As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure their development in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in island territories under U.S. administration.

The mission of the Department's Fish and Wildlife Service is to conserve, protect, and enhance fish and wildlife and their habitats for the continuing benefit of the American people. The Service is responsible for national programs of vital importance to our natural resources, including administration of the Federal Aid in Sport Fish Restoration and the Federal Aid of Wildlife Restoration Programs. These two grant programs provide financial assistance to the States for projects to enhance and protect fish and wildlife resources and to assure their availability to the public for recreational purposes. Multistate grants from these programs pay for the National Survey of Fishing, Hunting, and Wildlife-Associated Recreation.

Foreword

Fish and wildlife resources are part of our American culture. Whether we are fishing, hunting, watching wildlife or feeding backyard birds, Americans derive many hours of enjoyment from wildlife-related recreation. Wildlife recreation is the cornerstone of our Nation's great conservation ethic.

The 2001 National Survey of Fishing, Hunting, and Wildlife-Associated Recreation is a partnership effort with the States and national conservation organizations, and has become one of the most important sources of information on fish and wildlife recreation in the United States. It is a useful tool that quantifies the economic impact of wildlife-based recreation. Federal, State, and private organizations use this detailed information to manage wildlife, market products, and look for trends. The 2001 Survey is the tenth in a series that began in 1955.

More than 82 million U.S. residents fished, hunted, and watched wildlife in 2001. They spent over \$108 billion pursuing their recreational activities, contributing to millions of jobs in industries and businesses that support wildlife-related recreation. Furthermore, funds generated by licenses and taxes on hunting and fishing equipment pay for many of the conservation efforts in this country.

Wildlife recreationists are among the Nation's most ardent conservationists. They not only contribute financially to conservation efforts, but also spend time and effort to introduce children and other newcomers to the enjoyment of the outdoors and wildlife.

I appreciate the assistance of those who took time to participate in this valuable survey. We all can be grateful that America's great tradition of wildlife-related recreation remains strong.

Steve Williams
Director, U.S. Fish and Wildlife Service
U.S. Department of the Interior

Survey Background and Method

The National Survey of Fishing, Hunting, and Wildlife-Associated Recreation (Survey) has been conducted since 1955 and is one of the oldest and most comprehensive continuing recreation surveys. The purpose of the Survey is to gather information on the number of anglers, hunters, and wildlife-watching participants (formerly known as nonconsumptive wildlife-related participants) in the United States. Information also is collected on how often these recreationists participate and how much they spend on their activities.

Preparations for the 2001 Survey began in 1999 when the International Association of Fish and Wildlife Agencies (IAFWA) asked us, the Fish and Wildlife Service, to conduct the tenth national survey of wildlife-related recreation. Funding came from the Multistate Conservation Grant Programs, authorized by Sport Fish and Wildlife Restoration Acts, as amended.

We consulted with State and Federal agencies and nongovernmental organizations such as the Wildlife Management Institute and American Sportfishing Association to determine survey content. Other sportspersons' organizations and conservation groups, industry representatives, and researchers also provided valuable advice.

Four regional technical committees were set up under the auspices of the IAFWA to ensure that State fish and wildlife agencies had an opportunity to participate in all phases of survey planning and

design. The committees were made up of agency representatives.

Data collection for the Survey was carried out in two phases by the U.S. Census Bureau. The first phase was the screen which began in April 2001. During the screening phase, the Census Bureau interviewed a sample of 80,000 households nationwide to determine who in the household had fished, hunted, or engaged in wildlife-watching activities in 2000, and who had engaged or planned to engage in those activities in 2001. In most cases, one adult household member provided information for all household members. The screen primarily covered 2000 activities while the next, more in-depth phase covered 2001 activities. For more information on the 2000 data, refer to Appendix C.

The second phase of the data collection consisted of three detailed interview waves. The first wave began in April 2001, the second in September 2001, and the last in January 2002. Interviews were conducted with samples of likely anglers, hunters, and wildlife watchers who were identified in the initial screening phase. These interviews were conducted primarily by telephone, with in-person interviews for those respondents who could not be reached by telephone. Respondents in the second survey phase were limited to those at least 16 years old. Each respondent provided information pertaining only to his or her activities and expenditures. Sample sizes were designed to provide statistically reliable

results at the State level. Altogether, interviews were completed for 25,070 respondents from the sportspersons sample and 15,303 from the wildlife watchers sample. More detailed information on sampling procedures and response rates is found in Appendix D.

Comparability With Previous Surveys

The 2001 Survey's questions and methodology were similar to those used in the 1996 and 1991 Surveys. Therefore, the estimates of all three surveys are comparable.

The methodology of the 2001, 1996, and 1991 Surveys did differ significantly from the 1985 and 1980 Surveys, so their estimates are not directly comparable to those earlier surveys. The changes in methodology included reducing the recall period over which respondents had to report their activities and expenditures. Previous Surveys used a 12-month recall period which resulted in greater reporting bias. Research found that the amount of activity and expenditures reported in 12-month recall surveys was overestimated in comparison with that reported using shorter recall periods. See the Summary Section and Appendix B.

Highlights

Introduction

The National Survey of Fishing, Hunting, and Wildlife-Associated Recreation reports results from interviews with U.S. residents about their fishing, hunting, and other wildlife-related recreation. This report focuses on 2001 participation and expenditures of U.S. residents 16 years of age and older.

In addition to the 2001 numbers, we also provide 11-year trend data. The 2001 numbers reported can be compared with those in the 1991 and 1996 Survey reports because these three surveys used similar methodologies. However, the 2001 estimates should not be directly compared with the results from Surveys earlier than 1991 because of changes in methodology. These changes were made to improve accuracy in the information provided. Trend information from 1991 to 2001 is presented in Appendix B.

The report also provides information on participation in wildlife-related recreation in 2000, particularly of persons 6 to 15 years of age. The 2000 information is provided in Appendix C. Additional information about the scope and coverage of the Survey can be found in the Survey Background and Method section of this report. The remainder of this section defines important terms used in the Survey.

Wildlife-Associated Recreation

Wildlife-associated recreation includes fishing, hunting, and wildlife-watching activities. These categories are not mutually exclusive because many individuals enjoyed fish and wildlife in several ways in 2001. Wildlife-associated recreation is reported in two major categories: (1) fishing and hunting and (2) wildlife watching (formerly nonconsumptive wildlife-related recreation). Wildlife watching includes observing, photographing, and feeding fish and wildlife.

Fishing and Hunting

This Survey reports information about residents of the United States who fished or hunted in 2001, regardless of whether they were licensed. The fishing and hunting sections of this report are organized to report three groups: (1) sportspersons, (2) anglers, and (3) hunters.

Sportspersons

Sportspersons are those who fished or hunted. Individuals who fished or hunted commercially in 2001 are reported as sportspersons only if they also fished or hunted for recreation. The sportspersons group is composed of the three subgroups in the diagram below: (1) those who fished and hunted, (2) those who only fished, and (3) those who only hunted. The total number of sportspersons is equal to the sum of people who only

fished, only hunted, and both hunted and fished. It is not the sum of all anglers and all hunters, because those people who both fished and hunted are included in both the angler and hunter population and would be incorrectly counted twice.

Anglers

Anglers are sportspersons who only fished plus those who fished and hunted. Anglers include not only licensed hook-and-line anglers, but also those who have no license and those who use special methods such as fishing with spears. Three types of fishing are reported: (1) freshwater, excluding the Great Lakes, (2) Great Lakes, and (3) saltwater. Since many anglers participated in more than one type of fishing, the total number of anglers is less than the sum of the three types of fishing.

Hunters

Hunters are sportspersons who only hunted plus those who hunted and fished. Hunters include not only licensed hunters using common hunting practices, but also those who have no license and those who engaged in hunting with a bow and arrow, muzzleloader, other primitive firearms, or a pistol or handgun. Four types of hunting are reported: (1) big game, (2) small game, (3) migratory bird, and (4) other animals. Since many hunters participated in more than one type of hunting, the sum of hunters for big game, small game, migratory bird, and other animals exceeds the total number of hunters.

Sportspersons

Wildlife-Watching Activities (formerly Nonconsumptive Wildlife-Related Recreation)

Since 1980, the National Survey of Fishing, Hunting, and Wildlife-Associated Recreation has included information on wildlife-watching activities in addition to fishing and hunting. However, the 1991, 1996, and 2001 Surveys, unlike the 1980 and 1985 Surveys, collected data only for those activities where the primary purpose was wildlife watching (observing, photographing, or feeding wildlife). The Survey uses a strict definition of wildlife watching. Participants must either take a “special interest” in wildlife around their homes or take a trip for the “primary purpose” of wildlife watching. Secondary wildlife-watching activities such as incidentally observing wildlife while

pleasure driving were included in the 1980 and 1985 Surveys but not in the succeeding ones.

