

Optometric Manpower: Characteristics of Optometric Practice United States-1968

From information collected in a national survey of optometrists conducted by the National Center for Health Statistics, statistics are presented describing features of optometric practice in the United States in 1968. These features include the form and composition of practice arrangements, primary and secondary activities of the practitioners, the range of services that practitioners provided and the numbers and types of supplementary personnel that the optometrist used to assist him in his practice.

OPTOMETRIC MANPOWER: CHARACTERISTICS OF OPTOMETRIC PRACTICE

Hugo K. Koch, M.H.A., and Hazel M. Phillips
Division of Health Manpower and Facilities Statistics

INTRODUCTION

This is the sixth in a series of reports from the findings of a national survey of manpower in the eye-care occupations in 1968 and 1969. The survey, conducted by the National Center for Health Statistics with the active assistance of the Bureau of the Census, had as its goal to elicit information about ophthalmologists, optometrists, and opticians and about the supplementary personnel who assisted these primary functionaries in the provision of eye-care services. The five previously published reports based on the survey findings are:

Opticians Employed in Health Services. *Vital and Health Statistics*. DHEW Publication No. (HSM) 72-1025, Series 14 - No. 3. June 1972

Ophthalmology Manpower: A General Profile. *Vital and Health Statistics*. DHEW Publication No. (HSM) 73-1800, Series 14 - No. 5. December 1972

Ophthalmology Manpower: Characteristics of Clinical Practice. *Vital and Health Statistics*. DHEW Publication No. (HSM) 73-1802, Series 14 - No. 7. March 1973

Optometrists Employed in Health Services. *Vital and Health Statistics*. DHEW Publication No. (HSM) 73-1803, Series 14 - No. 8. March 1973

Ophthalmology Manpower: Utilization of Supplementary Personnel. *Vital and Health Sta-*

tistics. DHEW Publication No. (HSM) 73-1804, Series 14, No. 9. May 1973

The present report is the second report which describes personnel who provided optometric services in this Nation in 1968. A previous report on optometric manpower outlined the general demographic and professional characteristics of optometrists who were active and inactive in their profession at the time of the survey; selected statistics from this report are presented on pages 2 and 3. The present report, which contains 27 detailed statistical tables, presents statistics on several of the more specific features of optometric practice. These features include the form and composition of practice arrangements, primary and secondary activities of the optometric practitioner, and the range of optometric services that the practitioner provided. A substantial portion of the report is devoted to the numbers and types of supplementary personnel that the optometrist used to assist him in his practice. The 27 detailed tables that are found in this report are optometrists by number of patient visits per week (tables 1-3), number of patients seen per week (tables 4-6), number of supplementary personnel of all types used to assist the optometrist in practice, such as secretaries and/or receptionists, general optometric assistants, optometric technicians, dispensing opticians, contact lens technicians, and optical technicians (tables 7-27).

Statistics used in the two reports on optometric manpower reflect the application of a statistical adjustment designed to compensate for total or partial nonresponse to the survey question-

naire. The adjustment yielded an estimate of 18,427 for the number of optometrists active in their profession at the time of the 1968 survey; this figure supplied the statistical base for most of the tables and textual discussion that appeared in the first report. Very few members of this active universe occupied themselves solely with activities such as teaching, research, or administration—activities which excluded patient care. About 99 percent of the active universe reported that they devoted at least some part of their weekly professional effort to the care of optometric patients. This 99 percent, numbering 18,299 practitioners, make up the report universe for the present report; they are the chief subjects of its tabular data and textual commentary.

In the pages that follow, comparison will sometimes be made between the practice characteristics of optometrists and those of the ophthalmologists surveyed in 1968 (Series 14, No. 7), especially when the two professional groups appear to overlap in the patient services that they offered and in their respective utilizations of the available manpower resource in supplementary eye-care personnel.

The text is supported by the 27 detailed statistical tables and three appendixes. Appendix I explains the methodology that was used in the collection and processing of data obtained from the 1968 survey of optometrists. Appendix II defines certain terms used in the report and Appendix III is a facsimile of the questionnaire used to survey optometrists in 1968.

1968 OPTOMETRISTS IN PERSPECTIVE

General Demographic and Professional Characteristics

The following statistics were selected from the earlier report, *Optometrists Employed in Health Services: United States-1968* (Series 14, Number 8), the first report on optometric manpower from the findings of the 1968 survey.

There were an estimated 20,301 civilian optometrists in the United States in 1968. Of these, 1,873 optometrists, or about 9 percent of the total, were inactive in their profession, 922 by reason of retirement and 951 for other reasons. About 91 percent of the total, 18,427 optometrists, were actively engaged in professional optometric activities, a ratio of 9.3 active optometrists to every 100,000 persons in the general population.

The geographic distribution of optometrists did not always mirror the distribution of the general population, as is revealed in table A. The ratio of optometrists to population was lowest in the South Region although the largest regional proportion of the Nation's population was to be found in the South. The North Central Region was favored over other regions both in the percent of all active optometrists located there and in the fact that it boasted the second highest ratio of optometrists to general population. The West Region had the highest ratio—11.2 optometrists per 100,000 population. For a more localized

Table A. Percent distribution of 1968 civilian population, active optometrists, and rates per 100,000 population, according to geographic region: United States, 1968

Geographic region	1968 civilian population	Active optometrists	Optometrists per 100,000 population
	Percent distribution		
United States-----	100.0	100.0	9.3
Northeast-----	24.4	25.8	9.9
North Central-----	28.0	31.9	10.6
South-----	31.0	22.4	6.8
West-----	16.6	19.9	11.2

analysis of optometrist concentration, refer to figure 1 where the ratio of active optometrists to general population is pictured by State.

The median age of all active optometrists was 47.5 years, with about 55 percent of their number located in the age interval 40-54 years. About 98 percent of all active optometrists were male. About 76 percent were licensed in only one State. The typical optometrist reported a working year that exceeded 48 weeks and a working week of roughly 40 hours. A substantial 16 percent of all active optometrists spent fewer than 35 hours per week in optometric activities.

Participation in professional activities other than direct patient care was limited. Only about

2 percent of active optometrists devoted some part of their working time to teaching in schools of optometry; about 6 percent were engaged to some degree in optometric research; and about 12 percent were at least partially active in administrative duties other than those connected with the care of patients, e.g., optometric associations.

More than 99 percent of all active optometrists were engaged to some extent in the direct care of optometric patients. It is these patient-seeing optometrists—18,299 in number—who make up the report universe of the present report and supply the statistical base for most of the tables and textual commentary.

Figure 1, Number of active optometrists per 100,000 population: United States, 1968.

CHARACTERISTICS OF OPTOMETRIC PRACTICE

Form and Composition of Independent Practice Arrangements

Of the 18,299 optometrists comprising this report universe, 16,218, or about 89 percent, were engaged in self-employed practice arrangements as follows:

Form of practice	Number of practi- tioners	Percent of report universe
All arrangements--	16,218	88.6
Solo practice-----	13,510	73.8
Partnership-----	2,178	11.9
Group practice-----	530	2.9

Solo practice was clearly the form of independent practice most favored by respondents. Using medians, the typical solo practitioner was a male Doctor of Optometry between 47 and 48 years of age and licensed to practice in only one State. He maintained only one office, worked more than 48 weeks per year, and devoted roughly 40 hours per week to all his professional activities. About 74 percent of solo practitioners made use of supplementary personnel to assist them in practice.

