 Data are calculated, estimated, or reported. See notes for more information.

Tellurium Worksheet Notes

Data Sources

The sources of data for the tellurium worksheet are the mineral statistics publications of the U.S. Bureau of Mines and the U.S. Geological Survey— Mineral Commodity Summaries (MCS) and Minerals Yearbook (MYB) and its predecessor, Mineral Resources of the United States (MR). Metal price data are from Metal Prices in the United States through 1998 (MP98) and the MYB since 1998. The years of publication and corresponding years of data coverage are listed in the References section below. Blank cells in the worksheet indicate that data were either not available or were withheld from publication because they were proprietary.

Production

Production represents the refinery production of tellurium metal. Tellurium and tellurium dioxide are recovered from copper anode slime and lead refinery skimming. Production data are initially reported in the 1926 MR. Production data for the years 1931–33 and 1976 to the most recent are withheld because they are proprietary. Data are recorded from the MCS, MR, and MYB.

Shipments

Shipment data represent sales from producers. Shipment data for the years 1976–84 are calculated by subtracting imports from calculated apparent consumption. Data were withheld for the years 1931 and 1985 to the most recent because they are proprietary. Data are recorded from the MR and MYB.

Imports

Import data represent the gross weight of tellurium in unwrought metal and waste and scrap for all reported years prior to and including 1974. After 1974, import data include salts and compounds expressed in tellurium content for the years 1975 and 1985–88. Starting in 1989 the MYB dropped the compounds and salts classes from reported data. Unwrought metal, waste, and scrap classes are listed as “tellurium” under the Harmonized Tariff Schedule, and grouped together with boron. However, imports of boron are thought to be very small relative to tellurium. For the years 1989 to the most recent, the tellurium content for unwrought and waste and scrap is assumed to be 100 percent. Data are recorded from the MR and the MYB.

Exports

Export data represent the gross weight of tellurium metal and waste and scrap exported. Export data are not available for most years. Published export data are available for the years 1943–45, 1989 and 2001 to the most recent. Data are recorded from the MR and the MYB.

Apparent Consumption

Large year-to-year changes in apparent consumption estimates may reflect incomplete reporting of data and timing of tellurium shipments, rather than actual changes in apparent consumption. For the years 1926–30 and 1932–69, apparent consumption data are calculated as the sum of shipments and imports. For the year 1931, apparent consumption was calculated using data for the years 1930 and 1932. Apparent consumption data are recorded from the MYB for the years 1970–84. For the years 1985 to the most recent, withheld production and shipments data prevents the calculation of apparent consumption. Data are from the MR and MYB.

Estimated Unit Value

Unit value is the value in actual U.S. dollars of 1 metric ton (t) of tellurium apparent consumption. Unit values are calculated from the tellurium metal price in the MP98 for the years 1917–98. Price data are not available for the years 1918–21 and 1924–25 and unit value data are estimated for these years by linear interpolation. For the years 1999 to 2004, unit value was estimated using the value of imports. For the year 2005 to the most recent, a published price from the Mining Journal for United Kingdom lump and powder 99.95% minimum tellurium was used.

Unit Value (98\$/t)

The Consumer Price Index conversion factor, with 1998 as the base year, is used to adjust unit value in current U.S. dollars to the unit value in constant 1998 U.S. dollars.

World Production

World production data relate to refinery output only. Thus, countries that produced tellurium concentrate or other impure mixtures containing tellurium from copper ores, copper concentrates, blister copper, and/or refinery residues, but did not recover or report refined tellurium, are excluded. The world production table in the MR and MYB are not totaled because of exclusion of data from major world producers, notably the former Soviet Union and the United States. In addition to the countries listed in the world production table (Canada, Japan, Peru, and the United States), Australia, Belgium, Chile, Germany, Kazakhstan, the Philippines, and Russia are known to have produced refined tellurium, but output is not reported; available information is inadequate for formulation of reliable estimates of output levels. World production estimates do not include U.S. production data for the year 1931 and for the year 1976 and subsequent years because the U.S. data are proprietary. Data are recorded from the MR and the MYB.