Two types of wildlife-watching activity are reported: (1) nonresidential and (2) residential. Because some people participate in more than one type of wildlife-watching activity, the sum of participants in each type will be greater than the total number of wildlife watchers. The two types of wildlife-watching activities are defined below.

Nonresidential (away from the home)

This group included persons who took trips or outings of at least 1 mile for the primary purpose of observing, feeding, or photographing fish and wildlife. Trips to fish, hunt, or scout and trips to zoos,

circuses, aquariums, or museums were not considered wildlife-watching activities.

Residential (around the home)

This group included those whose activities are within 1 mile of home and involve one or more of the following: (1) closely observing or trying to identify birds or other wildlife; (2) photographing wildlife; (3) feeding birds or other wildlife on a regular basis; (4) maintaining natural areas of at least one-quarter acre where benefit to wildlife is the primary concern; (5) maintaining plantings (shrubs, agricultural crops, etc.) where benefit to wildlife is the primary concern; or (6) visiting public parks within 1 mile of home for the primary purpose of observing, feeding, or photographing wildlife.

2001 Kansas Summary

(Participants 16 years old and older)

Activities in the United States by Kansas Residents

Fishing

Anglers	431,000
Days of fishing	6,426,000
Average days per angler	15
Total expenditures	\$331,195,000
Trip-related	\$119,372,000
Equipment and other	\$211,823,000
Average per angler	\$768
Average trip expenditure per day	\$19
Trip and equipment expenditures by Kansans out of state	\$109,671,000

Hunting

Hunters	202,000
Days of hunting	3,424,000
Average days per hunter	17
Total expenditures	\$223,192,000
Trip-related	\$58,292,000
Equipment and other	\$164,900,000
Average per hunter	\$1,105
Average trip expenditure per day	\$17
Trip and equipment expenditures by Kansans out of state	\$33,847,000

Wildlife Watching

Total wildlife-watching participants	735,000
Nonresidential	286,000
Residential	718,000
Total expenditures	\$175,030,000
Trip-related	\$81,231,000
Equipment and other	\$93,799,000
Average per participant	\$238
Trip and equipment expenditures by Kansans out of state	\$74,946,000

Activities in Kansas by U.S. Residents

Fishing

Anglers	404,000
Days of fishing	5,662,000
Average days per angler	14
Total expenditures	\$192,629,000
Trip-related	\$80,948,000
Equipment and other	\$111,681,000
Average per angler	\$472
Average trip expenditure per day	\$14
Trip and equipment expenditures by nonresidents in Kansas	\$6,971,000

Hunting

Hunters	291,000
Days of hunting	3,647,000
Average days per hunter	13
Total expenditures	\$235,549,000
Trip-related	\$96,364,000
Equipment and other	\$139,185,000
Average per hunter	\$783
Average trip expenditure per day	\$26
Trip and equipment expenditures by nonresidents in Kansas	\$59,585,000

Wildlife Watching

Total wildlife-watching participants	807,000
Nonresidential	297,000
Residential	718,000
Total expenditures	\$128,663,000
Trip-related	\$32,175,000
Equipment and other	\$96,488,000
Average per participant	\$159
Trip and equipment expenditures by nonresidents in Kansas	\$31,734,000

Wildlife-Associated Recreation

Participation in Kansas

The 2001 Survey revealed that 1.1 million Kansas residents and nonresidents 16 years old and older fished, hunted, or wildlife watched in Kansas. Of the total number of participants, 404 thousand fished, 291 thousand hunted, and 807 thousand participated in wildlife-watching activities, including observing, feeding, and photographing wildlife. The sum of anglers, hunters, and wildlife watchers exceeds the total number of participants in wildlife-related recreation because many individuals engaged in more than one wildlife activity.

Participation by 6- to 15-year-old Kansas Residents

The focus of this report is on the activity of participants 16 years old and older since they are the primary source of wildlife-associated expenditures. However, the activity of 6 to 15 year olds can be calculated using the screening data covering the year 2000. It is assumed for estimation purposes that the relative activity levels of 6- to 15-year-old

participants and participants 16 years old and older remained the same from 2000 to 2001. Based on this assumption, in addition to the 431,000 resident anglers 16 years old and older in Kansas, there were 165,000 resident anglers 6 to 15 years old. Also, there were 202,000 16-year-old and older Kansans and 26,000 6- to 15-year-old Kansans who hunted. Finally, there were 735,000 Kansans 16 years old and older and 159,000 Kansans 6 to 15 years old who wildlife watched. Further information on 6 to 15 year olds is provided in Appendix C.

Expenditures in Kansas

In 2001, state residents and nonresidents spent \$591 million on wildlife recreation in Kansas. Of that total, trip-related expenditures were \$209 million and equipment purchases totaled \$321 million. The remaining \$61 million was spent on licenses, contributions, land ownership and leasing, and other items and services.

Percent of Total Participation by Activity

(Total: 1.1 million participants)

Participants in Wildlife-Associated Recreation in Kansas—2001

(U.S. residents 16 years old and older)

Wildlife-Associated Recreation Expenditures in Kansas

(Total: \$591 million)

Sportspersons

In 2001, 563 thousand state resident and nonresident sportspersons 16 years old and older fished or hunted in Kansas. This group comprised 404 thousand anglers (72 percent of all sportspersons) and 291 thousand hunters (52 percent of all

sportspersons). Among the 563 thousand sportspersons who fished or hunted in the state, 272 thousand (48%) fished but did not hunt in Kansas. Another 160 thousand (28%) hunted but did not fish there. The

remaining 132 thousand (23%) fished and hunted in Kansas in 2001.

Sportspersons' Participation in Kansas

(State residents and nonresidents 16 years old and older)

Sportspersons (fished or hunted)	563 thousand

Detail does not add to total because of multiple responses.

Anglers

Participants and Days of Fishing

In 2001, 404 thousand state residents and nonresidents 16 years old and older fished in Kansas. Of this total, 357 thousand anglers (88%) were state residents and 47 thousand anglers (12%) were nonresidents. Anglers fished a total of 5.7 million days in Kansas—an average of 14 days per angler. State residents fished 5.5 million days, 97 percent of all fishing days within Kansas compared to nonresidents who fished 158 thousand days—3 percent of all fishing days in the state.

There were 431 thousand Kansans 16 years old and older who fished in the United States in 2001. These anglers fished a total of 6.4 million days. Approximately 357 thousand resident anglers (83%) fished in Kansas. They spent 5.5 million days, 86 percent of their total fishing days, fishing in their resident state.

Some state residents fished in other states as well as in Kansas. In 2001, 157 thousand anglers fished in other states—37 percent of the resident angler total.

They fished 922 thousand days as nonresidents, representing 14 percent of all days fished by Kansas residents. For further details about fishing in Kansas, see Table 3.

Anglers in Kansas

(State residents and nonresidents 16 years old and older)

Anglers	404 thousand
Resident	357 thousand
Nonresident	47 thousand
Days of fishing	5.7 million
Resident	5.5 million
Nonresident	158 thousand

Detail does not add to total because of multiple responses.

Fishing Expenditures in Kansas

Anglers 16 years old and older spent nearly \$193 million on fishing expenses in Kansas in 2001. Trip-related expenditures including food and lodging, transportation, and other expenses totaled \$81 million—42 percent of all their fishing expenditures. They spent \$32 million on food and lodging and \$26 million on transportation. Other trip expenses such as equipment rental, bait, and cooking fuel totaled \$23 million. Each angler spent an average of \$201 on trip-related costs during 2001.

Anglers spent \$101 million on equipment in Kansas in 2001, 52 percent of all fishing expenditures. Fishing equipment (rods, reels, line, etc.) totaled \$30 million—29 percent of the equipment total. Auxiliary equipment expenditures (tents, special fishing clothes, etc.) and special equipment expenditures (boats, pickups, etc.) amounted to \$71 million, 71 percent of the equipment total. Special and auxiliary equipment are items that were purchased for fishing, but could be used in activities other than fishing.

The purchase of other items such as magazines, membership dues, licenses, permits, stamps, and land leasing and ownership amounted to \$11 million—6 percent of all fishing expenditures. For more details about fishing expenditures in Kansas, see Tables 19, 21-23.

Fishing Expenditures in Kansas

(State residents and nonresidents 16 years old and older)

Total	\$193 million
Trip-related	\$81 million
Equipment	\$101 million
Fishing	\$30 million
Auxiliary and special	\$71 million
Other	\$11 million

Source: Table 19.

Fishing Expenditures in Kansas

(Total: \$193 million)

Hunters

Participants and Days of Hunting

In 2001, there were 291 thousand residents and nonresidents 16 years old and older who hunted in Kansas. Resident hunters numbered 189 thousand accounting for 65 percent of the hunters in Kansas. There were 103 thousand nonresidents who hunted in Kansas—35 percent of the State's hunters. Residents and nonresidents hunted 3.6 million days in 2001, an average of 13 days per hunter. Residents hunted on 3.1 million days in

Kansas or 84 percent of all hunting days, while nonresidents spent 579 thousand days hunting in Kansas, 16 percent of all hunting days.

