to the point where suitable nesting habitat conditions are unattainable in the long-term, and 3) at risk due to poor forest health conditions including high fuel loads and/or overstocking.
 - As a result of discussions in 1999 between members of the Regional Ecosystem Office Team and the Klamath Falls Resource Area Staff, meadows and natural openings would be buffered only in cases where it has been determined the area is “occupied” by great gray owls. Occupancy is defined in the May 12, 1995, great gray owl survey protocol. Forested areas adjacent to meadows and natural openings would receive 300-foot buffers within approximately two miles from activity centers of sites occupied by great gray owls.
 - A Memorandum from the Executive Director to the State Director dated August 4, 1999, served as documentation of the Regional Ecosystem Office’s (REO) review of the Late Successional Reserve Assessment and finding that the LSRA provides a sufficient framework and context for future management activities within the 300-foot meadow buffers in the Topsy/Pokegama Landscape Analysis Area.
 - On pages 23, 33 & 56 of the KFRA RMP, for Westside Matrix lands, Management Actions / Directions states:
“Retain 16 to 25 large green trees per acre where available.”
To be consistent with the Medford RMP, Chapter 2-21, the KFRA will change the wording in the KFRA RMP to read:
“Retain at least 16 to 25 large! green trees per acre in regeneration harvest units.”

Rationale for change:

The proposed change will help clarify when the KFRA must meet the 16-25 standard and guide (S&G). It was noted during the 3rd year evaluation that there was a difference in the wording and subsequent interpretation between the Medford District and the KFRA RMPs relating to this S&G. The Medford District applies this S&G to regeneration harvest units only. The word “regeneration” was left out of the KFRA RMP. Subsequently, KFRA personnel interpreted this S&G to be applied to all types of harvest units including density management harvests. The KFRA has completed four density management harvests to date and posttreatment stand exam data indicates that over 200 trees per acre are being retained including the larger and more vigorous trees. BLM Managers feel that this S&G is not applicable nor was it intended for density management harvests and should only be applied to regeneration harvest units as defined in the Medford RMP. Presently, the KFRA has not

implemented any regeneration harvests. The 16 to 25 tree S&G in regeneration harvest units should be sufficient to meet the intended objectives of structural retention for both a legacy component as well as serve as a shelterwood for the understory component. In addition, this change will align with how these stands were initially modeled.

- On pages 23, of the KFRA RMP, for Westside Matrix lands, Management Actions / Directions states: *“When an area is regeneration harvested, limit patch size to 3 acres.”* The above sentence erroneously includes the word “regeneration” where “density management” was intended. The KFRA will modify the patch cut size limit from 3 acres to 5 acres. The limit on patch cuts to 15% or less of the density management harvest area, which was intended, and was used in modeling, was not mentioned in the RMP. Therefore, the correct wording for this maintenance should be modified to read:

“Patch cuts within a density management unit are limited to 5 acres in size and to no more than 15% of the density management treatment area.”

Rationale for Change:

A clarification is needed between patch cuts and regeneration harvests. Patch cuts are small openings in relatively large density management units. The primary objective of cutting small patches/openings is to regenerate under-represented species in the stand; normally pines and Douglas-fir. Due to past harvesting practices and fire suppression, the species composition of stands has trended from shade intolerant species (pines and Douglas-fir) towards stands dominated by tolerant species (white fir). On page E-10 (Appendix E) of the RMP, Table E-1 lists the “Desired Species Composition (by percent conifer basal area)” for the South General Forest Management Area (SGFMA). The RMP states on page E-10 that the KFRA is to “Manage so that trees species over time trend toward ...” these composition levels. One of primary reasons for this objective is to improve the resiliency of the stands to natural disturbances (insects, disease, and fire). The small patch cuts are one of the prescriptions the KFRA is using to meet the species composition objective.

The amount of patch cuts that can be implemented in a density management unit is not changing. The limit, as modeled, has always been and will remain up to 15% of the unit. However, because the 15% limit has never been documented, it was necessary to add that statement as well. The size is increasing from 3 acres to 5 acres to insure that sufficient sunlight is reaching the younger seedlings and is not impacted by the shade from the patch cut edge. To date, approximately 72 acres (2.3%) of 3072 acres of density management treatments have received patch cuts.

- **Clarification of What a Regeneration Harvest Is, and the Constraints Involved When Implementing.**

A regeneration harvest is a silvicultural system discussed in a number of places in the RMP. The partial objective of regeneration harvests (See Glossary, page 6-14, Vol. 1 of the FEIS) is to open “a forest stand to the point where favored tree species will be reestablished.”

There are two constraints to regeneration harvests. The first is mentioned in Appendix E, page E-10 of the RMP that states, “Regeneration harvests would not be programmed for stands under 120 years of age and generally would not be programmed for stands under 150 years of age within the next decade unless required by deteriorating stand condition, disease, or other factors that threaten the integrity of the stand.” The second constraint relates to the Plan Maintenance items mentioned above that states; retain at least 16 to 25 large green trees per acre in regeneration harvest units. The KFRA projected 131 acres of regeneration harvests on the Westside and 33 acres on the Eastside. To date, no regeneration harvests have been implemented due to placing priority on mortality salvage sales.

- **Clarification of Snag Classification**

During a timber sale review in KFRA in fiscal year 1999, the initial posttreatment stand exam data indicated that not enough Class 1 & 2 snags were retained. The stand exam data was surprising because many snags were intentionally marked for removal as required in

the silvicultural prescription due to an already abundant down fuels load and snags at the time of marking. A review of the posttreatment stand exam data revealed that a snag was only classified as Class 1 or 2 if it had just died and/or still had red needles on it (1-2 years old). All other snags were classified as Class 3, 4, or 5. The KFRA determined that it needed a standardized format for classifying snags. The BLM Forest Survey Handbook, BLM Manual Supplement 5250-1, pages IV-10 to IV-12 was reviewed to determine if it was sufficient for classifying snags. The handbook provides both pictures and descriptions of the different snag categories. The KFRA concluded that the handbook would be sufficient for classifying snags for future monitoring purposes.

Plan Maintenance for Fiscal Year 2000

- **Page I-7, KFRA RMP, Appendix I - Land Tenure,**

Delete: Remove the following lands from Land Tenure Zone 3 and place them into Land Tenure Zone 1.

T.36 S., R.15 E. W.M.; Sec. 28 (all); Sec. 32 (all).

Rational for Change: The presence of the endangered species, cinder pit, and wetlands associated with Campbell Reservoir on the public lands preclude the BLM from making the finding that the resource values on the federal land are less than the resource values of the private land.

- Page #_C-44, Last Paragraph, Line # 2 (Also found on other pages) of **Record of Decision for Amendments to Forest Service and Bureau of Land Management Planning documents Within the Range of the Northern Spotted Owl Standards and Guidelines for Management of Habitat for Late-Successional and Old-Growth Forest Related Species Within the Range of the Northern Spotted Owl.**

“Provide for retention of old-growth fragments in watersheds where little remains.”

“Landscape areas where little late-successional forest persists should be managed to retain late-successional patches. This standard will be applied to fifth field watersheds (20-200 square miles) in which federal forest lands are currently comprised of 15 percent or less late-successional forest.”

- Pages 51-52, **KFRA RMP, Off-Highway Vehicles**

Add:

- To allow off-highway vehicles to use BLM/Klamath Falls Resource Area roads when weather conditions are such that damage to roads will not occur, or to use roads that will not impact threatened, endangered, or sensitive plant, animal, or fish species.
- To prevent off-highway vehicles from using BLM/Klamath Falls Resource Area roads by extending the seasonal closure when weather conditions are such that damage to roads will occur, or to prevent use of roads that will impact threatened, endangered or sensitive plant, animal, or fish species.

Before either scenario is implemented, the proposal must be reviewed by the Klamath Falls Resource Area Interdisciplinary Team (ID Team). The ID Team will make a recommendation to the Klamath Falls Field Manager to open the road or to extend the closure. The Field Manager will consider the ID Team’s recommendation and make a decision on that recommendation.

A decision to extend the closure must be accompanied by publishing a Notice of Emergency Closure in the Federal Register according to the regulations found at 43 CFR 8364.1.

Rational for Change: The Plan Maintenance provides a mechanism to close a road prior to November 1st or to extend the closure past April 15th, if conditions warrant it. The same mechanism would be used to delay closing a road past the November 1st date or to open a road prior to April 15, if conditions warrant it.

Plan Maintenance for Fiscal Year 2002

Change of RMP Evaluation Interval to Five Years

The RMP, in the Use of the Completed Plan section, established a three year interval for conducting plan evaluations. The purpose of a plan evaluation is to determine if there is significant new information and or changed circumstance to warrant amendment or revision of the plan. The ecosystem approach of the RMP is based on long term management actions to achieve multiple resource objectives including; habitat development, species protection, and commodity outputs. The relatively short three year cycle has been found to be inappropriate for determining if long term goals and objectives will be met. A five year interval is more appropriate given the resource management actions and decisions identified in the RMP. The Annual Program Summaries and Monitoring Reports continue to provide the cumulative RMP accomplishments. Changes to the RMP continue through appropriate amendments and plan maintenance actions. A five year interval for conducting evaluations is consistent with the BLM planning regulations as revised in November 2000. The State Director decision to change the evaluation interval from three years to five years was made on March 8, 2002. The next evaluation of the Klamath Falls Resource Area RMP will address implementation through September 2008.

36.0 Plan Amendments and Revisions

Plan Amendment for Unintentional Encroachments - May 1999

- An amendment to the RMP on Unintentional Encroachments and Survey Hiatuses was completed in FY 99. The plan amendment allowed a 1.62-acre tract of land to be moved from Land Tenure Zone 1 to Land Tenure Zone 3, which allows for sale. The amendment added the provision to the RMP Land Tenure Adjustment - Management Actions/Direction for All Land Use Allocations section:
 - *“Where survey hiatuses and unintentional encroachments on public lands are discovered in the future that meet disposal criteria, the lands may be automatically assigned to Zone 3 for disposal.”*

Plan Amendment for Survey and Manage Program - January 2001

Amendment to the Northwest Forest Plan

The Survey and Manage mitigation in the Northwest Forest Plan was amended in January 2001 through the signing of the Record of Decision (ROD) for the “Final Supplemental Environmental Impact Statement for Amendment to the Survey and Manage, Protection Buffer, and other Mitigation Measures Standards and Guidelines.” This January 2001 Record of Decision amended a portion of the Northwest Forest Plan by adopting new standards and guidelines for Survey and Manage, Protection Buffers, and other mitigating measures. The ROD selects, with additional mitigation and minor modifications, Alternative 1 in the November 2000 Final Supplemental Environmental Impact Statement for Survey and Manage, Protection Buffers, and other Mitigation Measures in the Northwest Forest Plan (Final SEIS). The ROD made it possible for the Agencies to more efficiently provide the level of species protection intended in the Northwest Forest Plan. The ROD retained the major elements of Survey and Manage, restructuring them for clarity, describing criteria and processes for changing species assignments in the future, and removing 72 species in

all or part of their range because new information indicates they are secure or otherwise do not meet the basic criteria for Survey and Manage. The Decision applies to administrative units of the USDA Forest Service and USDI Bureau of Land Management (BLM) (generally referred to as “the Agencies”) within the range of the northern spotted owl.

Although this ROD continues to use the popular and inclusive title of “Northwest Forest Plan” to denote what is being amended, readers need to recognize there is no one such “Plan.” The phrase denotes the April 13, 1994, amendments to all existing land and resource management plans for the U.S. Bureau of Land Management and U.S. Forest Service within the range of the northern spotted owl relating to management of habitat for late-successional and old-growth forest related species, as well as to the Regional Guides for Forest Service Regions 5 and 6, as listed below. The ROD amended a portion of those previous amendments, the standards and guidelines relating to Survey and Manage, Protection Buffers, and three other mitigation measures. The administrative units whose Plans were amended by this Decision are generally located in western Oregon and Washington (including some areas east of the Cascades) and northwestern California. The amended Resource Management Plans are for the Salem, Eugene, Roseburg, Medford, and Coos Bay Districts in Oregon; the Klamath Falls Resource Area of the Lakeview District, also in Oregon; and the Arcata, Redding, and Ukiah field offices in California. The King Range National Conservation Area Management Plan in the Arcata Resource Area in California is also amended.

Copies of the ROD and Final SEIS may be obtained by writing the Regional Ecosystem Office at P.O. Box 3623, Portland, Oregon 97208, or may be accessed at: <http://www.or.blm.gov/nwfp/nepa>

Plan Amendment for Survey and Manage Program - March 2003

Survey and Manage Annual Species Review

The 2001 Record of Decision added a process called the Annual Species Review to change in category and add or drop species from the Survey and Manage list. This process allows for adaptive management of species based on new information. In March of 2003 the Annual Species Review was released reducing the number of species requiring Survey and Manage mitigation from 317 to 304. Reference Table 1-1 of the 2002 ASR for a complete listing. Table 35.1 shows a break down of the placement of these species and a brief description of management actions required for each.

Table 36.1 - Redefined Survey and Manage Categories

| <u>Relative Rarity</u> | <u>Pre-Disturbance Surveys Practical</u> | <u>Pre-Disturbance Surveys Not Practical</u> | <u>Status Undetermined Pre-disturbance Surveys Not Practical</u> |
|------------------------|--|--|---|
| Rare | Category A - 53 species • Manage All Known Sites • Pre-Disturbance Surveys • Strategic Surveys | Category B - 182 species • Manage All Known Sites • N/A • Strategic Surveys | Category E - 17 species • Manage All Known Sites • N/A • Strategic Surveys |
| Uncommon | Category C - 3 species • Manage High-Priority Sites • Pre-Disturbance Surveys • Strategic Surveys | Category D - 12 species ¹ • Manage High-Priority Sites • N/A • Strategic Surveys | Category F - 8 species • N/A • N/A • Strategic Surveys |

¹ Includes three species for which pre-disturbance surveys are not necessary

Plan Amendment for Aquatic Conservation Strategy - October 2003

In October, 2003 the Under Secretary of Agriculture for Natural Resources and the Environment and the Assistant Secretary of the Interior for Land and Minerals Management, amended the 1994 Northwest Forest Plan to clarify provisions relating to the Aquatic Conservation Strategy (ACS). The Northwest Forest Plan is formally known as the Record of Decision for Amendments to Forest Service and Bureau of Land Management Planning Documents within the Range of the Northern Spotted Owl (April 13, 1994). The Northwest Forest Plan amended agency resource management plans throughout the range of the Northern Spotted Owl. This decision amended Resource Management Plans (RMPs) for seven Bureau of Land Management (BLM) Districts including the Klamath Falls Resource Area Resource Management Plan and also amended Land and Resource Management Plans for 19 National Forests. The decision clarified the proper spatial and temporal scale for evaluating progress toward attainment of ACS objectives and clarified that no project-level finding of consistency with the ACS objectives is required.

The ACS is intended to maintain and restore the ecological health of watersheds and aquatic ecosystems within the Northwest Forest Plan area. The April 13, 1994 Record of Decision (1994 ROD) identifies the nine objectives of the ACS. Page B-10 of the 1994 ROD includes language that had been incorrectly interpreted. This language had been interpreted to mean that decision makers must evaluate proposed site-specific projects for consistency with all of the ACS objectives, and that a project cannot be approved if it has adverse short-term effects, even if the ACS objectives could be met at the fifth-field or larger scale over the long term. However, the ACS objectives were never intended to be applied or achieved at the site-specific (project) scale or in the short term; rather, they were intended to be applied and achieved at the fifth-field watershed and larger scales, and over a period of decades or longer rather than in the short-term. Indeed, failing to implement projects due to short-term adverse effects may frustrate the achievement of the goals of the ACS. The decision specifically reinforces the principle that projects must be considered in a long-term, fifth-field watershed or larger scale to determine the context for project planning and National Environmental Policy Act (NEPA) effects analysis.

The decision amended existing agency resource management plans in order to clarify project requirements with regard to the ACS but did not authorize any specific actions. It was a non-significant amendment under the National Forest Management Act. Project requirements related to Watershed Analysis, Endangered Species Act consultation, and NEPA will not change as a result of this decision. This decision does not assign or otherwise estimate Probable Sale Quantity (PSQ) for individual administrative units or for the Northwest Forest Plan as a whole.

Plan Amendment for Survey and Manage Program - March 2004

The Survey and Manage mitigation in the Northwest Forest Plan was amended in March 2004 through the signing of the Record of Decision (ROD) for the "Final Supplemental Environmental Impact Statement to Remove or Modify the Survey and Manage Mitigation Measure Standards and Guidelines." The intent of the amendment was to "conserve rare and little known species, reduce cost and effort and allow for achievement of healthy forests and timber outputs." The ROD removes the Survey and Manage Mitigation Standards Guidelines from the Northwest Forest Plan. The ROD states that this action will:

1. Continue to provide for diversity of plant and animal communities in accordance with the National Forest Management Act and conserve rare and little known species that may be at risk of becoming listed under the Endangered Species Act.
2. Reduce the Agencies' cost, time and effort associated with rare and little known species conservation.

3. Restore the Agencies' ability to achieve Northwest Forest Plan resource management goals and predicted timber outputs.

This decision does not eliminate the portion of the Survey and Manage Mitigations for certain cavity nesting birds, some bat roosts, and Canadian Lynx. Former Survey and Manage requirements regarding survey protocols, buffer requirements, and management of known sites will no longer apply. Some of the species that were formerly Survey and Manage are already listed as Special Status Species. The Forest Service and Bureau of Land Management's Special Status species programs will consider additional species for listing under their respective programs. Information Bulletin No. OR-2004-145 implemented special status species guidelines for former Survey and Manage species for the BLM.

For the BLM, this Decision amended the Resource Management Plans for the Salem, Eugene, Roseburg, Medford, and Coos Bay Districts in Oregon; the Klamath Falls Resource Area of the Lakeview District, also in Oregon; and the Arcata, Redding, and Ukiah field offices in California. The King Range National Conservation Area Management Plan in the Arcata Resource Area in California is also amended. Copies of the ROD and Final SEIS may be obtained by writing the Regional Ecosystem Office at P.O. Box 3623, Portland, Oregon 97208, or may be accessed at: <http://www.or.blm.gov/nwfp/nepa>

Survey and Manage Program Update - FY 2006

On August 1, 2005, the U.S. District Court order in Northwest Ecosystem Alliance et al. v. Rey et al. found portions of the Final Supplemental Environmental Impact Statement to Remove or Modify the Survey and Manage Mitigation Measure Standards and Guidelines (January, 2004) (EIS) to be inadequate. A subsequent order on January 9, 2006:

- set aside the 2004 Record of Decision To Remove or Modify the Survey and Manage Mitigation Measure Standards and Guidelines in Forest Service and Bureau of Land Management Planning Documents Within the Range of the Northern spotted Owl (March, 2004) (2004 ROD) and
- reinstated the 2001 Record of Decision and Standards and Guidelines for Amendments to the Survey and Manage, Protection Buffer, and other Mitigation Measure Standards and Guidelines (January, 2001) (2001 ROD), including any amendments or modifications in effect as of March 21, 2004.

The Survey and Manage program is currently being implemented according to direction specified in Instruction Memorandum OR-2006-029.

Plan Revision

Based on the August 2003 Settlement Agreement with the American Forest Resource Council, and the Association of O&C Counties the BLM is required to revise the six existing Resource Management Plans in western Oregon, including the Klamath Falls Resource Area RMP. In FY 2004, the BLM in western Oregon began the Resource Management Plan revisions.

In FY 2005, the Analysis of the Management Situation (AMS) was prepared to assist managers in the formulation of alternatives and contains information relevant to subsequent development of the affected environment chapter in the RMP environmental impact statement.

In February of 2006, the team prepared the Scoping Report and the Proposed Planning Criteria and State Director Guidance and released them for public review. In addition three newsletters were prepared and sent to the public mailing list with over 1,600 people. These newsletters were:

Newsletter Issue #2 (December 2005) - Summary of the Analysis of Management Situation

Newsletter Issue #3 (February 2006) - Scoping Report, Planning Criteria, and ACEC Nominations

Newsletter Issue #4 (April 2006) - Summary of Public Review of Planning Criteria & Use of Science in Plan Revisions

Copies of these documents are available on the Western Oregon Plan Revision web site: <http://www.blm.gov/or/plans/wopr/index.htm>.

KLAMATH FALLS RESOURCE AREA

MONITORING REPORT

Fiscal Year 2006

KLAMATH FALLS RESOURCE AREA RESOURCE MANAGEMENT PLAN MONITORING REPORT

Introduction

This document represents the eleventh year monitoring report of the Klamath Falls Resource Area Resource Management Plan since the Record of Decision was signed in June 1995. This monitoring report compiles the results and findings of implementation monitoring for fiscal years 1996-2006. This report does not include all the monitoring conducted by the Klamath Falls Resource Area that is identified in activity or project plans. Monitoring at multiple levels and scales, along with coordination with other BLM and Forest Service units, has been initiated through the Regional Interagency Executive Committee (RIEC).

Fiscal Year 1996-2006 Monitoring Summary

The Resource Management Plan monitoring effort for Fiscal Years 1996-2006 addressed the 88 implementation questions relating to the 21 land use allocations and resource programs contained in the Monitoring Plan. There are 54 effectiveness and validation questions included in the Monitoring Plan. The effectiveness and validation questions were not addressed because some time is required to elapse after management actions are implemented in order to evaluate results that would provide answers.

Findings

Monitoring results found full compliance with management action/direction in the 21 land use allocations and resource programs identified for monitoring as well as the 88 implementation monitoring questions contained in the plan.

