Salmonella

Salmonella is one of the most common causes of food poisoning and can be fatal. It is contracted mainly through eating raw or undercooked food.

First major food scare linked eggs to salmonella

Salmonella came to prominence when Edwina Currie MP, a junior health minister, said in 1988 that most eggs in Britain were infected with the bacterium.

Her comments sparked a public outcry and two weeks later she resigned.

But by early 1989, the House of Commons Select Committee on Agriculture

had investigated the issue and concluded there was a link between eggs and salmonella poisoning.

Egg-safety measures to be announced today

July 1, 1999
Web posted at: 8:45 a.m. EDT (1245 GMT)

WASHINGTON (CNN) -- A government report says federal agencies need to do a better job of fighting salmonella contamination in eggs, and, as a result, new safety initiatives will be announced Thursday.

Aims

To estimate the health impact of the emergence of indigenous foodborne *Salmonella enterica* serotype Enteritidis phage type 4 (IFSE4) on the population of England and Wales during the period 1981 - 2000.

-
-
-

Methods

Laboratory reports of *S. Enteritidis* PT4 (SE4) to PHLS

•
•

Results - Impact 1998 - 2000

Estimated prevention of:

- ï 80,000 illnesses
- ï 63,000 people presenting to family doctors
- ï 2,700 hospitalizations
- ï 16,000 bed days
- ï 190 deaths

Estimated cost saving of: \$48,000,000 (1995 prices)

•
•
•

Conclusions

- IFSE4 - profound impact
- Sharp decline following interventions by the food industry
- Benefits to individuals
- Savings to the Health Service

-
-
-

Eggs follow hens

-
-