There were 202 thousand Kansas residents 16 years old and older who hunted in the United States in 2001. Of the total 3.4 million days of hunting by state residents, 3.1 million days (90 percent of the total) were spent pursuing game within Kansas.

Some state residents hunted in other states as well as in Kansas. Altogether, 43 thousand Kansas hunters, 21 percent of the total, hunted as nonresidents in other states. Their 357 thousand days of hunting in other states represented 10 percent of all days Kansas residents spent hunting in 2001. For more information on hunting activities by Kansas residents, see Table 3.

Hunters in Kansas

(State residents and nonresidents 16 years old and older)

Hunters	291 thousand
Resident	189 thousand
Nonresident	103 thousand
Days of hunting	3.6 million
Resident	3.1 million

Hunting Expenditures in Kansas

Hunters 16 years old and older spent \$236 million in Kansas in 2001. Trip-related expenses such as food and lodging, transportation, and other trip costs totaled \$96 million, 41 percent of their total expenditures. They spent \$47 million on food and lodging and \$36 million on transportation. Other expenses such as equipment rental totaled \$12 million for the year. The average trip-related expenditure per hunter was \$331.

Hunters spent \$113 million on equipment—48 percent of all hunting expenditures. Hunting equipment (guns, ammunition, etc.) totaled nearly \$85 million and comprised 75 percent of all equipment costs. Hunters spent \$29 million on auxiliary equipment (tents, special hunting clothes, etc.) and special equipment (boats, pickups, etc.), accounting for 25 percent of total equipment expenditures for hunting. Special and auxiliary equipment are items

that were purchased for hunting but could be used in activities other than hunting.

The purchase of other items such as magazines, membership dues, licenses, permits, and land leasing and ownership cost hunters \$26 million—11 percent of all hunting expenditures. For more details on hunting expenditures in Kansas, see Tables 20-23.

Hunting Expenditures in Kansas

(State residents and nonresidents 16 years old and older)

Total	\$236 million
Trip-related	\$96 million
Equipment	\$113 million
Hunting	\$85 million
Auxiliary and special	\$29 million
Other	\$26 million

Hunting Expenditures in Kansas

(Total: \$236 million)

Wildlife-Watching Activities

Participants and Days of Activity

In 2001, 807 thousand U.S. residents 16 years old and older fed, observed, or photographed wildlife in Kansas. Approximately 89 percent—718 thousand

of the wildlife watchers—enjoyed their activities close to home and are called "residential" participants. Those persons who enjoyed wildlife at least 1 mile from home are called "nonresidential"

participants. People participating in nonresidential activities in Kansas in 2001 numbered 297 thousand—37 percent of all wildlife watchers in Kansas. Of the 297 thousand, 221 thousand were state residents and 76 thousand were nonresidents.

Kansans 16 years old and older who enjoyed nonresidential wildlife watching within their state totaled 221 thousand. Of this group, 214 thousand participants observed wildlife, 86 thousand fed wildlife, and 56 thousand photographed wildlife. Since some individuals engaged in more than one of the three nonresidential activities during the year, the sum of wildlife observers, feeders, and photographers exceeds the total number of nonresidential participants.

Kansans spent nearly 1.7 million days engaged in nonresidential wildlife-watching activities in their state. During 2001, they spent 1.4 million days observing wildlife, 300 thousand days feeding wildlife, and 251 thousand days photographing wildlife. The sum of days observing, feeding, and photographing wildlife exceeds the total days of wildlife-watching activity because individuals may have engaged in more than one activity on some days. For further details about nonresidential activities, see Table 25.

Kansas residents also took an active interest in wildlife around their homes. In 2001, 718 thousand state residents enjoyed observing, feeding, and photographing wildlife within 1 mile of their homes. Among this residential group, 627 thousand fed wildlife, 477 thousand observed wildlife, and 161 thousand photographed wildlife around their homes. Another 118 thousand residential participants visited public parks within a mile of home; 92 thousand participants maintained natural areas of one-quarter acre or more for wildlife; and 81 thousand participants maintained plantings for the benefit of wildlife. Adding the participants in these six activities results in a sum that exceeds the total number of residential participants because many people participated in more than one type of residential activity. For further details about Kansas residents participating in residential wildlife-watching activities, see Table 28.

Wildlife-Watching Participants in Kansas

(State residents and nonresidents 16 years old and older)

Total	807 thousand	100%
Residential	718 thousand	89%
Nonresidential	297 thousand	37%

Detail does not add to total because of multiple responses.

Wild Bird Observers

Bird watching attracted many wildlife enthusiasts in Kansas. In 2001, 569 thousand people observed birds around the home and on trips. The majority, 78 percent (441 thousand), observed wild birds around the home while 47 percent (267 thousand) took trips away from home to watch birds.

People bird watching in Kansas varied in their ability to identify different bird species. Within Kansas, 433 thousand of these 569 thousand birders (76 percent) could identify 1 to 20 different types of birds; 68 thousand birders (12 percent) could identify 21 to 40 types of birds; and 43 thousand birders (8 percent) could identify 41 or more types of birds.

Approximately 34 thousand wild bird enthusiasts kept birding life lists in 2001. Participants keeping these lists—a tally of bird species seen by a birder during his or

her lifetime—comprised 6 percent of all wild bird observers in Kansas. For further details about birding in Kansas, see Tables 30 and 31.

Wildlife-Watching Expenditures in Kansas

Participants 16 years old and older spent \$129 million on wildlife-watching activities in Kansas in 2001. Trip-related expenditures, including food and lodging (\$20 million), transportation (\$11 million), and other trip expenses such as equipment rental (\$960 thousand) amounted to \$32 million. This summation comprised 25 percent of all wildlife-watching expenditures by participants. The average trip-related expenditure for nonresidential participants was \$108 per person in 2001.

Wildlife-watching participants spent nearly \$72 million on equipment—56 percent of all their expenditures.

Specifically, wildlife-watching equipment (binoculars, special clothing, etc.) totaled \$69 million, 96 percent of the equipment total. Auxiliary equipment expenditures (tents, backpacking equipment, etc.) and special equipment expenditures (campers, trucks, etc.) amounted to \$3 million—4 percent of all equipment costs. Special and auxiliary equipment are items that were purchased for wildlife-watching recreation but can be used in activities other than wildlife-watching activities.

Other items purchased by wildlife-watching participants such as magazines, membership dues, and contributions, land leasing and ownership, and plantings totaled close to \$25 million—19 percent of all wildlife-watching expenditures. For more details about wildlife-watching expenditures in Kansas, see Table 33.

Wild Bird Observers in Kansas

(State residents and nonresidents 16 years old and older)

Participants, total	569 thousand	100%
Residential (around the home)	441 thousand	78%
Nonresidential (away from home)	267 thousand	47%
Days, total	48.8 million	100%

1991-2001 Survey Comparisons

Comparing the estimates from the 1991, 1996, and 2001 National Surveys provides a picture of wildlife-related recreation in the 1990s and early 2000s in Kansas. Only the most general recreation comparisons are presented here.

The best way to compare estimates from surveys is to compare the confidence intervals around the estimates—not to compare the estimates themselves. A 90-percent confidence interval around an estimate gives the range of estimates that

90 percent of all possible representative samples would supply. If the 90-percent confidence intervals of two survey's estimates overlap, it is not possible to say the two estimates are statistically different at the 10 percent level of significance.

The state resident estimates cover the participation and expenditure activity of Kansas residents anywhere in the United States. The in-state estimates cover the participation, day, and expenditure activity of U.S. residents in Kansas.

The expenditure estimates were made comparable by adjusting the estimates for inflation—all dollar estimates are in 2001 dollars. Also, expenditure items that were not common to each survey were not included in the comparisons. Therefore, expenditure estimates used in the comparisons may not match the estimates presented elsewhere in this report.

Guide to Statistical Tables

Purpose and Coverage of Tables

The statistical tables of this report were designed to meet a wide range of needs for those interested in wildlife-related recreation. Special terms used in these tables are defined in Appendix A.

The tables are based on responses to the 2001 Survey which was designed to collect data about participation in wildlife-related recreation. To have taken part in the Survey, a respondent must have been a U.S. resident (a resident of one of the 50 states or the District of Columbia). No one residing outside the United States (including U.S. citizens) was eligible for interviewing. Therefore, reported state and national totals do not include participation by those who were not U.S. residents or who were residing outside the United States.

Comparability With Previous Surveys

The numbers reported can be compared with those in the 1991 and 1996 Survey Reports. The methodology used in 2001 was similar to that used in 1996 and 1991. These results should not be directly compared to results from surveys earlier than 1991 since there were major changes in methodology. These changes were made to improve accuracy in the information provided.