Recommendations

No implementation or management adjustments are recommended, as Fiscal Year 1996-2006 monitoring results indicate very high compliance with management action/direction.

Conclusions

Analysis of the Fiscal Years 1996-2006 monitoring results concludes that the Klamath Falls Resource Area has almost 100% compliance with management action/direction, and therefore no major changes in management direction or resource Management Plan implementation is warranted at this time. The results indicate a continuing conscientious implementation of the plan by informed and knowledgeable staff and managers.

Fiscal Year 2006 Monitoring

Introduction

The following information represents the tenth monitoring report of the Klamath Falls Resource Area Resource Management Plan for which the Record of Decision was signed in June 1995. This monitoring report compiles the results and findings of implementation monitoring of the tenth full fiscal year of implementation of the RMP, fiscal year 2006. Tables M-1 and M-2 provide a summary of the projects monitored and the selection categories respectively.

This report does not include the monitoring conducted by the Klamath Falls Resource Area that is identified in activity or project plans. Monitoring at multiple levels and scales along with coordination with other BLM and Forest Service units has been initiated through the Regional Interagency Executive Committee (RIEC).

Table M.1 - Projects Monitored FY 2006

| <u>Project Type</u> | <u>Number and/or Names of Projects Monitored</u> |
|-------------------------------------|---|
| Timber Sales | Muddy Tom TS (soils), Gerber Stew Stewardship Contract (Norcross Springs Area and Chase Mountain Section 5), Thin Sheep TS (pre-treatment data), Baldy Salvage TS (snag data), Walter’s Cabin TS (canopy closure data) |
| Silviculture Treatments | Forest Development Projects: restoration thinning, precommercial thinning, pruning, site preparation, tree and bitterbrush planting, reforestation surveys, maintenance/ protection of stands |
| Fish Habitat Improvement | Sucker population studies (Gerber Reservoir, Dry Prairie, Horsefly, and Pitchlog Grazing Allotments); Population monitoring by ODFW after the Willow Valley Reservoir Fish Habitat Enhancement project |
| Riparian Habitat Improvement | Post-treatment riparian monitoring photo points in Spencer Creek and Grenada West riparian thins; post-treatment monitoring of juniper treatments assessing riparian vegetation and soils in the Norcross Springs project area; and vegetation monitoring at Caseview Springs. |
| Wetland Water Quality | Temperature monitoring in Wood River and Agency Lake |
| Wildlife | Wood River Wetland - Oregon spotted frogs, waterfowl brood counts, and neotropical landbirds Remainder of the Resource Area - Four western sage grouse historic leks, four peregrine falcon potential nest areas, four areas in South Gerber for bats as part of the Oregon Bat grid, 10 osprey nests , neotropical landbird monitoring; 15 Northern spotted owl nest territories; 23 bald eagle nest territories and four mid-winter trend routes; the Buck Lake Spotted Frog site 10 Northern Goshawk nest territories, and five golden eagle nest territories |
| Prescribed Burns | Baldy Crest, Keno 5, Ben Hall, Big Adobe East, Brady Butte |
| Grazing Projects | 16 existing improvements (fences, spring improvements) and 62 grazing allotments (studies and use supervision) |
| Water & Soil Projects | Monitoring of spring flow in the Gerber Block; soil monitoring on Norcross Stewardship; Ben Hall Creek bank erosion monitoring; road sediment trap monitoring and maintenance in the Gerber watershed and sediment trap maintenance in the Spencer Creek watershed; water temperature monitoring in the Gerber watershed, Klamath River, Spencer Creek, Johnson Creek, and 4-mile Creek; riparian photo points throughout the resource area, and monitoring by USGS of water quality and quantity at Wood River Wetland. Pitch Log Creek bank profile monitoring. Spencer Creek Culvert placement, a Title 2 Project, was implemented where Spencer Creek flows under the Spencer Creek Hookup Road. Spencer Creek Culvert placement monitoring prior, during and post implementation. Relicensing of the J.C. Boyle power plant Klamath Hydroelectric Project (FERC) - mapping riparian vegetation along the Klamath River in order to aid in the FERC process |
| Juniper Projects | Norcross Springs, Alkalai Spring (43 acres), Bug Spring (21 acres), East Fork Spring (17 acres), Campbell Reservoir (10 acres), South Bly WUI, and Caseview Springs |

Table M.2 - FY 2006 Implementation Monitoring Selection Categories

| Selection Categories | # of Projects | # Monitored | % Monitored |
|--|----------------------|--------------------|--------------------|
| Ground-Disturbing Activities (other than timber sales) | 18 | 16 | 89% |
| Grazing Allotments | 95 | 62* | 65% |
| Projects in Riparian Reserves | 7 | 3 | 43% |
| Removing Structures within Riparian Reserves | 0 | 0 | N/A |
| Projects in Late Successional Reserves | 0 | 0 | N/A |
| Timber Sales in Watersheds With <15% Late Success. Forest | 0 | 0 | N/A |
| Timber Sales (Harvesting completed) | 3 | 2 | 50% |
| Juniper Projects | 16 | 4 | 25% |
| Projects Within or Adjacent to Special Areas | 2 | 2 | 100% |
| Projects That Include or are Adjacent to Special Habitats | 3 | 3 | 100% |
| Projects in VRM II or III Areas | 4 | 4 | 100% |
| Projects Within or Adjacent to Wild & Scenic River Corridors | 0 | 0 | N/A |
| Projects in Rural Interface (prescribed fire) | 2 | 2 | 100% |
| Noxious Weed Project (sites) | 273 | 52 | 19% |
| Prescribed Burn Projects | 8 | 2 | 25% |
| Projects That Required Dust Abatement | 0 | 0 | N/A |

Note: Minimum monitoring requirement in each listed category is 20%. The district exceeded the minimums in numerous categories, primarily due to overlapping applicability (many projects meet several criteria in above table).

* Includes one or more of the following monitoring studies or activities: utilization, use supervision, condition, trend, actual use, photo points, range/riparian studies.

Discussion of Discrepancies**Timber Harvest Acres - Discrepancies from the RMP:**

Table M-3 compares projected volume and acres to actual volume and acres harvested to date. On the Westside, 68.67 MMBF (97 percent of assumed annual average) has been sold on approximately 20,070 acres. On the Eastside, 6.72 MMBF (140 percent of the assumed annual average) as been offered (not sold) on approximately 3,952 acres. The Adobe East Timber Sale was offered in 2005 but received no bids. It was reoffered in 2006 and sold, awarded and approved. While the total volumes harvested are in line with the RMP, the number of acres yielding that volume was higher than predicted. A combination of factors has contributed to this discrepancy. Regeneration harvests were expected to result in higher yields per acre than other treatments. Only 227 acres of regeneration harvests have been implemented to date on the Westside and none on the Eastside. Under the RMP, regeneration harvest was planned for approximately 131 acres per year on the Westside (1,572 acres in twelve years) and 36 acres annually on the Eastside (396 acres in twelve years). In lieu of regeneration harvests, approximately 28 percent of the volume to date has come from mortality salvage sales. Typically, mortality salvage harvests consist of removing less volume per acre but treating more acres than regeneration harvests.

In FY 2006, 4.57 million board feet (MMBF) was offered. This represents approximately 72% of the 6.31 MMBF allowable sale quantity for both the Eastside and Westside lands. Cumulative information on timber harvest acres, volumes, and harvest types since the beginning of the RMP are provided in Table M-4. Except for the District declared Allowable Sale Quantity, projections made in the RMP are not intended as management action/direction, but rather are underlying RMP assumptions. Projected levels of activities are the approximate level expected to support the Allowable Sale Quantity.

Unresolved litigation, and uncompleted strategic surveys under Survey and Manage limited the ability to offer timber sales at the levels anticipated by the RMPs during Fiscal Year 2001 and in some prior years. The KFRA has been able to make up the shortfall in volume sold in previous years. The KFRA is presently working on revising the Resource Management Plan which will include reassessing all the assumptions that go into generating an Allowable Sale

Quantity. It is anticipated that the revised RMP will be completed in 2008. The KFRA will continue to implement the present RMP Allowable Sale Quantity until the revised RMP is signed.

Wildlife Discrepancies:

As part of the RMP, it was planned to treat 1/4 of the brushfields in each allotment during a decade. Treatment, in this case, meant returning the brushfield to an early seral state or rejuvenating it through extensive use of mechanical, manual or fire treatments. The acre figures noted in the Grazing EIS were based on 1/4 of the acres of identified mature brushfield in each allotment. Since the RMP was approved, the range inventories have shown the need for more treatment acres to simply maintain existing sagebrush stands in optimum condition. The treatments did not result in as extensive ground disturbance as originally proposed, but may cover more acres per allotment.

The prescribed fire EA (Environmental Assessment OR-014 94-09) was incorporated into the RMP and proposed treating up to 10,000 acres. Currently, the projects proposed to treat excess fuels under the Fire EA, treat some of the same allotments where brushfields are scheduled to be managed. Fuels management treatments were also analyzed in the RMP.

Therefore, there may be more acres treated in each allotment than is covered in Appendix H of the RMP. However, since the types of treatments have been analyzed in the RMP and the disturbance per acre is less than previously predicted, the impacts are well within those analyzed in the RMP.

The number of acres treated in large blocks for density management purposes may have a negative effect upon deer and elk and other species dependent upon the understory components of a stand for cover. In order to provide some variation in the stand density across the landscape, small clumps of trees were retained within the sale areas. The number and acreage of clumps retained was dependent upon the importance of an area to deer and elk and upon the original characteristics of the stand. The combination of these clumps and reserve areas such as Riparian Reserves comprise up to 20 percent of the harvested acres for a given entry. Some of these “wildlife clumps” are comprised primarily of white fir and are overstocked. These “wildlife” clumps may be treated during subsequent harvest entries and are not considered to be permanent reserves. For the sales within the third year evaluation time frame, all wildlife clumps were less than an acre. For the period beyond this evaluation period, larger clumps of up to 15 acres may be retained. The decision not to thin these areas may result in an increase in the number of snags and thus result in a potential benefit to woodpeckers, secondary cavity nesters and bats. No evaluation of the use of these wildlife clumps by wildlife has been made to date.

Table M.3 - Projected vs. Actual Harvest Volumes and Acres to Date

| Harvest Method | WESTSIDE | | | | EASTSIDE | | | |
|-----------------------|---------------|--------------|---------------|---------------|--------------|----------------|-----------------|--------------|
| | Volume(MMBF)* | | Acres | | Volume(MMBF) | | Acres | |
| | Projected | Actual | Projected | Actual | Projected | Actual | Projected | Actual |
| Density Management | 70.92** | 49.68** | 9,936 | 12,515 | 4.8** | 5.06** | 3,228 | 2,778 |
| Regeneration Harvests | 70.92** | 49.68** | 1,572 | 227 | 4.8** | 5.06** | 396 | 0 |
| Mortality Salvage | 0.0 | 18.99 | 0 | 7,328 | 0.0 | 1.72 | 0 | 1,174 |
| Totals | 70.92 | 68.67 | 11,508 | 20,070 | 4.4 | 6.72*** | 3,624*** | 3,952 |

*MMBF = Million Board Feet **Combined figures for Density Management, Regeneration Harvest, and Stewardship volumes.

***Actual exceeds Projected because the KFRA offered 2.5MMBF of volume on the eastside in 2005, which equates to approximately 5-6 years of volume for estimated ASQ on the eastside. The KFRA now has no planned eastside sales until FY 2009 or 2010. Preparing larger sales (Adobe East TS in 2005) improves efficiency for both potential purchasers and the BLM.

Table M.4 - Timber Sale Volume and Acres Offered (Entire Resource Area)**Total Timber Volume – MBF (Thousand Board Feet)**

All Land Use Allocations**Expected Future Conditions and Outputs**

- Protection of SEIS special attention species so as not to elevate their status to any higher level of concern.

Implementation Monitoring

Monitoring Question 1: Are surveys for the species listed in Appendix E (RMP/EIS) and/or Table 1-1 of the Standards and Guidelines (S&M SEIS) conducted before ground-disturbing activities occur?

Monitoring Requirement: At least 20 percent of all ground-disturbing management actions will be examined prior to project initiation and reexamined following project completion, to determine if surveys are conducted for species listed in Appendix E, protection buffers are

provided for specific rare and locally endemic species and other species in the upland forest matrix, and sites of species listed in Appendix E are protected.

Monitoring Performed: In the fall of 2003, pre-disturbance surveys were conducted according to Survey and Manage guidelines. In March 2004, the Record of Decision (ROD) for the “Final Supplemental Environmental Impact Statement to Remove or Modify the Survey and Manage Mitigation Measure Standards and Guidelines” was signed and the Survey and Manage program mitigation and standards and guidelines were removed from the Northwest Forest Plan. Surveys were continued in the spring of FY 2005 for former Survey and Manage species that were added to the agency’s Special Status Species list. In FY 2005, the 2004 ROD was challenged in court and in FY 2006 the BLM was mandated to revert back to the Standards and Guidelines of the 2001 ROD. In FY 2006 surveys were completed to meet survey and manage protocol for Thin Sheep TS, Klamath River Oak Thin and Big Bend prescribed burn., Surveys continued for the Cold Onion, West Spencer and Miner’s Creek Salvage timber sales. Surveys for these sales will be completed in FY 07.

Findings (for all activities):

Animals

Great Gray Owl

During the 2006 field season, the first year of surveys for the great gray owl (GGO) were conducted to protocol within suitable habitat for the Cold Onion, West Spencer and Miner’s Creek Salvage area. No detections of GGO’s occurred during those surveys. The second year of surveys will be conducted in FY 07. For the Thin Sheep sale area, nest searches were conducted for the nesting pair located within that sale in 2005. The pair was located but no nest was found this year.

Mollusks

In the spring of 2006, pre-disturbance surveys were completed for terrestrial and aquatic mollusk species within the Thin Sheep TS and Klamath River Oak Thin and Big Bend prescribed burn .No special status species were found within the Thin Sheep TS. One survey and manage aquatic snail *Fluminicola n.sp.3* was located in a spring within the Klamath River Oak Thin area. No other survey and manage species were located but several sites of the Klamath tail-dropper slug (BLM sensitive species) were located within the Klamath River Oak thin and prescribed burn area. Terrestrial mollusk surveys were initiated and aquatic mollusk surveys were completed for the Miner’s Creek Salvage. One survey and manage species, the evening field slug was located. Mollusk surveys are complete for the Cold Onion and West Spencer TS areas.

Plants

Fungi

Under the Survey and Manage program, pre-disturbance surveys are not required for fungi on the KFRA. No incidental finds of special status fungi were found during FY 2006.

Vascular Plants

Approximately 6,353 acres of systematic inventory for botanical resources were conducted on the resource are during FY 2006. Target species of surveys included former survey and manage species now classified as special status species.

Conclusions: Surveys for former Survey and Manage/ current Special Status Species are being implemented.

Monitoring Question 2: Are protection buffers being provided for specific rare and locally endemic species and other species in the upland forest matrix?

Monitoring Requirement: At least 20 percent of all ground-disturbing management actions will be examined prior to project initiation and reexamined following project completion, to determine if surveys are conducted for species listed in Appendix E, protection buffers are provided for specific rare and locally endemic species and other species in the upland forest matrix, and sites of species listed in Appendix E are protected.

Monitoring Performed: Surveyor Timber Sale

Findings:

Animals

Great Gray Owl

During the 2005 field season, one great gray owl (GGO) nest was located in the Thin Sheep timber sale area. To meet the requirements in the 2001 ROD the nest tree was provided a ¼ protection zone (no harvest) and meadow habitat within the sale area was provided a 300 ft no harvest buffer (2001 ROD pp. 39).

Mollusks

Mollusk surveys were performed for Survey and Manage mollusks within the Thin Sheep, Klamath River Oak Thin and Big Bend Prescribed Burn, and Cold Onion and Miner's Creek Salvage timber sale units.

Plants

Fungi

Based on management recommendations in Appendix J2 in the Northwest Forest Plan Final SEIS, and appropriate literature, buffer for each of these species were determined. These sites will be managed as known sites and will be revisited following project completion. In FY 2006, Surveyor Timber Sale buffers for fungi were revisited and were intact.

Vascular Plants

No high priority sites that required buffers for vascular plants were found within these project areas.

Conclusions: The required management actions for specific rare, and locally endemic, species, and other species in the upland forest matrix, are being implemented.

Monitoring Question 3: Are the known sites of amphibians, mammals, bryophytes, mollusks, vascular plants, fungi, lichens, and arthropod species listed in Appendix E and/or Table 1-1 of the Standards and Guidelines (S&M SEIS) being protected?

Monitoring Requirement: At least 20 percent of all ground-disturbing management actions will be examined prior to project initiation and reexamined following project completion, to determine if surveys are conducted for species listed in Appendix E, protection buffers are provided for specific rare and locally endemic species and other species in the upland forest matrix, and sites of species listed in Appendix E are protected.

Monitoring Performed: Surveyor and Thin Sheep timber sales

Findings: See answer to Monitoring Question 2 above.

Conclusions: Known sites of amphibians, mammals, bryophytes, mollusks, vascular plants, fungi, lichens, and arthropod species listed in Appendix E of the RMP and/or Table 1-1 of the Standards and Guidelines (S&M SEIS) are being surveyed and protected.

Monitoring Question 4: Are the known sites of amphibians, mammals, bryophytes, mollusks, vascular plants, fungi, lichens, and arthropod species listed in Appendix E of the RMP being surveyed?

Monitoring Requirement: At least 20 percent of all ground-disturbing management actions will be examined prior to project initiation and reexamined following project completion, to determine if surveys are conducted for species listed in Appendix E, protection buffers are provided for specific rare and locally endemic species and other species in the upland forest matrix, and sites of species listed in Appendix E are protected.

Monitoring Performed: Thin Sheep and Surveyor timber sales

Findings See answer to Monitoring Question 1 above.

Conclusions: Known sites of amphibians, mammals, bryophytes, mollusks, vascular plants, fungi, lichens, and arthropod species listed in Appendix E of the RMP are being surveyed and protected.

Monitoring Question 5: Are high priority sites for species management being identified?

Monitoring Requirement: At least 20 percent of all ground-disturbing management actions will be examined prior to project initiation and reexamined following project completion, to determine if surveys are conducted for species listed in Appendix E, protection buffers are provided for specific rare and locally endemic species and other species in the upland forest matrix, and sites of species listed in Appendix E are protected.

Monitoring Performed: Thin Sheep and West Spencer timber sales

Findings:

Animals

Great Gray Owl

See answer to Monitoring Question 1 and 2 above.

Mollusks

Aquatic - There are no high priority aquatic mollusks sites on the resource area.

Terrestrial - There are no high priority terrestrial mollusk sites on the resource area.

Plants

Fungi

One high priority Survey and Manage fungi species (*Clavariadelphus truncates*) was found on the Klamath Falls Resource area in the Frosty Timber Sale. It is inside the riparian reserve and is being managed as a known site.

Vascular Plants

No high priority sites for vascular plants were found within these project areas.

Conclusions: High priority sites for species management are being identified. High priority species are managed the same as manage all known sites species.

Late-Successional Reserves

Expected Future Conditions and Outputs

- Development and maintenance of a functional, interacting, Late-Successional, and old-growth forest ecosystem in Late-Successional Reserves

- Protection and enhancement of habitat for Late-Successional and old-growth forest-related species including the northern spotted owl

Implementation Monitoring

Monitoring Question 1: What is the status of the preparation of assessments and fire plans for Late-Successional Reserves?

Monitoring Requirement: The Annual Program Summary will address Implementation Question #1.

Monitoring Performed:

The status of the development of the resource area wide LSR assessment was reviewed.

Findings: A single Late-Successional Reserve Assessment was prepared in FY 2003 that assesses all 19 of the reserves designated for late-successional forest values within the resource area. Data on current conditions within each of the reserves had been collected in previous fiscal years. Along with historical descriptions and harvest data, these data served as a basis for written assessments of conditions in each reserve. The Late-Successional Reserve Assessment was submitted to the Regional Ecosystem Office (REO) for review and approval in the spring of 2003. In a memorandum dated September 27, 2004, the Regional Ecosystem Office, based upon the final review of the LSR Assessment by the LSR Work Group, concurred with the Klamath Falls Resource Area in its findings and consistency with the Standards and Guidelines (S&Gs) under the Northwest Forest Plan (NWFP). In FY 2005, the KFRA began preparation of categorical exclusions for treatments within the Tunnel Creek and Surveyor DDRs. During FY 2006, a CX was prepared and approved to implement fuels treatments within the Tunnel Creek DDR, and marking of the trees has begun.

Conclusion: RMP requirements will be met in FY 2006.

Monitoring Question 2:

A) What activities were conducted or authorized within Late-Successional Reserves (LSRs) and how were they compatible with the objectives of the LSR plan?

B) Were the activities consistent with SEIS ROD Standards and Guides, RMP management direction, and Regional Ecosystem Office review requirements and the LSR assessment?

Monitoring Requirement: The Annual Program Summary will address Implementation Question #2.

Monitoring Performed: Review of activities conducted or authorized within Late-Successional Reserves (LSRs).

Findings: Tree marking was begun during FY 2006 in the Tunnel Creek DDR in preparation for the planned fuels treatment.

Conclusion: The planned fuels treatment will maintain old growth habitat features within the Tunnel Creek DDR and reduce the probability that these habitat features would be lost as the result of a wildfire.

Monitoring Question 3: What is the status of development and implementation of plans to eliminate or control non-native species, which adversely impacts LSRs?

Monitoring Requirement: The Annual Program Summary will address Implementation Question #3.

Monitoring Performed: Review of species lists from each unmapped LSR, and review of the noxious weed management program.