About 15 percent of the report universe (2,708 optometrists) practiced optometry in multiple-member arrangements. The partnership was the most frequently reported form of multiple-member practice—an estimated 2,178 optometrists (about 12 percent of the report universe) participated in this form of practice—and only about 3 percent of the respondents were to be found in group practice. Again reporting median tendencies, the typical member of a multiple-member practice differed from his colleague in solo practice in certain, perhaps significant, respects; for example, he tended to be about 2 years younger than the solo practitioner and to work at least 2 hours more per working week. There was also a

notably stronger tendency to make use of supplementary eye-care personnel in partnerships and group practice arrangements. About 94 percent of the optometrists in multiple-member forms of practice reported the use of supplementary helpers as compared with 74 percent for solo practitioners.

Survey findings did not permit a direct and complete evaluation of the composition of multiple-member forms of practice. There was evidence, however, that the most utilized form was a two-member practice arrangement in which both members were optometrists. This derives from the finding that of the optometrists who reported sharing supplementary personnel with associates, about 69 percent reported that they shared these personnel with two associates, and of these optometrists who reported sharing personnel with two associates, about 77 percent reported that their associates were fellow optometrists. The number of optometrists in multiple-member forms of practice was more exactly evaluated by responses to the survey question "If in partnership or group practice, how many optometrists are there in the partnership or group (counting yourself)?" To this question, 2,105 respondents reported two optometrists in their multiple-member arrangement; 421 respondents reported three optometrists; and 182 reported four optometrists or more.

Primary and Secondary Activities

An examination of the primary and secondary activities reported by patient-serving optometrists is shown in table B. Clearly, practicing optometrists did not show any marked tendency to specialize since about 97 percent of them engaged in general practice as their primary activity and 13 percent reported no secondary activity at all. Of the secondary activities, contact lens fitting was by far the most favored by respondents. In order of preference the three most popular secondary activities were contact lens fitting, general practice activities, and vision training. The typical practice obviously centered around general practice activities plus some contact lens work with a tendency, not very sharply pronounced, to be engaged in some vision training.

Table B. Primary and secondary activities of optometrists: United States, 1968

Activity	Number engaged in activity	Percent distribution
<u>Primary</u>		
Total-----	18,299	100.0
General practice-----	17,657	96.5
Contact lens fitting-----	368	2.0
Visual training (orthoptics)-----	63	0.3
Developmental vision-----	87	0.5
Prescribing low vision aids-----	6	0.0
Industrial vision-----	29	0.2
Other-----	90	0.5
<u>Secondary</u>		
Total-----	18,299	100.0
No secondary activity-----	2,373	13.0
General practice-----	2,709	14.8
Contact lens fitting-----	10,588	57.9
Visual training (orthoptics)-----	1,104	6.0
Developmental vision-----	483	2.6
Prescribing low vision aids-----	218	1.2
Industrial vision-----	611	3.3
Other-----	213	1.2

Patient Services Rendered

Fourteen specific patient services were listed on the survey questionnaire and respondents were asked to check those rendered by them or under their direction. The 14 services in descending order from the most frequently rendered to the least are ranked in table C. Judging from median tendencies, the typical practitioner rendered at least eight or nine of these services, in most instances the services listed above the dotted line. Services below the line were less commonly provided; substantially fewer than one-half of the Nation's practitioners rendered any one of these six services.

A substantial overlap occurred between services rendered by optometrists and those rendered by the Nation's ophthalmologists during the same reporting period. Examples of overlap

include: 8,282 ophthalmologists engaged in diagnostic examination (including tonometry), 7,802 performed visual field examinations, 4,834 reported the fitting of contact lenses, 4,571 prescribed low-vision aids, 2,710 provided orthoptic training or directed its provision, and 786 reported aniseikonic testing among their activities (Series 14, No. 7).

Volume of Patient-Care Activity

Volume of patient-care activity was directly assessed by two items on the survey questionnaire. Respondents were asked: "In your *optometric practice*, approximately how many patient visits for all purposes do you have during a typical week?" and further: "Approximately how many *patients* does this represent? (Patients with multiple visits should be counted only once)."

Table C. Specific patient services rendered by optometrists: United States, 1968

Type of service	Number providing service	Percent of report universe
Refractions-----	18,238	99.7
Dispensing and adjusting eyeware-----	17,122	93.6
Ophthalmoscopy-----	16,928	92.5
Frame repairs-----	15,532	84.9
Contact lens fitting-----	14,521	79.4
Visual field examination-----	13,780	75.3
Tonometry-----	12,098	66.1
Visual training (orthoptics)-----	9,128	49.9
Prescribing low vision aids-----	7,450	40.7
Fabrication of eyeware-----	6,610	36.1
Biomicroscopy-----	5,907	32.3
Developmental vision-----	5,225	28.6
Visual readiness for reading-----	4,735	25.9
Aniseikonic testing-----	1,528	8.4

Patient visits per week.—The national experience of optometrists in patient visits per week was distributed as follows:

Patient visits per week	Number of practitioners	Percent distribution
Total-----	18,299	100.0
Less than 25 visits--	1,578	8.6
25-49 visits-----	3,762	20.6
50-74 visits-----	4,989	27.3
75-99 visits-----	2,750	15.0
100 visits or more---	5,221	28.5

The national median was 69 visits per week for the typical practitioner. Regional variations from the national median were not very dramatic, as the following distribution by geographic region shows:

Geographic region	Number of active optometrists per 100,000 population	Median visits per week
United States--	9.3	69
Northeast-----	9.9	64
North Central-----	10.6	71
South-----	6.8	73
West-----	11.2	67

It may be meaningful that Southern optometrists, with the smallest concentration in the United States (in terms of number per 100,000 population), reported the highest median in patient visits per week. And Western optometrists, with a concentration per 100,000 population exceeding that of the other regions, reported a median experience in patient visits which was below the

national median. Assuming a need for optometric services which was fairly uniform regardless of geographic area, this might indicate that the typical Southern optometrist was, at least partially, attempting to compensate for his comparative scarcity in that area by extending the volume of his patient-care activity. It is clear, however, that factors other than simple geographic concentration were at work to influence the volume of patient-care activity. Thus optometrists of the North Central Region, with a concentration exceeded only by Western optometrists, still reported a median in patient visits which exceeded the national median and in fact was second only to the median reported by the Southern optometrist.

Figure 2 plots the relationship between patient visits per week and the age of the practitioner. Patient-care activity in terms of visits per week is seen to peak at a median of about 75 visits for optometrists in the age interval from 35 to 44 years and to decrease with each age interval until among optometrists over 65 years the median experience was about 40 visits per week.

With a median experience of about 51 visits per week, female optometrists reported a rate of patient-care activity that was substantially smaller than the 69 visits per week reported by the typical male practitioner.

The tabulation that follows reveals the relationship between patient visits and the form of practice that the optometrist engaged in.