Coverage of an Individual Table

Since the Survey covers many activities in various places by participants of different ages, all table titles, headnotes, stubs, and footnotes are designed to identify and articulate each item being reported in the table. For example, the title of Table 2 shows that data about anglers and hunters, their days of participation, and their number of trips are being reported by type of activity. By contrast, the title of Table 7 indicates that it contains data on freshwater anglers and the days they fished for different species of fish.

Percentages Reported in the Tables

Percentages are reported in the tables for the convenience of the user. When exclusive groups are being reported, the base of a percentage is apparent from its context because the percents add to 100 percent (plus or minus a rounding error). For example, if a table reports the number of trips taken by big game hunters (57 percent), those taken by small game hunters (23 percent), those taken by migratory bird hunters (12 percent), and those taken by sportspersons hunting other animals (8 percent), then these percentages would total 100 percent because they are exclusive categories.

Percents should not add to 100 when nonexclusive groups are being reported. Using Table 2 as an example, note that adding the percentages associated with total number of big game hunters, total small game hunters, total migratory bird hunters, and total hunters of other animals will not necessarily yield 100 percent because respondents could hunt for more than one type of game.

When the base of the percentage is not apparent in context, it is identified in a footnote. For example, Table 12 reports 3 percentages with different bases: one for the number of hunters, one for the number of trips, and one for days of hunting. Footnotes are used to clarify the bases of the reported percentages.

Footnotes to the Tables

Footnotes are used to clarify the information or items that are being reported in a table. Symbols in the body of a table indicate important footnotes. These symbols are used in the tables to refer to the same footnote each time they appear:

- * Estimate based on a small sample size.
- ... Sample size too small to report data reliably.
- W Less than .5 dollars.
- Z Less than .5 percent.
- X Not applicable.
- NA Not available.

Estimates based upon fewer than 10 responses are regarded as being based on a sample size that is too small for reliable reporting. An estimate based upon at least 10 but fewer than 30 responses is treated as an estimate based on a small sample size. Other footnotes appear, as necessary, to qualify or clarify the estimates reported in the tables. In addition, these two important footnotes appear frequently:

- Detail does not add to total because of multiple responses.
- Detail does not add to total because of multiple responses and nonresponse.

“Multiple responses” is a term used to reflect the fact that individuals or their characteristics fall into more than one category. Using Table 2 as an example, those who fished in saltwater and freshwater appear in both of these totals. Yet each angler is represented only once in the “Total, all fishing” row. Similarly, in Table 12 those who hunt for big game and small game are counted only once as a hunter in the “Total, all hunting” row. Therefore, totals may be smaller than the sum of subcategories when multiple responses exist.

“Nonresponse” exists because the survey questions were answered voluntarily and some respondents did not or could not answer all the questions. The effect of nonresponses is illustrated in Table 18 where the total for hunting expenditures may be greater than the sum for the different types of hunting expenditures. This occurs because some respondents did not specify the type of hunting as the primary purpose of the purchase. As a result, it is known that the expenditures were for hunting, but it is not known whether they were primarily for a particular type of hunting. In this case, totals are greater than the sum of subcategories when nonresponses have occurred.

Table 1. Fishing and Hunting in Kansas by Resident and Nonresident Sportspersons: 2001

(Population 16 years old and older. Numbers in thousands)

* Estimate based on a small sample size. ... Sample size too small to report data reliably.

Note: Detail does not add to total because of multiple responses. U.S. totals include responses from participants residing in the District of Columbia, as described in the statistical accuracy appendix.

Appendix A

Appendix A.

Definitions

Annual household income—Total 2001 income of household members before taxes and other deductions.

Auxiliary equipment—Equipment owned primarily for wildlife-associated recreation. These include for the sportspersons section—camping bags, packs, duffel bags and tents, binoculars, field glasses, telescopes, special fishing and hunting clothing, foul weather gear, boots, waders, and processing and taxidermy costs; and for the wildlife-watching section—tents, tarps, frame packs, backpacking equipment and other camping equipment.

Big game—Antelope, bear, deer, elk, moose, wild turkey, and similar large animals which are hunted.

Birding life list—A tally of bird species seen during a birder's lifetime.

Day—Any part of a day spent in a given activity. For example, if someone hunted 2 hours 1 day and 3 hours another day, it would be recorded as 2 days of hunting. If someone hunted 2 hours in the morning and 3 hours in the evening of the same

day, it would be considered 1 day of hunting.

Education—The highest completed grade of school or year of college.

Expenditures—Money spent in 2001 for wildlife-related recreation trips in the United States and wildlife-related recreational equipment purchased in the United States. Expenditures include both money spent by participants for themselves and the value of gifts they received.

Federal land—Public land owned by the federal government such as National Forests and National Wildlife Refuges.

Fishing—The sport of catching or attempting to catch fish with a hook, line, bow and arrow, or spear; it also includes catching or gathering shellfish (clams, crabs, etc.); and the noncommercial seining or netting of fish, unless the fish are for use as bait. For example, seining for smelt is fishing, but seining for bait minnows is not included as fishing.

Fishing equipment—Items owned primarily for fishing. These items are listed in Table 19.

Freshwater—Reservoirs, lakes, ponds, and the nontidal portions of rivers and streams.

Great Lakes fishing—Fishing in Lakes Superior, Michigan, Huron, St. Clair, Erie, and Ontario, their connecting waters such as the St. Marys River system, Detroit River, St. Clair River, and the Niagara River, and the St. Lawrence River south of the bridge at Cornwall, New York. Great Lakes fishing includes fishing in tributaries of the Great Lakes for smelt, steelhead, and salmon.

Home—The starting point of a wildlife-related recreational trip. It may be a permanent residence or a temporary or seasonal residence such as a cabin.

Hunting—The sport of shooting or attempting to shoot wildlife with firearms or archery equipment.

Hunting equipment—Items owned primarily for hunting. These items are listed in Table 20.

Local land—Public land owned by local government such as county parks or municipal watersheds.

Maintain natural areas—To set aside one-quarter acre or more of natural environment such as wood lots or open fields for the primary purpose of benefiting wildlife.

Maintain plantings—To introduce or encourage the growth of food and cover plants for the primary purpose of benefiting wildlife.

Metropolitan statistical area (MSA)—Except in the New England States, an MSA is a county or group of contiguous counties containing at least one city of 50,000 or more inhabitants or twin cities (i.e., cities with contiguous boundaries and constituting, for general social and economic purposes, a single community) with a combined population of at least 50,000. Also included in an MSA are contiguous counties that are socially and economically integrated with the central city. In the New England States, an MSA consists of towns and cities instead of counties. Each MSA must include at least one central city.

Migratory birds—Birds that regularly migrate from one region or climate to another. The survey focuses on migratory birds which may be hunted, including bandtailed pigeons, coots, ducks, doves, gallinules, geese, rails, and woodcocks.

Multiple responses—The term used to reflect the fact that individuals or their characteristics fall into more than one reporting category. An example of a big game hunter who hunted for deer and elk demonstrates the effect of multiple responses. In this case, adding the number of deer hunters (1) and elk hunters (1) would over state the number of big game hunters (1) because deer and elk hunters are not mutually exclusive

categories. In contrast, total participants is the sum of male and female participants, because male and female are mutually exclusive categories.

Nonresidential activity (away from home)—Trips or outings at least 1 mile from home for the primary purpose of observing, photographing, or feeding wildlife. Trips to zoos, circuses, aquariums, and museums are not included.

Nonresidents—Individuals who do not live in the state being reported. For example, a person living in Texas who watches whales in California is a nonresident participant in California.

Nonresponse—Nonresponse is a term used to reflect the fact that some survey respondents provide incomplete sets of information. For example, a survey respondent may have been unable to identify the primary type of hunting for which a gun was bought. Hunting expenditures will reflect the gun purchase, but it will not appear as spending for big game or any other type of hunting. Nonresponses result in reported totals that are greater than the sum of their parts.

Observe—To take special interest in or try to identify birds, fish, or other wildlife.

Other animals—Coyotes, crows, foxes, groundhogs, prairie dogs, raccoons, and similar animals that are often regarded as varmints or pests. Other animals may be classified as unprotected or nongame animals by the state in which they are hunted.

Participants—Individuals who engaged in fishing, hunting, or a wildlife-watching activity.

Primary purpose—The principal motivation for an activity, trip, or expenditure.

Public areas—Public lands owned by local, state, or federal governments.

Public land—Land that is owned by the local, state, or federal government.

Private land—Land that is owned by a private individual, group of individuals, or nongovernmental organization.

Residential activity (around the home)—Activity within 1 mile of home with a primary purpose: (1) closely observing or trying to identify birds or other wildlife, (2) photographing wildlife, (3) feeding birds or other wildlife, (4) maintaining natural areas of at least one-quarter acre primarily for the benefit to wildlife, (5) maintaining plantings (shrubs, agricultural crops, etc.) primarily for the benefit of wildlife, or (6) visiting public parks within 1 mile of home to observe, photograph, or feed wildlife.

Residents—Individuals who lived in the state being reported. For example, persons who live in California and watch whales in California are resident participants in California.

