SUBJ: Progress under Task 1:
Editing/analysis of the on-board transit count database.

Overview

Information from the 1996 Juarez travel survey has been stored in four main databases:

1. On-board transit count
2. Household survey
3. Workplace/special generator survey
4. External station survey

The present Tech Memo summarizes the procedures developed for data editing and preliminary analysis of the on-board transit count database.

Background

As in the case of other major mexican cities, transit is a very important mode of travel in Juarez. Despite its overall poor state, it is estimated that over 60% of the population use it, and currently accounts for at least one fourth of all daily person-trips in the city. Thus, no transportation model for this city could be complete without including this mode.

At the present time, transit service in Juarez is provided in two ways: 1) Normal route, and 2) Special trips (viajes especiales). Normal route transit in Juarez consists of school type buses operating mixed in traffic under 145 fixed routes, but without fixed schedules. Officially, there are about 1,700 buses in service, which are operated by 26 private bus companies. Special trip transit also use school type buses owned by the same 26 private bus companies, but operates as a non-stop express service (one origin, one destiny), contracted for private use by major employers (usually maquiladoras). It is estimated that less than 5% of daily person trips are done through special trips. The on-board transit count concentrated exclusively on normal route service.

From October 1996 to March 1997, a number of buses on each route were sampled by field personnel during a minimum of two weekdays to obtain relevant demand and operation data. Each bus was sampled for at least an entire half of its route cycle (inbound or outbound). At the end, close to 3,100 samples were obtained in this period, that is, over 20 buses per route on average (approximately 10% of the buses operating per day, for each route), generating close to 100,000 records.

This information was then entered into an electronic database, known as the on-board transit count database. Work has now been done to verify and clean the stored information.

In order to expand the sample and obtain the total daily passenger demand, other teams counted the number of times that buses covered each route per day. Thus, the total passengers/route/day could be estimated by multiplying the average passengers/bus/route times the number of buses/day.

Database design

Since this was the first database from the 1996 travel survey that the IMIP team needed to handle, it was imperative to do it under a familiar environment: for the IMIP team this meant using MS-Excel spreadsheets, and programming any data check procedure or macro using Visual Basic codes.

Simultaneously, there would be some experimenting with MS-Access and its powerful query builder capabilities.

The On-board transit count database is composed of a principal table (CAB_) and a details table (DET_). To work with manageable table sizes in MS-Excel, a database was created for each of the bus companies, thus a tag was added at the end of the name of each table implying its bus company source (i.e. CAB_1A and DET_1A for bus company 1A).

A general layout of the database and its component tables and fields is shown in Figure 1. A description of each of the fields is given in Appendix A. The two component tables are related by the common field CVE_AFORO (sample unique code).

Figure 1. On-board transit count database layout (example from 1A bus company).

Edit checks

Six different macros (Visual Basic subroutines) were programmed to aggregate information from the on-board transit count database, as well as to identify logical or numerical errors or inconsistencies. Table 1 provides a description of these macros.

Table 1. Macros developed for error checking and to generate summary reports.

Serial	VB subroutine	Description
TS-01	Sub subMilitis()	Converts times of every start and stop the bus makes for boarding/deboarding from hh:mm:ss to seconds. Adds a new field to both tables to incorporate the respective value.
TS-02	Sub Busquer()	Computes times between stops. Through cell coloring, identifies negative times (red), times of more than 5 (green), and 10 (blue) minutes. Computes time between a stop and respective start. Identifies negative times (purple). Identifies illogic sequence in the stop numbering (red). Identifies cells with missing data for boarding/deboarding (yellow). Provides summary of colored cells.
TS-03	Sub CerosSalidas()	Identifies with yellow color, last stops with a starting time (all last stops should have a start time of zero). Provides summary of colored cells.
TS-04	Sub buscDET()	Computes number of passengers and occupancy rate between stops.
TS-05	Sub verifLuis()	Computes time between the initial start from the base terminal and the first stop in the half route cycle. Identifies negative times (red), times of more than 10 (green), and 20 (blue) minutes. Provides summary of colored cells.
TS-06	Sub verifTAB()	For each direction on every route, computes summary stats (average, n, std dev, max, min) for passenger demand, occupancy rate between stops, stops/route/direction, and time/stop. An additional VB code for MS-Access computes summary stats for cycle travel time.

Using these macros, the errors and inconsistencies detected were corrected, and summary statistics reports were generated for each route, and for each bus company. In most instances, the errors were originated at the time of the electronic data entry (input typos) where the system did not have validation rule from its design. Only a considerably small portion of the errors detected were inconsistencies registered in the field (found in 20 of the 3,000+ sample forms). Whenever the information could not be verified, the sample was eliminated from the database.