Form of Practice	Number of practitioners	Median patient visits per practitioner per week
Solo practice-----	13,510	65
Partnership-----	2,178	87
Group practice-----	530	93

Clearly, within the typical multiple-member practice arrangement, the workload in patient visits was higher than that experienced by the typical solo practitioner. It was further noted that, within the partnership or group practice, the median experience in patient visits increased in positive proportion to the number of optometrists practicing in any particular multiple-member arrangement. For example, where two optometrists were engaged, the median was about 87 visits per week; where three optometrists were involved, the median was 97 visits; and in practice arrangements that involved four or more, the median exceeded 100 visits per week.

However, in the national perspective of optometric care it must be remembered that practitioners in the multiple-member practice forms were in the decided minority, with only 2,178 of them practicing in partnerships and 530 engaged in group practice. It was the estimated 13,510 solo practitioners, constituting about 74 percent of the national manpower resource, who with their median experience of 65 visits per week provided by far the greatest bulk of professional service to optometric patients in the United States at the time of the survey.

A reference to tables 2 and 3 will suggest the positive relationship that prevailed between number of patient visits and the following variables: hours worked per week, number of office locations, number of States licensed in, and number of optometric services rendered by the practitioner. As one increased, so did the other, though not always in a manner that was exactly proportional. For example, an analysis of the number of optometric services rendered yielded the following:

Figure 2 Median patient visits per week according to age of optometric practitioner: United States 1968.

Number of optometric services rendered	Median patient visits per week
1-3 services-----	47
4-6 services-----	64
7-9 services-----	70
10 services or more-----	74

Patients seen per week.—The tendencies noted in the discussion of patient visits per week also apply generally to the number of optometric patients seen per week.

The national experience of optometric patients seen per week was as follows:

Patients seen per week	Number of practitioners	Percent distribution
Total-----	18,299	100.0
Less than 25 patients-----	4,086	22.3
25-49 patients-----	6,886	37.6
50-74 patients-----	3,719	20.3
75-99 patients-----	1,726	9.4
100 patients or more-----	1,881	10.3

The national median was 43 optometric patients seen per week by the typical practitioner. A comparison to the median of 69 patient visits per week roughly suggests the extent to which multiple visits were made by the same patient within a single week. Regional distribution of the median patients seen per week is as follows:

Geographic region	Median patients seen per week	Median patient visits per week
United States---	43	69
Northeast-----	41	64
North Central-----	45	71
South-----	44	73
West-----	43	67

Figure 3. Median patients seen per week according to age of optometric practitioner United States 1968

36

Figure 3 plots the relationship between patients seen per week and the age of the practitioner. The median of patients seen per week is seen to peak at about 47 patients for optometrists in the age interval 35-44 years and decrease with advancing age until among optometrists over 65 years the median experience was only about 25 patients per week.

With a median experience of about 34 patients seen per week, female optometrists reported patient-care activity that was substantially smaller than the 44 patients per week reported by the typical male practitioner.

Tabulated below are figures revealing the relationship between patients seen per week and the form of practice that the optometrist engaged in.

Form of practice	Number of practitioners	Median patients seen per week
Solo practice-----	13,510	40
Partnership-----	2,178	55
Group practice-----	530	60

Clearly, within the typical multiple-member practice arrangement the number of patients seen was higher than that experienced by the typical solo practitioner. It was further noted that, within the partnership or group practice, the median in patients seen increased in proportion to the number of optometrists practicing in any par-

ticular multiple-member arrangement. For example, where two optometrists were engaged, the median was about 53 patients per week; where three optometrists were involved, the median was 63 patients; and, in practice arrangements that involved four optometrists or more, the median was 70 patients per week.

However, in the national perspective of optometric care, it must be remembered that practitioners in the multiple-member practice forms were in the decided minority, with only 2,178 of their numbers practicing in partnerships and only 530 engaged in group practice. It was the estimated 13,510 solo practitioners, constituting about 74 percent of the report universe who, with their median experience of 40 patients per week, provided by far the greatest bulk of professional service to optometric patients in the United States at the time of the survey.

A reference to tables 5 and 6 will suggest the positive relationship that prevailed between number of patients seen per week and the following variables: hours worked per week, number of

office locations, number of States licensed in, and number of optometric services rendered by the practitioner. As one increased, so did the other.

UTILIZATION OF SUPPLEMENTARY PERSONNEL

General Characteristics of Users of Auxiliary Personnel

Respondents to the 1968 survey were asked whether or not they used the services of auxiliary personnel to assist them in caring for their optometric patients. A total of 14,339 optometrists (about 78 percent of the report universe) reported that they did; they will hereafter be referred to as "users." About 98 percent of users were male. The median age of users was 46.5 years, 1 year less than the median age of 47.5 reported for the entire universe of active optometrists. Geographically, users were distributed as shown in table D.

Table D. Number of optometrists who utilized supplementary personnel according to geographic area: United States, 1968

Region and division	Number who utilized supplementary personnel	Percent distribution
United States-----	14,339	100.0
Northeast-----	3,106	21.7
New England-----	862	6.0
Middle Atlantic-----	2,244	15.6
North Central-----	4,548	31.7
East North Central-----	3,172	22.1
West North Central-----	1,377	9.6
South-----	3,629	25.3
South Atlantic-----	1,718	12.0
East South Central-----	715	5.0
West South Central-----	1,196	8.3
West-----	3,056	21.3
Mountain-----	603	4.2
Pacific-----	2,453	17.1

The tendency to use supplementary personnel was strongest among optometrists of the South Region, where about 88 percent of the patient-serving optometrists reported the use of assistants. This was well above the 78 percent calculated for the Nation as a whole, and, when one remembers that the concentration of optometrists in the South (6.8 per 100,000 population) was substantially lower than the ratio for any other region in the United States, this rate may suggest that the Southern optometrist was at least partially compensating for his relative scarcity by using assistants in an effort to extend his range of services.

There was a direct relationship between form of practice and the reported usage of supplementary assistants. Whereas about 74 percent of the Nation's solo practitioners relied on supplementary personnel, the figure was 93 percent for optometrists in partnerships and about 96 percent for those engaged in group practice. However, since users in solo practice outnumbered users in the other practice forms by almost 4 to 1, it is clear that most supplementary personnel performed their services for solo practitioners.

The questionnaire requested information on the utilization of six specific types of supplementary assistants. Of the Nation's 14,339 users of auxiliary personnel, about 84 percent utilized the services of secretaries and/or receptionists and 30 percent utilized general optometric assistants (supplementary personnel who spent less than 75 percent of their time in any of the assistant categories were counted as general optometric assistants). Sixteen percent utilized dispensing opticians, 10 percent utilized optical technicians (shopmen), 5 percent utilized optometric technicians, and 4 percent utilized contact lens technicians.

Certain professional characteristics of the user are brought into sharper focus when they are directly contrasted with corresponding characteristics of the 3,960 members of the report universe who reported that they did not utilize supplementary personnel. For example, the typical user reported about 76 visits by eye patients per week; the typical nonuser, about 45. The typical user saw about 48 patients in the course of a week; the typical nonuser saw only about 28.