Rural—Respondent lived in a rural nonfarm, or rural farm area, as determined by Census.

Saltwater—Oceans, tidal bays and sounds, and the tidal portions of rivers and streams.

Screening interviews—The first survey contact with a household. Screening interviews with a household representative in each household to identify respondents who are eligible for indepth interviews. Screening interviews gather data about the individuals in the households, such as their age and sex. Screening interviews are discussed in the Survey Background and Method section of this report.

Small game—Grouse, partridge, pheasants, quail, rabbits, squirrels, and similar small animals and birds for which many states have small game seasons and bag limits.

Special equipment—Items of equipment that are owned primarily for wildlife-related recreation. These include for the sportsmen section bass boat and other types of motor boat; canoe and other types of nonmotor boat; boat motor, boat trailer/hitch, and other boat accessories; pickup, camper, van, travel or tent trailer, motor home, house trailer, RV, cabin; and trail bike, dune buggy, 4x4 vehicle, four-wheeler, and snowmobile. For the wildlife-watching section these include off-the-road vehicles such as snowmobiles, four-wheeler, 4x4 vehicle, trail bike, dune buggy, travel or tent trailer, motor home, pickup, camper, van,

house trailer, RV, boat and boat accessories, and cabin.

Spenders—Individuals who reported an expenditure value for fishing, hunting, or wildlife-watching activities or equipment.

Sportspersons—Individuals who engaged in fishing, hunting, or both.

State land—Public land owned by a state such as state parks or state wildlife management areas.

Trip—An outing involving fishing, hunting, or wildlife-watching activities. In the context of this survey, a trip may begin from an individual's principal residence or from another place, such as a vacation home or the home of a

relative. A trip may last an hour, a day, or many days.

Type of fishing—Three types of fishing are reported: fishing in (1) freshwater except Great Lakes, (2) Great Lakes, and (3) saltwater.

Type of hunting—Four types of hunting are reported: hunting for (1) big game, (2) small game, (3) migratory bird, and (4) other animals.

Urban—Respondent lived in an urban area, as determined by the U.S. Census Bureau.

Wildlife—Animals such as birds, fish, insects, mammals, amphibians, and reptiles that are living in natural or wild environments. Wildlife does not include

animals living in aquariums, zoos, and other artificial surroundings or domestic animals such as farm animals or pets.

Wildlife-associated recreation—Recreational fishing, hunting, or wildlife watching.

Wildlife-watching activity—An activity engaged in primarily for the purpose of feeding, photographing, or observing fish or other wildlife. In previous years, this was termed nonconsumptive activity. (See also residential and nonresidential activities.)

Wildlife-watching equipment—Items owned primarily for observing, photographing, or feeding wildlife. These items are listed in Table 33.

Appendix B

Appendix B.

National and Regional 1991-2001 Comparisons

Appendix B provides national and regional trend information based on the 1991, 1996, and 2001 Surveys. Since all three surveys used similar methodologies, their published information is directly comparable.

Fishing and Hunting

Comparing national hunting and fishing estimates for the 1991, 1996, and 2001 Surveys found participation declined over that 10-year time period. In 1991 and 1996, the number of people who hunted and fished remained essentially unchanged. In 2001, the overall number of people who hunted and fished declined from their 1991/1996 levels. In 1991, there were 35.6 million anglers and 14.1 million hunters. In 1996, there were 35.2 million anglers and 14.0 million hunters. In 2001, there were 34.1 million anglers—a 4 percent drop from its 1991 level, and 13.0 million hunters—a 7 percent drop from 1991.

The amount of time people spent fishing and hunting fluctuated between 1991 and 2001. The number of days spent fishing rose 22 percent between 1991 and 1996 and then fell 11 percent between 1996 and 2001. Days of hunting followed a similar pattern. Between 1991 and 1996, hunting days increased 9 percent but then fell 11 percent between 1996 and 2001.

The amount of money spent for fishing and hunting trips and equipment rose from 1991 to 1996 and fell from 1996 to 2001. Total fishing expenditures rose 37 percent from \$31.2 billion in 1991 to \$42.7 billion in 1996; and, then fell 17 percent to \$35.6 billion in 2001. Likewise, hunting expenditures increased from \$16.0 billion in 1991 to \$23.3 billion in 1996—45 percent increase—and then fell 12 percent to \$20.6 billion in 2001.

Wildlife Watching

Comparing the results from the last three surveys finds different trends for various

types of wildlife watching. The number of wildlife watchers decreased 17 percent from 1991 to 1996 and increased 5 percent from 1996 to 2001—with 76.1 million participants in 1991, 62.9 million in 1996, and 66.1 million in 2001. Residential wildlife watching, the preeminent type of wildlife watching, lead this trend with an 18 percent drop from 1991 to 1996 and a 4 percent increase from 1996 to 2001. Unlike residential wildlife watching, nonresidential wildlife watching dropped throughout the '90s and early '00s with a 21 percent drop from 1991 to 1996 and an 8 percent drop from 1996 to 2001. Days afield by participants tended upward, counter to the trend in participation, although the increase is not statistically significant. Total expenditures for wildlife watching increased 21 percent from 1991 to 1996 and 16 percent from 1996 to 2001, making an overall increase of 41 percent from 1991 to 2001.

Differences in the 1991, 1996, and 2001 Surveys

The 1996 and 2001 Surveys underwent a number of changes in order to improve data collection, lower costs, and meet the data needs of its users. The most significant design differences in the three surveys are as follows:

1. The 1991 Survey data was collected by interviewers filling out paper questionnaires. The data entries were keyed in a separate operation after the interview. The 1996 and 2001 survey data were collected by the use of computer-assisted interviews. The questionnaires were programmed into computers, and interviewers keyed in the responses at the time of the interview.
2. The 1991 Survey screening phase was conducted in January and February of 1991, when the sample households were contacted and a household respondent was

interviewed on behalf of the entire household. The 1991 screening interview consisted primarily of sociodemographic questions and wildlife-related recreation questions concerning activity in the year 1990 and intentions for the year 1991. The screening interviews for the 1996 and 2001 Surveys were conducted April through June of their survey years in conjunction with the first wave of the detailed interviews. The screening interviews consisted primarily of sociodemographic questions and wildlife-related recreation questions concerning activity in the previous year (1995 or 2000) and intentions for the survey year (1996 or 2001).

3. In the 1991 Survey, an attempt was made to contact every sample person in all three detailed interview waves. In 1996 and 2001, respondents who were interviewed in the first detailed interview wave were not contacted again until the third wave. Also, all interviews in the second wave were conducted by telephone. In-person interviews were only conducted in the first and third waves.

Important instrument differences in the 1991, 1996, and 2001 Surveys

1. The 1991 Survey collected information on all wildlife-related recreation purchases made by participants without reference to where the purchase was made. The 1996 and 2001 Surveys asked in which state the purchase was made.
2. In 1991, respondents were asked what kind of fishing they did, i.e., Great Lakes, other freshwater, or saltwater, and then were asked in what states they fished. In 1996 and 2001, respondents were asked in which states they fished and then were asked the pertinent kind of fishing questions. This method had the advantage of not asking about,

for example, saltwater fishing when they only fished in a noncoastal state. In 1991, respondents were asked how many days they "actually" hunted or fished for a particular type of game or fish and then how many days they "chiefly" hunted or fished for the same type of game or fish rather than another type of game or fish. To get total days of hunting or fishing for a particular type of game or fish, the "actually" day response was used, while to get the sum of all days of hunting or fishing, the "chiefly" days were summed. In 1996 and 2001, respondents were asked their total days of hunting or fishing in the United States and each state, then how many days they hunted or fished for a particular type of game or fish.

Trip-related and equipment expenditure categories were not the same for all Surveys. "Guide fee" and "Pack trip or package fee" were two separate trip-related expenditure items in 1991, while they were combined into one category in the 1996 and 2001 Surveys. "Boating costs" was added to the 1996 and 2001 hunting and wildlife-watching trip-related expenditure sections. "Heating and cooking fuel" was added to all of the trip-related expenditure sections. "Spearfishing equipment" was moved from a separate category to the "Other" list. "Rods" and "Reels" were two separate categories in 1991 but were combined in 1996 and 2001. "Lines, hooks, sinkers, etc." was one category in 1991 but split into "Lines" and "Hooks, sinkers, etc." in 1996 and 2001. "Food used to feed other wildlife" was added to the wildlife-watching equipment section, "Boats" and "Cabins" were added to the wildlife-watching special equipment section, and "Land leasing and ownership" was added to the wildlife-watching expenditures section.

5. Questions asking sportspersons if they participated as much as they wanted were added in 1996 and 2001. If the sportspersons said no, they were asked why not.