Transit demand and performance summary

From the summary stats directly computed by the macros, the following fields were generated to establish daily passenger demand, and as indicators of the operating performance of the different routes:

N	Number of buses sampled for a given half route cycle.
bus/day	Average number of times that the route was traveled (covered) by a bus.
pax/bus	Average number of passengers that boarded the bus in a half route cycle.
pax/day	Average number of passengers per day using a specific half route ($[pax/bus] \times [bus/day]$).
paxd/kmr	Average number of passengers per kilometer traveled ($[pax/day] / [half cycle distance] \times [bus/day]$).
occup rate	Average occupancy rate between stops (passengers on-board / number of seats in the bus).
stops[@mts]	Average distance between stops (in Juarez, bus-stop signs are not observed by most bus drivers).
stop time	Average time the bus stays at a stop (for boarding/deboarding and/or rest).
travel time	Average time the bus takes to complete a half route cycle.
travel speed	Average speed of the bus ($[travel\ time] / [distance]$).
cruise rate	Percentage of time in the half route cycle that bus is in motion or not.

The complete demand and performance summary is shown in Appendix B. These results will be used to eventually develop, calibrate, and verify any transit mode demand model for Juarez.

Concluding remarks

The data gathered in the on-board transit count was basically passenger movement and timing at every bus stop for boarding/deboarding, thus checks focused on logic time sequence of the routes and reasonable travel and waiting times. The number of checks generated for this database although small in appearance, is the basic requirement of such a simple data structure. The described checks cover all the needs in data accuracy for a reliable passenger demand and operation performance analysis. Geocoding of bus stop locations was the only field left unchecked at this time due to priority and time constraints. In addition it was considered that errors in bus stop geocoding would not compromise passenger demand and operation performance analysis. In any case, this check could be done in a later time when other analyses are required.

Regarding the overall analysis of the transit system, as expected the summary shows a high number of users, in the range of half a million passengers per day, for a city population of just over 1 million. Yet, it seems that the operation performance is in the low side. For instance, an average occupancy rate between stops of just over 0.50 (with respect to the number of seats in the bus) hints an excessive fleet size for the current passenger demand and for a transit service with no government subsidies whatsoever. This of course has more to do with politics and power struggles, than with efficiency criteria and good business practices of the bus companies. Another evidence of poor performance is the observed travel speeds. On the average these are in the order of 15 km/hr, low even for buses in mixed traffic. Lack of paved streets and high number of stops are only a couple of possible causes of this low speed. Certainly, these preliminary statistics give an insight on how important is public transportation for the people in Juarez, and thus its important role in transportation planning.

INSTITUTO MUNICIPAL DE INVESTIGACION Y PLANEACION

Estudio Integral de Transporte para Ciudad Juarez

Component tables for the On-board transit count database

TABLE NO.	TABLE NAME	FIELD NAME	DESCRIPTION	RELATION
1	Cab_[tag]	CVE_AFORO	Sample unique number. Primary key for relating tables.	CVE_AFORO (Det_[tag])
		CVE_RUTA	Bus company code	
(principal table)		CVE_RAMA	Route code	
		CVE_ECON	Bus serial number	
		FECHA	Date	
		PASAJEROS	Number of passengers on-board when bus leaves initial terminal	
		NO_ASIENTO	Number of seats in the bus	
		AF_HH	Time of day (hour) when bus leaves initial terminal	
		AF_MM	Time of day (minutes in the hour) when bus leaves initial terminal	
		AF_SS	Time of day (seconds in the minute) when bus leaves initial terminal	
		AF_AM	Either AM (=1) or PM (=2)	
		VUELTA	Consecutive number of sample for the specific route and direction	
		DIRECCION	Either OUTBOUND(=1) or INBOUND (=2)	
2	Det_[tag]	CVE_AFORO	Sample unique number. Primary key for relating tables.	CVE_AFORO (Cab_[tag])
		NO_PARAD	Consecutive number for bus stop (for boarding/deboarding) in the sample	
(details table)		P_HH	Time of day (hour) when bus stops	
		P_MM	Time of day (minutes in the hour) when bus stops	
		P_SS	Time of day (seconds in the minute) when bus stops	
		P_AM	Either AM (=1) or PM (=2) when the bus stops	
		S_HH	Time of day (hour) when bus leaves the stop	
		S_MM	Time of day (minutes in the hour) when bus leaves the stop	
		S_SS	Time of day (seconds in the minute) when bus leaves the stop	
		S_AM	Either AM (=1) or PM (=2) when the bus leaves the stop	
		SUBEN	Number of passengers boarding at the stop	
		BAJAN	Number of passengers deboarding at the stop	
		OBSERVA	Notes about the stop (I.e. reasons for a delay, traffic accidents, etc)	
		NUM_NODO	Geocode of the nearest intersection to the stop (intersection index)