The following tabulation contrasts the range of professional activity of the user of supplementary personnel and the nonuser by the extent to which each provided 14 selected patient services or directed the provision of these services.

Patient service	Users	Nonusers
	Percent	
Refractions-----	99	99
Visual field examination-----	78	65
Tonometry-----	72	43
Aniseikonic testing-----	9	6
Biomicroscopy-----	37	14
Ophthalmoscopy-----	94	86
Contact lens fitting-----	84	61
Visual training (orthoptics)-----	52	42
Developmental vision-----	31	19
Prescribing low vision aids-----	44	29
Visual readiness for reading-----	28	18
Dispensing and adjusting eyeware-----	94	90
Frame repairs-----	86	79
Fabrication of eyeware---	38	31

Note the direct relationship between use of supplementary personnel and the tendency to render any of the services except refractions. For several of the services (e.g., tonometry, biomicroscopy, and fitting contact lenses), the reliance on supplementary assistance is especially evident.

Judging by the number of the 14 services that optometrists provided, without regard for the frequency of rendition or for the time or degree of sophistication involved in the performance of each service, about 78 percent of all users reported that they provided more than seven of the 14 services, as opposed to about 54 percent of all nonusers.

Number of Supplementary Personnel

The typical patient-serving optometrist who used supplementary personnel in the United States in 1968 utilized the services of 2.1 assistants

(a median figure). Variations in numbers of assistants are perhaps more meaningfully expressed by reporting for appropriate demographic and professional categories, the proportion of users who made use of two or more supplementary assistants.

For the Nation as a whole, the proportion of "using" optometrists who utilized two or more assistants was about 54 percent. The following tabulation shows user experience by geographic regions and their component divisions.

Region and division	Percentage of users who use 2 or more assistants
United States-----	54
Northeast-----	49
New England-----	39
Middle Atlantic-----	53
North Central-----	56
East North Central-----	56
West North Central-----	55
South-----	53
South Atlantic-----	52
East South Central-----	49
West South Central-----	58
West-----	56
Mountain-----	53
Pacific-----	57

Thus, though the tendency to use two or more assistants does not show dramatic variations when it is expressed by geographic region, considerable variation may be observed among divisions within a single region as well as among divisions which are geographically remote from one another. For example, note the New England Division of the Northeast Region, where the tendency to use two or more supplementary personnel contrasted sharply with the experience of optometrists in the Middle Atlantic Division. The tendency in New England was, in fact, markedly weaker than anywhere else in the Nation.

The tabulation that follows relates number of assistants to the age of the user.

Age	1 assistant	2 or more assistants
	Percent of total users	
Total users-	46	54
Under 35 years----	40	60
35-44 years-----	43	57
45-54 years-----	47	53
55-64 years-----	53	47
65 years and over-	55	45

Note the inverse relationship that existed between age and the tendency to utilize two or more assistants. At its strongest among younger practitioners, the tendency declined markedly as age categories advanced.

Conditions of Utilization

Users of supplementary personnel were asked to specify the conditions in which they utilized each type of assistant. The following four conditions of utilization were possible:

Full-time unshared, i.e., 35 hours or more per week, services of assistant not shared with associates.

Full-time shared, i.e., 35 hours or more per week, services of assistant shared with associates.

Part-time unshared, i.e., less than 35 hours per week, services of assistant not shared with associates.

Part-time shared, i.e., less than 35 hours per week, services of assistant shared with associates.

The use of one or more assistants of a given type in one of the above four conditions of utilization is treated in this analysis as a "report of utilization." By this measurement of usage, there were a total of 25,487 reports of utilization of supplementary personnel. Of this total, about 58 percent were for secretaries and/or receptionists, 19 percent for general optometric assistants, 10 percent for dispensing opticians, 6 percent for optical technicians (shopmen), 3

percent for optometric technicians, 2 percent for contact lens technicians, and 3 percent were for other types of supplementary personnel (e.g., orthoptists). Members of this "other" category were not reported with sufficient frequency to warrant separate treatment in this report.

An overall analysis of the conditions in which assistants were used showed that, in order of preference, about 70 percent of all reports specified *full-time* utilization, about 30 percent specified *part-time*; 64 percent of all reports specified *unshared* utilization, and 36 percent specified the *sharing* of assistants with associates.

When these two fundamental bases of usage were combined, it was apparent that:

- 43 percent of all reports of utilization specified assistance on a *full-time unshared* basis.
- 27 percent specified assistance on a *full-time shared* basis.
- 22 percent specified assistance on a *part-time unshared* basis.
- 9 percent specified assistance on a *part-time shared* basis.

In the discussion that follows, the basis of utilization will be seen to vary with the specific type of assistant under consideration. The preference was generally for the full-time unshared utilization of secretaries and/or receptionists. General optometric assistants were likewise generally used on a full-time unshared basis. For optometric technicians, dispensing opticians, contact lens technicians, and optical technicians, however, the preference was for full-time shared personnel. Only with the undifferentiated "other" types of assistants did the reports of utilization favor assistance on a part-time basis.

Utilization of Secretaries and/or Receptionists

There were 14,661 reports of utilization of secretaries and/or receptionists. Assistants of this type were distributed according to the following conditions of usage. About 45 percent of the reports of utilization specified utilization on a *full-time unshared* basis, 21 percent specified *full-time shared*, 25 percent specified *part-time unshared*, and 9 percent specified utilization on a *part-time shared* basis. Thus full-time unshared

utilization was the most popular condition of usage and part-time shared utilization the least popular.

Of the 12,044 optometrists who utilized secretaries and/or receptionists, about 66 percent used one; about 23 percent used two; and 11 percent used three or more. When an optometrist reported the use of only one assistant of any type, in almost eight cases out of 10 this assistant was a secretary or receptionist. Of those who reported that they used two assistants of any type, about 85 percent reported that the assistants included at least one secretary or receptionist. And, of those who reported the use of three or more assistants of any type, about 92 percent reported that their assistants included one or more secretaries and/or receptionists.

The following tabulation shows the extent to which the utilization of secretaries and receptionists was reflected in the tendency to render specific patient services.

Patient service	Users	Nonusers
	Percent	
Refractions-----	99	99
Visual field examination-----	78	70
Tonometry-----	72	54
Aniseikonic testing-----	9	7
Biomicroscopy-----	37	23
Ophthalmoscopy-----	94	89
Contact lens fitting-----	84	70
Visual training (orthoptics)-----	51	47
Developmental vision-----	30	26
Prescribing low vision aids-----	44	35
Visual readiness for reading-----	27	24
Dispensing and adjusting eyeware-----	94	92
Frame repairs-----	86	83
Fabrication of eyeware---	38	33

Note that the addition of administrative personnel increased the tendency to perform all patient services except routine refractions. The influence was a general one. It probably operated by freeing the optometrist from the performance of routine clerical and administrative tasks, thus allowing him more time for his strictly clinical functions.

