Governor

METHODOLOGY

The Business Tax and Valuation Bureau develops a capitalization rate for each centrally assessed utility industry group using the band-of-investment technique. The typical industry rate for each source of capital (common equity and debt) is weighted according to its proportion in the typical market capital structure for each industry to derive a weighted average direct capitalization rate for the specific industry. The rate for each of the sources of capital is taken from directly observed information in the market.

For a company in a given industry, the capitalization rate for its industry is applied directly to an estimate of the company's typical net utility operating income to derive an income indicator of value for the company.

COMPARABLE COMPANIES

The companies used as comparables are taken from the appropriate industry group in the Value Line Investment Survey.

THE RATE FOR COMMON EQUITY

Under direct capitalization, the measure of the rate for common equity is the Earnings/Price (E/P) ratio. The E/P ratio is the annual earnings (net operating income) per share of common stock divided by the average market price per share for common stock.

Montana Department of Revenue

Dan Bucks
Director

2009 Capitalization Rate Study
Business Tax & Valuation Bureau
Centrally Assessed Properties

Brian Schweitzer
Governor

For each of the companies included in the equity portion of the industry capitalization rate data set, the Bureau calculates several different measures of the E/P ratio, and then calculates an industry (simple) average for each of these measures:

- | | |
|----------------------------|--|
| E/P (Yahoo) | The previous calendar year's earnings per share reported on Yahoo Finance's website is divided by the average of the previous calendar year's monthly high and low price (January through December) reported by Yahoo Finance. |
| E/P (VL) | The previous calendar year's earnings per share reported in the Value Line Investment Survey is divided by the average of the previous calendar year's monthly high and low price (January through December) reported by Yahoo Finance. |
| Inverse of P/E (Yahoo) | This is calculated by dividing 1 by the Price/Earnings (P/E) ratio reported by Yahoo Finance for end of the previous calendar year. |
| Inverse of P/E (VL) | This is calculated by dividing 1 by the P/E ratio reported in the Value Line Investment Survey for end of the previous calendar year. |
| Inverse of MEDIAN P/E (VL) | This is calculated by dividing 1 by the MEDIAN Price/Earnings ratio reported in the Value Line Investment Survey for end of the previous calendar year. Value Line derives the MEDIAN P/E ratio by calculating the average of a company's last 10 years P/E ratios after deleting the 2 highest and 2 lowest values. |

THE RATE FOR PREFERRED STOCK

The measure of the rate for preferred stock is a percent dividend yield.

The Business Tax and Valuation Bureau does not calculate an annual (simple) average of the monthly percent yields for all preferred stock issues as a separate rate used in the band of investment. Instead, the preferred stock is included in the debt portion of the capital structure.

THE RATE FOR DEBT

The measure of the rate for debt used in the direct capitalization rate and yield rate is yield to maturity. The yield to maturity is the interest rate that equates the present value of a bond's cash flow to its current price (expressed as a percent). Yield to maturity assumes that the bond will be held to maturity. If the bond is not held until maturity, or if the interim cash flows are reinvested at a rate that differs from the yield to maturity, an investor's actual yield will differ from the yield to maturity. The yield to maturity calculation equates a bond's cash flows to its current price; this yield calculation considers both coupon and income and any capital gain or loss the investor will realize by holding the bond to maturity.

Although valuation theory typically requires the use of current yields (the annual coupon rate divided by price) for direct capitalization and the use of yield to maturity for yield capitalization, the two rates will generally not vary significantly for seasoned issues (except under certain circumstances) and they will be the same for new issues. Therefore, for consistency the Department has chosen to use the same cost of debt for both direct capitalization and yield capitalization. This may have a minor effect on the overall rates but using the same rate for direct capitalization and the yield capitalization rates is consistent with the assumption that the prospective buyers would finance the hypothetical sale with new debt securities.

Yield to Maturity

2009 Capitalization Rate Study Business Tax & Valuation Bureau Centrally Assessed Properties

Brian Schweitzer
Governor

For each of the companies included in the embedded debt portion of the industry capitalization rate data set, the bureau calculates an annual (simple) average of the monthly yield to maturities for all debt issues listed in the Standard & Poor's Bond Guide. These average yields are then used to calculate an industry (simple) average.

DIRECT CAPITALIZATION of "GROSS" CASH FLOW

The Business Tax and Valuation Bureau develops another direct capitalization rate for each centrally assessed utility industry group. This direct capitalization rate is calculated like the rate for capitalizing net operating income. The only difference is that the rate for common equity is "gross" cash flow per share divided by price per share.

"Gross" cash flow is defined as net utility operating income plus depreciation and amortization expense minus preferred stock dividends.

For a company in a given industry, the capitalization rate for its industry is applied directly to an estimate of the company's typical "gross" cash flow to derive an income indicator of value for the company.

The use of the "gross" cash flow capitalization model is less common than the traditional net operating income capitalization model. The "gross" cash flow model can be valuable in developing an income indicator of value for industries or companies that have been experiencing net operating losses, or in cases where book depreciation does not reflect economic depreciation.