Findings: Noxious weed management is not a habitat manipulation activity that requires a Late-Successional Reserve Assessment before implementation. Standards and Guides for LSRs direct us to evaluate the impacts of nonnative species currently within reserves, and to develop plans for control or elimination of species that are inconsistent with LSR objectives.

Vascular plant inventories revealed only four nonnative plant species that frequently occur in the LSRs. Bull thistle (*Cirsium vulgare*), mullein (*Verbascum thapsis*), western salsify (*Tragopogon dubius*), and cheat grass or downy brome (*Bromus tectorum*) were found in physically disturbed areas within LSRs. These species are not targeted for control by the resource area noxious weed management program because they are abundant and widespread in disturbed sites, and decline in abundance without disturbance. Therefore, these species are not inconsistent with LSR objectives. None of the noxious weed species that are targeted for control were found within LSRs.

Conclusion: Impacts of nonnative species have been evaluated, and the species that currently exist within the reserves, are not inconsistent with LSR objectives. Noxious weed management activities and prevention strategies on lands near and adjacent to late-successional reserves will reduce the probability that other nonnative species will become established within the reserves.

Monitoring Question 4:

- A) Are the effects of existing and proposed livestock management and handling facilities in Late-Successional Reserves being evaluated to determine if LSR objectives are met?
- B) Are livestock management and/or handling facilities relocated where LSR objectives are not met?

Monitoring Requirement: The Annual Program Summary will report the status of evaluations of existing and proposed livestock management facilities inside LSRs, to determine if reserve objectives are being met. The APS will report on the status of relocating those facilities where LSR objectives cannot be met.

Monitoring Performed: Review of existing and proposed livestock management facilities within the resource area.

Findings: No existing or proposed livestock management facilities are located within LSRs in the resource area.

Matrix

Expected Future Conditions and Outputs

- Production of a stable supply of timber and other forest Commodities.
- Maintenance of important ecological functions such as dispersal of organisms, carryover of some species from one stand to the next, and maintenance of ecologically valuable structural components such as downed logs, snags, and large trees.
- Assurance that forests in the Matrix provide for connectivity between mapped Late-Successional Reserves.
- Provision of habitat for a variety of organisms associated with early and Late-Successional forests.

Implementation Monitoring

Monitoring Question 1: Are suitable numbers of snags, coarse woody debris, and green trees being left, following timber harvest, as called for in the SEIS ROD Standards & Guidelines and RMP management direction?

Monitoring Requirements: At least 20 percent of timber sales in the resource area will be examined by pre- and post-harvest (and after site preparation) inventories to determine snag and green tree numbers, heights, diameters, and distribution within harvest units. Snags and green trees left following timber harvest activities (including site preparation for reforestation) will be compared to those that were marked prior to harvest.

The same timber sales will be inventoried pre- and post-harvest to determine if SEIS Record of Decision and RMP down log retention direction and protection buffers for special status and SEIS special attention species have been followed.

Monitoring Performed: Table M-5 displays all the timber sales that have been monitored from FY 1997 through FY 2006.

Table M.5 - Timber Sale Monitoring Summary

| FY | Timber Sale Name | Acres | Monitored By | Pre/Post Treatment Stand Exams Completed | Soil Monitoring Completed |
|-----------|----------------------------|--------------|------------------------------|---|--------------------------------------|
| 1997 | Too Frosty | 459 | KFRA ID Team | Yes | Post Treatment Only |
| 1998 | Lower Spencer Salvage | 1000+ | REO & KFRA ID Team | No | No |
| 1999 | Kakapoo Stew | 397 | REO & KFRA ID Team | Yes | Pre & Post Treatment |
| 2000 | Stukel Mountain | 230 | KFRA ID Team | Yes | No |
| 2001 | Grenada East | 1440 | Silviculture/Wildlife/Timber | Yes | Post Treatment Only |
| 2001 | Grenada West | 1003 | Silviculture | Pre-treatment | No |
| 2001 | Slim Chicken | 2113 | Silviculture | Pre-treatment only | No |
| 2001 | Muddy Tom | 400 | Soils | Yes | Pre Treatment |

| 2005 | Saddled Again | 200 | Soil / Snow Logging | No | Post Treatment |
| 2006 | Chase Mountain (Sec. 5) | 449 | Timber | Yes | No |
| 2006 | Thin Sheep | 590 | Wildlife/Forestry | Pre-treatment only | No |

Findings: Results of prior year timber sale monitoring are shown in earlier Annual Program Summaries. Table M-6 summarizes the stand attribute data that was gathered from pre-treatment stand exams on the proposed Thin Sheep Timber Sale. This sale was located on the westside of the Resource Area.

Table M.6 - Summary of Pre-Treatment Stand Characteristics for the Proposed Thin Sheep Timber Sale

| <u>Stand Attributes</u> | <u>Thin Sheep TS Area (217 Plots)</u> |
|------------------------------|---------------------------------------|
| Canopy Closure | Average = 63% Range 0 - 100% |
| Basal Area - "Take" Trees | 53 sq. ft./acre |
| Basal Area - "Leave" Trees | 96 sq. ft./acre |
| Total Basal Area | 149 sq. ft./acre |
| Number of "Take" Trees/Acre | 60 trees/acre |
| Number of "Leave" Trees/Acre | 83 trees/acre |
| Total Number of Trees/Acre | 143 trees/acre |

Snag Data/Acre

| <u>Category</u> | <u>7"-11" DBH</u> | <u>12"-19" DBH</u> | <u>20"-40"</u> | <u>> 40"</u> | <u>Totals</u> |
|--------------------------------|-------------------|--------------------|----------------|-----------------|---------------|
| Class 1, 2, 3, and Broken Tops | 4.75 | 3.47 | 0.37 | 0.02 | 8.61 |

Snags

The KFRA RMP requires leaving approximately 1.9 snags per acre (1.4 eastside) to meet the 60 percent optimum cavity nesting habitat for cavity nesters. An additional 0.7 snags per acre must also be left to meet the protection buffer requirement for white-headed and black-back woodpeckers. Snags for the white-headed woodpecker need to be at least 15 inches DBH and in the soft category. For the black-backed woodpecker, the snags must be at least 17 inches DBH and in the hard category. Silvicultural prescriptions in the KFRA have generally called for leaving a total of 2.6 snags per acre (1.4 eastside) or more with at least one greater than 20 inches DBH. For the Thin Sheep Timber Sale, an average of 8.61 snags per acre greater than 7" DBH and an average of 3.86 snags per acre greater than 12" DBH are present. As M-6 indicates, a large number of green trees per acre (83 trees/acre > 7"DBH) are reserved which allows for potential snag recruitment, many exceeding 15 inches in diameter.

Coarse Woody Debris (CWD)

Page C-40 of the Northwest Forest Plan Record of Decision (ROD) states, “Until standards are developed as described above, the following guidelines apply in areas of **regeneration harvests...**” and sets the down wood requirement at 120 linear feet of logs per acre greater than or equal to 16 inches in diameter and 16 feet long in **regeneration harvest** areas only. For the Eastside, these standards are 50 linear feet of logs per acre greater than or equal to 12 inches in diameter and 8 feet long in **regeneration harvest** areas only. The guideline for partial harvest, as stated on page 23 of the KFRA RMP and page C-40 of the ROD is, “In areas of partial harvest, the same basic guidelines should be applied, but they should be modified to reflect the timing of stand development cycles where partial harvesting is practiced.” The KFRA needs to determine how they plan to monitor down wood through different stand development cycles where partial cutting (density management) is practiced to meet this standard and guideline.

No quantitative CWD data was gathered for Thin Sheep pre-treatment. Qualitative observations indicated a large amount of CWD in the mature, natural stands primarily a result of insect, disease, and wind throw.

Green Tree Retention

The RMP requires that an average of 16 to 25 Westside (5-10 eastside) large green trees per acre be left. Plan maintenance (see 1999 APS) clarification indicates that this requirement is for regeneration harvests only. Over the past twelve years, the KFRA has implemented 227 acres of regeneration harvest on the westside and none on the eastside. Most harvest prescriptions have consisted of either density management or mortality salvage. In both prescriptions, a majority of the large green trees are retained. For the Thin Sheep Timber Sale, as Table M-6 indicates, on average, 83 trees per acre (7"- 40"+ DBH) will be retained. With the exception of regeneration harvest areas, the KFRA intends to implement uneven-aged management prescriptions, maintain late-successional structural components, and address forest health issues in the Matrix. That is why the stand exam data reveals a complete array of tree sizes.

Tree Species Composition

The KFRA is tracking species composition changes through pre- and post-treatment stand exams to help determine trends in species composition changes. Many of the mixed conifer stands contain a higher percentage of shade tolerant species (white fir) than historically found (Leiburg, 1899). This is primarily a result of past harvesting practices—where many of the overstory pines and Douglas-fir were removed—and fire suppression, which tends to favor the shade tolerant white fir. An objective in most silvicultural prescriptions is to retain the healthy pines and Douglas-fir. Eastside stands are predominantly ponderosa pine with scattered juniper and some white fir and cedar. The pre-treatment monitoring data from the Thin Sheep Timber Sale indicates that trees to be harvested will consist of approximately 54% white fir, 26% ponderosa pine, 10% Douglas fir, and 0.5% sugar pine.

Canopy Closure

The KFRA is monitoring canopy closure changes through pre- and post-treatment stand exams. Biologists often use canopy closure to evaluate whether a particular stand meets nesting, roosting, or foraging habitat for different species. To date, using the density management prescription, canopy closure after harvest on westside timber sales has averaged 65 to 86 percent, which is a level that meets the requirements for some late-successional dependent species. On the Thin Sheep Timber Sale, the canopy closure before harvest averages 63% with a range from 0% in the openings to 100%.

Basal Area

The KFRA monitors basal area changes for a number of reasons. First, there has been considerable research on optimizing stand densities and growth using basal area to monitor

stand stocking levels. The Growth and Yield Model (ORGANON) that was used to help determine the ASQ is highly dependent upon basal area before and after harvest to determine growth rates. The silvicultural prescriptions for all sales contain basal area objectives. Pre- and post-treatment monitoring is done to determine if those silvicultural objectives are being met. Second, there has been a significant amount of research, particularly on drier sites, determining basal area levels where stands are susceptible to insect outbreaks. The KFRA uses these threshold levels in the silvicultural prescriptions to assure that silvicultural treatments are adequate to improve resiliency of the stand and reduce insect outbreaks. Generally, the higher elevation stands have a higher basal area threshold than the drier, low elevation stands. The objective for the Thin Sheep Timber Sale is to retain, on the average, between 80 and 120 square feet of basal area per acre. The pre-treatment monitoring data indicated an average basal area of 96 square feet per acre would be retained (see Table M-6).

Conclusion:

The FY 2001 annual program summary contained some clarification in the Plan Maintenance addressing the requirement of leaving an average of 16 to 25 large green trees in regeneration harvests only. The KFRA has complied with the snag, coarse woody debris, and green tree requirements to date. A quality control program has been initiated to assure that silvicultural prescriptions modeled are actually being implemented on the ground. This is normally monitored using basal area. Post-harvest monitoring of timber sales indicates retention of many desirable late-successional characteristics. The wildlife staff is monitoring biological use of posttreatment stands by late-successional dependent species (see Wildlife Section).

Monitoring Question 2: Are timber sales being designed to meet ecosystem goals for the Matrix?

Monitoring Requirements: At least 20 percent of the files on each year's timber sales within Matrix will be reviewed annually to determine if ecosystem goals were addressed in the silvicultural prescription.

Monitoring Performed: Monitoring is completed on at least one timber sale per year. In FY 2006, pre-treatment monitoring was initiated on one sale (Thin Sheep) and post-treatment soil monitoring was completed on a second sale (Muddy Tom). In addition, post-treatment monitoring was also completed on the 449-acre Chase Mountain/Section 5 Stewardship Contract task order. Table M-5 displays sales monitored from FY 1997 through 2006.

Findings: All timber sales are designed to meet ecosystem goals for the Matrix and address resource concerns raised in both the respective Watershed Analysis and Environmental Assessment. All resources are analyzed for impacts including wildlife, soils, hydrology, plants, social, cultural, as well as others. All timber sales incorporate the applicable Best Management Practices (BMPs) described in Appendix D of the RMP. Posttreatment monitoring of all sales to date indicates that most BMPs have been addressed in the Environmental Analysis and incorporated into the Timber Sale Contract.

Monitoring Question 3: Are late-successional stands being retained in fifth-field watersheds in which federal forest lands have 15 percent or less late-successional forest?

Monitoring Requirements: All proposed regeneration harvest timber sales in watersheds with less than 15 percent late-successional forest remaining will be reviewed prior to sale to ensure that a watershed analysis has been completed.

Monitoring Performed: A 15% analysis has been completed.

Findings: For all three Watershed Analyses, an analysis was done to determine the amount of Late-Successional Forest in the watershed on federal lands. For both the Spencer Creek Watershed and the Topsy/Pokegama/Hamaker Landscape Analysis Area, the percent of Late-

Successional Forest in the watershed was above 15%. Further direction has required that the Topsy/Pokegama/Hamaker Landscape Analysis Area be analyzed at the fifth field watershed level, which means four different watersheds within the Topsy/Pokegama/Hamaker Landscape need further evaluation.

One unique feature of the KFRA, as indicated by posttreatment monitoring thus far, is that many of the stands after treatment are still capable of contributing to late-successional habitat within the watershed due to the residual stand characteristics being left. Silvicultural prescriptions have been implemented that addressed two primary objectives: first, maintenance of late-successional habitat; and second, treating overstocked stands to reduce risks of catastrophic fire and/or insect events. There are some watersheds where the residual late-successional habitat may be close to 15% and still experiencing forest health concerns that could benefit from some light understory treatments.

Riparian Reserves

Expected Future Conditions and Outputs

(See also Aquatic Conservation Strategy Objectives)

- Provision of habitat for special status and SEIS special attention species.

Implementation Monitoring

Monitoring Question 1: Are watershed analyses being completed before on-the-ground actions are initiated in Riparian Reserves?

Monitoring Requirement: The files for each year's on-the-ground actions will be checked annually to ensure that watershed analyses were completed prior to project initiation and to ensure the concerns identified in the watershed analysis were addressed in the project's Environmental Assessment (EA).

Monitoring Performed: Review of project files and EAs.

Findings: Watershed analyses have been completed for most areas in the KFRA that contain substantial riparian areas. Since the completion of the Gerber-Willow Valley Watershed Analysis, planning and implementation of projects recommended for riparian areas has progressed.

Conclusions: Watershed analyses were completed for all projects having activities within Riparian Reserves. Recommendations and objectives of the watershed analysis were addressed in the EAs and in contract stipulations.

Monitoring Question 2: Is the width and integrity of the Riparian Reserves (RR) being maintained?

Monitoring Requirement: At least 20 percent of management activities within the KFRA will be examined prior to project initiation and reexamined following project completion, to determine whether the width and integrity of the Riparian Reserves (RRs) were maintained.

Monitoring Performed: In FY 2006 approximately 35 acres of riparian reserves were delineated adjacent to intermittent streams within the planned Walters Cabin Timber Sale Units. Riparian Reserves were also delineated adjacent to streams and wetlands within the Campbell, Bug Spring, Alkali Spring, and East Fork Spring juniper projects by the hydrology, forestry, and range staff. Informal field visits occurred post project and no riparian reserves were compromised.

Findings: The widths of these reserves comply with management direction in the KFRA RMP. Management activities conducted within riparian reserves in FY 2006 maintained the integrity of these reserves.

Conclusions: Riparian reserves were delineated properly.

Monitoring Question 3: What silvicultural practices are being applied to control stocking, reestablish and manage stands, and acquire desired vegetation characteristics needed to attain ACS objectives?

Monitoring Requirements: The Annual Program Summary will report what silvicultural practices are being applied in order to attain ACS objectives. See Watershed Restoration Projects and Riparian Habitat Enhancement, for a description of the silvicultural prescriptions applied in FY 2006.

Monitoring Performed: The riparian thin project along Spencer Creek was completed in FY 2006. Post treatment photo points were re-read in riparian reserves in the Norcross Springs juniper treatment area, along Spencer Creek, and in the Grenada West riparian reserve thinning. The understory thinning projects (Johnson, Sheepy, Ben Hall, Pitchlog, and Wildhorse Creeks) were monitored during project inspection to ensure contract specifications were met. Photo points were established for implementation monitoring at juniper treatment projects (Upper Antelope Creek, Duncan Creek, and the East Fork of the Lost River). Project inspectors ensured that contract specifications were satisfied. Monitoring of Juniper removal spring restoration within Alkali, East Fork, and Bug Springs to ensure contract specifications were met. Monitoring of Hand cut and piled Juniper within riparian buffer along Campbell Reservoir tributary during project to insure contract specifications were met.

Findings: Implementation of understory thinning and juniper treatment projects will help attain ACS objectives.

Monitoring Question 4: Are management activities in riparian reserves consistent with SEIS Record of Decision Standards and Guidelines, RMP management direction, and ACS objectives?

Monitoring Requirement: At least 20 percent of the activities that are conducted or authorized within Riparian Reserves will be reviewed in order to identify whether the actions were consistent with the SEIS Record of Decision Standards and Guidelines, RMP management direction, and ACS objectives. In addition to reporting the results of this monitoring, the Annual Program Summary will also summarize the types of activities that were conducted or authorized within Riparian Reserves.

Monitoring Performed: Riparian vegetation and soil monitoring transects were read again at the Norcross Springs stewardship juniper treatment area. Photo points were established within the Bug, Alkali, and East Fork Spring riparian projects.

Findings: This information will help in assessing the consistency of management actions with planning direction. It will also provide useful guidance for the design and implementation of future projects within riparian reserves. Monitoring data will provide a baseline for post-treatment analysis of long-term trend.

Conclusion: Monitoring results to date show that the silvicultural activities were consistent with the SEIS Record of Decision Standards and Guidelines, RMP management direction, and ACS objectives.

Comment/Discussion: See the Aquatic Conservation Strategy section of the Annual Program Summary for a discussion of the activities that were conducted or authorized in riparian reserves.

Monitoring Question 5: Are new structures and improvements in riparian reserves constructed to minimize the diversion of natural hydrologic flow paths, reduce the amount of sediment delivery into the stream, protect fish and wildlife populations, and accommodate the 100-year flood?

Monitoring Requirement: All new structures and improvements within a Riparian Reserve will be monitored during and after construction to ensure that it was constructed to: minimize the diversion of natural hydrologic flow paths, reduce the amount of sediment delivery into the stream, protect fish and wildlife populations and accommodate the 100-year flood.

Monitoring Performed: Post-treatment photo monitoring was performed on the Spencer Creek Large Wood Debris placement project in FY 2006. Fish and geomorphic parameters were measured in 2004 and will be repeated in 2007 to determine effectiveness of the project in improving fish habitat. Spencer Creek culvert replacement for improvement of fish passage was implemented in 2006. Monitoring was done during, and post project.

Conclusion: Monitoring results will not be meaningful until several years of high flow act on placed large wood and effect sediment processes and cause pool scour. Preliminary conclusions will be available in 2007 after fish and geomorphic monitoring.

Monitoring Question 6:

A) Are all mining structures, support facilities and roads located outside the Riparian Reserves?

B) Are those located within the Riparian Reserves meeting the objectives of the Aquatic Conservation Strategy?

C) Are all solid and sanitary waste facilities excluded from Riparian Reserves or located, monitored, and reclaimed in accordance with Supplemental Environmental Impact Statement Record of Decision Standards and Guidelines, and resource management plan management direction?

Monitoring Requirement: All approved mining Plans of Operations will be reviewed to determine if: A) both a reclamation plan and bond were required, B) structures, support facilities and roads were located outside of Riparian Reserves, or in compliance with management action/direction for Riparian Reserves if located inside the Riparian Reserve, C) and if solid and sanitary waste facilities were excluded from Riparian Reserves or located, monitored, and reclaimed in accordance with RMP management direction.

Monitoring Performed: None; there are no mining claims in the Klamath Falls RA.

Monitoring Question 7: Are new recreation facilities within the Riparian Reserves designed to meet, and where practicable, contribute to Aquatic Conservation Strategy Objectives? Are mitigation measures initiated where existing recreation facilities are not meeting Aquatic Conservation Strategy Objectives?

Monitoring Performed: An evaluation of existing recreation facilities inside Riparian Reserves has not been completed to date.

Monitoring Question 8: Are new livestock handling and/or management facilities located outside Riparian Reserves? Are existing livestock handling and/or management facilities within the Riparian Reserves meeting the Aquatic Conservation Strategy Objectives?

Monitoring Performed: Riparian enclosure fences are the only type of livestock handling and/or management facilities present or proposed in Riparian Reserves. The primary purpose for development of these projects is to meet Aquatic Conservation Strategy objectives.

Air Quality

Expected Future Conditions and Outputs

- Attainment of national Ambient Air Quality Standards, Prevention of Significant Deterioration goals, and Oregon Visibility Protection Plan and Smoke Management Plan goals.
- Maintenance and enhancement of air quality and visibility in a manner consistent with the Clean Air Act and the State Implementation Plan.

Implementation Monitoring

Monitoring Question 1: Were efforts made to minimize the amount of particulate emissions from prescribed burns?

Monitoring Requirements: At least twenty percent of prescribed burn projects are randomly selected for monitoring to assess what efforts were made to minimize particulate emissions, and whether the environmental analysis that preceded the decision to burn addressed the questions set forth in the SEIS discussion of Emission Monitoring (pages 3&4-100).

Monitoring Performed: Since 1998, the Lakeview District has implemented a program of aerial observation of burns located near smoke sensitive areas during marginal weather events. In a number of situations, the smoke plume was videotaped as a record.