Utilization of General Optometric Assistants

There were 4,832 reports of utilization for general optometric assistants; this included persons who spent less than 75 percent of their time in any of the assistant categories. They were distributed according to the following conditions of usage. About 48 percent of the reports of utilization specified use on a *full-time unshared* basis, 22 percent on a *full-time shared* basis, 23 percent on a *part-time unshared* basis, and 7 percent specified use on a *part-time shared* basis. Thus, as with secretaries and receptionists, full-time unshared utilization was the most popular condition of usage and part-time shared utilization the least popular.

Of the 4,230 optometrists who utilized general optometric assistants, about 71 percent used one, about 20 percent used two, and about 9 percent used three or more. Of those who reported that they used two assistants, about 35 percent reported that the two included at least one general optometric assistant. And, of those who reported the use of three or more assistants of any type, about 45 percent reported that the number included one or more general optometric assistants.

The following tabulation shows the extent to which the utilization of general optometric assistants was reflected in the tendency to render specific patient services.

Patient service	Users	Nonusers
	Percent	
Refractions-----	99	99
Visual field examination-----	83	73
Tonometry-----	80	62
Aniseikonic testing-----	11	8
Biomicroscopy-----	49	27
Ophthalmoscopy-----	96	91
Contact lens fitting-----	89	77
Visual training (orthoptics)-----	61	47
Developmental vision	40	25
Prescribing low vision aids-----	50	38
Visual readiness for reading-----	36	23
Dispensing and adjusting eyeware-----	96	93
Frame repairs-----	89	84
Fabrication of eyeware---	39	35

Note that the addition of general optometric assistants generally increased the tendency to perform all the clinical functions except routine refractions. It was most dramatically manifest in the tendency to perform the diagnostic functions of biomicroscopy and tonometry.

Utilization of Optometric Technicians

There were 707 reports of utilization of optometric technicians. Assistants of this type were distributed according to the following conditions of usage. About 36 percent of the reports of utilization specified utilization on a *full-time unshared* basis, 44 percent specified a *full-time shared* basis, 11 percent specified a *part-time unshared* basis, and 9 percent specified utilization on a *part-time shared* basis. Thus in contrast with the utilization of administrative personnel and general optometric assistants, full-time shared utilization was the most popular condition of usage for optometric technicians although part-time shared utilization remained the least popular.

Of the relatively few optometrists (650) who utilized optometric technicians, about 75 percent used one, about 16 percent used two, and about 10 percent used three or more. Of optometrists who reported using only one assistant of any type, fewer than 1 percent reported that this one assistant was an optometric technician. Of those who reported that they used two assistants, about 4 percent reported that the two included at least one optometric technician. And, of those who reported the use of three or more assistants of any type, about 13 percent reported that the number included one or more optometric technicians.

The following tabulation shows the extent to which the utilization of optometric technicians was reflected in the tendency to render specific patient services. Except for a slightly negative effect on the function of dispensing and adjusting, the addition of optometric technicians generally increased the tendency of optometrists to render all of the clinical functions. Most pronounced was the increased tendency to perform the diagnostic functions of biomicroscopy and aniseikonic testing.

Patient service	Users	Nonusers
	Percent	
Refraction-----	100	99
Visual field examination-----	77	75
Tonometry-----	72	66
Aniseikonic testing-----	14	8
Biomicroscopy-----	46	32
Ophthalmoscopy-----	93	92
Contact lens fitting-----	84	79
Visual training (orthoptics)-----	53	50
Developmental vision-----	33	28
Prescribing low vision aids-----	50	40
Visual readiness for reading-----	33	26
Dispensing and adjusting eyeware-----	92	94
Frame repairs-----	84	85
Fabrication of eyeware---	45	36

Utilization of Dispensing Opticians

There were 2,455 reports of utilization of dispensing opticians. They were distributed according to the following conditions of usage. About 37 percent of the reports of utilization specified utilization on a *full-time unshared* basis, 48 percent on a *full-time shared* basis, 8 percent specified *part-time unshared* utilization, and 7 percent specified *part-time shared* utilization. Thus, as with the utilization of optometric technicians, full-time shared utilization was the most popular condition of usage.

Of the 2,231 optometrists who utilized dispensing opticians, about 62 percent used one, about 20 percent used two, and about 18 percent used three or more. Of optometrists who reported using only one assistant of any type, only about 2 percent reported that this one assistant was a dispensing optician. Of those who reported that they used two assistants of any type, again only a small proportion (about 12 percent) reported that the two included at least one dispensing optician. However, among optometrists who reported the use of three or more assistants of any type, a more substantial number, about 44 percent, tended to use one or more dispensing opticians.

The following tabulation shows the extent to which the utilization of dispensing opticians was

reflected in the tendency to render specific patient services.

Patient service	Users	Nonusers
	Percent	
Refractions-----	99	99
Visual field examination-----	64	77
Tonometry-----	61	67
Aniseikonic testing-----	8	8
Biomicroscopy-----	33	32
Ophthalmoscopy-----	92	93
Contact lens fitting-----	80	79
Visual training (orthoptics)-----	35	52
Developmental vision-----	21	30
Prescribing low vision aids-----	38	41
Visual readiness for reading-----	19	27
Dispensing and adjusting eyeware-----	89	94
Frame repairs-----	79	86
Fabrication of eyeware---	45	35

Note that the trend recorded for users of administrative personnel, general optometric assistants, and optometric technicians was generally reversed among users of dispensing opticians. That is, optometrists who were assisted by dispensing opticians showed a reduced tendency to perform most patient services other than the fabrication of eyeware. The presence of a dispensing optician appeared to create an increased tendency toward specialization among optometrists who used them.

Utilization of Contact Lens Technicians

There were 539 reports of utilization for contact lens technicians. Assistants of this type were distributed according to the following conditions of usage. About 26 percent of the reports of utilization specified utilization on a *full-time unshared* basis, 49 percent on a *full-time shared* basis, 18 percent specified *part-time unshared* utilization, and 7 percent specified *part-time shared* utilization. Again, as with optometric technicians and dispensing opticians, full-time shared utilization was the preferred condition of usage.

Of the relatively few optometrists (516) who utilized contact lens technicians, about 81 percent

used one, about 12 percent used two, and about 7 percent used three or more. Of the 6,655 optometrists who reported using only one assistant of any type, only 8 practitioners (0.1 percent) reported that this one assistant was a contact lens technician. Of optometrists who reported that they used two assistants of any type, only 1-2 percent reported that the two included at least one contact lens technician. When the optometrist used three or more assistants of any type, there was a somewhat stronger tendency to include contact lens technicians—about 11 percent of these optometrists reported using one or more contact lens technicians.

The following tabulation shows the extent to which the utilization of contact lens technicians was reflected in the tendency to render specific patient services.

Patient service	Users	Nonusers
	Percent	
Refractions-----	98	99
Visual field examination--	66	76
Tonometry-----	62	66
Aniseikonic testing-----	13	8
Biomicroscopy-----	44	32
Ophthalmoscopy-----	90	93
Contact lens fitting-----	90	79
Visual training (orthoptics)-----	38	50
Developmental vision-----	21	29
Prescribing low vision aids-----	41	41
Visual readiness for reading-----	19	26
Dispensing and adjusting eyeware-----	82	94
Frame repairs-----	72	85
Fabrication of eyeware---	38	36

The use of contact lens technicians understandably increased the tendency to perform the service of contact lens fitting, evidently at the expense of most other patient services with aniseikonic testing and biomicroscopy being interesting exceptions.

