

The Digital Geologic Atlas of Texas

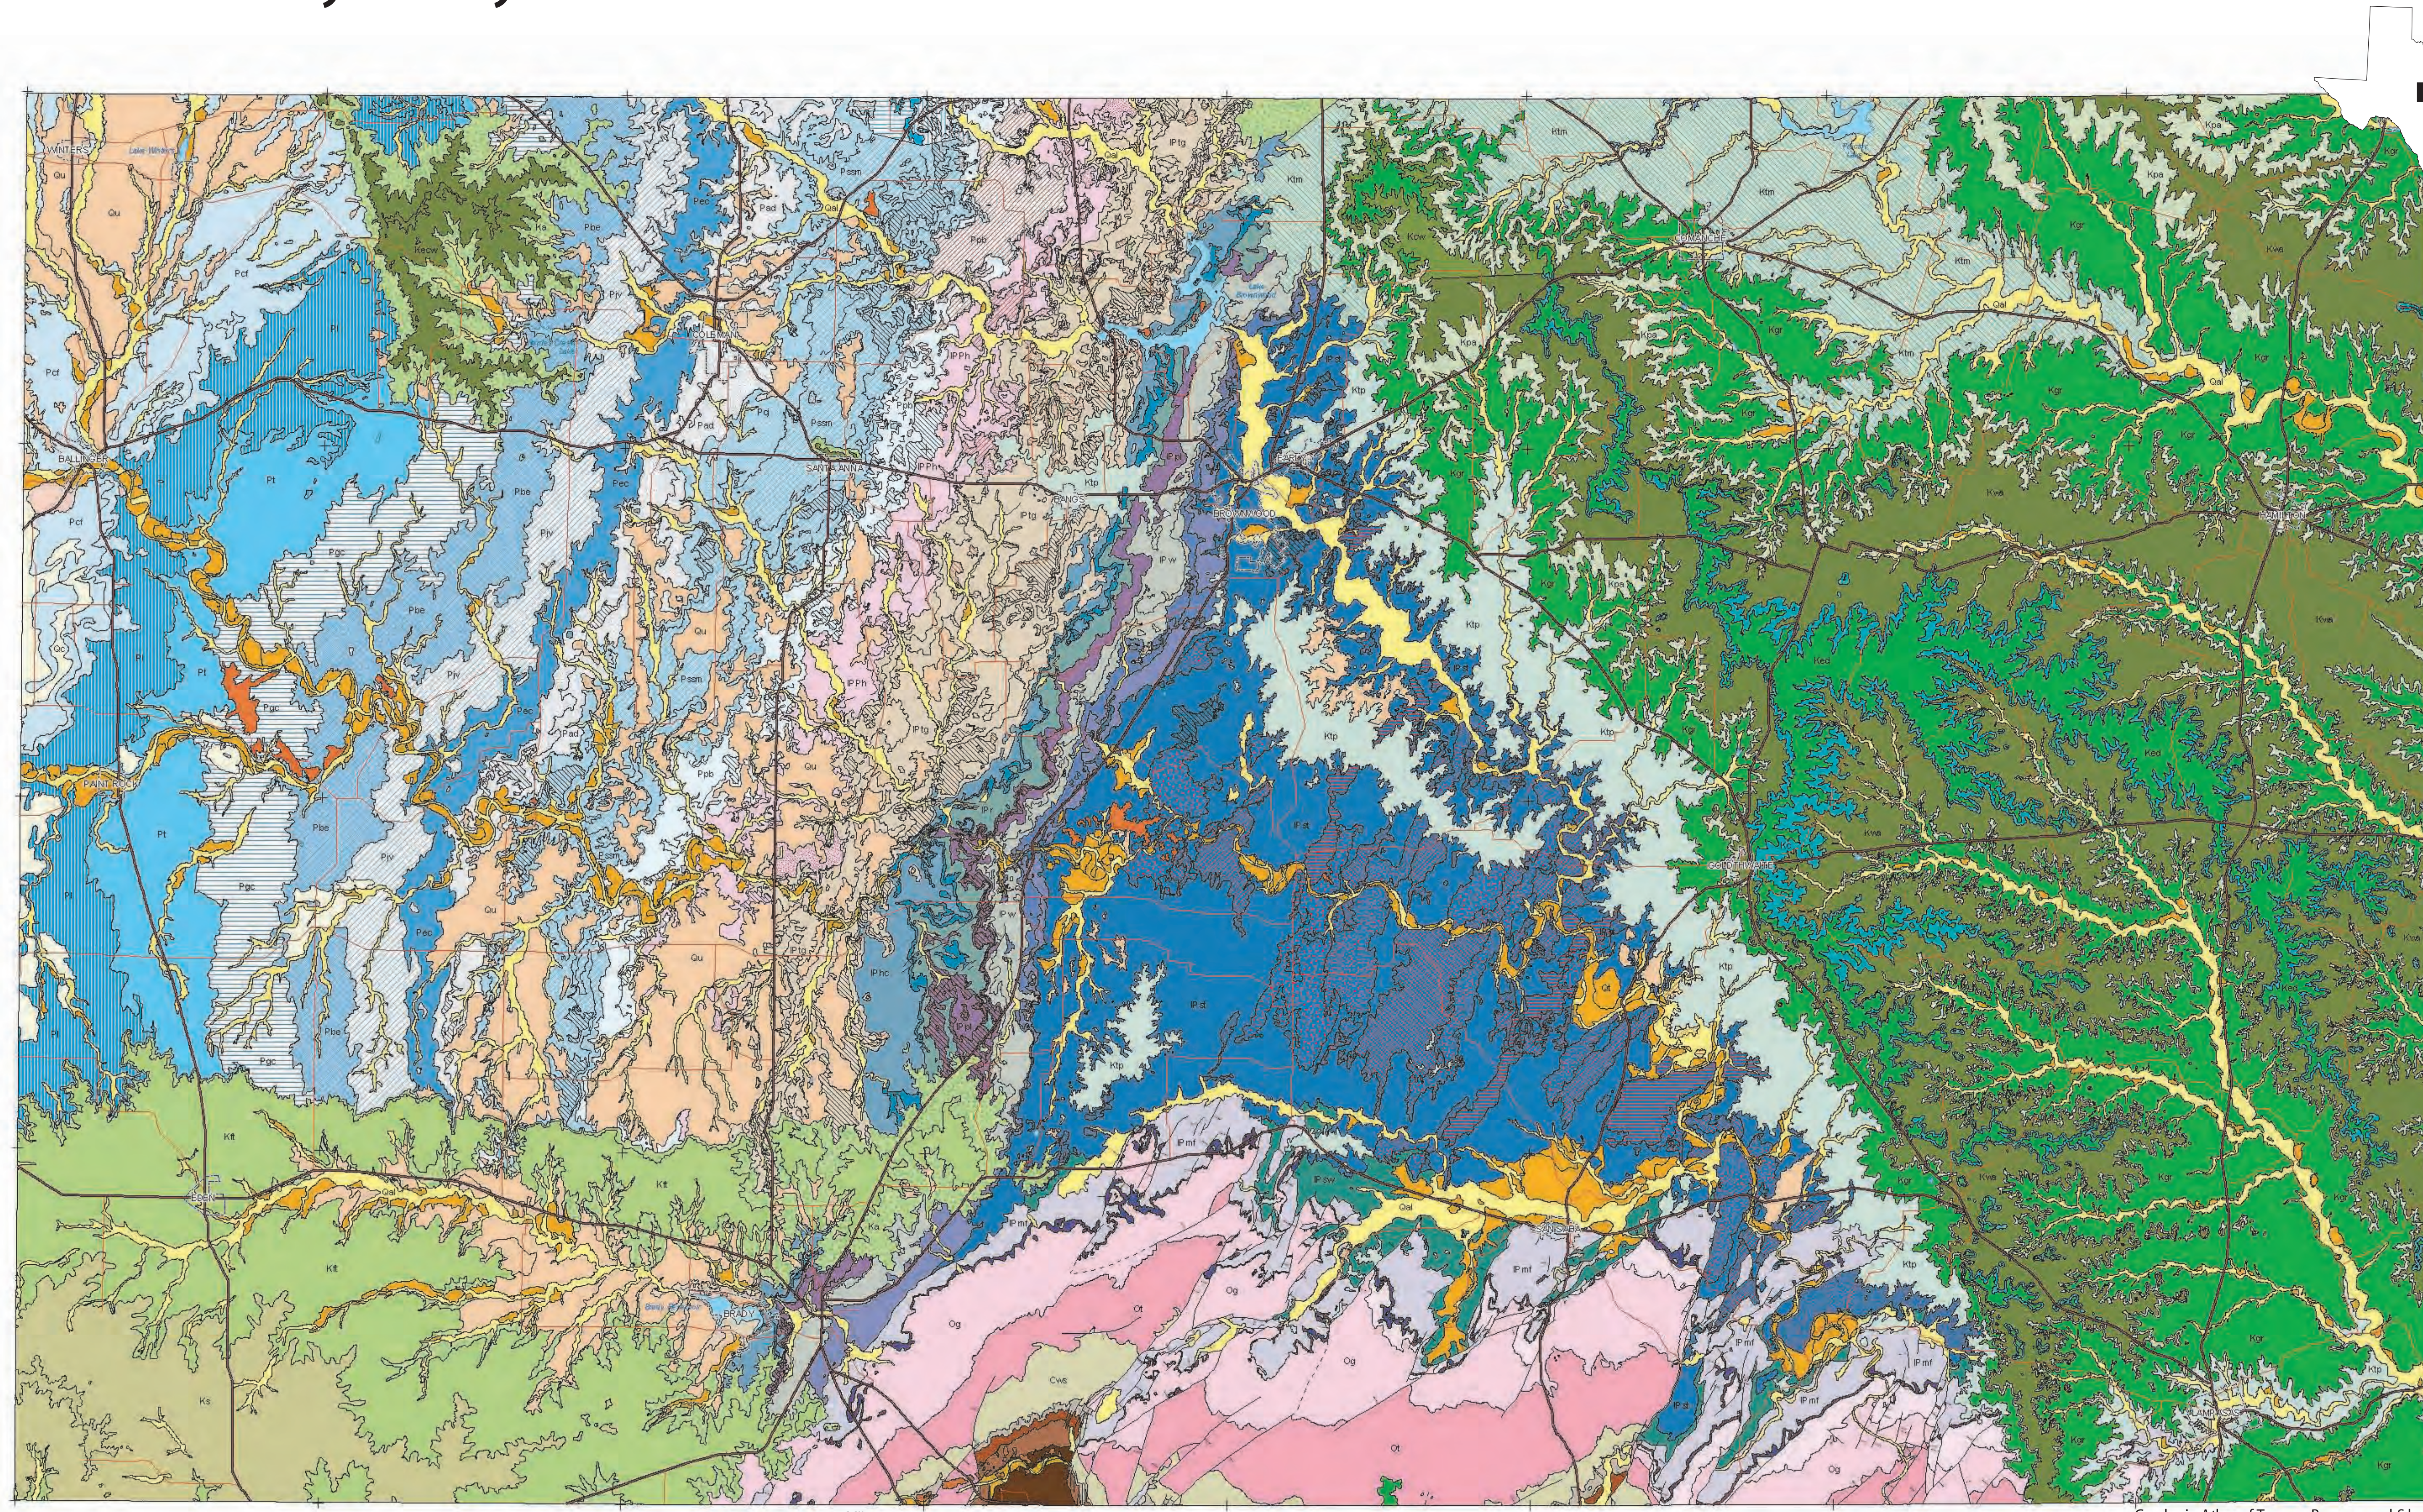

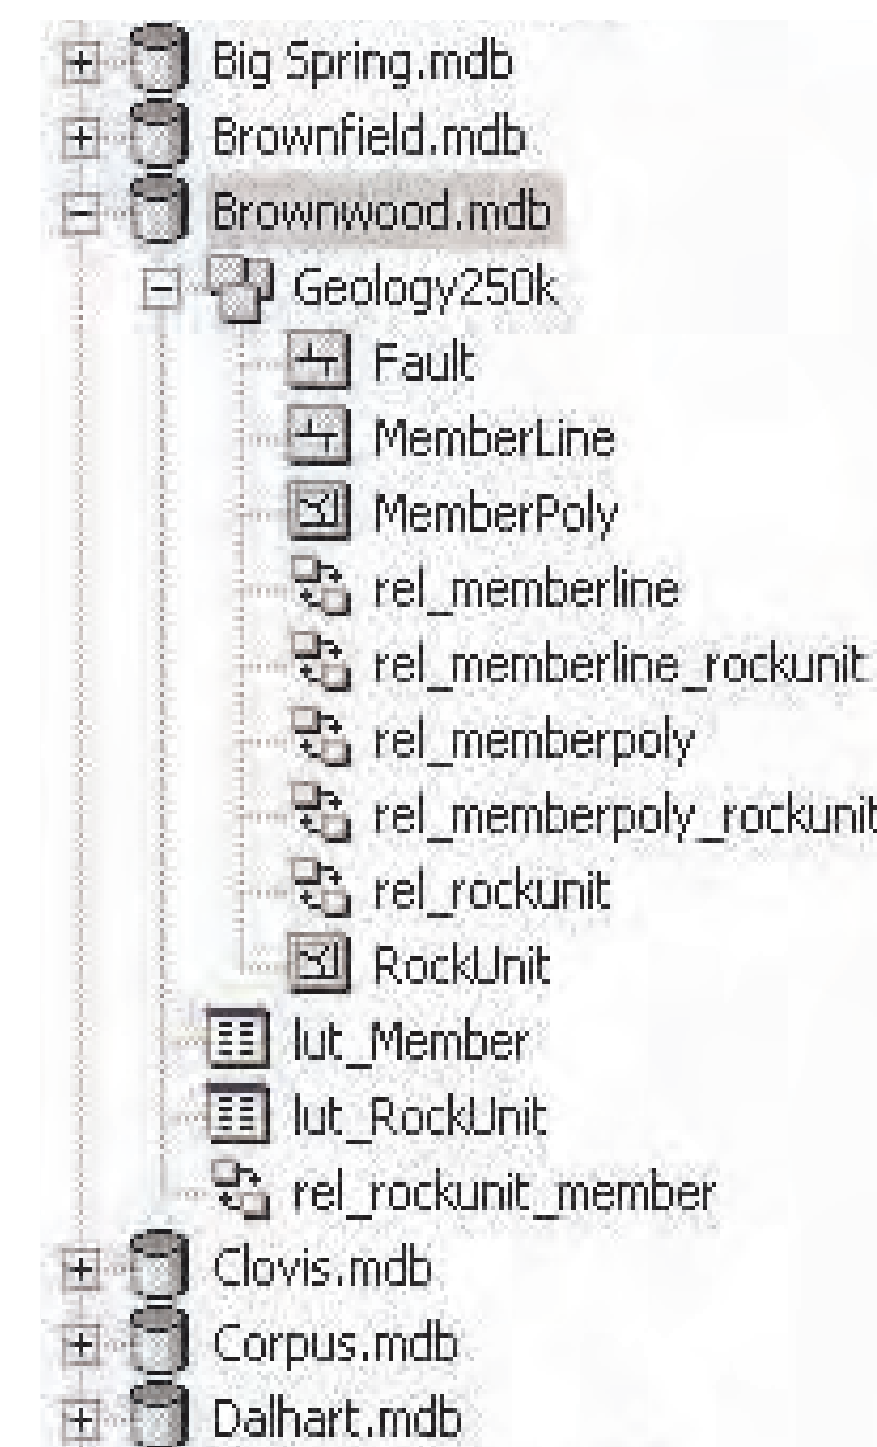

by Toby L. Welborn and Daniel K. Pearson

Abstract

In September 1961, the University of Texas Bureau of Economic Geology began compiling the first 38 Geologic Atlas of Texas map sheets. Each map sheet encompassed an area of 1 degree latitude by 2 degrees longitude and was created at a scale of 1:250,000. With the advancement and widespread use of geographic information systems technology, the necessity for digital versions of the Geologic Atlas of Texas map sheets has become apparent. The USGS, in cooperation with the Texas Water Development Board, has developed a standardized method and geodatabase structure for the Digital Geologic Atlas of Texas. While keeping the geology of each sheet intact, the digital media allows data sets to be transferred easily between users, manipulated or restructured to fit work needs, converted to fit within existing digital models or data sets, and thematically mapped so that users can analyze spatial data layers relative to one another.