YIELD CAPITALIZATION of PROJECTED FUTURE (NET) CASH FLOWS

The Business Tax and Valuation Bureau also develops a yield capitalization rate for each centrally assessed utility industry group. Yield capitalization is fundamentally different from direct capitalization, both in the rates developed for each source of capital (common equity and debt), and the level and nature of income that the capitalization rate is applied to.

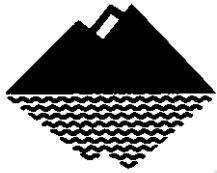

The rate for each source of capital is the "cost of capital" for each industry group. The cost of debt is the yield to maturity for debt derived from the set of comparable companies for each industry group. The cost of equity capital is calculated using several methods, including the DCF (discounted cash flow) model, the ERP (equity risk premium model), the CAPM (capital asset pricing model) or a combination thereof depending on the quantity and quality of available data.

The correct application of a yield capitalization rate is to use the rate for the industry to discount a stream of estimated future (net) cash flows for a company to present value.

It is important to note that the cash flow used in yield capitalization is "true", "net" or "free" cash flow and not the "gross" cash flow used in the Department's direct "gross" cash flow indicator.

The development of a valid future cash flow stream requires considerable time and effort. Most companies choose not to spend the time and effort to develop this future cash flow stream. Therefore, in the event a company does not provide a future cash flow stream as requested in the Annual Reporting Forms, the Department normalizes "net" historical cash flows to determine a cash flow stream. The yield capitalization rate for specific industries is applied directly to this derived cash flow stream.

Properly developed and applied, yield capitalization and direct capitalization usually result in similar indicators of value.

and the corresponding ΔT_{air} values. The results are shown in Fig. 10. The ΔT_{air} values are positive for all the stations, indicating that the air temperature is higher than the surface temperature. The magnitude of the difference is largest at the coastal stations (e.g., 1.5°C at St. John's) and smallest at the inland stations (e.g., 0.5°C at Yellowknife). The ΔT_{air} values are generally larger in the winter than in the summer.

The results of the comparison between the observed and simulated ΔT_{air} values are shown in Fig. 11. The ΔT_{air} values are generally overestimated by the model, particularly at the coastal stations.

The results of the comparison between the observed and simulated ΔT_{air} values are shown in Fig. 11. The ΔT_{air} values are generally overestimated by the model, particularly at the coastal stations.

The results of the comparison between the observed and simulated ΔT_{air} values are shown in Fig. 11. The ΔT_{air} values are generally overestimated by the model, particularly at the coastal stations.

STANDARD &POOR'S

Press Release

S&P 500 Dividends Projected to Decline 13.3% in 2009; Worst Annual Decline Since World War II

New York, February 6, 2009 – Standard & Poor's Index Services announced today that it expects 2009 S&P 500 dividends to decline 13.3%, the worst annual decline since 1942 when dividends fell 16.9%. The \$24.60 dividend rate translates into an expected \$214.66 billion in payments for S&P 500 companies in 2009 versus the \$28.39, or \$247.9 billion, paid in 2008.

"Given the current economic climate and growing concern over dividend cuts, dividend increases for the S&P 500 companies are expected to slow in 2009," says Howard Silverblatt, Senior Index Analyst at Standard & Poor's. "Unless companies believe that their financial future will improve, their need to conserve cash will outweigh their desire to pay dividends."

Standard & Poor's Index Services also announced today that it is decreasing the indicated dividend rate on the S&P 500 from \$27.35 to \$24.90.

"Due to recent events, including potential congressional action that might limit dividend payments, we are reducing the indicated dividend rate on the S&P 500," continues Silverblatt. "Standard & Poor's expects the indicated rate to decline further during the year as the full economic impact is felt by companies, and then move upward as corporate confidence leads to higher future commitments."

Standard & Poor's Index Services data shows that sixty-two S&P 500 companies decreased their dividends in 2008 by an aggregate \$40.6 billion with forty-eight of the decreases coming from Financials (\$37 billion). Over the previous five years (2003-2007), there were only 12 dividend decreases in the Financials sector amounting to \$5.1 billion.

So far in 2009, fourteen issues (nine of which are Financials) have decreased their dividend rate by over \$13.5 billion. "Actual January dividend payments for the S&P 500 were down 23.9%, which speaks to the Q4 decreases, the \$13.5 billion cuts year-to-date speaks to future payments", warns Silverblatt.

While dividend decreases and warnings are now prevalent in sectors, Financials remain the primary (but not only) concern. At the end of 2007, 96.7% of the Financials paid cash dividends, accounting for 29.1% of the dividend payments. Currently 84.5% pay, accounting for 15.0% of the dividends.

"The bottom line is that investors need to do a lot more homework than in years past as the prospect for future dividends remains extremely cautious," continues Silverblatt. "On former President Ronald Reagan's 98th birthday, his words still ring true today, *Trust but Verify.*"