Findings: Burns were conducted when the atmosphere was unstable and transport winds favorable; thereby decreasing the impact of smoke in sensitive areas. As related to harvest units, logging methods required the yarding of tops and limbs attached. Some of this material was chipped and utilized. The material not in locations suitable to chipping were burned in the winter to provide for complete and quick consumption. Where feasible, sheared juniper was removed from the site for utilization rather than burning.

Conclusion: Efforts were made to reduce particulate emissions from prescribed burns and still meet hazard reduction objectives by conducting burns with higher fuel loads in the spring.

Monitoring Question 2: Are dust abatement measures used during construction activities and on roads during BLM timber harvest operations and other BLM commodity hauling activities?

Monitoring Requirements: At least 20 percent of the construction activities and commodity hauling activities carried out in FY 2006 and subject to the current RMP will be monitored to determine if dust abatement measures were implemented where needed.

Monitoring Performed: The Slim Chicken, Surveyor, and Matchbox timber sales have been monitored since harvest operations started.

Findings: All timber sales in the Klamath Falls Resource Area include a road watering specification as part of the contract. Water is required to abate dust during any road construction phase of the contracts. Impacts on air quality from road construction and timber hauling were of short duration, local nature, and had little impact on regional air quality. In addition, approximately 9,000 tons of slash material that would normally be burned in landing piles was chipped for use in biomass energy production. Thereby reducing emissions including particulates.

Monitoring Question 3: Are conformity determinations being prepared prior to activities, which may contribute to a new violation of the national Ambient Air Quality Standards,

increase the frequency or severity of an existing violation, or delay the timely attainment of a standard?

Monitoring Requirements: The Annual Program Summary will address Implementation Question 3.

Monitoring Performed: In FY2006, the smoke plume from the Keno 5 prescribed fire was videotaped as a record. All burns are reported to the Oregon Department of Forestry via the FASTER database to increase the accuracy of smoke modeling and management effectiveness.

Findings: Preplanning of prescribed fire projects, use of current weather data, and onsite observations during prescribed burning have reduced frequency and severity of smoke from prescribed fire violating Air Quality Standards.

Water and Soils

Expected Future Conditions and Outputs

- Restoration and maintenance of the ecological health of watersheds. See Aquatic Conservation Strategy Objectives.
- Improvement and/or maintenance of water quality in municipal water systems.
- Improvement and/or maintenance of soil productivity.
- Reduction of existing road mileage within Key Watersheds, or at a minimum, no net increase.

Implementation Monitoring

Monitoring Question 1: Are site specific Best Management Practices, identified as applicable during interdisciplinary review, carried forward into project design and execution?

Monitoring Requirement: All management activities using best management practices will be monitored to determine whether best management practices are incorporated into the project design. At least twenty percent of the timber sales, silviculture projects, or other ground disturbing activities stratified by management category will be randomly selected for monitoring to determine whether or not best management practices were implemented as prescribed. The selection of management actions to be monitored will be based on beneficial uses likely to be impacted, and for which best management practices are being prescribed.

Monitoring Performed: In FY 2006, post treatment soil monitoring was initiated on the Norcross Stewardship project. Results from this data will be used to design future juniper biomass and slashbusting treatments.

Findings: Paired transects were established in skid trails where juniper was yarded and in adjacent sites that were not yarded. Frequency and cover (%) were taken on each transect. Each transect will be measured over time to determine plant response in the skid roads and control as an indicator of soil health and compaction.

Conclusion: Resource Management Plan (RMP) objectives for limiting soil disturbance have been met.

Comment/Discussion: Quantifying soil disturbance enables resource area staff to determine whether resource management plan objectives for protecting soil resources are being met. Soil monitoring on the resource area is a long term program.

To date, quantitative soil monitoring has been completed on four resource area timber sales: Kakapoo Stew, Frosty Too, Grenada East, and Bly Mountain. Post-treatment monitoring has been initiated on the Muddy Tom timber sale. Pretreatment quantitative soil monitoring has been initiated on the Saddled Again timber sale. Quantitative soil monitoring has been conducted on additional projects such as juniper treatments, slashbusting treatments, and prescribed burns. The results from soil monitoring on these timber sales and other ground disturbing projects will be considered in the layout of future resource area timber sales/projects, and in the design of future soil monitoring programs. In FY2006 soil monitoring on the Norcross Stewardship Juniper Project was concentrated in the juniper yarding skid trails. Paired transect (one in a disturbed area and one in a non-disturbed area) were established. Cover (%) and frequency were measured. These measurements will be re-read to see what vegetation re-establishes after this type of disturbance and will give an indicator of soil health.

Monitoring Question 2: Are the prescribed actions, programs and interagency coordination efforts called for in the NFP Record of Decision Standards and Guidelines and resource management plan management direction being conducted?

Monitoring Performed: Review of timber sale and project files and monitoring of ground disturbing activities.

Findings: Management actions and programs are being conducted to meet or move towards desired future water and soils conditions. Riparian reserve treatments are being implemented to move towards Aquatic Conservation Strategy objectives. In coordination with Oregon Department of Environmental Quality (ODEQ), the resource area is supporting the development of Total Maximum Daily Load (TMDL) calculations and associated Water Quality Restoration Plans (WQRPs) for 303(d)-listed streams within the resource area. Data collection to support the sediment and temperature TMDLs has been completed in coordination with the USFS and ODEQ for the Lost River subbasin and the Upper Klamath subbasin. In late FY 2003, the TMDL and associated USFS/BLM WQRP for the Upper Klamath Lake drainage was completed and is continuing to be implemented. An interim WQRP is being implemented for riparian projects in the Gerber Block.

Soil productivity requirements are being maintained and improved in timber sales and other projects. Existing road mileage in the Spencer Creek watershed is being reduced. Riparian reserves are being managed to meet ACS objectives.

Monitoring Question 3: What watershed analyses have been or are being performed? Are watershed analyses being performed prior to management activities in key watersheds?

Findings: See Table M-7 describing the completed and ongoing watershed analyses.

Table M.7 - Status of Watershed Analysis

| <u>Watershed Analyses Completed</u> | <u>Key Watersheds Present</u> | <u>Completion Date</u> |
|---|-------------------------------|------------------------|
| Spencer Creek Watershed Analysis | Spencer Creek & Clover Creek | August 1995 |
| Jenny Creek Watershed Analysis | Jenny Creek | February 1995 |
| Topsy-Pokegama Landscape Analysis | None | July 1996 |
| Gerber/Willow Valley Watershed Analysis | None | July 2003 |

Conclusion: Watershed analyses have been completed for 77% of the KFRA, including all key watersheds and essentially all BLM managed lands west of Highway 97. The Spencer Creek watershed analysis will eventually be updated with the new GIS Hydrology theme, the recently completed Spencer Creek Road Inventory, and new water temperature data. Portions of the

Topsy-Pokegama Landscape Analysis will be updated in the Affected Environment section of the Upper Klamath River Management Plan/EIS.

The findings and recommendations of watershed analyses are incorporated in project design.

Monitoring Question 4:

What is the status of identification of in-stream flow needs for the maintenance of channel conditions, aquatic habitat, and riparian resources?

Findings: The BLM is cooperating with PacifiCorp and numerous other stakeholders to develop and implement studies as part of the relicensing of the Klamath Hydroelectric Project. Some of these studies focus on the relationships between instream flow, aquatic habitat, water quality, and riparian vegetation. These studies will be used to determine flow regimes that will be incorporated in the new license for the Project.

Monitoring Question 5: What watershed restoration projects are being developed and implemented?

Findings: In addition to the projects described in the Aquatic Conservation Strategy section, other restoration projects are being developed as part of the Klamath River Management Plan/EIS and other project level analyses.

In FY 2006, replacement of a large culvert on the Spencer Hookup Access Road was completed - bringing an under-sized culvert up to NFP standards, alleviating a barrier for upstream fish passage; improving water, sediment, and wood debris transport capacity; and lowering the risk of culvert blockage and subsequent environmental damage. In FY 2006, photo monitoring of the large wood debris (LWD) placement sites in four miles of Spencer Creek was conducted following several large flood events that occurred that winter. The results of the monitoring revealed that the structures functioned as anticipated. There was some movement of the placed logs however, they generally remained in the same location, trapping smaller logs and forming complex stream habitat features. New gravel patches suitable for trout spawning formed and new pools were scoured under and around the debris structures.

Project planning and implementation continues throughout the KFRA to enhance aspen stands; remove, realign, and improve roads; and construct fences to better manage livestock grazing near riparian areas.

Conclusion: Watershed restoration projects are being developed and implemented to meet the RMP and ACS objectives.

Monitoring Question 6: What fuel treatment and fire suppression strategies have been developed to meet Aquatic Conservation Strategy Objectives?

Findings: BMPs for the protection of soils, water, and riparian resources are being implemented during prescribed fire activities. Silvicultural prescriptions involving understory thinning treatments are being implemented in riparian reserves to reduce potential fuel loads to decrease the risk of catastrophic fires. These treatments are designed to improve forest health and meet the Aquatic Conservation Strategy objectives.

Conclusions: Fuel treatment prescriptions are being implemented to meet ACS and RMP objectives.

Monitoring Question 7: What is the status of development of road or transportation management plans to meet Aquatic Conservation Strategy Objectives?

Findings: A Transportation Management Plan (TMP) has been developed for lands covered by the NFP ROD. Inventories of existing road conditions and their potential to effect the attainment of ACS objectives have been completed in the Spencer Creek watershed, the Klamath River canyon, and the Gerber and Upper Lost River watersheds. This data will be used to supplement the existing TMP. A TMP is currently underway for the eastside of the resource area. Analysis of roads and road treatment options is done during timber sale planning.

Conclusions: A Transportation Management Plan has been developed and will be revised and supplemented with additional data from road inventories and project analyses.

Monitoring Question 8: What is the status of preparation of criteria and standards which govern the operation, maintenance, and design for the construction and reconstruction of roads?

Findings: A Transportation Management Plan has been developed for lands covered by the NFP ROD. Roads, culverts, and bridges are designed, constructed and maintained in accordance with policies and standards set forth in BLM 9100 Series Manual and the Best Management Practices (BMP). Maintenance levels are assigned to each road reflecting the appropriate maintenance that fits the Transportation Management Objectives (TMO) for the planned management activity.

In FY 2006, the BLM completed the final year of data collection for the road sediment trap study in the Gerber-Upper Lost River Watershed. Data was collected to quantify sediment production from roads at 15 monitoring stations. Analysis of data from the study will examine the effects of several parameters including slope, road surface material, and drainage factors and will help refine the standards for road construction and maintenance. Another 15 road sediment trap sites within the Spencer Creek Watershed are continuing to be maintained for potential future road sediment monitoring efforts.

Conclusions: Progress is being made on development of the criteria and standards for roads.

Monitoring Question 9: What is the status of the reconstruction of roads and associated drainage features identified in watershed analysis as posing a substantial risk? What is the status of closure or elimination of roads to further Aquatic Conservation Strategy Objectives, and to reduce the overall road mileage within all watersheds? If funding is insufficient to implement road mileage reductions, are construction and authorizations through discretionary permits denied to prevent a net increase in road mileage in Key Watersheds?

Findings: During FY 2006, one-tenth of a mile of road was improved and 7.3 miles of road were closed year round to reduce erosion. For a complete summary of road treatments, refer to Section 24.0 - Transportation and Roads and Table 24.1.

Replacement of the under-sized culvert on the Spencer Creek Hook-Up road was implemented in FY 2006.

Conclusions: Progress is being made in reducing overall road mileage and density and reducing the impacts of roads on water quality and aquatic/riparian habitat.

Monitoring Question 10: What is the status of reviews of ongoing research in key watersheds to insure that significant risk to the watershed does not exist?

Monitoring Requirement: Review of existing and proposed research activities in key watersheds and riparian reserves.

Findings: No formal research activities are being conducted in key watersheds or riparian reserves in the Klamath Falls Resource Area.

Monitoring Question 11: What is the status of evaluation of recreation, interpretive and user-enhancement activities/facilities to determine their effects on the watershed? What is the status of eliminating or relocating these activities/facilities when found to be in conflict with Aquatic Conservation Strategy objectives?

Findings: An evaluation of existing recreation facilities inside riparian reserves has not been completed to date.

Monitoring Question 12: What is the status of cooperation with other agencies in the development of watershed-based Coordinated Resource Management Plans and other cooperative agreements to meet Aquatic Conservation Strategy objectives? What is the status of cooperation with other agencies to identify and eliminate wild ungulate impacts which are inconsistent with attainment of Aquatic Conservation Strategy objectives?

Findings: A Coordinated Resource Management Plan was developed for the Spencer Creek Watershed in 1994 by a group consisting of several government agencies, private companies and individuals. Many individual and cooperative projects have been implemented to address concerns from the plan. The group continues to meet on a regular basis to address resource management concerns on both public and private land.

Resource concerns on private and public lands west of Highway 97 are also addressed through the Pokegama Cooperative Habitat Project, which is an alliance of government agencies, private companies, citizens groups and organizations, and individuals.

No detrimental impacts from wild ungulates have been identified. The Pokegama Cooperative Habitat Project group and the BLM will address any impacts if they are identified.

Conclusions: Cooperative agreements and planning efforts are being developed to meet RMP and ACS objectives.

Monitoring Question 13: Are management practices achieving the goal of maintaining long-term site productivity by avoiding, minimizing, or ameliorating soil compaction, displacement, surface erosion, and loss of organic material, including coarse woody debris?

Monitoring Requirement: All management activities using best management practices will be monitored to determine whether best management practices are incorporated in the project design.

At least twenty percent of the timber sales, silviculture projects, or other ground disturbing activities stratified by management category will be randomly selected for monitoring to determine whether or not best management practices were implemented as prescribed. The selection of management actions to be monitored will be based on beneficial uses likely to be impacted, and for which best management practices are being prescribed.

Monitoring Performed: In FY 2006, post-treatment soil monitoring was conducted on the Norcross Stewardship project. No new timber sales were selected for soil disturbance monitoring.

Findings: See Findings under Water and Soils, Implementation Question 1.

Conclusions: See Conclusion under Water and Soils, Implementation Question 1.

Comment/Discussion: The issue of soil health on the resource area is being investigated by quantifying disturbance levels. Concerns have been raised on the resource area about excessive soil compaction possibly occurring with repeated use of a mechanical harvester, mechanical

slashbuster, or combination of both in a forest stand or juniper woodland over time. Use of a mechanical harvester/slashbuster results in greater areal ground disturbance since it is not confined to skid roads, although in theory a mechanical harvester reportedly causes less soil compaction since it exerts less pounds per square inch of force/pressure than other ground-based harvesting machinery. Since use of a mechanical harvester/slashbuster is becoming more and more common and is the most economical choice for density-management treatment of forest stands and juniper woodlands, the resource area is measuring the areal extent of soil disturbance and changes in soil bulk density in representative ground disturbing projects to evaluate soil health.

The RMP threshold for soil disturbance is detrimental soil compaction (defined as 15 percent increase in bulk density) over 20 percent of the project area. Findings from monitoring done in 1998 for one timber sale area suggest that detrimental soil compaction may have occurred. Findings from monitoring done in a different timber sale area in 1998 through 2000 suggest that the threshold for detrimental compaction was approached. The areal extent of soil disturbance monitored in a third timber sale in FY 2000 and FY 2001 was within the standards and guidelines recommendations. In FY 2004, post treatment soil monitoring was conducted on the Short Lake Mountain juniper treatment area and the Bly Mountain Timber Sale on the Eastside of the resource area. Findings on areal disturbance on Bly Mountain show that there was a 30 percent increase in total disturbance, caused primarily by the creation of new skid roads during the timber sale. Insufficient data exist to determine how much of the disturbance was detrimental.

Results of monitoring data analysis to date have not been conclusive regarding soil compaction. Consequently, the resource area will continue to monitor ground disturbing treatments and modify monitoring protocols to quantify the areal extent and degree of soil compaction resulting from various treatment methods. In FY 2006, paired transects were established in the Norcross Stewardship Juniper Project to compare cover (%) and frequency on skid roads and non-yarded areas. Copies of the soil monitoring reports, detailing methods and results, can be obtained at the resource area office.

Terrestrial Species Habitat

Expected Future Conditions and Outputs

- Maintenance of biological diversity and ecosystem health to contribute to healthy wildlife populations, consistent with BLM's Fish and Wildlife 2000 plan and other nationwide initiatives.
- Maintenance of desired conditions in each special habitat (such as meadows, wetlands, and cliff/talus slopes), plus desired conditions in buffers at least 100 feet wide around dry meadows, and wooded swamps.

Implementation Monitoring

Monitoring Question 1: Are suitable (diameter, length and numbers of) snags, coarse woody debris and green trees being left, in a manner that meets the needs of species and provides for ecological function in harvested areas as called for in the SEIS Record of Decision Standards and Guidelines and RMP management direction?

Monitoring Requirement: At least 20 percent of regeneration harvest timber sales in each resource area will be examined by pre- and post-harvest (and after site preparation) inventories to determine snag and green tree numbers, heights, diameters, and distribution within harvest units. The measure of distribution of snags and green trees will be the percent in the upper, middle and lower thirds of the sale units monitored. Snags and green trees remaining following

timber harvest activities (including site preparation for reforestation) will be compared to those that were marked prior to harvest.

The same timber sales will be inventoried pre- and post-harvest to determine if SEIS Record of Decision and RMP down log retention direction has been followed.

Monitoring Performed: No post harvest stand exams were conducted in 2006. However, canopy closure monitoring was conducted on the Muddy Tom TS. Thermal clumps were identified and established to meet wildlife objectives in timber sale areas. Project design features for retention of coarse woody debris and snag retention were implemented in timber sale and fuel treatment units. (Refer to the monitoring section in the APS for further discussion.) Snag monitoring was conducted in areas that were salvage harvested in FY 2005. One hundred twenty-four acres were surveyed to ensure snag retention guidelines were being met. See APS for snag monitoring summary.

Monitoring Question 2: Are special habitats being identified and protected?

Monitoring Requirement: At least 20 percent of BLM actions, within each resource area, on lands including or near special habitats will be examined to determine whether special habitats were protected.

Monitoring Performed: Surveys for special status species such as the great gray owls, Northern goshawk, and terrestrial mollusks are conducted prior to ground-disturbing activities. Nest sites and areas are protected to maintain the necessary structure around the sites for the species. For fuels projects, big sagebrush, bitterbrush, and mountain mahogany patches were flagged and retained as unique habitat features in certain fuel treatment areas. Aspen stands and big sagebrush/shrub steppe habitat throughout the resource area were identified for treatment and improvement. Multiple new nest sites were identified and protected in FY 2006.

Findings: Special habitats are identified and protected through project design that avoids these habitats or by creating reserves within the project areas. Buffers and seasonal restrictions are also included in the project design features. Wildlife biologists often participate in the actual layout to ensure that special habitats get proper recognition and protection. Biologists also participate in the fuels program to identify objectives of the treatment that are compatible with special habitats.

Monitoring Question 3: What is the status of designing and implementing wildlife restoration projects?

Monitoring Performed: Projects completed to improve wildlife habitat in FY 2006 were: 1) planting of 52,000 bitterbrush and mountain mahogany seedlings on 200 acres within a wildfire area, and 2) mechanical and manual removal of juniper trees on historic sage grouse leks and big-game winter ranges. Two hundred acres of oak were flagged in preparation of thinning to promote a healthier oak stand and increase acorn production. Various bird nest boxes and bat boxes were erected throughout the resource area and wildlife escape ramps were upgraded or installed in 14 water developments within the Gerber area.

Findings: Several projects have been designed and implemented to improve habitat for wildlife. Fuels reduction projects were designed around eagle nest sites and range improvement projects were implemented to benefit sage grouse and landbirds.

Monitoring Question 4: What is the status of designing and constructing wildlife interpretive and other user-enhancement facilities?

Monitoring Performed: Development of the Wood River Wetland Interpretive Project continued in FY 2006. The KFRA also continued to work as a cooperator on the Klamath Basin Birding Trail Project.

Findings: Actions in FY 2006 continued for design and development of a wildlife interpretive center, signs, and improved trail system in the Wood River Wetland area. Discussions are continuing to develop programs along the Upper Klamath River and in the Gerber/Willow Valley reservoir area.

Monitoring Question 5: Are elk herds on BLM-administered lands stable or increasing?

Monitoring Performed: Annual guzzler/cistern maintenance and repair was conducted. In addition, native grasses were seeded and bitterbrush and mountain mahogany seedlings were outplanted in several known or potential elk winter range areas. Seasonal and permanent road closures continued across to the Resource Area in elk habitat.

Findings: According to Oregon Department of Fish and Wildlife (ODFW) informal herd counts, elk are stable to increasing in number in the Klamath Falls Resource Area.

Monitoring Question 6: Are range conditions stable or is there obvious competition between resources?

Monitoring Performed: See the response to the “Grazing Management” question #1 in regards to studies and monitoring that address the range condition stability.

In addition, one wildlife specific rangeland monitoring study type has been performed over the past 10 years on some priority wildlife winter range (or potential winter range) allotments - the Modified Cole Browse study. This study measures the post-growth and post-livestock grazing utilization on key browse species in the fall. Then, as a comparison, measurements are taken of the post-winter and pre-growth utilization level in the spring (i.e. measures winter use by wildlife). These measurements are periodically performed on wedgeleaf ceanothus and serviceberry on the KFRA's westside and on antelope bitter brush on the eastside.

Findings: In general, all studies have found range conditions to be stable to improving on the vast majority of the BLM administered lands in the KFRA. Also, see the response to Question #1 in “Grazing Management”.

