

Global Warming

A Green Ring, around the earth, indicates greenhouse gas. It is formed from the carbon dioxide, and other gases. These gases cause the climate to change, and temperature rising on the Earth's surface. Polar ice caps start to melt and threaten to flood low-lying cities and coastlines by rising sea levels. Warmer waters will spawn bigger and more dangerous hurricanes which will threaten coastlines.

Global Heating

An atmosphere will be more hot! Droughts, floods, severe storms, and wildfires in the forests will be worst. Billion of animals and people will be killed by heat waves, food and water shortages, and outbreaks of disease. This will happen in 40-50 years later.

Doomsday!

Life on Earth will be gone by inhaling the carbon dioxide for more than 100 years later.