Utilization of Optical Technicians

There were 1,596 reports of utilization for optical technicians (shopmen). They were dis-

tributed according to the following conditions of usage. About 28 percent of the reports of utilization specified utilization on a *full-time unshared* basis, 51 percent on a *full-time shared* basis, 12 percent of the reports specified *part-time unshared* utilization, and 9 percent specified *part-time shared* utilization. As it was with optometric technicians, dispensing opticians, and contact lens technicians, there is a clear preference for full-time shared utilization of this type of assistant.

Of the 1,474 optometrists who utilized optical technicians (shopmen), about 67 percent used one, about 17 percent used two, and about 17 percent used three or more. Of optometrists who reported using only one assistant of any type, fewer than 1 percent reported that this one assistant was an optical technician. Of those who reported that they used two assistants of any type, again only a small proportion (about 7 percent) reported that the two included at least one optical technician. However, among optometrists who reported the use of three or more assistants of any type, a more substantial proportion (about 30 percent) tended to use one or more optical technicians.

The following tabulation shows the extent to which the utilization of optical technicians was reflected in the tendency to render specific patient services.

Patient service	Users	Nonusers
	Percent	
Refractions-----	99	99
Visual field examination--	69	76
Tonometry-----	62	66
Aniseikonic testing-----	7	8
Biomicroscopy-----	35	32
Ophthalmoscopy-----	93	92
Contact lens fitting-----	78	79
Visual training (orthoptics)-----	39	51
Developmental vision-----	22	29
Prescribing low vision aids-----	38	41
Visual readiness for reading-----	20	26
Dispensing and adjusting eyeware-----	93	94
Frame repairs-----	84	85
Fabrication of eyeware---	61	34

Predictably, users of optical technicians showed an increased tendency towards the fabrication of eyewear. As a possible consequence of this increased emphasis, the tendency was to reduce the provision of most of the other patient services.

The optometrist's utilization of supplementary personnel is summarized in the table that follows:

Type of assistant	Number of reports of utilization
Secretaries/receptionists-----	14,661
General optometric assistants--	4,832
Optometric technicians-----	707
Dispensing opticians-----	2,455
Contact lens technicians-----	539
Optical technicians (shopmen)--	1,586
Other type personnel (e.g., orthoptists)-----	707

Optometrists were not the only professional group with a need for supplementary eye-care personnel. Ophthalmologists used them too. The findings of the 1968 survey of ophthalmologists suggest a substantial overlap between optometrists and ophthalmologists in their need for and use of certain types of eye-care personnel. For example, among ophthalmologists surveyed, there were 1,794 reports of utilization of optical fitters (including opticians). There were also 1,263 reports of utilization of laboratory, ophthalmic, and contact lens technicians, 646 reports of utilization of orthoptists, 222 reports of utilization of optometrists, and 439 reports of utilization of other clinical (eye-care) assistants (Series 14, Number 9).

APPENDIX I

TECHNICAL NOTES

Background of Report

The data presented in this report were collected as part of the 1968-69 Vision and Eye Care Manpower Survey. The survey, conducted by the U.S. Bureau of the Census under contract to the then Division of Health Resources Statistics, National Center for Health Statistics (NCHS), was designed to obtain information about the demographic and professional characteristics of optometrists engaged in providing direct health care to the public.

Survey Coverage

The total number of optometrists for purposes of this survey was defined as all legally registered persons licensed to practice optometry in any of the 50 States and the District of Columbia. The most complete and readily available list of these persons was *The Blue Book of Optometrists*,¹ which provided the names and addresses of licensed optometrists in each State and the District of Columbia. This list of 20,565 names and addresses became the original mailing list for the survey.

A pretest of the questionnaire used for the optometrists' survey was conducted during the period May-July 1968. Questionnaires were mailed to two optometrists in each State and the District of Columbia. After an initial mailout, one mail followup, and a telephone followup a response rate of 91 percent was achieved. The questionnaire proved to be an effective instrument. Only minor alterations were required for the final questionnaire. (See appendix III for a copy of the final questionnaire.)

Data Collection and Processing

The collection of data for the 1968 Manpower Survey was accomplished under contract with the U.S. Bureau of the Census. This agency was responsible for mailing the questionnaires, receipt and control procedures, coding the completed questionnaires in accordance with specifications established by NCHS, and for followup

whenever incomplete or inadequate questionnaires were returned or whenever a questionnaire was not returned.

For the actual survey, three mailouts were employed in an attempt to elicit a response, the first two by first-class mail, the last by certified mail. All three mailings were made in every case in which a return was not received.

Telephone contacts and personal interviews were also used. They were employed in cases of nonresponse or refusal as well as in cases of questionnaires that had been only partially completed.

A preliminary edit of the data was undertaken at the time of the return of the survey questionnaires. This was done to insure completeness of the responses. The data from the questionnaires were coded, punched on cards, transferred to computer tape, and sent to NCHS for processing. Processing included an elaborate series of checks and cross-checks to confirm the accuracy of responses, to correct coding and punching errors that occurred, and also to insure consistency between related items.

Response to the Survey

A total of 20,565 optometrists were provided by the original mailing list for the survey; 262 duplicate names and military personnel were eliminated. Military personnel were eliminated because some were inaccessible. The data provided in this report are for civilian optometrists in the 50 States and the District of Columbia. This amounted to 20,303 optometrists, or 98.7 percent of the original list.

A total of 18,533, or 91.2 percent of the 20,303, responded to the survey with usable questionnaires. The remainder was composed of 699 nonrespondents (i.e., reasons unknown); 533 postmaster returns (i.e., unable to locate); 308 deceased; and 230 refusals.

Of these 18,533 usable questionnaires (good responses), 16,835, or 90.8 percent, were active optometrists, while 1,698 reported that they were either retired or not currently engaged in optometrical activities although not retired (table I). There is evidence to indicate that the responses from active optometrists were better than those from inactive optometrists.

¹*The Blue Book of Optometrists: 1968*. Chicago. (Professional Press Inc., 1968).

Table I. Number and percent distribution of respondents to the questionnaire by question number and content, according to activity status: United States, 1968

Question number and content	All active respondents	Inactive respondents, retired and not retired
		Number
All respondents-----	16,835	1,698
	Percent distribution	
Total-----	100.0	100.0
2. In what year were you born?-----	99.6	82.5
5. Sex?-----	97.9	81.1
6a. From which school of optometry did you graduate?-----	99.1	78.1
6b. When did you graduate?-----	98.7	75.6
7. What degrees have you earned?-----	97.5	72.4
8. In which States do you currently hold an active license to practice optometry?-----	98.6	74.1
9. Are you currently active in optometry?-----	100.0	100.0
10. Which categories best describe your principal form of employment?-----	99.6	...
11. How many weeks per year do you usually practice optometry?-----	99.0	...
12. How many hours per week do you usually practice optometry?-----	99.0	...
13a. Approximately what percent of the hours per week do you usually spend in optometric practice?-----	98.8	...
16a. In your optometric practice, approximately how many patient visits for all purposes do you have during a typical week?-----	92.0	...
16b. Approximately how many patients does this represent?-----	88.4	...
18. In your optometric practice do you have supplementary personnel to assist you?-----	98.4	...