Summarized findings to date are that livestock (cattle) and wild horses (westside only) make little use of any of the shrub species, with a couple exceptions. Cattle and, in particular, wild horses, will make occasional significant use (i.e., moderate or higher) on serviceberry on the westside; neither make significant summer use of the wedgeleaf ceanothus. On the eastside of the KFRA, cattle will make similar occasional significant use (moderate to heavy) on bitterbrush, but only in the few areas that receive significant livestock use after approximately August 15th.

Conclusions: Rangeland conditions are apparently stable or improving on most of the BLM administered lands within the KFRA. The recently completed Ecological Site Inventory showed this to be true on the Gerber Block. Also, see response to Question #1 in “Grazing Management”.

There are no particular resource concerns with shrub use within the KFRA. The westside use on the serviceberry is insignificant because that shrub is an insignificant part of the vegetation communities. Wedgeleaf ceanothus is vastly more abundant and is not being impacted at present by summer livestock (or wildlife) use. On the eastside, the areas that have received moderate or higher bitterbrush use are extremely small and in areas that are rarely, if ever, used by wintering deer or elk. No studies have found any significant resource competition issues between large wildlife herbivores and livestock on the BLM lands.

Monitoring Question 7: Are facilities or improvements functional and providing desired management results?

Monitoring Requirement: Maintain and check management facilities (such as guzzlers, springs, road closures, etc.) periodically to ensure that they are functioning properly.

Monitoring Performed: Currently, 10 cisterns and 24 spring developments in the resource area are being maintained for wildlife. The cisterns are located throughout the resource area in areas where water is not plentiful. In the past, maintenance of these water sources was through a challenge cost share with the Oregon Department of Fish and Wildlife. In 2006, these springs and guzzlers were checked by volunteers, fire crew members and BLM biologists. Major repairs were scheduled through the range and wildlife programs. Fourteen escape ramps were replaced in the spring developments to upgrade the ramps. The remainder of the developed springs will have new escape ramps installed in 2007.

Various bird nest boxes and bat boxes were erected throughout the resource area. There are 18 owl platforms that are monitored annually for nesting.

In the Gerber area, approximately 11 wood duck nesting-boxes are maintained. Nest boxes are monitored for success and for needed repairs. At the Wood River Wetland, 76 nest boxes were monitored and maintained. Additional areas that could support nesting structures and water developments are periodically reviewed.

Seasonal road closures are visited biannually. Permanent road closures are checked on an annual basis. Four pipe gates were built in cooperation with ODFW to replace some of our older cable gates. These will be installed in 2007.

Findings: Severe damage to locks and road closure gates throughout the KFRA is a continual problem. Many of the locks are being shot and the gates opened, and/or vehicles are driving around the closures.

Conclusions: More time and effort needs to be given to wildlife improvements. Project files have been updated with current maps created in GIS. Due to the decreased effectiveness of the Gerber area closures, a project to replace the existing cable closures with more effective pipe gate closures is being considered. A challenge cost share project proposal with US Timberlands to eliminate unneeded roads on the west side of the resource area is ongoing. The roads are being closed to benefit wildlife habitat and alleviate maintenance problems. An increased monitoring effort will be proposed with help from the Oregon Department of Fish and Wildlife, Oregon State Police, and local conservation groups. This may alleviate some of the closure violations and damage to the gates.

All water improvements for wildlife will be revisited and reviewed in summer of FY 2007.

Monitoring Question 8: Is the BLM protecting special habitats as provided for in the RMP?

Monitoring Requirement: Examine 20 percent of BLM actions on lands containing or near special habitats to determine whether special habitats were protected as provided for in the RMP. Monitor the effects of BLM management on wildlife species using a variety of methods. Coordinate surveys of game species with the Oregon Department of Fish and Wildlife. Conduct monitoring of other species and habitats as needed, such as Neotropical migratory landbirds by vegetation community, individual species surveys when needed, and vegetation surveys as part of the timber and range management activities.

Monitoring Performed: Riparian zones are marked and managed according to the Aquatic Conservation Strategy. Raptor nest sites are protected with buffers and nest season restrictions. Special habitats (such as talus slopes, seeps and springs, etc.) are identified during the planning phase of the activities and protected during the design and implementation phase using the Best Management Practices identified in the RMP. Other habitats such as meadows important

to Great Gray Owls, big game species, and other wildlife are identified during surveys, and buffers are established during timber sale preparation. Landbird surveys were continued in special habitats identified as a concern by the Western Working Group of Partners in Flight.

Surveys are being conducted for landbirds in the Klamath River Canyon, Wood River, grazing allotments, and Gerber Reservoir in cooperation with the Klamath Bird Observatory and Pacific Southwest Research Station of the USFS. Partners in the project included World Wildlife Fund, Point Reyes Bird Observatory, Klamath Basin National Wildlife Refuge, and Winema NF. Data compiled has been and will be used for BLM's evaluation of the FERC relicensing of power projects on the Klamath River, the COB Power Plant proposal, and fuel treatments.

A study of landbirds in habitats including sagebrush steppe, juniper/sagebrush, old growth juniper, and juniper/ponderosa pine, was continued. The purpose of this multi-year study is to evaluate the conditions and trends within these habitat types for assessment of management actions related to juniper harvest treatments.

Findings: District Designated Reserve Buffers (DDRBs) have been established around all spotted owl nest cores, per RMP guidance. The need for special spotted owl habitat silvicultural prescriptions within these DDRBs is evaluated during timber sale planning for potential habitat improvement.

Boundaries for Great Gray Owl buffers were posted around approximately 275 acres of meadows and natural openings in 1999. Within the Muddy Tom Timber Sale area, a portion of the buffer area was identified for habitat enhancement and a silvicultural prescription was developed. In FY 2000, pretreatment stand exams were conducted within these Great Gray Owl meadow buffers. Photo-monitoring plots were established in 2001-2002.

Studies of landbirds are ongoing and site-specific analysis has not yet been completed.

Conclusions: Special habitats specified in the RMP are being provided for as they are identified.

Monitoring Question 9: Is the average width of undisturbed buffers retained following timber harvest and site preparation activities as specified in the RMP?

Monitoring Requirement: Determine average buffer widths by measurements at approximately equidistant points around the affected unique habitat within each timber sale unit.

Monitoring Performed: Buffers are checked during the post timber sale reviews on 20 percent of the sales. Nest buffers for owls, eagles, and accipiters are visited annually during nesting and reproductive success monitoring efforts.

Findings: Buffers are marked and managed according to NFP and RMP guidelines. The average width of buffers established according to the NFP and RMP are being retained following timber harvests.

Special Status and SEIS Special Attention Species Habitat

Expected Future Conditions and Outputs

- Protection, management, and conservation of federal listed and proposed species and their habitats, to achieve their recovery in compliance with the Endangered Species Act and Bureau special status species policies.
- Conservation of federal candidate and Bureau sensitive species and their habitats so as not to contribute to the need to list, and recover the species.

- Conservation of state listed species and their habitats to assist the state in achieving management objectives.
- Maintenance or restoration of community structure, species composition, and ecological processes of special status plant and animal habitat.
- Protection of Bureau assessment species and SEIS special attention species so as not to elevate their status to any higher level of concern.

Implementation Monitoring

Monitoring Question 1:

A) Are special status species being addressed in deciding whether or not to go forward with forest management and other actions?

B) During forest management and other actions that may disturb special status species, are steps taken to mitigate or avoid disturbances?

Monitoring Requirement: At least 20 percent of the files on each year's timber sales, range improvements, grazing decisions, and other relevant actions (e.g., rights-of-way, instream structures) will be reviewed annually to evaluate documentation regarding special status species and related recommendations and decisions in light of the Endangered Species Act requirements, policy and SEIS Record of Decision Standards and Guidelines, and RMP management direction. If mitigation was required, review will ascertain whether such mitigation was incorporated in the authorization document and the actions will be reviewed on the ground after completion to ascertain whether the mitigation was carried out as planned.

Monitoring Performed: Review of the following projects for Special Status Species (including Survey and Manage species): West Spencer, Thin Sheep, and Big Adobe timber sales. Survey for potential habitat and monitoring of known territories/sites continues on the resource area for special status species.

Findings: All areas where forest management or other ground disturbing actions are to take place are surveyed to protocol before the project implementation. If any listed species are found they are managed according to the Management Recommendation in the NFP and resource area guidelines.

Animals

Northern Spotted Owl

Northern spotted owls were adequately addressed to protocol in all of the timber sale areas and fuel treatment units mentioned. Seasonal restrictions have been placed in all appropriate areas to avoid disturbance.

Northern Goshawk

Northern goshawk were adequately addressed to protocol in all of the timber sale areas and fuel treatment units mentioned. Seasonal restrictions have been placed in all appropriate areas to avoid disturbance.

Great Gray Owl

Great gray owls were adequately addressed to protocol in all of the timber sale areas and fuel treatment units mentioned. Seasonal restrictions have been placed in all appropriate areas to avoid disturbance. For the Thin Sheep Sale, a ¼ mile buffer was placed around the nest site and the meadows within the sale were buffered 300ft along the meadows edge.

Bald Eagles

Bald eagles were adequately addressed to protocol in all of the timber sale areas and fuel treatment units mentioned. Seasonal restrictions have been placed in all appropriate areas to avoid disturbance. Projects are designed to maintain nesting and roosting habitat.

Sage Grouse

Sage grouse were adequately addressed to protocol in all of the fuel treatment units mentioned. Seasonal restrictions have been placed in all appropriate areas to avoid disturbance and sage brush was maintained to provide habitat. Juniper treatment is focused on reducing competition with sagebrush and other desirable vegetation to restore sage grouse habitat.

Mollusks

Terrestrial

Several S & M/Special Status terrestrial mollusks have been found on the resource area. These sites will be managed as known sites. During the spring of 2006, potential habitat was surveyed within the Thin Sheep timber sale and the Klamath River Oak Thin/Big Bend fuel treatment areas.

Plants

Vascular Plants

Approximately 6,353 acres of systematic inventory for botanical resources were conducted on the resource area during FY 2006. Several new sites of green-flowered ginger (*Asarum wagneri*), a Bureau sensitive species, were documented. Inventory was accomplished with both BLM resource specialists and consultants through an IDIQ contract.

Conclusions: Special status species are being addressed in deciding whether or not to go forward with forest management and other actions, and steps are taken to mitigate or avoid disturbances.

Monitoring Question 2: Are the actions identified in plans to recover species being implemented in a timely manner?

Monitoring Requirement: Review implementation schedule and actions taken annually, to ascertain if the actions to recover species were carried out as planned.

Monitoring Performed: Programs were reviewed for compliance with recovery plans.

Findings:

Animals

Recommendations contained in the NFP and consultations on individual projects were followed closely.

Plants

No Federally listed threatened or endangered plant species occur on BLM land administered by the Klamath Falls Resource Area. Therefore, no recovery plans have been developed for plant species, which occur in the resource area. The resource area botanist has evaluated the recovery plan and actions for the federally listed (endangered) Applegate's milkvetch (*Astragalus applegatei*). This species is endemic to the Klamath Basin, but no known populations occur on federal lands.

Conclusions: Actions identified in plans to recover species are being implemented in a timely manner.

Monitoring Question 3: What coordination with other agencies has occurred in the management of special status species?

Monitoring Requirement:

The Annual Program Summary will address Implementation Question 3.

Monitoring Performed: The KFRA continued monitoring historic sage grouse leks in FY 2006. Coordination and consultation continued with the USFWS on timber sales, forest health and fuel treatment projects, and any projects with potential impact to threatened and endangered species.

The KFRA has coordinated with adjacent landowners on management of northern spotted owls, bald eagles, and great gray owls. These practices include surveying for spotted owls, agreeing on core areas, coordinating timber management and silvicultural practices, and monitoring of nesting activity before, during, and after projects.

The KFRA continued to communicate with USFWS, ODFW, the Klamath Tribes, Oregon Division of State Lands, Bureau of Reclamation, and several private organizations about the Wood River Wetland restoration effort. Oregon spotted frog surveys were conducted at the Wood River Wetland (including adjacent lands) and at Buck Lake (Tunnel Creek) in coordination with the USGS and the USFS.

Findings: Coordination and cooperation with multiple agencies is a continuous process in project planning and implementation on the Klamath Falls Resource Area.

Conclusions: Coordination with other agencies has occurred in the management of special status species.

Monitoring Question 4: What land acquisitions occurred or are underway, to facilitate the management and recovery of special status species?

Monitoring Requirement: The Annual Program Summary will address Implementation Question 4.

Monitoring Performed: Reviewed potential land acquisitions.

Findings and Conclusions: No land acquisitions occurred or are underway, to specifically facilitate the management and recovery of special status species.

Monitoring Question 5: What site-specific plans for the recovery of special status species were or are being developed?

Monitoring Requirement: The Annual Program Summary will address Implementation Question 5.

Monitoring Performed: Program review.

Findings:

Animals

The KFFO is not currently involved in the development of any site-specific recovery plan.

Plants

An enclosure fence was constructed around a population of Baker's globe mallow (*Iliamna bakeri*) in FY 2003 to document the effect of the removal of livestock grazing pressure. In FY 2004, the number of Baker's globemallow plants were counted to monitor the effects of the exclusion of livestock. Monitoring was conducted in FY 2006 and the plants inside and outside the enclosure were still present. A final report on the conservation status of profuse-flowered mesa mint (*Pogogyne floribunda*) was completed in FY 2006. The project was funded through CCS with a cooperating OSU researcher, and the final report made management recommendations for this species.

Conclusions: Analyses that ascertain species requirements or enhances the recovery or survival of a species are ongoing.

Monitoring Question 6: What is the status of analysis, which ascertains species requirements or enhances the recovery or survival of a species?

Monitoring Requirement: The Annual Program Summary will address Implementation Question 6.

Monitoring Performed: Program review.

Findings:

Animals

The KFFO continues to monitor known sites for northern spotted owls, northern goshawks, and eagles. In addition we also survey potential habitat for spotted owls and Northern goshawks before we conduct ground disturbing activity.

Plants

In FY 2002, a Challenge Cost Share project was proposed to develop a conservation assessment and strategy for profuse-flowered mesa mint (*Pogogyne floribunda*), a Bureau sensitive species that was newly discovered on the resource area in FY 2000. The final report, completed in FY 2006, made management recommendations for this species.

Conclusions: Analyses that ascertain species requirements or enhances the recovery or survival of a species are ongoing.

Monitoring Question 7: What is the status of efforts to maintain or restore the community structure, species composition and ecological processes of special status plant and animal habitat?

Monitoring Requirement: The Annual Program Summary will address Implementation Question 7.

Monitoring Performed: Program review.

Findings:

Animals

Timber harvest prescriptions and fuels treatments continue to look at long term health of the ecosystem. The objectives of the prescriptions are to manage for a multi-storied stand that will be healthy and remain as habitat or return to functional habitat as soon as possible.

Plants

No efforts have been made specifically to maintain or restore the community structure, species composition and ecological processes of special status plant species habitat. However, the reintroduction of fire as an ecosystem process through the prescribed fire program may indirectly accomplish this objective since special status plant species are similarly adapted to fire as other plant species in the plant community of which they are a component.

Conclusions:

Long-term ecosystem health is addressed in management of the timbered land and rangelands.

Aquatic Species Habitat

Expected Future Conditions and Outputs

(See also Aquatic Conservation Strategy Objectives)

- Maintenance or enhancement of the fisheries potential of streams and other waters consistent with BLM's Fish and Wildlife 2000 Plan, the Bring Back the Natives initiative, and other nationwide initiatives.
- Rehabilitation and protection of at-risk fish stocks and their habitat.

Implementation Monitoring

Monitoring Question 1: Are at-risk fish species and stocks being identified?

Monitoring Requirements: The Annual Program Summary will report on the status of watershed analysis of habitat within individual watersheds and restoration project needs.

Monitoring Performed: Refer to Tables 5.1 and 5.2 for status of watershed analyses in the Klamath Falls Resource Area.

Findings: The KFRA continued to implement restoration projects on BLM administered lands as identified within the relevant watershed analyses. Presence/absence and distribution of at-risk fish species/stock continued to be developed in support of restoration actions.

Monitoring Question 2: Are fish habitat restoration and enhancement activities being designed and implemented, which contribute to attainment of Aquatic Conservation Strategy Objectives?

Monitoring Requirements: The Annual Program Summary will report on the status of the design and implementation of fish habitat restoration and habitat activities.

Monitoring Performed: Project implementation of Spencer Creek restoration was completed in 2004. Six miles of Spencer Creek, from the mouth of Miner's Creek to the base of Buck Lake, is proposed for large wood enhancement to for the purpose of increasing channel complexity and habitat diversity. Monitoring of this project began in 2004 and preliminary findings will be available in 2007. A fish passage project including the replacement of a large undersized culvert on a primary access road has been designed and the contract awarded for FY 2006 implementation.

Findings: Fish habitat restoration and enhancement activities are being designed and implemented to contribute towards attainment of ACS objectives.

Monitoring Question 3: Are potential adverse impacts to fish habitat and fish stocks being identified?

Monitoring Requirements: The Annual Program Summary will report on the status of cooperation with federal, tribal and state fish management agencies to identify and eliminate impacts associated with poaching, harvest, habitat manipulation and fish stocking which threaten the continued existence and distribution of native fish stocks inhabiting federal lands. The APS will identify any management activities or fish interpretive and other user-enhancement facilities that have been detrimental effects on native fish stocks.

Monitoring Performed: There has been considerable cooperation between state, federal, and tribal biologists on the work being conducted and work being proposed at the Wood River project (see Wood River section). The project will have long term benefits to fish habitat but there have been short-term losses in habitat quality such as increased sediment which have been identified. These impacts have been mitigated in a number of ways (see Wood River section).

There has also been considerable cooperation between state, federal, and tribal biologists on the Klamath Hydro-electric relicensing project (#2082) to identify existing and potential adverse impacts to fish habitat and fish stocks.

The resource area staff have been cooperating with U.S. Fish and Wildlife Service, Oregon Department of Fish and Wildlife, U.S. Forest Service, The Nature Conservancy, U.S. Bureau of Reclamation, and U.S. Geological Survey-Biological Resources Division on redband trout, sucker, and bull trout working groups to develop and implement scientifically based management strategies for these species.

The resource area staff continues to coordinate with the range, timber, and fuels management programs in order to protect and improve the aquatic habitats. Through the interdisciplinary process actions that are identified as potentially affecting fishery and aquatic resources are identified and recommendations are made to avoid adverse impacts.

Findings: Adverse impacts to fish habitat and fish stocks are being identified and mitigation performed.

Monitoring Question 4: Are habitat improvement projects and opportunities being identified?

Monitoring Requirements: At least twenty percent of the files on each year's timber sales, and other relevant actions, will be reviewed annually to evaluate documentation regarding fish species and habitat and related recommendations and decisions in light of policy and NFP ROD Standards and Guidelines and RMP management direction. If mitigation was required, review will ascertain whether such mitigation was incorporated in the authorization document and the actions will be reviewed on the ground after completion to ascertain whether the mitigation was carried out as planned.

Monitoring Performed: A review of project proposals, including watershed analysis, is performed throughout the year. Habitat improvement projects are typically designed as part of the proposed action or alternatives to the proposed action.

Significant time has been spent time in Gerber, Spencer Creek, and Klamath River areas reviewing existing road/stream crossings for extension of channel connections from road networks and sedimentation problems in most of the fish bearing reaches on BLM administered lands.

Findings: Habitat improvement projects and opportunities are being identified and designed into the overall management of the resource area.

Monitoring Question 5: Are fish populations adequate to provide present and expected future recreational needs?

Monitoring Requirements: Monitor lakes and fish populations, and stocks if necessary.

Monitoring Performed: The KFRA has several excellent recreational fisheries: the lower Wood River, the Klamath River, Four Mile Creek, Miller Creek, Spencer Creek, reservoirs of the Gerber/Willow Valley Watershed, and Topsy reservoir. Most stream fisheries are for redband trout, but Fourmile Creek contains brook trout as well. Reservoir fisheries are for multiple cold water and warm water game fish species. The BLM has contributed to ODFW radio-telemetry monitoring of the Wood River redband trout populations to assess fish movement and aquatic habitats.

Findings: Recreational needs for fisheries are growing in Klamath County. The resource area staff will need to assess and consult with ODFW and USFWS on these streams and watersheds

in light of the increasing recreational demand. The potential exists for improving habitat to protect recreational fisheries against adverse impacts in order to continue to meet recreational needs.

Noxious Weeds

Expected Future Conditions and Outputs

- Containment and/or reduction of noxious weed infestations on BLM-administered land using an integrated pest management approach.
- Avoidance of the introduction or spread of noxious weed infestations in all areas.

Implementation Monitoring

Monitoring Question 1: Are noxious weed control methods compatible with Aquatic Conservation Strategy Objectives?

Monitoring Requirements: Review the files of at least twenty percent of each year's noxious weed control applications to determine if noxious weed control methods were compatible with Aquatic Conservation Strategy Objectives.

Findings: Noxious weed control applications in FY 2006 were conducted using an integrated pest management approach that includes manual, mechanical, chemical, and biological control methods. These methods are used in accordance with the Klamath Falls Resource Area Integrated Weed Control Plan (IWCP) and Environmental Assessment (EA)(OR-014-93-09), which is tiered to the Northwest Area Noxious Weed Control Program EIS (December 1985) and Supplement (March 1987), and are compatible with Aquatic Conservation Strategy Objectives.