6. The 1991 Survey included questions about participation in organized fishing competitions; anglers using bows and arrows, nets or seines, or spearfishing; hunters using pistols or handguns and target shooting in preparation for hunting. These questions were not asked in 1996 and 2001.
7. The 1996 Survey included questions about catch and release fishing and persons with disabilities participating in wildlife-related recreation. These questions were not part of the 1991 Survey. The 2001 Survey included questions about persons with disabilities participating in wildlife-related recreation but not about catch and release fishing.
8. The 1991 Survey included questions about average distance traveled to recreation sites. These questions were not included in the 1996 and 2001 Surveys.
9. The 1996 Survey included questions about the last trip the respondent took. Included were questions about the type of trip, where the activity took place, and the distance and direction to the site visited. These questions were not asked in 2001.
10. The 1991 Survey collected data on hunting, fishing, and wildlife watching by U.S. residents in Canada. The 1996 and 2001 Surveys collected data on fishing and wildlife-watching by U.S. residents in Canada.

Important instrument changes in the 2001 Survey

1. The 1991 and 1996 single race category "Asian or Pacific Islander" was changed to two categories "Asian" and "Native Hawaiian or Other Pacific Islander." In 1991 and 1996, the respondent was required to pick only one category, while in 2001 the respondent could pick any combination of categories. The next question stipulated that the respondent could only be identified with one category and then asked what that category was.

2. The 1991 and 1996 land leasing and ownership sections asked the respondent to combine the two types of land use into one and give total acreage and expenditures. In 2001, the two types of land use were explored separately.
3. The 1991 and 1996 wildlife watching sections included questions on birdwatching for residential users only. The 2001 Survey added a question on birdwatching for nonresidential users. Also, questions on the use of birding life lists and how many species the respondent can identify were added in 2001.
4. "Recreational vehicles" was added to the sportspersons and wildlife watchers special equipment section in 2001. "House trailer" was added to the sportspersons special equipment section.
5. Total personal income was asked in the detailed phase of the 1996 Survey. This was changed to total household income in the 2001 Survey.
6. A question was added to the trip-related expenditures section in the 2001 Survey to ascertain how much of the total was spent in the respondent's state of residence when the respondent participated in hunting, fishing, or wildlife watching out-of-state.
7. Boating questions were added to the 2001 Surveys fishing section. The respondent was asked about the extent of boat usage for the three types of fishing.
8. The 1996 Survey included questions about the months residential wildlife watchers fed birds. These questions were not repeated in the 2001 Survey.
9. The contingent valuation sections of the three types of wildlife-related recreation were altered, using an open-ended question format instead of 1996's dichotomous choice format.

Table B-1. Comparison of Wildlife-Related Recreation in the United States: 1991 to 2001

(U.S. population 16 years old and older. Numbers in thousands)

Participants, days, and expenditures	1991 (Number)	2001 (Number)	1991-2001 (Percent change)	1996 (Number)	2001 (Number)	1996-2001 (Percent change)

Appendix C

Appendix C.

Participants 6 to 15 Years Old

The 2001 National Survey of Fishing, Hunting, and Wildlife-Associated Recreation was carried out in two phases. The first (or screening) phase began in April 2001. The main purpose of this phase was to collect information about persons 16 years old and older in order to develop a sample of potential sportsmen and wildlife-watching participants for the second (or detailed) phase. Information was also collected on the number of persons 6 to 15 years old who participated in wildlife-related recreation activities in 2000. These data are reported here in order to include the recreation activity of 6- to 15-year-olds in this report.

It is important to emphasize that the information reported here from the 2001 screening questionnaires relates to activity only up to and including 2000.

Also, these data were based on long-term recall (at least 12-month recall was required for most of these tables) and were reported, in most cases, by one household respondent speaking for all household members rather than the shorter term recall of the actual participant, as in the case of the 2001 detailed phase.

Tables C-1 to C-3 report data on participants 6 to 15 years old in 2000. Detailed expenditures and recreational activity data were not gathered for the 6- to 15-year-old participants.

Because of the difference in methodologies of the screening phase and the detailed phase of the 2001 Survey, the data are not comparable. Only participants 16 years old and older were eligible for the detailed phase. The

detailed phase was a series of three interviews conducted at 4-month intervals. The screening interviews were 1-year recall. The shorter recall period of the detailed phase had better data accuracy. It has been found in survey studies that in many cases longer recall periods result in over-estimating participation in and expenditures on wildlife-related recreation activities.

Table C-1. Kansas Residents 6 to 15 Years Old Participating in Fishing and Hunting: 2000

(State population 6 to 15 years old. Numbers in thousands)

Sportspersons	Sportspersons 6 to 15 years old		
	Number	Percent of sportspersons	Percent of population
Total sportspersons	208	100	53
Total anglers	206	99	53
Fished only	180	87	46
Fished and hunted	*26	*12	*7
Total hunters	*28	*13	*7
Hunted only
Hunted and fished	*26	*12	*7

* Estimate based on a small sample size. ... Sample size too small to report data reliably.

Note: Detail does not add to total because of multiple responses. Column showing percent of sportspersons is based on the "Total sportspersons" row. Column showing percent of population is based on the state population 6 to 15 years old, including those who did not fish or hunt. Data reported on this table are from screening interviews in which one adult household member responded for household members 6 to 15 years old. The screening interview required the respondent to recall 12 months worth of activity. Includes state residents who fished or hunted only in other countries.

* Estimate based on a small sample size. ... Sample size too small to report data reliably.

Note: Percent who participated shows the percent of each row's population who participated in the activity named by the column (the percent of those living in urban areas who fished, etc.). Remaining percent columns show the percent of each column's participants who are described by the row heading (the percent of anglers who lived in urban areas, etc.). Data reported on this table are from screening interviews in which one adult household member responded for 6 to 15 years old. The screening interview required the respondent to recall 12 months worth of activity. Includes state residents who fished or hunted only in other countries.

Table C-3. Kansas Residents 6 to 15 Years Old Participating in Wildlife Watching: 2000

(State population 6 to 15 years old. Numbers in thousands)

Participants	Number	Percent of participants	Percent of population
Total participants	180	100	46
Nonresidential	72	40	18
Residential	160	89	41
Observe wildlife	127	70	32
Photograph wildlife	*18	*10	*5
Feed wild birds or other wildlife	100	55	25
Maintain plantings or natural areas	*29	*16	*7

* Estimate based on a small sample size.

Note: Detail does not add to total because of multiple responses. The column showing percent of participants is based on total participants. The column showing percent of population is based on the state population 6 to 15 years old, including those who did not participate in wildlife watching. Data reported on this table are from screening interviews in which one adult household member responded for household members 6 to 15 years old. The screening interview required the respondent to recall 12 months worth of activity.

Appendix D

Appendix D.

Sample Design and Statistical Accuracy

This Appendix is presented in two parts. The first part is the U.S. Census Bureau Source and Accuracy Statement. This statement describes the sampling design for the 2001 Survey and highlights the steps taken to produce estimates from the completed questionnaires. The statement explains the use of standard errors and confidence intervals. It also provides comprehensive information about errors characteristic of surveys, and formulas and parameters to calculate an approximate standard error or confidence interval for each number published in this report. The second part reports approximate standard errors (S.E.s) for selected measures of participation and expenditures for wildlife-related recreation. Tables D-1 to D-3 show common estimates by state with their estimated standard errors. Tables D-4 to D-9 provide parameters for computing standard errors.

Source and Accuracy Statement for the Kansas State Report of the 2001 National Survey of Fishing, Hunting, and Wildlife-Associated Recreation

Source of Data

The estimates in this report are based on data collected in the *2001 National Survey of Fishing, Hunting, and Wildlife-Associated Recreation* (FHWAR).

The 2001 FHWAR Survey was designed to provide state-level estimates of the number of participants in recreational hunting and fishing, and in wildlife-watching activities (e.g., wildlife observation). Information was collected on the number of participants, where and how often they participated, the type of wildlife encountered, and the amounts of money spent on wildlife-related recreation.

The survey was conducted in two stages: an initial screening of households to

identify likely sportspersons and wildlife-watching participants, and a series of follow-up interviews of selected persons to collect detailed data about their wildlife-related recreation during 2001.

The 2001 FHWAR state samples were selected from expired samples of the Current Population Survey (CPS).

Sample Design

A. CPS - Current Population Survey

The expired CPS samples used for the 2001 FHWAR had been selected initially from 1990 decennial census files with coverage in all 50 states and the District of Columbia. The samples, while active, had been continually updated to reflect new construction. The sample addresses were located in 754 geographic areas consisting of a county or several contiguous counties.

B. The FHWAR Screening Sample

The screening sample consisted of households identified from the above sources. In Kansas, 1,635 household interviews were assigned to be interviewed. Of these, 10 percent were found to be vacant or otherwise not enumerated. Of the remaining households, about 26.4 percent could not be enumerated because the occupants were not found at home after repeated calls or were unavailable for some other reason.

Overall, **1,046** completed household interviews were obtained for a state response rate of **73.6** percent. The field representatives asked screening questions for all household members 6 years old and older. Interviewing for the screen was conducted during April, May, and June of 2001.