Item Response

A response to the survey does not necessarily insure adequate answers to all of the questions on the questionnaire. In fact, a response to a single question is considered a response to the survey. This section will be concerned with the nonresponses to individual questions on the questionnaire, i.e., item nonresponse. The previous section discussed nonresponses to the survey as a whole, i.e., unit nonresponses. This discussion will involve only the 18,533 good unit responses because interest here concerns the variability of responses to different questions. Table I presents the distribution of responses to selected questions on the questionnaire. Selection of the questions was based on their relevance to this report.

One can hardly avoid noticing the differences in the percentages of responses to the individual questions between the active and inactive respondents. At least 17 percent more active respondents answered every question (among those asked of both active and inactive optometrists) than did inactive respondents. Based on this finding, it is not unrealistic to suspect that a similar situation prevailed in terms of responses to the question-

naire generally. A larger share of the unit nonresponses were probably attributable to inactive persons than to those who were active.

Imputation for Unknowns

As a matter of policy, tables in this publication are presented with item nonresponses imputed. The allocation of the item nonresponses was done by computer, utilizing two principles: first, random assignment; and second, utilization of related information as category controls to insure consistency among different related items within the same record.

Assignment of values to replace item nonresponse is done on a random basis to prevent bias. The value used to replace an item nonresponse is randomly selected from within a range of values prescribed by related information from the record containing the item nonresponse. Establishment of a range of values is necessary to insure that the value used to replace the item nonresponse will not be inconsistent with other values within the record in which the value is being placed.

An example may clarify the procedures. Mr. Blank is 48 years of age. His year at graduation is not known. It must be imputed. Age and year at graduation are related items. In this case, Mr. Blank's age will be used as a category control to choose an appropriate record from which a year at graduation will be selected. By means of a random selection process, Mr. Given's record is chosen because his age was 49. The age category in this case could have been 48-50. Thus Mr. Blank's and Mr. Given's ages were both in the same category. Mr. Given's year at graduation was listed as 1942. The year 1942 is then copied into Mr. Blank's record as his year at graduation and will be counted in all tabulations as if it were the actual year Mr. Blank had provided on his questionnaire.

State and National Estimates

The statistics presented in this report were inflated to allow for unit nonresponses, i.e., for entire question-

naires that were not available. This "inflation" factor was the ratio of total optometrists to the number of usable (good) responses obtained. Within each State the number of optometrists was divided by the number of good responses to obtain the increment needed to adjust the statistics for the nonresponses. The increment multiplied by the number of respondents provided the inflated number of civilian optometrists (20,301). Table II presents the number of respondents to the optometry manpower survey, the ratio weights, and the inflated numbers of active optometrists for each State.

Rounding

Numbers that appear in the present report were independently rounded and may not add to totals. Percents were also independently rounded and may not always add to 100 percent. Percents and rates were calculated on the basis of original, unrounded figures and will not necessarily agree with rates and percents which might be calculated from rounded data.

Table II. Number of optometrists by activity status, before and after inflation: United States and each State, 1968

State	Optometrist		Inflation factors	Inflated active optometrists	Inflated inactive optometrists	Inflated total
	Active	Inactive

APPENDIX II

DEFINITIONS

Age.—Age refers to the respondent's age in 1970. In all cases, age is calculated as the difference between 1970 and the respondent's year of birth.

Geographic area.—For the purpose of reporting the data yielded by the 1970 Podiatry Survey, the United States (the 50 States and the District of Columbia) is divided into the geographic regions and divisions used by the U.S. Bureau of the Census and into the ten Standard Federal Administrative Regions as follows:

<i>Geographic region and division</i>	<i>States included</i>
Northeast	
New England-----	Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut
Middle Atlantic-----	New York, New Jersey, Pennsylvania
North Central	
East North Central-----	Ohio, Indiana, Illinois, Michigan, Wisconsin
West North Central-----	Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, Kansas
South	
South Atlantic-----	Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida
East South Central-----	Kentucky, Tennessee, Alabama, Mississippi
West South Central-----	Arkansas, Louisiana, Oklahoma, Texas
West	
Mountain-----	Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada
Pacific-----	Washington, Oregon, Alaska, California, Hawaii

<i>Standard Federal Administration Region with headquarters city</i>	<i>States included</i>
Region I (Boston)-----	Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont
Region II (New York)-----	New York, New Jersey
Region III (Philadelphia)---	District of Columbia, Delaware, Maryland, Pennsylvania, Virginia, West Virginia
Region IV (Atlanta)-----	Alabama, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, Tennessee
Region V (Chicago)-----	Illinois, Indiana, Minnesota, Michigan, Ohio, Wisconsin
Region VI (Dallas-Fort Worth)-----	Arkansas, Louisiana, New Mexico, Oklahoma, Texas
Region VII (Kansas City)--	Iowa, Kansas, Missouri, Nebraska
Region VIII (Denver)-----	Colorado, Montana, North Dakota, South Dakota, Utah, Wyoming
Region IX (San Francisco)--	Arizona, California, Hawaii, Nevada
Region X (Seattle)-----	Alaska, Idaho, Oregon, Washington

SURVEY OF OPTOMETRISTS

1. Is your name correct, and is the address above your PRIMARY PLACE OF PRACTICE?

1 Yes 2 No

↓
If no, please enter the correct information below:

Name: _____
First Middle Last

Primary place of practice: _____
Number Street

_____ *City State Zip Code*

2. In what year were you born? _____
(Year)

3. Where were you born? _____
(State or foreign country)

4. Are you a citizen of the United States? *(Please check appropriate box)*

- 1 Yes, Native Born
2 Yes, Naturalized
3 No

5. Sex: 1 Male
2 Female

6. A. From which school of optometry did you graduate?

Name of School

_____ *City State or Country*

B. When did you graduate? _____
(Year graduated)

7. What degrees have you earned? (Check all that apply)

- 1 Doctor of Optometry
- 2 Doctorate (Specify major field: _____)
- 3 Master's (Specify major field: _____)
- 4 Bachelor's (Specify major field: _____)
- 5 Other (Specify: _____)

8. In which States do you currently hold an ACTIVE LICENSE to practice optometry?

9. Are you CURRENTLY ACTIVE in optometry? (Include patient care, teaching, research, and administration)

- 1 Yes, Full-time
- 2 Yes, Part-time
- 3 No, Not active in optometry
- 4 No, Retired

↓
**PROCEED to
Question 10.**

↓
STOP!
Remainder of questionnaire does not apply. Please
return questionnaire in the envelope provided.

10. Which of the following categories best describes your PRINCIPAL form of employment? (Check one)

- 01 Self-employed – Solo practice
- 02 Self-employed – Partnership practice
- 03 Self-employed – Group practice
- 04 Employed by – Military
- 05 Employed by – Government (*non-military*)
- 06 Employed by – Optometrist(s)
- 07 Employed by – Ophthalmologist(s)
- 08 Employed by – Physician(s) other than ophthalmologist(s)
- 09 Employed by – Firm or corporation (*profit-making*)
- 10 Employed by – Nonprofit organization or institution
- 11 Other (Specify: _____)

If in partnership or group practice, how many
OPTOMETRISTS are there in the partnership
or group **COUNTING YOURSELF**?