Special Areas

Expected Future Conditions and Outputs

- Maintenance, protection, and/or restoration of the relevant and important values of the special areas which include: Areas of Critical Environmental Concern, Research Natural Areas, and Environmental Education Areas.
- Preservation, protection, or restoration of native species composition and ecological processes of biological communities in research natural areas.
- Retention of existing research natural areas and existing areas of critical environmental concern that meet the test for continued designation. Retention of other special areas. Provision of new special areas where needed to maintain or protect important values.

Implementation Monitoring

Monitoring Question 1: Are BLM actions and BLM authorized actions/uses near or within special areas consistent with resource management plan objectives and management direction for special areas?

Monitoring Requirement: Annually, the files on all actions and research proposals within and adjacent to special areas will be reviewed to determine whether the possibility of impacts on areas of critical environmental concern values was considered, and whether any mitigation identified as important for maintenance of areas of critical environmental concern values was required. If mitigation was required, the relevant actions will be reviewed on the ground, after completion, to ascertain whether it was actually implemented.

Monitoring Performed: Review of program and actions for consistency with RMP objectives and direction.

Findings: The Wood River Wetland Area of Critical Environmental Concern (ACEC) has a specific prescriptive plan, developed in conformance within a separate RMP that provides overall management direction and resource use constraints. The project has its own published annual monitoring report, covering a wide range of resources.

A prescribed fire originally planned for FY 2000 was implemented in 2003 and allowed to burn into the Old Baldy RNA/ACEC. Prescribed fire monitoring plots were established in FY 1999 and 2002 according to protocols developed by the National Park Service, and pre-burn data were collected by a researcher from the Oregon Natural Heritage Program (ONHP). Additional vegetation and fuels data were collected in fall 2001, summer 2002, immediately post-burn in 2003, and again in FY 2004, FY 2005, and FY 2006.

Treatment of noxious weed populations is conducted annually within the Klamath Canyon ACEC. An integrated management approach is used which includes chemical, mechanical and biological methods. Control of noxious weeds would help maintain and restore the biological, recreational and scenic resources for which the area was designated.

Conclusions: BLM actions and BLM authorized actions/uses near or within special areas are consistent with resource management plan objectives and management direction for special areas.

Monitoring Question 2:

What is the status of the preparation, revision, and implementation of areas of critical environmental concern management plans?

Findings: The Wood River Wetland ACEC has a specific prescriptive plan, developed in conformance within a separate RMP that provides overall management direction and resource use constraints. Many of the restoration and interpretation actions have been completed, including river restoration, interpretive displays, and scenic view areas. Implementation and management direction has been closely coordinated with the Klamath Tribes. The project has its own published annual monitoring report, covering a wide range of resources.

Management of the Klamath Canyon ACEC was addressed in the Draft Upper Klamath River Management Plan and Environmental Impact Statement, released for public comment in April 2003. The final River Plan/EIS will be completed at some future date.

The Old Baldy RNA/ACEC was designated to fill the southern Cascades chaparral plant community cell. This community is thought to be partially maintained by fire. Therefore, prescribed fire conducted in FY 2003 was allowed to burn into the RNA. Prescribed fire monitoring plots were established in 1999 and 2002 according to protocols developed by the National Park Service, and pre-burn data were collected by a researcher from the Oregon Natural Heritage Program. BLM staff collected pre-burn and immediate post-burn vegetation and fuels data. Vegetation data were collected again in FY 2004, FY 2005, and FY 2006. These actions will help maintain and protect the resource values for which the area was designated.

No other management plans for ACECs have been developed. However, all ACECs are managed to protect the relevant and important values, which were identified when they were evaluated and designated during the RMP process. General management direction for each special area is given in the Klamath Falls Resource Area Record of Decision and Resource Management Plan and Range Program Summary (pp. 41 - 42).

Conclusions: Management plans for some ACECs are being or have been developed and implemented.

Monitoring Question 3: What environmental education and research initiatives and programs are occurring in the research natural areas and environmental education areas?

Findings: A prescribed fire implemented in FY 2003 was allowed to burn into a portion of the Old Baldy RNA/ACEC. Prescribed fire effects monitoring plots were established in 1999 according to protocols developed by the National Park Service to study the effects of fire on this plant community. These pre-burn data were collected by a researcher from the Oregon Natural Heritage Program and BLM staff. Additional vegetation and fuels data were collected in Fall 2001, Summer 2002, and immediately post-burn in 2003. Vegetation data were collected again in FY 2004, FY 2005, and FY 2006.

The Clover Creek Environmental Education Area is the site of an annual Forestry School Tour. Sixth graders from all over Klamath County learn about reforestation, tree identification, soil and water conservation, fire, wildlife and outdoor recreation. This three-day event includes about 80 kids and a number of agencies including BLM, USFWS, USFS, ODFW, ODF and several private and county groups. Multiple tours of the Wood River Wetland are conducted for participants that range in age from first graders to adults.

Conclusions: Environmental education and research initiatives and programs are occurring in the research natural areas and environmental education areas.

Monitoring Question 4: Are existing BLM actions and BLM authorized actions and uses not consistent with management direction for special areas being eliminated or relocated?

Findings: BLM actions and BLM authorized actions/uses near or within special areas are consistent with resource management plan objectives and management direction for special areas.

Monitoring Question 5:

A) Are actions being identified which are needed to maintain or restore the important values of the special areas?

B) Are the actions being implemented?

Findings: The Wood River Wetland ACEC has a specific prescriptive plan, developed in conformance within a separate RMP that provides overall management direction and resource use constraints. Many of the restoration and interpretation actions have been completed, including river restoration, interpretive displays, and scenic view areas. Implementation and management direction has been closely coordinated with the Klamath Tribes. The project has its own published annual monitoring report, covering a wide range of resources.

The Old Baldy RNA/ACEC was designated to fill the southern Cascades chaparral plant community cell. This community is thought to be partially maintained by fire. Therefore, prescribed fire planned for FY 2003 will be allowed to burn into the RNA. Prescribed fire monitoring plots were established in 1999 according to protocols developed by the National Park Service, and pre-burn data were collected by a researcher from the Oregon Natural Heritage Program. Additional vegetation and fuels data were collected in fall 2001, summer 2002, and immediately post-burn in 2003. Additional vegetation data were collected in FY 2004, FY 2005, and FY 2006. These actions will help maintain and protect the resource values for which the area was designated.

In the Tunnel Creek District Designated Reserve, prescribed fire effects monitoring plots were established in FY 2003 according to protocols developed by the National Park Service. The plots will provide pre- and post-treatment data on dead and down fuel loads and vegetation

composition. In FY 2004, modified KFRA tree exams were established in the same plots to monitor tree condition and age pre and post treatment. Additional data were collected in FY 2005. Analysis will describe changes in cover and frequency of species, fuel loading, organic soil layers, burn severity and tree mortality.

Treatment of noxious weed populations is conducted annually within the Klamath Canyon ACEC. An integrated weed management approach is used which includes chemical, mechanical and biological methods. Control of noxious weeds would help maintain and restore the biological, recreational and scenic resources for which the area was designated.

Conclusions: Actions are being identified which are needed to maintain or restore the important values of the special areas, and the actions are being implemented.

Wild and Scenic Rivers

Expected Future Conditions and Outputs

- Protection of the Outstandingly Remarkable Values of designated components of the national Wild and Scenic Rivers System through the maintenance and enhancement of the natural integrity of river-related values.
- Protection of the Outstandingly Remarkable Values of eligible/suitable Wild and Scenic Rivers and the maintenance or enhancement of the highest tentative classification pending resolution of suitability and/or designation.
- Designation of important and manageable river segments suitable for designation where such designation contributes to the National Wild and Scenic Rivers System.

Implementation Monitoring

Monitoring Question 1: Are BLM actions and BLM authorized actions consistent with protection of the Outstandingly Remarkable Values of designated or suitable rivers?

Monitoring Requirements: Annually, the files on all actions and research proposals within and adjacent to Wild and Scenic River corridors will be reviewed to determine whether the possibility of impacts on the Outstandingly Remarkable Values was considered, and whether any mitigation identified as important for maintenance of the values was required. If mitigation was required, the relevant actions will be reviewed on the ground, after completion, to ascertain whether mitigation was actually implemented.

Monitoring Performed: BLM recreation staff members met periodically with upper Klamath River outfitters and guides and staff members of PacifiCorp, the utility company that operates the hydroelectric plants above and below the designated Wild & Scenic segment. In FY 2006, a preseason meeting was held to review the previous rafting season and to discuss issues regarding timing, volume, and duration of water releases during the peak rafting season. Relicensing of the Klamath River hydroelectric project was also discussed.

Findings: Whitewater rafting is consistent with maintaining the Outstandingly Remarkable recreation Value on the upper Klamath Wild and Scenic river.

Monitoring Question 2:

- A) Are existing plans being revised to conform to Aquatic Conservation Strategy Objectives?
- B) Are revised plans being implemented?

Findings: A draft Upper Klamath River Management Plan/EIS, released for public comment in April 2003, was developed for the 15-mile portion of the Klamath River that is within the

KFRA to conform with Aquatic Conservation Strategy Objectives. The final UKRMP/EIS is on hold.

Monitoring Question 3: Do actions and plans address maintenance or enhancement of the outstandingly remarkable values?

Monitoring Requirements: Annually, the files on all actions and research proposals within and adjacent to Wild and Scenic River corridors will be reviewed to determine whether the possibility of impacts on the Outstandingly Remarkable Values was considered, and whether any mitigation identified as important for maintenance of the values was required. If mitigation was required, the relevant actions will be reviewed on the ground, after completion, to ascertain whether mitigation was actually implemented.

Monitoring Performed: No research proposals were reviewed in 2005.

Findings: Objectives for maintaining and enhancing ORV's were met in all project implementation.

Cultural Resources Including American Indian Values

Expected Future Conditions and Outputs

- Identification of cultural resource localities for public, scientific, and cultural heritage purposes.
- Consideration and protection of cultural resource values for future generations.
- Provision of information on long-term environmental change and past interactions between humans and the environment.
- Fulfillment of responsibilities to appropriate American Indian groups regarding heritage and religious concerns.

Implementation Monitoring

Monitoring Question 1:

Are cultural resources being addressed in deciding whether or not to go forward with forest management and other actions? During forest management and other actions that may disturb cultural resources, are steps taken to adequately mitigate disturbances?

Monitoring Requirements: At least 20 percent of the files on each year's timber sales and other relevant actions (e.g., rights-of-way, instream structures) will be reviewed annually to evaluate documentation regarding cultural resources and American Indian values in light of requirement, policy and NFP Record of Decision Standards and Guidelines, and RMP management direction. If mitigation was required, review will ascertain whether such mitigation was incorporated in the authorization document and the actions will be reviewed on the ground after completion to ascertain whether the mitigation was carried out as planned.

Monitoring Performed: Review of existing survey data for Fuels and Timber management projects and in-field inspection of contract activity.

Findings: A review of existing data (Class I inventory) was conducted prior to implementation of the fire and timber projects, then, the previously unsurveyed areas were 100% surveyed (Class III Inventory). A total of 92 new prehistoric and historic sites were recorded during survey of 10,632 acres.

In previously surveyed areas, an archaeologist performed monitoring at the sites. Monitoring consisted of relocating sites, reestablishing flagging to outline site boundaries, and updating site

location and site report forms. Once sites were relocated with a Global Positioning System, site location/boundaries were downloaded into a geographical information system (GIS) database. Because the sites would be avoided during project activity, a “no effect” determination was made in consultation with the State Historic Preservation Officer.

Conclusion: Cultural resources were addressed in deciding whether or not to go forward with ground disturbing activities.

Monitoring Question 2: What mechanisms have been developed to describe past landscapes and the role of humans in shaping those landscapes?

Findings: Professor Stephen Beckham from Lewis and Clark College was contracted to write a historical landscape overview of the Klamath River Canyon. The overview focuses on the river canyon, but also investigates historical developments within the region as they relate to the canyon. The research effort was completed in FY 2005 and publication of this research is planned in FY 2007 as part of the OR/WA Cultural Resource series.

Site location data was collected during archaeological inventory and transferred into the geographic information system. This information will be used to analyze site location patterning with respect to current environmental variables and may prove useful for detecting human/environment interaction during the relatively recent past.

Conclusion: Due to limited funding and Klamath Tribal concerns, no archaeological excavations were conducted on lands administered by the Klamath Falls Field Office. Excavations often provide important data that can be used to interpret the roles humans have played in shaping past environments.

Monitoring Question 3: What efforts are being made to work with American Indian groups to accomplish cultural resource objectives and achieve goals outlined in existing memoranda of understanding and develop additional memoranda as needs arise?

Findings: The BLM consults with the Klamath Tribes on projects that could potentially impact cultural resources and Tribal values through a bimonthly meeting with the Klamath Tribes Culture and Heritage Department. Extensive consultation is conducted via presentations to the Tribal Council for projects of serious concern to the Klamath Tribes. A Draft Memorandum of Understanding (Agreement) was developed to foster increased communication between the Klamath Tribes and the BLM, but has yet to be signed by the Klamath Tribes.

Monitoring Question 4: What public education and interpretive programs were developed to promote appreciation of cultural resources?

Findings: KFRA archaeologists regularly participate in public education programs. During FY 2006 a variety of archaeological presentations were given to the following groups: universities and colleges, high schools, historical societies, Tribes, professional societies, and public events. Approximately 504 people attended these presentations. In FY 2006, cultural resource specialists gave presentations during an Oregon Archaeology Month event at Portland State University and a workshop on the Archaeological Resources Protection Act was organized for the Northwest Anthropological Conference.

Visual Resources

Expected Future Conditions and Outputs

- Preservation or retention of the existing character of landscapes on BLM-administered lands allocated for Visual Resource Management Class I and II management; partial

retention of the existing character on lands allocated for Visual Resource Management Class III management and major modification of the existing character of some lands allocated for Visual Resource Management Class IV management.

- Continuation of emphasis on management of scenic resources in selected high-use areas to retain or preserve scenic quality.

Implementation Monitoring

Monitoring Question 1: Are visual resource design features and mitigation methods being followed during timber sales and other substantial actions in Visual Resource Management Class II, III, and IV areas?

Monitoring Requirements: Twenty percent of the files for timber sales and other substantial projects in Visual Resource Management Class II and III areas will be reviewed to ascertain whether relevant design features or mitigating measures were included.

Monitoring Performed: All fiscal year 2005 timber sales and other substantial projects.

Findings: The CHEW Timber Sale EA (OR-014-05-03) was reviewed in FY 2005. Within the project area, there are approximately 350 acres of BLM lands in VRM class II areas and 850 acres of VRM class III areas. During the review of the EA some additional project design features and mitigation measures were added to assist in maintaining visual class II objectives.

The South Gerber forest health EA (OR-014-04-06) was completed in FY 2005. The project area contains approximately 1,400 acres of BLM lands in VRM class II areas. During the review of the project, additional project design features were added to protect recreation sites and assist in maintaining visual class II objectives.

PacifiCorp's final license application for the Klamath Hydroelectric Project (FERC #2082) was reviewed for consistency in protecting BLM lands within VRM class II and III areas. Preliminary proposed terms and conditions have been identified to improve scenic quality and reduce visual impacts from the proposed project operations and existing facilities.

Several other project actions for various resources, including fuels treatments, were reviewed and additional mitigation or project design features to protect visual resources were incorporated as needed.

Conclusion: Visual resource design features and mitigation methods are being followed during forest health treatments planning and other substantial actions in Visual Resource Management Class II, III, and IV areas to ameliorate any adverse impacts from those projects on visual resources.

Rural Interface Areas

Expected Future Conditions and Outputs

- Consideration of the interests of adjacent landowners, including residents, during analysis, planning, and monitoring related to managed rural interface areas. These areas are defined as public lands within 1/4 mile of identified rural interface areas zoned for one to twenty acre lots. (These interests include personal health and safety, improvements to property and quality of life.)

Implementation Monitoring

Monitoring Question 1: Are design features and mitigation measures developed and implemented to avoid/minimize impacts to health, life and property and quality of life and to minimize the possibility of conflicts between private and federal land management?

Monitoring Requirements: At least 20 percent of all actions within the identified rural interface areas will be examined to determine if special project design features and mitigation measures were included and implemented as planned.

Monitoring Performed: In FY 2006, monitoring was completed on projects implemented in rural interface areas.

Findings: The monitoring of interface projects found no instances where the project design features or mitigation measures were not followed.

Conclusion: Implementation of interface projects is consistent with project design features and objectives to minimize impacts were met.

Socioeconomic Conditions

Expected Future Conditions and Outputs

- Contributions to local, state, national, and international economies through sustainable use of BLM-managed lands and resources and use of innovative contracting and other implementation strategies.
- Provision of amenities for the enhancement of communities as places to live and work.

Implementation Monitoring

Monitoring Question 1: What strategies and programs have been developed, through coordination with state and local governments, to support local economies and enhance local communities?

Findings: Since 1991, the resource area has been participating in a unique partnership of government and private recreation and tourism providers: Klamath/Lake/Modoc/Siskiyou County Outdoor Recreation Working group. The group meets approximately every two months, sharing information on projects, and events, exploring new opportunities for partnerships and coordination, and promotion of local tourism. For FY 2005, the Lakeview District provided \$5,000 to support this organization. The Wood River Wetland continues to be a focus for cooperation and restoration efforts. The Upper Basin (Hatfield) Working Group, a citizen group commissioned by Senator Mark Hatfield continues to identify short and long-term restoration opportunities in the Klamath Basin and Northern California above Iron Gate Dam have identified and found funding sources for implementation of many restoration opportunities within the Klamath Basin.

The Klamath Falls Resource Area has coordinated with state and local governments in diverse activities such as recreation and timber sale planning, fish habitat inventory, water quality monitoring, hazardous material cleanup, air quality maintenance, wildfire suppression, road improvement, and recreation site developments.

Monitoring Question 2: Are RMP implementation strategies being identified that support local economies?

Findings: In 2006, the majority of the support for local economies came from timber sales, stewardship contract work, and fuel reduction/vegetation manipulation contracts that employed local people. The Resource Area tasked out approximately \$800,000 of service work under the Gerber Stew Stewardship Contract and 1.8 million dollars on fuel reduction contracts. Funding for the stewardship work came from multiple sources and treatments included forest health thinning, riparian restoration, spring improvement, juniper woodland cutting and yarding, road improvement, culvert removal, and road obliteration. In addition to the service work which generated assisted local employment, a variety of forest and rangeland products were removed and delivered both locally and to the surrounding region. Products included sawlogs, clean chips for hardboard production locally, and biomass for energy production. The KFRA also offered two timber sales in FY 2006 and the local plywood mill was the high bidder on both timber sales. Recreation facilities in such areas including the upper Klamath River and several campgrounds (Gerber, and Topsy) received infrastructure enhancements to improve visitor experiences and meet user expectations. Additional enhancements such as construction of new trails, designated back county byways, interpretive displays, and brochures will be developed as funding allows.

Monitoring Question 3: What is the status of planning and developing amenities that enhance local communities, such as recreation and wildlife viewing facilities?

Findings: Reference Monitoring Question Findings in # 1 and 2 above, and in the sections addressing Recreation, Wildlife and the Wood River Wetland area accomplishments in this document.

Recreation

Expected Future Conditions and Outputs

- Provision of a wide range of developed and dispersed recreation opportunities that contribute to meeting projected recreation demand within the planning area.
- Provision of non-motorized recreational opportunities and creation of additional opportunities consistent with other management objectives.

Implementation Monitoring

Monitoring Question 1: What is the status of the development and implementation of recreation plans?

Findings: The BLM completed the draft Upper Klamath River Management Plan/ Environmental Impact Statement (KRMP/EIS) in April 2003. The final KRMP/EIS is on hold. Recreation management (including proposed alternatives for non-motorized recreation opportunities) is a component of this river plan. A memorandum of understanding has been signed with the Oregon State Parks and Recreation Department on joint management of the Wild and Scenic River/State Scenic Waterway. A separate chapter of the river plan will address State Scenic Waterway issues.

Analysis of issues and projects has been completed for the Hamaker Mountain Special Recreation Management Area (SRMA), and has been started for the Stukel Mountain SRMA. No timeline for completing more comprehensive recreation plans for these areas is proposed.

Site-specific design and planning along with ongoing facility upgrades and renovations continue to be implemented through Recreation Pipeline Restoration Funds under the existing Klamath Falls RMP and Wood River Wetland RMP.

The Gerber/Willow Valley Watershed Analysis was completed in July 2003. The watershed analysis contains a discussion of existing recreation management and proposed changes or additions to recreation management in the Gerber area, since completion of the RMP/EIS in June 1995. Layout and design for the Miller Creek-Potholes non-motorized trail began in FY 2003. Construction of approximately 8 miles of trail to link Gerber North and South campgrounds with Miller Creek and 3 primitive campsites began in 2005. The three primitive campsites will receive small corrals along with barrier posts and access upgrades to reduce impacts from vehicles. Through FY 2006, a total of four miles of the trail have been constructed.

Forest Management and Timber Resources

Expected Future Conditions and Outputs

- Provision of a sustained yield of timber and other forest products.
- Reduction of the risk of stand loss due to fires, animals, insects, and diseases.
- Provision of salvage harvest for timber killed or damaged by events such as wildfire, windstorms, insects, or disease, in a manner consistent with management objectives for other resources.
- Maintenance or restoration of healthy ecosystems while providing for the harvest of timber and other forest products in balance with other resource values and needs.

Implementation Monitoring

Monitoring Question 1: By land-use allocation, how do timber sale volumes, harvested acres, and the age and type of regeneration harvest stands compare to the projections in the SEIS ROD Standards & Guidelines and RMP management objectives?