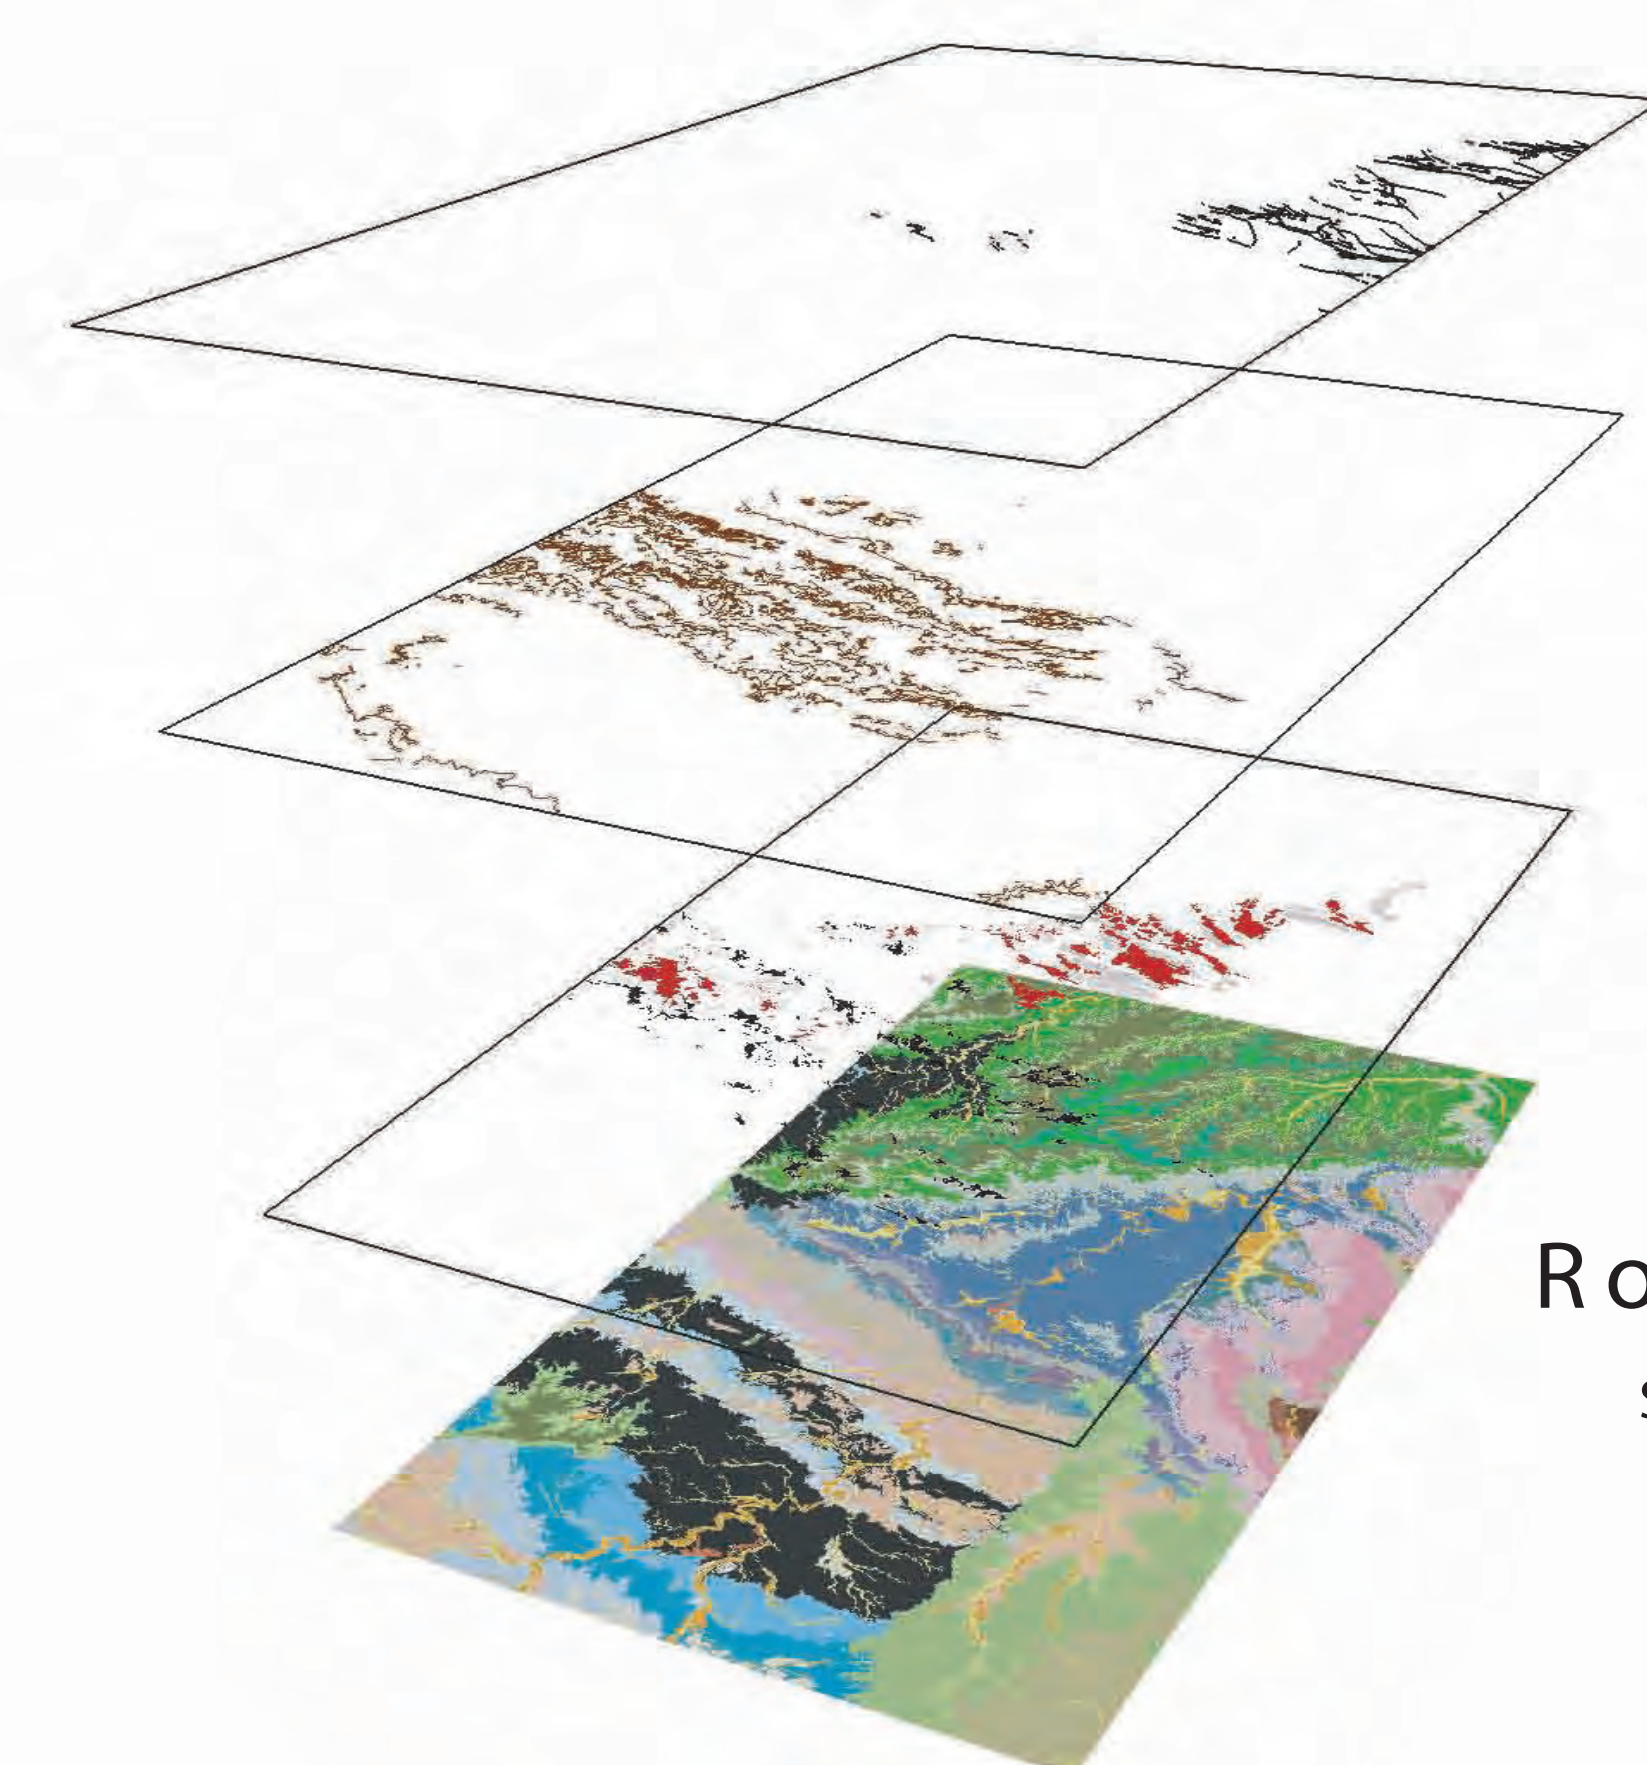

Geodatabase Structure

The Digital Geologic Atlas of Texas stores each map sheet in a personal geodatabase. The feature dataset, Geology250K, is a collection of all surface geology spatial features and is divided into individual line or polygon feature classes representing the faults, members and rock units for the entire map sheet. Relationship classes between the RockUnit and the Member feature classes model the connection between the individual formations and their associated members. Member and RockUnit look-up tables store descriptions, abbreviations, time periods, and other additional information. The geodatabase structure provides the necessary standardization for the Digital Geologic Atlas of Texas but is flexible enough to handle the different features on each map sheet.

EXPLANATION

Qal Alluvium	IPhc Home Creek Limestone
Qs Windblown Sand	IPsc Colony Creek Shale
Qt Fluviatile terrace deposits	IPr Ranger Limestone
Qc Caliche and gravel deposits	IPpl Placid Shale
Qu Surficial deposits undivided	IPw Winchell Limestone
Qcg Caliche cemented gravel	IPod Cedarion Shale