Data for the FHWAR sportspersons sample and wildlife-watchers sample were collected in three waves. The first wave started in April 2001, the second in September 2001, and the third in January 2002. In the sportspersons sample, all persons who hunted or fished in 2001 by the time of the screening interview were interviewed in the first wave. The remaining sportspersons sample were interviewed in the second wave. All sample persons (from both the first and second waves) were interviewed in the third wave.

The reference period was the preceding 4 months for waves 1 and 2. In wave 3, the reference period was either 4 or 8 months depending on when the sample person was first interviewed.

C. The Detailed Samples

Two independent detailed samples were chosen from the FHWAR screening sample. One consisted of sportspersons (people who hunt or fish) and the other of wildlife watchers (people who observe, photograph, or feed wildlife).

1. Sportspersons

The Census Bureau selected the state detailed samples based on information reported during the screening phase. Every person 16 years old and older in the FHWAR screening sample was assigned to a sportspersons stratum based on time devoted to hunting/fishing in the past and time expected to be devoted to hunting/fishing in the future.

The four sportspersons categories were:

Active - a person who had already participated in hunting/fishing in 2001 at the time of the screener interview.

Likely - a person who had not participated in 2001 at the time of the screener but had participated in 2000 OR said they were likely to participate in 2001.

Inactive - a person who had not participated in 2000 or 2001 AND said they were somewhat unlikely to participate in 2001.

Nonparticipant - a person who had not participated in 2000 or 2001 AND said they were very unlikely to participate in 2001.

Persons were selected for the detailed phase based on these groupings.

Active sportspersons were given the detailed interview twice—at the same time of the screening interview (April-June 2001) and again in January/February 2002. Likely sportspersons and a subsample of the inactive sportspersons were also interviewed twice—first in September/October 2001, then in January/February 2002. If Census field representatives were not able to obtain the first interview, they attempted to interview the person in the final interviewing period with the reference period being the entire year. Persons in the nonparticipant group were not eligible for a detailed interview.

About **686** persons were designated for interviews in Kansas. Overall, **628** detailed sportspersons interviews were completed for a response rate of **91.5** percent.

2. Wildlife Watchers

The wildlife-watching state detailed sample also was selected based on information reported during the screening phase. Every person 16 years of age and

older was assigned to a category based on time devoted to wildlife-watching activities in previous years, participation in 2001 by the time of the screening interview, and intentions to participate in activities during the remainder of 2001.

Each person was placed into one of the following five groups based on their past participation:

Active - a person who had already participated in 2001 at the time of the screening interview.

Avid - a person who had not yet participated in 2001 but in 2000 had taken trips to participate in wildlife-watching activities for 21 or more days or had spent \$300 or more.

Average - a person who had not yet participated in 2001 but in 2000 had taken trips to wildlife-watch for less than 21 days and had spent less than \$300 OR had not participated in wildlife-watching activities but said they were very likely to in the remainder of 2001.

Infrequent - a person who had not participated in 2000 or 2001 but said they were somewhat likely or somewhat unlikely to participate in the remainder of 2001.

Nonparticipant - a person who had not participated in 2000 or 2001 and said they were very unlikely to participate during the remainder of 2001.

Persons were selected for the detailed phase based on these groupings. Persons in the nonparticipant group were not eligible for a detailed interview. A subsample of each of the other groups was selected to receive a detailed interview with the chance of being selected diminishing as the likelihood of participation diminished.

Wildlife-watching participants were given the detailed interview twice. Some received their first detailed interview at the same

time as the screening interview (April-June 2001). The rest received their first detailed interview in September/October 2001. All wildlife-watching participants received their second interview in January/February 2002. If Census field representatives were not able to obtain the first interview, they attempted to interview the person in the final interviewing period with the reference period being the entire year.

About **353** persons were designated for interviews in Kansas. Overall, **323** detailed wildlife-watching participant interviews were completed for a response rate of **91.5** percent.

Estimation Procedure

Several stages of adjustments were used to derive the final 2001 FHWAR person weights. A brief description of the major components of the weights is given below.

All statistics for the population 6 to 15 years of age were derived from the screening interview. Statistics for the population 16 and over came from both the screening and detailed interviews. Estimates which came from the screening sample are presented in Appendix C.

A. Screening Sample

Every interviewed person in the screening sample received a weight that was the product of the following factors:

1. *Base Weight*. The base weight is the inverse of the household's probability of selection.
2. *Household Noninterview Adjustment*. The noninterview adjustment inflated the weight assigned to interviewed households to account for households eligible for interview but for which no interview was obtained.
3. *First-Stage Adjustment*. The 754 areas designated for our samples were selected from over 2,000 such areas of the United States.

Some sample areas represent only themselves and are referred to as self-representing. The remaining areas represent other areas similar in selected characteristics and are thus designated nonself-representing. The first-stage factor reduces the component of variation arising from sampling the nonself-representing areas.

4. *Second-Stage Adjustment*. This adjustment brings the estimates of the total population in each state into agreement with census-based estimates of the civilian noninstitutional and nonbarrack military populations for each state.

B. Sportspersons Sample

Every interviewed person in the sportspersons detailed sample received a weight that was the product of the following factors:

1. *Screening Weight*. This is the individual's final weight from the screening sample.
2. *Sportspersons Stratum Adjustment*. This factor inflated the weights of persons selected for the detailed sample to account for the subsampling done within each sportsperson's stratum.
3. *Sportspersons Noninterview Adjustment*. This factor adjusts the weights of the interviewed sportspersons to account for sportspersons selected for the detailed sample for whom no interview was obtained. A person was considered a noninterview if he/she were not interviewed in the third wave of interviewing.
4. *Sportspersons Ratio Adjustment Factor*. This is a ratio adjustment of the detailed sample to the screening sample within sportspersons sampling stratum. This adjustment brings the population estimates of persons age 16 years old or older from the detailed sample into agreement with the same estimates from the screening sample, which was a much larger sample.

C. Wildlife-Watchers Sample

Every interviewed person in the wildlife-watchers detailed sample received a weight that was the product of the following factors:

1. *Screening Weight*. This is the individual's final weight from the screening sample.
2. *Wildlife-Watchers Stratum Adjustment*. This factor inflated the weights of persons selected for the detailed sample to account for the subsampling done within each wildlife-watcher stratum.
3. *Wildlife-Watchers Noninterview Adjustment*. This factor adjusts the weights of the interviewed wildlife-watching participants to account for wildlife watchers selected for the detailed sample for which no interview was obtained. A person was considered a noninterview if he/she were not interviewed in the third wave of interviewing.
4. *Wildlife-Watchers Ratio Adjustment Factor*. This is a ratio adjustment of the detailed sample to the screening sample within wildlife-watchers sampling strata. This adjustment brings the population estimates of persons age 16 years old or older from the detailed sample into agreement with the same estimates from the screening sample, which was a much larger sample.

Accuracy of the Estimates

Since the 2001 estimates came from a sample, they may differ from figures from a complete census using the same questionnaires, instructions, and enumerators. A sample survey estimate has two possible types of error—sampling and nonsampling. The accuracy of an estimate depends on both types of error, but the full extent of the nonsampling error is unknown. Consequently, one should be particularly careful when interpreting results based on a relatively small number of cases or on small differences between estimates. The standard errors for the 2001 FHWAR estimates primarily indicate the magnitude of sampling error. They also partially measure the effect of some

nonsampling errors in responses and enumeration, but do not measure systematic biases in the data. (Bias is the average over all possible samples of the differences between the sample estimate and the actual value.)

Nonsampling Variability

Let us suppose that a comparable complete enumeration was conducted. That is, an interview is attempted for every person 16 years old and older in the United States. Chances are we will not correctly estimate every parameter under consideration (for example, the proportion of people who fished). In this instance, the difference is due solely to nonsampling errors. Nonsampling errors also occur in sample surveys and can be attributed to several sources including the following:

- The inability to obtain information about all cases in the sample.
- Definitional difficulties.
- Differences in the interpretation of questions.
- Respondents' inability or unwillingness to provide correct information.
- Respondents' inability to recall information.
- Errors made in data collection such as in recording or coding the data.
- Errors made in the processing of data.
- Errors made in estimating values for missing data.
- Failure to represent all units with the sample (undercoverage).

Overall CPS undercoverage is estimated to be about 8 percent. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. Ratio estimation to independent population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different

characteristics from those of interviewed persons in the same age group.

Comparability of Data. Data obtained from the 2001 FHWAR and other sources are not entirely comparable. This results from differences in field interviewer training and experience and in differing survey processes. This is an

example of nonsampling variability not reflected in the standard errors. Use caution when comparing results from different sources (See Appendix B).

