SUPPLEMENTARY INFORMATION:

I. Introduction

The U.S. Nuclear Regulatory Commission (NRC) has issued for public comment a draft regulatory guide in the agency's "Regulatory Guide" series. This series was developed to describe and make available to the public such information as methods that are acceptable to the NRC staff for implementing specific parts of the NRC's regulations, techniques that the staff uses in evaluating specific problems or postulated accidents, and data that the staff needs in its review of applications for permits and licenses.

The draft regulatory guide (DG), entitled, "Manual Initiation of

Protective Actions," is temporarily identified by its task number, DG-1190, which should be mentioned in all related correspondence. This guide describes a method that the staff of the NRC considers acceptable for use in complying with the NRC's regulations with respect to the means for manual initiation of protective actions provided by otherwise automatically initiated safety systems. To meet these objectives, the means for manual initiation of protective actions must serve a safety-related function to complete all required protective actions for the safety system.

The regulatory framework that the NRC has established for nuclear power plants consists of a number of regulations and supporting guidelines applicable to manual initiation of protective actions, including, but not limited to, General Design Criterion (GDC) 1, "Quality Standards and Records," GDC 13, "Instrumentation and Control," GDC 21, "Protection System Reliability and Testability," and GDC 22, "Protection System Independence," as set forth in Appendix A, "General Design Criteria for Nuclear Power Plants," to Title 10, Part 50, "Domestic Licensing of Production and Utilization Facilities," of the Code of Federal Regulations (10 CFR Part 50). GDC 13 requires that appropriate controls shall be provided to maintain variables and systems that can affect the fission process, the integrity of the reactor core, the reactor coolant pressure boundary, and the containment and its associated systems within prescribed operating ranges. GDC 21 requires that the protection system shall be designed for high functional reliability. GDC 22 requires that design techniques, such as functional diversity or diversity in component design and principles of operation, shall be used to the extent practical to prevent loss of the protection function.

II. Further Information

The NRC staff is soliciting comments on DG-1190. Comments may be accompanied by relevant information or supporting data, and should mention DG-1190 in the subject line.