Ks Segovia Formation, Fort Terrett Formation, Edwards Limestone, Comanche Peak Limestone and Walnut Formation	IPab Adams Branch Limestone
Kt Antlers Sand, Paluxy Formation, Glen Rose Formation, Twin Mountains Formation and Travis Peak Formation	IPbr Pre-Brazos River Formation undivided
Ppl Clear Fork Group undivided	IPst Strawn Group undivided
Pl Lueders Formation	IPsh Smithwick Shale
Pt Talpa Formation	IPmf Marble Falls Formation
Pgc Grape Creek Formation	IMC Barnett Formation, Chappel Limestone and Houy Formation undivided
Pbc Bead Mountain Formation	Oh Honeycut Formation
Pva Jagger Bend and Valera Formations undivided	Og Gorman Formation
Pec Elm Creek Formation	Ot Tanyard Formation
Pdr Admiral Formation restricted	Ews Wilbrens Formation
Pcj Coleman Junction Formation expanded	Ewpp San Saba Member, Point Peak Member, Morgan Creek Limestone and Welge Sandstone Members undivided
Pssm Santa Anna Branch, Sedwick and Moran Formations undivided, Santa Anna Branch Formation, Sedwick Formation and Moran Formation	Crls Riley Formation
Ppb Pueblo Formation	LMS Lion Mountain Sandstone and Cap Mountain Limestone Members undivided, Hickory Sandstone Member
Pps Harpersville Formation	F Fault
IPK Thrifty and Graham Formations undivided	Dip slope exposure of thin limestone or sandstone bed. Gray shading occurs on various formation colors.

- Fault**
Normal faults, transverse faults, thrust faults, anticlines, and synclines are line features with direction.
- MemberLine**
Formation divisions such as members, facies, contacts, and beds are line features.
- MemberPoly**
Formation divisions such as members, facies, and dip slope exposures are polygon features.
- RockUnit**
Surface geology formations and groups are polygon features.

Future Objectives

- The next stage of the Digital Geologic Atlas of Texas is the creation of a statewide, seamless geology dataset. A seamless dataset provides:
1. A consistent naming convention for geologic formations across the entire State.
 2. A statewide color scheme to be applied to all formations with like names.
 3. The seamless dataset will be used as a base layer for analysis and modeling (for example, GAM, reservoir sedimentation, infrastructure development, and habitat inventories).
- In addition, the finished product will be served through the Texas Natural Resource Information System (TNRIS).
