

Leveraging Cost Model Development via XML

Federal Remediation Technology Roundtable

Environmental Cost Engineering Committee (EC²)

Robert Nash

Engineering Service Center

Naval Facilities Engineering Command

Environmental Cleanup Program

June 2003

The Need

- **Promote Sharing of Cost Items, Assemblies, Models, Data, & Other Cost Data**
- **Bridge Systems by Developing Models that are Independent of the Systems**
- **Foster Competition & Reduce Reliance on any one Model Builder**

Objective

Maximize

- ✓ interoperability
- ✓ integration
- ✓ cost data availability
- ✓ cost leveraging
- ✓ consistency
- ✓ automation
- ✓ competition

Minimize

- ✓ development costs
- ✓ maintenance costs
- ✓ redundancy
- ✓ reliance upon any one model builder
- ✓ reliance on few compatible data sources

The Solution

Establish a Bridge - 3 Components

#1 Parametric Cost Model Standard Practice

- Parametric cost models
- Parametric design models

#2 Electronic Standard

- Data definition, transmission, & application

#3 Cost Model Library/ Repository/ Network

- Centralized
- Decentralized/distributed

Advantages of XML

- **Interface/Platform/Application/Network Independent:**
 - ✓ Cross platform (Windows, NT, Unix)
 - ✓ Cross network (Internet, Intranet, LAN)
 - ✓ Cross application (CTC, RTET, & others)
 - consuming application can interpret the XML to model the estimate in many different ways

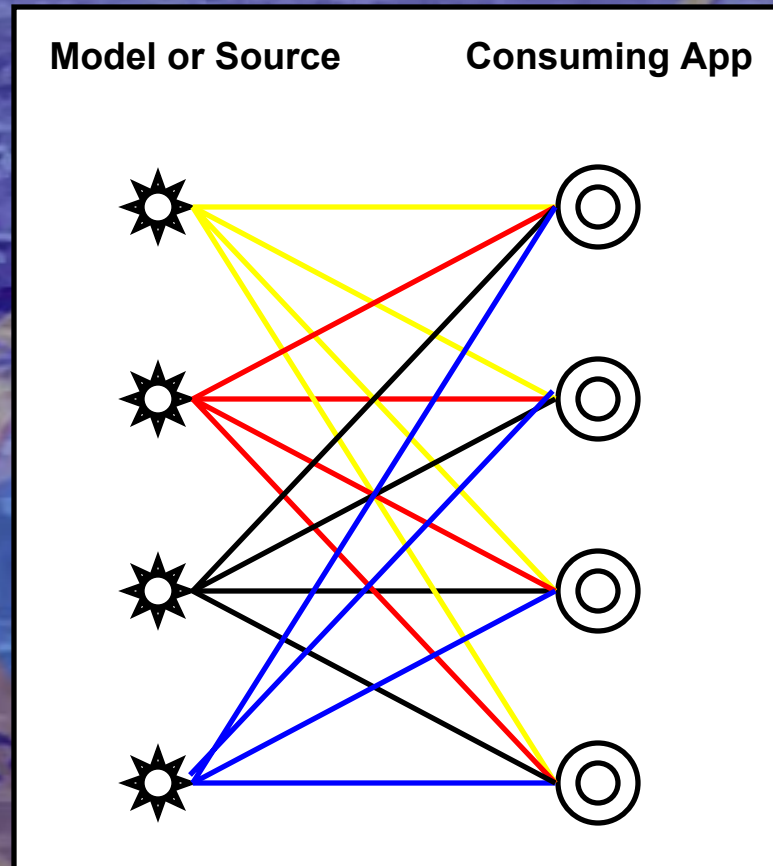

Advantages of XML

- **Increases Consistency & Compatibility**
- **Leverages Existing Systems:**
 - **Minimizes development & maintenance costs**
- **Allows Multiple Systems to Leverage Existing Models & Extend Them to Meet Their Unique Needs**
- **Provides Common Ground for Bridging Agency Budgeting Systems**

Electronic Standard - XML

One Source, Many Uses

Old Way: One-to-One

XML Way: One-to-Many

Electronic Standard - XML

Example

- **Consuming Application Can Interpret the XML to Model the Estimate in Different Ways:**
 - ✓ **CTC**: a relational database implements the XML standard as a translation of the XML into a relational-based cost model
 - ✓ **RTET**: an object-oriented internet-architected application consumes the data as modeled in XML

You have just connected to an Official Department Of The Navy Web Information Service

Department of the Navy automated information systems and related equipment are intended for the communication, transmission, processing and storage of U.S. Government information. These systems and equipment are subject to monitoring to ensure proper functioning, to protect against improper or unauthorized use or access, and to verify the presence or performance of applicable security features or procedures, and for other like purposes. Such monitoring may result in the acquisition, recording, and analysis of all data being communicated, transmitted, processed or stored in this system by a user. If monitoring reveals evidence of possible criminal activity, such evidence may be provided to law enforcement personnel.

To Get Started ...In the 'Application Explorer' tree view on the left side of your screen, double-click the component you wish to run. You may also single click on the plus sign (+) next to the component.

Legend >>

In Situ Soil Vapor Extraction -- Required Parameters

Required parameters, as the name implies, require input from the user. Specific information about the remediation project must be provided so that secondary parameters and cost estimates can be generated.

PARAMETER	VALUE	UNITS
<input type="checkbox"/> Interim Remedial Action		
Soil Type	Sand	
Area of Impacted Soil	.057	Ac
Depth of Contamination	80	Ft

In Situ SVE Model

In Situ Soil Vapor Extraction -- Secondary Parameters

All secondary parameters have been given default values, some of which are calculated from required parameters (indicated by purple text). These parameters do not require input from the user if the user chooses to accept the default values. The user may also choose to override the default values to better describe the remediation project of interest.

PARAMETER	VALUE	UNITS
<input type="checkbox"/> Halogenated VOCs		
<input checked="" type="checkbox"/> Nonhalogenated VOCs		
Operation and Maintenance Duration	5	Yr
Protection Level	D	
Number of Soil Vapor Extraction Wells	2	Ea
Total Vapor Flowrate	200.0	CFM

Conclusion

- XML Standardization is a Viable Means for Sharing & Leveraging Cost Model Development
- EC² is Working to Support Development of the Standards
- Soliciting Input on the *Parametric Cost Modeling Manual* & XML Definitions/Schema from:
 - ✓ AACE International
 - ✓ NIBS - IAI
- Develop ASTM Standards as a Derivative of the Manual