Note When Using Small Estimates. Because of the large standard errors involved, summary measures (such as medians and percentage distributions)

would probably not reveal useful information when computed on a base smaller than 100,000. Take care in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Sampling Variability

The particular sample used for the 2001 FHWAR Survey is one of a large number of all possible samples of the same size that could have been selected using the same sample design. Estimates derived from the different samples would differ from each other. This sample-to-sample variability is referred to as sampling variability and is generally measured by the standard error. The exact sampling error is unknown. However, guides to the potential size of the sampling error are provided by the standard error of the estimate.

Since the standard error of a survey estimate attempts to provide a measure of the variation among the estimates from the possible samples, it is a measure of the precision with which an estimate from a particular sample approximates the average result of all possible samples. Standard errors, as calculated by methods described next in “Standard Errors and Their Use,” are primarily measures of sampling variability, although they may include some nonsampling error.

The sample estimate and its standard error enable one to construct a confidence interval, a range that would include the average result of all possible samples with a known probability. For example, if all possible samples were surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.645 standard errors below the estimate to 1.645 standard errors above the estimate would include the average result of all possible samples.

A particular confidence interval may or may not contain the average estimate derived from all possible samples. However, one can say with specified confidence that the interval includes the average estimate calculated from all possible samples.

Standard errors may also be used to perform hypothesis testing—a procedure for distinguishing between population parameters using sample estimates. One common type of hypothesis is that the population parameters are different. An example would be comparing the proportion of anglers to the proportion of hunters.

Tests may be performed at various levels of significance where a significance level is the probability of concluding that the characteristics are different when, in fact, they are the same. To conclude that two characteristics are different at the 0.10 level of significance, the absolute value of the estimated difference between characteristics must be greater than or equal to 1.645 times the standard error of the difference.

This report uses 90-percent confidence intervals and 0.10 levels of significance to determine statistical validity. Consult standard statistical textbooks for alternative criteria.

Standard Errors and Their Use. A number of approximations are required to derive, at a moderate cost, standard errors applicable to all the estimates in this report. Instead of providing an individual standard error for each estimate, parameters are provided to calculate standard errors for each type of characteristic. These parameters are listed in tables D-4 to D-9. Methods for using the parameters to calculate standard errors of various estimates are given in the next sections.

Standard Errors of Estimated Numbers. The approximate standard error, s_x , of an estimated number shown in this report can be obtained using the following formulas. Formula (1) is used to calculate the standard errors of levels of sportspersons, anglers, and wildlife watchers.

$$s_x = \sqrt{ax^2 + bx} \quad (1)$$

Here, x is the size of the estimate and a and b are the parameters in the tables associated with the particular characteristic.

Formula (2) is used for standard errors of aggregates, i.e., trips, days, and expenditures.

$$s_x = \sqrt{ax^2 + bx + \frac{cx^2}{y}} \quad (2)$$

Here, x is again the size of the estimate; y is the base of the estimate; and a , b , and c are the parameters in the tables associated with the particular characteristic.

Illustration of the Computation of the Standard Error of an Estimated Number

Suppose that a table shows that 37,805,000 persons 16+ either fished or hunted in the United States in 2001. Using formula (1) with the parameters $a = -0.000020$ and $b = 4,289$ from table D-5, the approximate standard error of the estimates number of 37,805,000 sportspersons 16+ is

$$s_x = \sqrt{(-0.000020)(37,805,000)^2 + (4,289)(37,805,000)} = 365,500$$

The 90-percent confidence interval for the estimated number of sportspersons 16+ is from 37,203,800 to 38,406,200, i.e., $37,805,000 \pm 1.645 \times 365,500$. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Suppose that another table shows that 13,034,300 hunters 16+ engaged in 228,367,800 days of participation in 2001 in the United States. Using formula (2) with the parameters $a = 0.000168$, $b = -11,904$, and $c = 12,496$ from table D-7, the approximate standard error on 228,367,800 estimated days on an estimated base of 13,034,300 hunters is

$$s_x = \sqrt{0.000168 \times 228,367,800^2 + (-11,904) \times 228,367,800 + \frac{12,496 \times 228,367,800^2}{13,034,300}} = 7,486,100$$

The 90-percent confidence interval on the estimate of 228,367,800 days is from 216,053,200 to 240,682,400, i.e., $228,367,800 \pm 1.645 \times 7,486,100$. Again, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all possible samples.

Standard Errors of Estimated Percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and the denominator of the percentage are in different categories, use the parameter in the tables indicated by the numerator.

The approximate standard error, $s_{x,p}$, can be obtained by use of the formula

$$s_{x,p} = \sqrt{\frac{bp(100-p)}{x}} \tag{3}$$

Here, x is the total number of sportspersons, hunters, etc., which is the base of the percentage; p is the percentage ($0 \leq p \leq 100$); and b is the parameter in the tables associated with the characteristic in the numerator of the percentage.

Illustration of the Computation of the Standard Error of an Estimated Percentage

Suppose that a table shows that of the 13,034,300 hunters 16+ in the United States, 22.7 percent hunted migratory birds. From table D-5, the appropriate b parameter is 3,793. Using formula (3), the approximate standard error on the estimate of 22.7 percent is

$$s_{x,p} = \sqrt{\frac{3,793 \times 22.7 \times (100 - 22.7)}{13,034,300}} = 0.71$$

Consequently, the 90-percent confidence interval for the estimate percentage of migratory bird hunters 16+ is from 21.5 percent to 23.9 percent, i.e. $22.7 \pm 1.645 \times 0.71$.

Standard Error of a Difference. The standard error of the difference between two sample estimates is approximately equal to

$$s_{x-y} = \sqrt{s_x^2 + s_y^2} \quad (4)$$

where s_x and s_y are the standard errors of the estimates x and y . The estimates can be numbers, percentages, ratios, etc. This will represent the actual standard error quite accurately for the difference between estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. However, if there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration of the Computation of the Standard Error of a Difference

Suppose that a table shows that of the 13,034,300 hunters in the United States, 9,985,100 were licensed hunters, and 1,689,300 were exempt from a hunting license. The corresponding percentages are 76.6 percent and 13.0 percent, respectively. The apparent difference between the percent of licensed hunters and hunters who are exempt from a license is 63.6 percent. Using formula (3) and the appropriate b parameter from Table D-5, the approximate standard errors of 76.6 percent and 13.0 percent are 0.83 and 1.59, respectively. Using formula (4), the approximate standard error of the estimated difference of 63.6 percent is

$$s_{x-y} = \sqrt{0.72^2 + 0.57^2} = 0.92$$

The 90-percent confidence interval on the difference between licensed hunters and those who were exempt from a hunting license is from 62.1 to 65.1 percent, i.e., $63.6 \pm 1.645 \times 0.92$. Since the interval does not contain zero, we can conclude with 90 percent confidence that the percentage of licensed hunters is greater than the percentage of hunters who are exempt from a hunting license.

Standard Errors of Estimated Averages. Certain mean values for sportspersons, anglers, etc., shown in the report were calculated as the ratio of two numbers. For example, average days per angler is calculated as:

$$\frac{x}{y} = \frac{\text{total days}}{\text{total anglers}}$$

Standard errors for these averages may be approximated by the use of formula (5) below.

$$s_{x/y} = \frac{x}{y} \sqrt{\left[\frac{s_x}{x}\right]^2 + \left[\frac{s_y}{y}\right]^2 - 2r \frac{s_x s_y}{xy}} \quad (5)$$

In formula (5), r represents the correlation coefficient between the numerator and the denominator of the estimate. In the above formula, use 0.7 as an estimate of r .

Illustration of the Computation of the Standard Error of an Estimated Average

Suppose that a table shows that the average days per angler 16 years old or older for all fishing was 16.4 days. Using formulas (1) and (2) above, we compute the standard error on total days, 557,393,900, and total anglers, 34,071,100, to be 8,726,000 and 350,600, respectively. The approximate standard error on the estimated average of 16.4 days is

$$s_{x/y} = \frac{557,393,900}{34,071,100} \sqrt{\left[\frac{8,726,000}{557,393,900}\right]^2 + \left[\frac{350,600}{34,071,100}\right]^2 - 2 \times 0.7 \times \frac{8,726,000 \times 350,600}{557,393,900 \times 34,071,100}} = 0.18$$

therefore, the 90-percent confidence interval on the estimated average of 16.4 days is from 16.1 to 16.7, i.e., $16.4 \pm 1.645 \times 0.18$.

Table D-1. Approximate Standard Errors of Resident Anglers, Days of Fishing by State Residents, and Expenditures for Fishing by State Residents

(Numbers in thousands)

State	Participation		Days		Expenditures in dollars	
	Estimate	Standard error	Estimate	Standard error	Estimate	Standard error
Alabama	634	28	10,841	452	\$600,364	\$83,099
Alaska	185	8	2,445	262	\$213,781	\$18,009
Arizona	394	23	4,327	510	\$326,068	\$59,815
Arkansas	546	31	11,776	1,296	\$386,164	\$50,245
California	2,389	124	27,878	3,138	\$2,162,620	\$362,896
Colorado	626	31	7,639	638	\$772,537	\$105,782