Monitoring Performed: Table M-4 is a summary by land use allocation of the timber volume and acreage that has been harvested in the KFRA since the signing of the RMP on June 2, 1995. The volume and acres are summarized by harvest method, land allocation, RMP/EIS Assumed Average, and Percent of Assumed average. All KFRA westside lands are in the Southern General Forest Management Area (SGFMA). All KFRA eastside lands are outside the boundaries of the Northwest Forest Plan.

Findings: There are some differences between actual treatments acres and the projected average. These are discussed in detail in the section near the beginning of this monitoring report.

Monitoring Question 2: Were the silvicultural (for example, planting with genetically selected stock, fertilization, release, and thinning) and forest health practices anticipated in the calculation of the expected sale quantity implemented?

Monitoring Requirements: An annual district wide report will be prepared to determine if the silvicultural and forest health practices identified and used in the calculation of the probable sale quantity were implemented. This report is summarized in this Annual Program Summary.

Findings: Completed silvicultural treatments are shown in Table 2.1 and Table 19.10 of the Annual Program Summary. Calculation of the ASQ was based on successful planting of regeneration units and normal stand development unimpeded by excessive vegetative competition or animal damage, and also taking into consideration precommercial thinning when needed. (Yield gains were not assumed for planting genetically selected trees, fertilization, or pruning.)

All timber sale silvicultural prescriptions and watershed analyses considered forest health practices. In each prescription, retention and maintenance of under-represented and early-successional species (pines and Douglas fir) was emphasized to help increase the composition of these species in stands to more closely reflect historic conditions. These are generally located in the mixed conifer forest types in the Spencer Creek and Jenny Creek drainages. Even in the mortality salvage sales, some thinning is done around the larger old growth for reduction of understory competition. Elevated fuel level hazards are addressed in the density management sale prescriptions. All prescriptions are designed to leave harvested stands with reduced fuel loads, with a lower risk for a stand replacing fire, and in a condition where post-project underburns could be implemented in the stand.

Conclusion: Silvicultural and forest health practices were anticipated and are being implemented. The excess mortality that has occurred was not anticipated and as a result, a modification in treatment prescriptions has been necessary to harvest the on-going mortality.

Special Forest/Natural Products and Biomass

Expected Future Conditions and Outputs

- Production and sale of special forest/natural products when demand is present and where actions taken are consistent with primary objectives for the land use allocation.
- Utilization of the principles of ecosystem management to guide the management and harvest of special forest products.

Implementation Monitoring

Monitoring Question 1: Is the sustainability and protection of special forest/natural product resources ensured prior to selling special forest products?

Findings: To date, sustainability of special forest products has not been an issue because the demand has been primarily on special/natural products which can be readily found. Permits have been issued for wood products including; firewood, sawlogs, posts, and poles. Additional special forest products that have been sold include; juniper boughs, Christmas trees, mushrooms, greenery, lichen, cones, and transplants. When selling lichens, bryophytes, and certain fungi, resource specialists are consulted prior to issuing any unique permits.

With the recent shortage of power concerns throughout the west, there are some on-going discussions and plans for additional small cogeneration power plants that would be fueled by biomass. The KFRA has two potential sources of biomass that could be utilized for fuel. One source would be western juniper trees that have encroached on thousands of acres of rangeland. The KFRA analyzed treating up to 1,000 acres per year of western juniper in the RMP in addition to range allotment improvements where juniper cutting was also analyzed. The capability of providing western juniper on a sustained basis for power plants, and to meet the needs of the public for personal use as well, may eventually need to be addressed. Western juniper utilization (yarding) is presently being monitored by the resource area to assess short term and long term impacts (See Water and Soils section) Another source of biomass is from the residual logging slash as a result of various forest health treatments on the west side of the resource and within mixed conifer stands. The KFRA has historically burned residual landing piles from timber sales. In 2006, the KFRA issued a task order under the Gerber Stew Stewardship Contract to remove over 9,000 tons (approximately 360 chip vans) of residual logging slash from timber sale landings. The biomass went to three different biomass facilities in the region.

Conclusion: At the present time, based on the different resource evaluations completed thus far, and permits issued to date, sustainability of Special Forest Products is not threatened.

Monitoring Question 2: What is the status of the development and implementation of specific guidelines for the management of individual special forest/natural products?

Findings: The Klamath Falls Resource Area received from the Oregon State Office an updated Handbook 5400-2 addressing Special Forest Products in June of 1995. In addition, the Klamath Falls Resource Area individually develops specific harvesting guidelines for products to ensure sustainability and permit compliance. For example, for bough harvest, permit holders are required to follow specific guidelines to assure survival of the tree from which the boughs are removed. In addition, specific guidelines are written for harvesting mushrooms to ensure sustainability. Although most small sales permits generally result in minimal resource impacts, specifications are included in the permits that addresses weather, roads, fire risk, sustainability, cultural, and other resource concerns. In FY 2003, the KFRA updated the District Special Forest Product Handbook and included a number of new collection requirements. These requirements were applicable in FY 2006 as well.

The Klamath Falls Resource Area is continuing to monitor on-going juniper treatment areas. Monitoring is being designed to assess impacts from juniper cutting and in some cases removal. In addition, the plots are designed to monitor soil and vegetative impacts from the different equipment used to cut and remove the juniper. Pre and post treatment monitoring is being done (See Water and Soils section).

Conclusion: Based on field experience, and the small number of permits issued for products, sustainability of Special Forest Products in the immediate future is assured.

Wildfire / Fuels Management

Expected Future Conditions and Outputs

- Provision of the appropriate suppression responses to wildfires in order to meet resource management objectives and minimize the risk of large-scale, high intensity wildfires.
- Utilization of prescribed fire to meet resource management objectives. (This will include, but not be limited to, fuels management for wildfire hazard reduction, restoration or desired vegetation conditions, management of habitat, and silvicultural treatments.)
- Adherence to smoke management/air quality standards of the Clean Air Act and State Implementation Plan standards for prescribed burning.

Implementation Monitoring

Monitoring Question 1: Have analysis and planning been completed to allow some natural fires to burn under prescribed conditions?

Findings: No analysis and planning were completed for FY 2006 natural fires. BLM managers have not completed adequate planning or analysis to allow natural fires to burn under certain prescribed conditions.

Monitoring Question 2: Do wildfire suppression plans emphasize maintaining late-successional habitat?

Findings: Wildland Fire Situation Analyses will be prepared for all wildfire and suppression actions that escape initial attack.

Conclusions: In FY2006, all 17 fires were contained at initial attack, for a total of 51 acres. All fires were lightning caused.

Monitoring Question 3: Are Wildfire Situation Analyses being prepared for wildfires that escape initial attack?

Findings: Wildfire suppression plans include protecting multiple resources including Late-Successional habitat. The plans and assessments for late-successional reserves address this issue.

Monitoring Question 4: What is the status of interdisciplinary team preparation and implementation of fuel hazard reduction plans?

Findings: Fuels and Fire Management Plans continue to be developed in conjunction with a late-successional reserve assessments, completed by the interdisciplinary team. These LSR assessments contain recommendations for each LSR as to fuel treatments. Some LSRs require extensive actions, while others will receive no treatments at the present time.

Conclusions: In FY 2006, all 17 fires were contained at initial attack, for a total of 51 acres. All fires were lightning caused.

Rangeland Resources / Grazing Management

Expected Future Conditions and Outputs

- The livestock and wild horse grazing programs will be managed under the principles of multiple use and sustained yield. Monitor the existing grazing allotments and the wild horse herd management area in compliance with the established “Coordinated Monitoring and Evaluation Plan for Grazing Allotments” for the Klamath Falls Resource Area.
- Monitoring data will be the foundation to support adjustments in the management of grazing use by livestock and wild horses. Evaluation of the monitoring data, in relation to the identified allotment objectives in this Proposed Resource Management Plan as well as future standards and guidelines, will be completed through a team of interdisciplinary resource specialists, with public review as appropriate.

Implementation Monitoring

Monitoring Question 1: Are allotments and herd management area goals and objectives being achieved with current management as specified on an allotment specific basis?

Monitoring Performed: Rangeland monitoring studies have been completed during FY 1995-2005 in accordance with KFRA’s *Coordinated Monitoring and Evaluation Plan for Grazing Allotments*. This directs the most monitoring emphasis on high priority (management category “I”) allotments, including the two allotments (Dixie and Edge Creek), which constitute the Pokegama HMA. Of particular importance are the three allotments in the Gerber Block – Horsefly, Dry Prairie, and Pitchlog - that are under ESA Section 7 consultation.

Studies include various rangeland condition, trend, and utilization studies; riparian classification, condition, and photo trend studies; actual grazing use supervision and information; Ecological Site Inventory, or ESI (though not monitoring per se, this survey does help support and direct the other rangeland monitoring); and other rangeland monitoring studies as needed. On low priority allotments (virtually all of the “C” category allotments) monitoring is done on an as needed basis depending on problems or concerns that arise at some given point in time. Typically this is some situational, short term grazing administration problem that occurs on an allotment, needs some type of management attention to solve, the effects of

which need monitored (usually use supervision) to ensure that the problem was properly and adequately addressed. As noted previously under the grazing section, ESI is being conducted for most of the “C” category allotments in order to have ecologically based vegetation information to assist in the preparation of upcoming Rangeland Health Standards Assessments.

The Pokegama HMA has been aerial and/or ground censused every year since completion of the KFRA ROD/RMP. In 2005, the current herd population level was estimated to be between 30-35 head, based on the latest aerial census (February 2002) supplemented by numerous ground observations. This herd level is within the established AML (Appropriate Management Level) and not in need of any removals.

Findings: Rangeland monitoring studies established, read, and reread over the past 14 grazing seasons (FY 1992-2005) have found that grazing use on priority allotments is within land use planning and other pertinent resource objective levels and requirements including the five Standards for Rangeland Health for Oregon and Washington. Priority allotments include the 14 “I” category, 4 “M” category, and 1 “C” category allotments (allotment categorization is explained in the KFRA ROD/RMP - pages H-69-70). The combined acreage of these priority allotments comprises 60% of the KFRA grazing land base. Yearly priorities also include a number of “C” allotments that need attention based on a variety of grazing administration problems or issues. Recent watershed analysis efforts, allotment evaluations, and Rangeland Health Standards Assessments have supported the above finding. However, the amount of information collected is more than can be summarized in this APS; this information and the various evaluations and assessments are available at the KFRA.

For the Pokegama HMA, the herd was found to be above the determined Appropriate Management Level (AML) of 30 to 50 head in 1996 and 2000. (The AML was established based on properly evaluated rangeland monitoring studies performed over time that have determined the current number is appropriate to a self-sustaining population of healthy animals in balance with other uses and the productive capacity of their habitat.) Because the AML was exceeded, wild horse removals were necessary to get back to AML. This was accomplished by bait-trapping performed by Resource Area personnel during the spring/summer/fall of 1996 and again in May/June 2000. Twenty horses (in 1996) and 18 horses (in 2000) were removed from the HMA and transported to the wild horse corrals in Burns, Oregon for adoption via the Bureau’s Adopt-a-Horse program. No removals have been done since 2000. Based on the currently slow growth rate of the herd, it is not expected that any removals will be necessary until later in the decade.

Conclusion: The answer to this monitoring question is “generally yes”, on a priority allotment basis. This means that allotments in the “I” and “M” categories, those that are identified for livestock use reductions in the RMP, are under ESA Section 7 consultation, contain important perennial streams, and/or have other critical resource issues, are receiving the most attention and management action and are at, or moving significantly towards, meeting Land Use Plan (LUP) objectives. The Pokegama HMA is also meeting LUP objectives and goals by being within AML and having at least adequate habitat available. Lower priority “C” allotments are generally also meeting the minimal objectives set for these areas. The currently ongoing process of assessing all allotments (including low priority “C” category ones) to ensure the meeting of the Standards for Rangeland Health will determine if allotments are meeting resource objectives, and if not, management will be adjusted to ensure the future meeting of objectives. This process, which began in 1999, is scheduled to extend through 2010.

Monitoring Question 2: Are the appropriate standards and guidelines, applicable to livestock and wild horse grazing, being correctly applied and followed?

Findings: See response to #1 above.

Monitoring Question 3: Are rangeland improvement projects consistent with meeting the objectives of all resources addressed in this Resource Management Plan as well as the Aquatic Conservation Strategy and Late-Successional/District Designated Reserve objectives?

Monitoring Performed: Monitoring of rangeland improvements is done in conjunction with normal grazing use supervision and rangeland monitoring field visits to grazing allotments. This monitoring is typically to determine if a given rangeland improvement is functioning as it should, i.e. fence is intact, spring is flowing, etc. If not, the project is repaired or reconstructed by the BLM (typically maintenance of riparian projects), or the grazing user is notified and required to fix the problem if the project is their maintenance responsibility (grazing regulations at 43 CFR 4100). An estimated 20-25 grazing improvement projects are checked annually, with 5-10 repaired by BLM personnel. Many more are inspected and repaired by grazing permittees and lessees.

Findings: No existing rangeland improvements are known to conflict with the objectives stated in this monitoring question.

Conclusion: All rangeland projects (new or existing) are believed to be consistent with the meeting of the listed LUP objectives. If projects are found in the future that are inconsistent, they will be altered or removed. All future proposed projects would be reviewed to ensure consistency.

GLOSSARY / ACRONYMS

GLOSSARY / ACRONYMS

Allowable Sale Quantity (ASQ) - An estimate of annual average timber sale volume that can be harvested from lands allocated to be planned, sustainable harvest. ASQ is used interchangeably with PSQ in this Annual Program Summary to avoid confusion related to technical differences in their definitions.

Alternate Dispute Resolution (ADR) - Given the complexity of the Adjudication and other water allocations issues in the Klamath Basin, the Oregon Water Resources Department (OWRD) has initiated a voluntary alternative dispute resolution (ADR) process to provide a forum to address adjudication claim issues and other matters related to water supply and demand in the Klamath Basin.

Appropriate Management Level (AML) - The optimum number of wild horses (or burros) within a Herd Management Area (HMA) that results in a thriving ecological balance and avoids a deterioration of the range. Numbers above the AML are considered “excess” and must be removed.

Animal Unit Month (AUM) - Amount of forage required to sustain one cow and calf, or one horse, or five sheep, for one month.

Annual Program Summary (APS) - A review of the programs on a district or resource area for a specific time period, usually a fiscal year (FY).

Aquatic Conservation Strategy (ACS) - A strategy developed to restore and maintain the ecological health of watersheds and aquatic ecosystems within the planning area addressed by the Northwest Forest Plan.

Areal extent – In soil monitoring, a quantifiable measurement that is a comparison of pretreatment undisturbed project area and post treatment project disturbance area. Further defined as area of detrimental conditions: leave a minimum of 80% of area (including permanent transportation system) in an acceptable productivity potential for trees and other managed vegetation.

Archaeological Site - A geographic locale that contains the material remains of prehistoric and/or historic human activity.

Archaeological Resource Protection Act (ARPA) - (P.L. 96_95; 93 Stat. 721; 16 U.S.C. 470aa et seq.) as amended (P.L. 100_555; P.L. 100_588) - provides felony-level penalties, more severe than those of the Antiquities Act of 1906 (see .03A), for the unauthorized excavation, removal, damage, alteration, defacement, or the attempted unauthorized removal, damage, alteration, or defacement of any archaeological resource, more than 100 years of age, found on public lands or Indian lands. The act also prohibits the sale, purchase, exchange, transportation, receipt, or offering of any archaeological resource obtained from public lands or Indian lands in violation of any provision, rule, regulation, ordinance, or permit under the act, or under any Federal, State, or local law. No distinction is made regarding National Register eligibility. The act establishes definitions; permit requirements, and criminal and civil penalties, among other provisions, to correct legal gaps and deficiencies in the Antiquities Act (see .03A). The act overlaps with and partially supersedes the Antiquities Act.

Area of Critical Environmental Concern (ACEC) - An area of BLM administered lands where special management attention is needed to protect and prevent irreparable damage to important historic, cultural or scenic values, fish and wildlife resources, or other natural systems or processes; or to protect life and provide safety from natural hazards.

Best Management Practices (BMP) - Methods, measures, or practices designed to prevent or reduce water pollution. Not limited to structural and nonstructural controls and procedures for operations and maintenance. Usually, BMPs are applied as a system of practices rather than a single practice.

Biological Diversity - The variety of life and its processes, including a complexity of species, communities, gene pools, and ecological function.

Biological Opinion (BO) - A determination reached for endangered fish or wildlife species that is issued by the USFWS through consultation with another agency. This opinion evaluates the potential impacts to a species from a specific project and provides recommendations for protection of the viability of the species.

Board Foot - A unit of solid wood, one-foot square and one inch thick.

Bulk Density - Soil bulk density is the ratio of mass to volume for a given sample of soil and is commonly used as a measure of the compaction of a given soil. The higher the bulk density value, the more compact a soil is. Bulk density is expressed in grams/cubic centimeter (g/cm³). Water at room temperature (25 degrees C.) and 1 atmospheric pressure has a bulk density of 1.0 g/cm³.

Bureau Assessment Species – (Refer to “Special Status Species”)

Bureau of Land Management (BLM) - Agency within the Department of the Interior charged with management of the public lands.

Bureau Sensitive Species - (Refer to “Special Status Species”)

Candidate Species - (Refer to “Special Status Species”)

Categorical Exclusion (CX) - A categorical exclusion is used when it has been determined that some types of proposed activities do not individually or cumulatively have significant environmental effects and may be exempt from requirements to prepare an environmental analysis. Categorical exclusions (CX) are covered specifically by Department of Interior and BLM guidelines.

Cavity Nesters - Wildlife species, most frequently birds, that require cavities (holes) in trees for nesting and reproduction.

Clean Water Act (CWA) - the Clean Water Act is the primary Federal statute governing the restoration and maintenance of the chemical, physical, and biological integrity of the Nation’s waters.

Coarse Woody Debris (CWD) - Woody pieces of trees that have been detached from their original source of growth (dead trees that are not self-supporting shall be considered severed). This includes uprooted trees and any severed stems or branches attached to them. It does not include: live trees, dead limbs or branches attached to a dead tree, stumps, dead foliage, bark, or designated shrub species.

Coordinated Resource Management Plan (CRMP) - A resource management plan covering a specific geographical area, typically with a mixed land ownership pattern, that coordinates with all interested land owners and affected government agencies to manage for a wide array of resources and resource concerns. This process emphasizes mutually agreed upon goals and a cooperative, instead of confrontational, approach.

Council on Environmental Quality (CEQ) - Government agency with oversight of the implementation of the National Environmental Policy Act (NEPA).

Cubic Foot (CF) - A unit of solid wood, one foot square and one foot thick.

Cultural Resource - objects, sites and information of historic, prehistoric, archeological, architectural, paleontological or traditional significance.

Cumulative Effect - The impact that results from identified actions when they are added to other past, present, and reasonably foreseeable future actions regardless of who undertakes such other actions. Cumulative effects can result from individually minor but collectively significant actions taking place over a period of time.

Density Management (DM) - Cutting of trees for the primary purpose of widening their spacing so that growth of remaining trees can be accelerated. Density management harvest can also be used to improve forest health, to open the forest canopy, or to accelerate the attainment of old growth characteristics.

Department of Environmental Quality (DEQ) - A department of Oregon State government with responsibilities to oversee the state’s environmental laws.

Diameter at Breast Height (DBH) - The diameter of a tree 4.5 feet above the ground on the uphill side of the tree.

District Designated Reserves (DDR) - Areas designated for the protection of specific resources, flora and fauna, and other values. These areas are not included in other land use allocations nor in the calculation of the PSQ.

Ecological Site Inventory - BLM's rangeland survey method has four seral stages based on similarity to the perceived Potential Natural Community. Those stages are Early Seral, Mid Seral, Late Seral and Potential Natural Community.

Ecosystem Restoration Office (ERO) - The ERO is an interagency office which is operated cooperatively by the U.S. Fish and Wildlife Service, Bureau of Reclamation, U.S. Forest Service and the BLM. This interagency office provides funding, technical assistance, and monitoring for watershed restoration projects which are proposed by the Upper Klamath Basin Working Group. This group works closely with the Klamath Basin Provincial Advisory Committee and watershed councils within the Klamath Basin.

EIS Special Attention Species - A term that incorporates the "Survey and Manage" and "Protection Buffer" species from the Northwest Forest Plan.

Eligible River - A river or river segment found, through interdisciplinary team and, in some cases, interagency review, to meet Wild and Scenic River Act criteria of being free flowing and possessing one or more Outstandingly Remarkable Values.

Endangered Species - (Refer to "Special Status Species")

Endangered Species Act (ESA) - Act created in 1973 that identified a National List (administered by the USFWS) of any plant, animal, or fish that is in danger of extinction throughout all or a significant portion of its range. Prior to implementation of projects, a consultation process with USFWS is required for species that have threatened, proposed, and candidate status.

Environmental Assessment (EA) - A systematic analysis of site-specific BLM activities used to determine whether such activities have a significant effect on the quality of the human environment; and whether a formal Environmental Impact Statement is required; and to aid an agency's compliance with NEPA when no EIS is necessary.

Environmental Education Area - Area used to inform and educate the public on topics relating to the environment(s) found within the KFRA.

Environmental Impact Statement (EIS) - Type of document prepared by Federal agencies in compliance with the National Environmental Policy Act (NEPA) that identifies the environmental consequences of proposed major Federal actions expected to have significant impacts on the human environment.

Federal Energy and Regulatory Commission (FERC) - Government agency with responsibility for issuing permits and license for power projects.

Fiscal Year (FY) – Budgeting year for the BLM from October 1 through September 30 each year.

Geographic Information System (GIS) - Computer Database of resource information.