Number

11. How many WEEKS per year do you usually practice optometry? (Include patient care, teaching, research, and administration. Do not count vacations as weeks worked.)

(Weeks per year)

12. How many HOURS per week do you usually practice optometry? (Include patient care, teaching, research, and administration)

(Hours per week)

13. APPROXIMATELY what PERCENT of the hours per week, indicated in Item 12 above, do you usually spend in each of the following activities?

- a. _____ % Optometric practice
 - b. _____ % Teaching in a school of optometry
 - c. _____ % Optometric research
 - d. _____ % Administration (*Optometric Association, etc.*)
 - e. _____ % Other (*Specify: _____*)
- 100 % TOTAL

If 0% of your time is spent in OPTOMETRIC PRACTICE, (Item 13 a. above) STOP, and return questionnaire in the envelope provided; otherwise continue.

14. In your OPTOMETRIC PRACTICE, which of the services below are rendered to your patients by you or under your direction? (Check all that apply)

- 01 Refractions
- 02 Visual fields
- 03 Tonometry
- 04 Aniseikonic testing
- 05 Biomicroscopy
- 06 Ophthalmoscopy
- 07 Contact lens fitting
- 08 Visual training/orthoptics
- 09 Developmental vision
- 10 Prescribing low vision aids
- 11 Visual readiness for reading
- 12 Dispensing and adjusting
- 13 Frame repairs
- 14 Fabrication of eyewear
- 15 Other (*Specify: _____*)

15. In your OPTOMETRIC PRACTICE, what do you consider to be your PRIMARY, and your SECONDARY, activity?

A. PRIMARY activity: (Check one)

- 1 General practice
- 2 Contact lens fitting
- 3 Visual training/orthoptics
- 4 Developmental vision
- 5 Prescribing low vision aids
- 6 Industrial vision
- 7 Other (*Specify: _____*)

B. SECONDARY activity: (Check one)

- 1 General practice
- 2 Contact lens fitting
- 3 Visual training/orthoptics
- 4 Developmental vision
- 5 Prescribing low vision aids
- 6 Industrial vision
- 7 Other (*Specify: _____*)
- 8 None

16. A. In your **OPTOMETRIC PRACTICE, APPROXIMATELY** how many patient **VISITS** for-all purposes do you have during a typical week?

(Approximate number of visits)

B. **APPROXIMATELY** how many **PATIENTS** does this represent? (Patients with multiple visits should be counted only once)

(Approximate number of patients)

17. What is the total number of office locations at which you currently practice optometry?

(Number of locations)

18. In your **PRINCIPAL FORM OF EMPLOYMENT**, indicated in Item 10 above, do you have supplementary personnel to assist you?

1 Yes 2 No

↓
Please indicate the **NUMBER** in each category below for **ALL** offices combined which are related to your principal form of employment.

(Persons who spend less than **75%** of their time in any one category below should be counted in category b, general optometric assistant)

	NUMBER WHO WORK FULL-TIME		NUMBER WHO WORK PART-TIME	
	(35 hours or more per week)		(Less than 35 hours per week)	
	FOR YOU ALONE	FOR YOU AND ASSOCIATES	FOR YOU ALONE	FOR YOU AND ASSOCIATES
a. Secretaries, Receptionists . . .	_____	_____	_____	_____
b. General optometric assistants .	_____	_____	_____	_____
c. Optometric technicians	_____	_____	_____	_____
d. Dispensing opticians	_____	_____	_____	_____
e. Contact lens technicians	_____	_____	_____	_____
f. Optical technicians (Shopmen).	_____	_____	_____	_____
g. Other (Specify _____)	_____	_____	_____	_____

19. A. If you have made entries under **FOR YOU AND ASSOCIATES** in the full-time or part-time columns in Item 18 above how many associates, **COUNTING YOURSELF**, share these personnel?

(Number of associates)

B. Of these associates, how many are **OPTOMETRISTS, COUNTING YOURSELF?**

(Number of optometrists)

COMMENTS - General comments are invited as well as comments on specific items:

PLEASE RETURN QUESTIONNAIRE IN THE STAMPED ENVELOPE PROVIDED.

VITAL AND HEALTH STATISTICS PUBLICATION SERIES

Originally Public Health Service Publication No. 1000

- Series 1. Programs and collection procedures.*—Reports which describe the general programs of the National Center for Health Statistics and its offices and divisions, data collection methods used, definitions, and other material necessary for understanding the data.
- Series 2. Data evaluation and methods research.*—Studies of new statistical methodology including: experimental tests of new survey methods, studies of vital statistics collection methods, new analytical techniques, objective evaluations of reliability of collected data, contributions to statistical theory.
- Series 3. Analytical studies.*—Reports presenting analytical or interpretive studies based on vital and health statistics, carrying the analysis further than the expository types of reports in the other series.
- Series 4. Documents and committee reports.*—Final reports of major committees concerned with vital and health statistics, and documents such as recommended model vital registration laws and revised birth and death certificates.
- Series 10. Data from the Health Interview Survey.*—Statistics on illness, accidental injuries, disability, use of hospital, medical, dental, and other services, and other health-related topics, based on data collected in a continuing national household interview survey.
- Series 11. Data from the Health Examination Survey.*—Data from direct examination, testing, and measurement of national samples of the civilian, noninstitutional population provide the basis for two types of reports: (1) estimates of the medically defined prevalence of specific diseases in the United States and the distributions of the population with respect to physical, physiological, and psychological characteristics; and (2) analysis of relationships among the various measurements without reference to an explicit finite universe of persons.
- Series 12. Data from the Institutional Population Surveys* —Statistics relating to the health characteristics of persons in institutions, and their medical, nursing, and personal care received, based on national samples of establishments providing these services and samples of the residents or patients.
- Series 13. Data from the Hospital Discharge Survey.*—Statistics relating to discharged patients in short-stay hospitals, based on a sample of patient records in a national sample of hospitals.
- Series 14. Data on health resources: manpower and facilities.*—Statistics on the numbers, geographic distribution, and characteristics of health resources including physicians, dentists, nurses, other health occupations, hospitals, nursing homes, and outpatient facilities.
- Series 20. Data on mortality.*—Various statistics on mortality other than as included in regular annual or monthly reports—special analyses by cause of death, age, and other demographic variables, also geographic and time series analyses.
- Series 21. Data on natality, marriage, and divorce.*—Various statistics on natality, marriage, and divorce other than as included in regular annual or monthly reports—special analyses by demographic variables, also geographic and time series analyses, studies of fertility.
- Series 22. Data from the National Natality and Mortality Surveys.*—Statistics on characteristics of births and deaths not available from the vital records, based on sample surveys stemming from these records, including such topics as mortality by socioeconomic class, hospital experience in the last year of life, medical care during pregnancy, health insurance coverage, etc.