Global Positioning System (GPS) - Satellite technology used to locate a specific point on the ground.

Green Tree Retention (GTR) - Within the KFRA, a term for leaving green trees in a stand when planning a regeneration cut timber sale. Typically, between 16-25 trees per acre, will be retained in the stand.

Hazardous Materials - Anything that poses a substantive present or potential hazard to human health or the environment when improperly treated, stored, transported, disposed of or otherwise managed.

Herd Management Area (HMA) - Public land under the jurisdiction of the Bureau of Land Management that has been designated for special management emphasizing the maintenance of an established wild horse herd. HMAs are defined by the "Wild Free-Roaming Horse and Burro Act" of 1971.

Interdisciplinary Team (IDT) - A team of resource specialists organized by agencies to prepare environmental documents.

Integrated Weed Control Plan (IWCP) - The plan and programmatic EA for noxious weed management within the KFRA approved in 1993.

Intermountain West Joint Venture (IWJV) - The IWJV was formed in 1995 and covers eastern Oregon and parts of nine other western states. This group meets quarterly and is in the process of writing an area plan to determine conditions of wetlands and identify opportunities to improve wetland habitat. The plan (in development) will focus on the Klamath Basin eco-region. This plan, as well as other eco-regions plan within the ten western states, is following the guidelines outlined under the North American Wetlands Conservation Act of 1989. The representatives for the Klamath Basin eco-region are BLM, Ducks Unlimited, Oregon Department of Fish and Wildlife, U.S. Fish and Wildlife Service, Modoc National Forest, California Fish and Game, and Oregon Joint Venture. The plan is expected to be completed within two years.

Klamath Falls Resource Area (KFRA) - That portion of the BLM/Lakeview District located in the south end of Klamath County.

Land Use Allocation (LUA) - Allocations that define uses and or activities that are allowable, restricted, and prohibited. They may be expressed in terms of area such as acres or miles. Each allocation is associated with a specific management objective.

Late-Successional Reserves (LSR) - Lands managed to maintain and restore old-growth forest conditions.

Matrix Lands - Federal land outside of reserves and special management areas that will be available for timber harvest at varying levels.

Memorandum of Understanding (MOU) - A document between agencies or sovereign nations, such as an Indian tribe, that discloses the protocol for how each party will coordinate and consult with each other relative to a particular activity or activities.

Million Board Feet (MMBF) - An expression of volume of trees harvested from timber sales, in millions of board feet.

Monitoring and Evaluation - Collection and analysis of data to evaluate the progress and effectiveness of on-the-ground actions in meeting resource management goals and objectives.

Mortality Salvage - Timber sales designed to utilize mortality (dead and /or dying trees). This primarily involves only the removal of the mortality within the stand. Normally, less than 10% of the volume removed is live trees in the mortality salvage sales.

National Environmental Policy Act of 1969 (NEPA) - Law requiring all federal agencies to evaluate the impacts of proposed major Federal actions with respect to their significance on the human environment.

National Historic Preservation Act (NHPA) - An act to establish a program for the preservation of additional historic properties throughout the nation, and for other purposes. This act extends the policy in the Historic Sites Act to include State and local as well as national significance, expands the National Register of Historic Places, and establishes the Advisory Council on Historic Preservation, State Historic Preservation Officers, and a preservation grants-in-aid program.

Natural Resource Conservation Service (NRCS) - A Federal agency that helps private landowners correct resource problems occurring on their land.

Northwest Forest Plan (NFP) - The plan for management of Forest Service and Bureau of Land Management late-successional and old-growth forest lands within the range of the northern spotted owl.

Noxious Plant/Weed - A plant designated by the U.S. Department of Agriculture, or state or local weed board, as being injurious to public health, recreation, wildlife, or any public or private property.

O&C Lands (O&C) - Public lands granted to the Oregon and California Railroad Company, and subsequently re-vested to the United States, that are managed by the Bureau of Land Management and Forest Service under the authority of the O&C Lands Act.

Offered (sold) Volume or Offered (sold) Acres - Any timber sold during the year by auction or negotiated sales, including modifications to contracts. It should be noted that for this Annual Program Summary, offered is considered the same as sold.

Off-Highway Vehicle (OHV) - Any motorized track or wheeled vehicle designed for cross-country travel over natural terrain. The term, "Off Highway Vehicle" will be used in place of the term "Off Road Vehicle" to comply with the purposes of Executive orders 11644 and 11989. The definition for both terms is the same.

Open - Designated areas and trails where Off Highway Vehicles may be operated subject to operating regulations and vehicle standards set forth in BLM Manuals 8341 and 8343.

Limited - Designated areas and trails where Off Highway Vehicles are subject to restrictions limiting the number or types of vehicles, date, and time of use; limited to existing or designated roads and trails.

Closed - Areas and trails where the use of Off Highway Vehicles is permanently or temporarily prohibited. Emergency use is allowed.

Oregon Department of Agriculture (ODA) - A branch of Oregon State Government with responsibilities for agricultural activities, noxious weed management, and native plant conservation.

Oregon Department of Environmental Quality (ODEQ) - A department of Oregon State government with responsibilities to oversee the state's environmental laws.

Oregon Department of Fish and Wildlife (ODFW) - A branch of Oregon State Government with responsibilities for managing wildlife populations on federal and state lands.

Outstanding Natural Area (ONA) - An area that contains unusual natural characteristics and is managed primarily for educational and recreational purposes.

Outstandingly Remarkable Values (ORV) - Values among those listed in Section 1 (b) of the Wild and Scenic Rivers Act: "scenic, recreational, geological, fish and wildlife, historical, cultural, or other similar values...". Other similar values that may be considered include ecological, biological or botanical, paleontological, hydrological, scientific, or research.

Payment in Lieu of Taxes (PILT) - Federal payments to local governments to offset losses in property taxes due to nontaxable Federal lands within their boundaries. BLM is responsible for calculating the payments according to formulas established by law and distributing the funds appropriated by Congress.

Pre-commercial Thinning (PCT) - The practice of removing some of the trees less than merchantable size from a stand so that remaining trees will grow faster.

Prescribed Fire - A fire burning under specified conditions and designed to accomplish definite, define objectives.

Probable Sale Quantity (PSQ) - An estimated average annual volume that can be harvested from lands allocated to planned, sustainable harvest. PSQ is used interchangeably with ASQ in this Annual Program Summary to avoid confusion related to technical differences in their definitions.

Projected Acres - These "modeled" age class acres are estimates derived from modeling various silvicultural prescriptions for regeneration, commercial thinning and density management harvest. Modeled age class acre projections may or may not correspond to "Offered" or "Harvested" age class acres at a given point in the decade. Additional age classes are scheduled for regeneration, commercial thinning and density management harvest at other points in the decade.

Protection Buffer Species - Species designated in the Northwest Forest Plan that provides for specific management of known sites for these species, and, in many cases, requires surveys prior to ground disturbing activities.

Rangeland Program Summary (RPS) - A BLM planning document typically completed in conjunction with an RMP Record of Decision that lays out the specifics for grazing management by grazing allotment. This includes allotment specific resource objectives, level and season of use, allotment categorization, wildlife allocations, and other information relevant to a give allotment.

Resource Apprentice Program for Students (RAPS) - A work experience program for high school students intended to give the students actual experiences in natural resource management.

Regeneration Harvest - Timber harvest with the objective of opening a forest stand enough to regenerate desired tree species.

Regional Ecosystem Office (REO) - Office established to provide staff work and support to the Regional Interagency Executive Committee (RIEC) so the standards and guidelines in the Northwest Forest Plan can be successfully implemented.

Regional Interagency Executive Committee (RIEC) - This group serves as the senior regional entity to assure the prompt, coordinated, and successful implementation of the forest management plan standards and guidelines at the regional level.

Research Natural Area (RNA) - An area that contains natural resource values of scientific interest and is managed primarily for research and educational purposes. Each RNA is also an Area of Critical Environmental Concern (ACEC).

Resources and People (RAP) Camp - This camp is designed to inform students (ages 15-18) and educators about natural resource management and careers working with natural resources.

Resource Management Plan (RMP) - A land use plan prepared by the BLM under current regulations in accordance with the Federal land Policy and Management Act.

Right-of-Way (ROW) - A permit or easement that authorizes the use of public lands for specified purposes, such as pipelines, roads, telephone lines, electric lines, reservoirs, and the lands covered by such an easement or permit.

Riparian Reserve (RR) - Riparian Reserves are portions of watersheds where riparian-dependent resources receive primary emphasis and where special standards and guidelines apply. Riparian Reserves occur at the margins of standing and flowing water, intermittent stream channels and ephemeral ponds, and wetlands.

Rural Interface Areas (RIA) - Areas where BLM administered lands are adjacent to or intermingled with privately owned lands zoned for 1 to 20-acre lots or that already have residential development. (See also WUI.)

Seral Stages (Eastside rangeland communities) - The series of relatively transitory plant communities that develop during ecological succession from a community with no native plants (or possibly bare ground) to the potential natural community (PNC or climax) stage. There are four levels recognized by the Ecological Site Inventory, each of which is defined as the present state of vegetation on an ecological site in relation to the historic climax plant community for the site. The four stages are defined (for our area) as follows:

Early Seral – A plant community that exhibits 0-25% similarity to the historic climax plant community. Often these communities are dominated by exotic annual plant species or native species that are not typically found on the site (e.g. western juniper dominated sites that should not have much juniper). Site typical plant species are sparse to (rarely) absent.

Mid Seral - A plant community that exhibits 26-50% similarity to the historic climax plant community. These sites may or may not have functional plant communities, typically have a distinct overabundance of shrubs and/or juniper, have significant amounts of exotic annuals, and typically, have less half of the climax quantity of perennial native grasses.

Late Seral – A plant community that exhibits 51-75% similarity to the historic climax plant community. These communities are often very functional and stable, but may have a slight overabundance of shrubs or tree species, an slight to moderate under-abundance of native perennial grasses, and have some quantity of non-site typical plants species. Exotic annuals are sparse, though often present in small to insignificant quantities.

Potential Natural Community (PNC) – A plant community that has 76-100% of the historic climax plant community present. These are typically the most ecologically functional – and often stable - plant community that can exist on a site. Exotic annuals are rare to nonexistent.

Seral Stages (Westside forest communities) - The series of relatively transitory plant communities that develop during ecological succession from bare ground to the climax stage. There are five stages recognized in forest succession:

Early Seral Stage - The period from disturbance to crown closure of conifer stands usually occurring from 0-15 years. Grass, herbs, or brush are plentiful.

Mid Seral Stage - The period in the life of a forest stand from crown closure to ages 15-40. Due to stand density, brush, grass, or herbs rapidly decrease in the stand. Hiding cover for wildlife may be produced.

Late Seral Stage - The period in the life of a forest stand from first merchantability to culmination of Mean Annual increment. This is under a regime including commercial thinning, or to about 100 years of age, depending on wildlife habitat needs. During this period, stand diversity is minimal, except that conifer mortality rates will be fairly rapid. Hiding and thermal cover may be present. Forage is minimal.

Mature Seral Stage - The period in the life of a forest stand from Culmination of Mean Annual Increment to an old growth stage of about 200 years. This is a time of gradually increasing stand diversity. Hiding cover, thermal cover, and some forage may be present.

Old Growth - This stage constitutes the potential plant community capable of existing on a site given the frequency of natural disturbance events. For forest communities, this stage exists from approximately age 200 until when stand replacement occurs and secondary succession begins again. Depending on fire frequency and intensity, old growth forests may have different structures, species composition, and age distributions. In forests with longer periods between natural disturbances the forest structure will be more even-aged at late mature or early old growth stages.

Silvicultural Prescription - A professional plan for controlling the establishment, composition, constitution, and growth of forests.

Site Preparation - Any action taken in conjunction with a reforestation effort (natural or artificial) to create an environment that is favorable for survival of suitable trees during the first growing season. This condition can be created by altering ground cover, soil or microsite conditions, using biological, mechanical, or manual clearing, prescribed burns, or a combination of methods.

Southern General Forest Management Area (SGFMA) (See Matrix) - Forest land managed on a regeneration harvest cycle of 60-110 years. All Matrix lands south of Grants Pass, Oregon are designated as SGFMA.

Special Recreation Management Area (SRMA) - Area having commitment to provide specific recreation activity and experience opportunities. These areas usually require high level of recreation investment and/or management. Include, but not limited to, recreation sites.

Special Status Species - Plant or animal species falling into any one of the following Federal, State, or BLM status categories:

FEDERAL STATUS (USFWS)

Endangered – Any species defined through the Endangered Species Act as being in danger of becoming extinct within the foreseeable future throughout all or a significant portion of their range. Listings are published in the Federal Register.

Threatened - Any plant or animal species defined under the Endangered Species Act as likely to become endangered within the foreseeable future throughout all or a significant portion of its range. Listings are published in the Federal Register.

Listed Endangered (LE) - Taxa listed by the U.S. Fish and Wildlife Service (USFWS) or the National Marine Fisheries Service (NMFS) as Endangered under the Endangered Species Act (ESA), or by the Departments of Agriculture (ODA) and Fish and Wildlife (ODFW) of the state of Oregon under the Oregon Endangered Species Act of 1987 (OESA).

Listed Threatened (LT) - Taxa listed by the USFWS, NMFS, ODA, or ODFW as Threatened.

Proposed Endangered (PE) - Taxa proposed by the USFWS or NMFS to be listed as Endangered under the ESA or by ODFW or ODA under the OESA.

Proposed Threatened (PT) - Taxa proposed by the USFWS or NMFS to be listed as Threatened under the ESA or by ODFW or ODA under the OESA.

Candidate (C) - Taxa for which NMFS or USFWS have sufficient information to support a proposal to list under the ESA, or which is a candidate for listing by the ODA under the OESA. There are two categories of primary concern to BLM:

Category 1 - Taxa for which the USFWS has substantial information on hand to support proposing the species for listing as threatened or endangered. Listing proposals are either being prepared or have been delayed by higher priority listing work.

Category 2 - Taxa for which the USFWS has information to indicate that listing is possibly appropriate. Additional information is being collected.

Species of Concern (SoC) - Former C2 candidates which need additional information in order to propose as Threatened or Endangered under the ESA. These are species which USFWS is reviewing for consideration as Candidates for listing under the ESA.

BUREAU STATUS (BLM)

Bureau Sensitive (BS) - According to the definition in the Bureau 6840 policy, BS designation includes species that could easily become endangered or extinct in a state. They are restricted in range and have natural or human-caused threats to survival. BS species are not FE, FT, FPE, FPT, FC, SE, or ST, but are eligible for federal or state listing or candidate status. BS species are designated by the State Director and are tiered to the state fish/wildlife/botanical agencies' or ONHP designations. BS species that are Oregon state Critical - animals and Candidates - plants, Washington state Sensitive - animals and Threatened and Endangered - plants, or ONHP List 1 are considered BS species.

Bureau Assessment (BA) - Bureau Assessment is category that pertains to OR/WA BLM only per the OR/WA BLM 6840 policy. Plant and wildlife species which are not presently eligible for official federal or state status but are of concern in Oregon or Washington may, at a minimum, need protection or mitigation in BLM activities. These species will be considered as a level of special status species separate from BS, and are referred to as BA species.

Bureau Tracking (BT) - Bureau Tracking is a status that pertains to OR/WA BLM only per the BLM OR/WA 6840 policy. To enable an early warning for species which may become of concern in the future, districts are encouraged to collect occurrence data on species for which more information is needed to determine status within the state or which no longer need active management. Until status of such species changes to federal or state listed or proposed, FC, BS or BA species, BT will not be considered as special status species for management purposes.

STATE STATUS (ODFW)

Critical (SC) - Species for which listing as threatened or endangered is pending; or those for which listing as threatened or endangered may be appropriate if immediate conservation actions are not taken. Also considered critical are some peripheral species which are at risk throughout their range, and some disjunct populations.

Vulnerable (SV) - Species for which listing as threatened or endangered is not believed to be imminent and can be avoided through continued or expanded use of adequate protective measures and monitoring. In some cases the population is sustainable, and protective measures are being implemented; in others, the population may be declining and improved protective measures are needed to maintain sustainable populations over time.

Peripheral or Naturally Rare (SP) –Peripheral species refer to those whose Oregon populations are on the edge of their range. Naturally rare species are those which had low population numbers historically in Oregon because of naturally limiting factors. Maintaining the status quo for the habitats and populations of these species is a minimum requirement. Disjunct populations of several species which occur in Oregon should not be confused with peripheral.

Undetermined Status (SU) - Animals in this category are species for which status is unclear. They may be susceptible to population decline of sufficient magnitude that they could qualify for endangered, threatened, critical or vulnerable status, but scientific study will be required before a judgment can be made.

OREGON NATURAL HERITAGE PROGRAM STATUS (ONHP)

List 1 contains taxa that are threatened with extinction or presumed to be extinct throughout their entire range.

List 2 contains taxa that are threatened with extirpation or presumed to be extirpated from the state of Oregon. These are often peripheral or disjunct species which are of concern when considering species diversity within Oregon's borders. They can be very significant when protecting the genetic diversity of a taxon. ONHP regards extreme rarity as a significant threat and has included species which are very rare in Oregon on this list.

List 3 contains species for which more information is needed before status can be determined, but which may be threatened or endangered in Oregon or throughout their range.

List 4 contains taxa which are of conservation concern but are not currently threatened or endangered. This includes taxa which are very rare but are currently secure, as well as taxa which are declining in numbers or habitat but are still too common to be proposed as threatened or endangered. While these taxa currently may not need the same active management attention as threatened or endangered taxa, they do require continued monitoring.

State Listed Species - Any plant or animal species listed by the state of Oregon as threatened or endangered within the state under ORS 496.004, ORS 498.026, or ORS 564.040. (See above.)

Survey and Manage - As outlined in the Northwest Forest Plan, the survey and manage standards and guidelines; provide benefits to old-growth associated species, which are considered to be at risk even after establishment of mapped and unmapped Late-Successional reserves.

Target Volume - As used in the document, target volume refers to the volume to be offered for sale as directed by the resource area annual budget.

The Nature Conservancy (TNC) - An environmental group that promotes returning managed lands to their historical or natural state.

Threatened Species - (Refer to "Special Status Species")

Thousand Board Feet (MBF) - An expression of volume of trees harvested from timber sales in thousands of board feet.

Timber Sale Information System (TSIS) - The national information system that tracks all facets of a timber sale/salvage.

Total Maximum Daily Load (TMDL) - A tool for implementing State water quality standards. It is based on the relationship between pollution sources and in-stream water quality standards. The TMDL establishes allowable pollutant loadings or other quantifiable parameters (such as temperature) for a water body and thereby provides the basis for States to establish water quality-based controls.

Transportation Management Plan (TMP) - The transportation plan developed for a specific area or by a specific agency that provides how and what kinds of vehicles are allowed in that area.

Unmapped Late Successional Reserves (UMLSR) - a small block of forest approximately 100 acres in size designated around known spotted owl activity centers located on lands in the matrix. UMLSRs were established under the direction of the Northwest Forest Plan (NFP), but are not displayed on regional maps in the NFP. The objective for these areas is to protect and restore conditions for a variety of late successional and old growth dependent species.

Understory Reduction - Timber cutting done to reduce the density of primarily sub-merchantable (3-7 inch diameter) shade-tolerant species in the understory for the purpose of reducing fire risk and ladder fuels, as well as to enhance health of overstory trees.

United States Fish and Wildlife Service (USFWS) - That branch of the Federal Government with responsibility for enforcing the Endangered Species Act and managing the network of National Wildlife Refuge System Lands.

United States Forest Service (USFS) - An agency within the Federal Department of Agriculture with responsibility for management of the Federal National Forests.

Visual Resource Management (VRM) - The inventory and planning actions to identify visual values and establish objectives for managing those values, and the management actions to achieve visual management objectives.

Water Quality Management Plan (WQMP) - Plans required by the State of Oregon for management of rivers and tributaries to assure that total maximum daily loads are not exceeded.

Water Resources Department (WRD) - The Oregon Water Resources Department (WRD) initiated the Klamath Basin Adjudication in 1975. The Klamath Adjudication is an Oregon general water claim adjudication in which the final decree will be issued by the Klamath County Circuit Court. All Adjudication claims were filed with the WRD by April 1997. The Adjudication is the first Oregon general water adjudication in which complex federal claims have been filed.

Watershed Council - There is ongoing participation with the Klamath Watershed Council. The BLM is represented on the Councils' Technical Advisory Committees. The council is active in coordinating watershed and water quality enhancement projects.

Whitewater Rafting - The recreational activity of running a river in a rubber raft or other river non-motorized craft usually when river flows are high.

Wild & Scenic River System (W&S) - A National system of rivers or river segments that have been designated by Congress and the President as part of the national Wild and Scenic Rivers System (Public Law 90-542, 1968). Each designated river is classified as one of the following:

Wild River - A river or section of a river free of impoundments and generally inaccessible except by trail, with watersheds or shorelines essentially primitive and waters unpolluted. Designated wild as part of the Wild and Scenic Rivers System.

Scenic River - A river or section of river free of impoundments, with shorelines or watersheds still largely primitive and undeveloped but accessible in places by roads. Designated scenic as part of the national Wild and Scenic Rivers System.

Recreational River - A river or section of a river readily accessible by road or railroad that may have some development along its shorelines, and that may have undergone some impoundment or diversion in the past. Designated recreational as part of the national Wild and Scenic Rivers System.

Wilderness Study Area (WSA) - Public land under the jurisdiction of the Bureau of Land Management that has been studied for wilderness character and is currently in an interim management status awaiting official wilderness designation or release from WSA status by Congress.
