- 13 SCHAEEL 07A limits are from R_c , Q_{FB}^{depl} , and hadronic cross section measurements.
- 14 SCHAEEL 07A limits are from R_b , A_{FB}^b .
- 15 CHEUNG 01B is an update of BARGER 98E.
- 16 SCHAEEL 07A limit assumes quark flavor universality of the contact interactions.
- 17 ABULENCIA 06L limits are from $p\bar{p}$ collisions at $\sqrt{s} = 1.96$ TeV.
- 18 ABBIENDI 04G limits are from $e^+e^- \rightarrow q\bar{q}$ cross section at $\sqrt{s} = 130\text{--}207$ GeV.
- 19 ADLOFF 03 limits are from the $d\sigma/dQ^2$ measurement of $e^\pm p \rightarrow e^\pm X$.
- 20 ACHARD 02J limit is from the bound on the $e^+e^- \rightarrow t\bar{t}$ cross section. $\Lambda_{LL} = \Lambda_{LR} = \Lambda_{RL} = \Lambda_{RR}$ and $m_t = 175$ GeV are assumed.
- 21 ABBIENDI 00R limits are from $e^+e^- \rightarrow q\bar{q}$ cross section at $\sqrt{s} = 130\text{--}189$ GeV.
- 22 ACCIARRI 00P limit is from $e^+e^- \rightarrow qq$ cross section at $\sqrt{s} = 130\text{--}189$ GeV.
- 23 ADLOFF 00 limits are from the Q^2 spectrum measurement of $e^+p \rightarrow e^+X$.
- 24 BARATE 00i limits are from $e^+e^- \rightarrow q\bar{q}$ cross section and jet-charge asymmetry at 130–183 GeV.
- 25 BARATE 00i limits are from R_b and jet-charge asymmetry at 130–183 GeV.
- 26 BREITWEG 00B limits are from Q^2 spectrum measurement of e^+p collisions. See their Table 3 for the limits of various models.
- 27 ABBIENDI 99 limits are from $e^+e^- \rightarrow q\bar{q}$ cross section at 130–136, 161–172, 183 GeV.
- 28 ABBIENDI 99 limits are from R_b at 130–136, 161–172, 183 GeV.
- 29 ABBOTT 99D limits are from e^+e^- mass distribution in $p\bar{p} \rightarrow e^+e^-X$ at $E_{cm} = 1.8$ TeV.
- 30 ABREU 99A limits are from flavor-tagged $e^+e^- \rightarrow q\bar{q}$ cross section at 130–172 GeV.
- 31 ZARNECKI 99 use data from HERA, LEP, Tevatron, and various low-energy experiments.
- 32 ACCIARRI 98J limits are from $e^+e^- \rightarrow q\bar{q}$ cross section at $E_{cm} = 130\text{--}172$ GeV.
- 33 ACKERSTAFF 98V limits are from $e^+e^- \rightarrow q\bar{q}$ at $E_{cm} = 130\text{--}172$ GeV.
- 34 ACKERSTAFF 98V limits are from R_b measurements at $E_{cm} = 130\text{--}172$ GeV.
- 35 BARGER 98E use data from HERA, LEP, Tevatron, and various low-energy experiments.

> 6.5		³⁹ DIAZCRUZ	94 RVUE	$\Lambda_{LL}^-(\tau\nu_\tau \mu\nu_\mu)$

- 37 JODIDIO 86 limit is from $\mu^+ \rightarrow \bar{\nu}_\mu e^+ \nu_e$. Chirality invariant interactions $L = (g^2/\Lambda^2) [\eta_{LL} (\bar{\nu}_\mu L \gamma^\alpha \mu_L) (\bar{e}_L \gamma_\alpha \nu_e L) + \eta_{LR} (\bar{\nu}_\mu L \gamma^\alpha \nu_e L) (\bar{e}_R \gamma_\alpha \mu_R)]$ with $g^2/4\pi = 1$ and $(\eta_{LL}, \eta_{LR}) = (0, \pm 1)$ are taken. No limits are given for Λ_{LL}^\pm with $(\eta_{LL}, \eta_{LR}) = (\pm 1, 0)$. For more general constraints with right-handed neutrinos and chirality nonconserving contact interactions, see their text.
- 38 DIAZCRUZ 94 limits are from $\Gamma(\tau \rightarrow e \nu \nu)$ and assume flavor-dependent contact interactions with $\Lambda(\tau \nu_\tau e \nu_e) \ll \Lambda(\mu \nu_\mu e \nu_e)$.
- 39 DIAZCRUZ 94 limits are from $\Gamma(\tau \rightarrow \mu \nu \nu)$ and assume flavor-dependent contact interactions with $\Lambda(\tau \nu_\tau \mu \nu_\mu) \ll \Lambda(\mu \nu_\mu e \nu_e)$.

SCALE LIMITS for Contact Interactions: $\Lambda(e\nu qq)$

VALUE (TeV)	CL%	DOCUMENT ID	TECN
>2.81	95	40 AFFOLDER 01i	CDF

⁴⁰ AFFOLDER 00i bound is for a scalar interaction $\bar{q}_R q_L \bar{\nu} e_L$.

SCALE LIMITS for Contact Interactions: $\Lambda(qqqq)$

Limits are for Λ_{LL}^\pm with color-singlet isoscalar exchanges among u_L 's and d_L 's only, unless otherwise noted. See EICHTEN 84 for details.

VALUE (TeV)	CL%	DOCUMENT ID	TECN	COMMENT
>2.7	95	41 ABBOTT 99C	D0	$p\bar{p} \rightarrow$ dijet mass. Λ_{LL}^+

		44 BERTRAM 98	RVUE	$p\bar{p} \rightarrow$ dijet mass

- ⁴¹ The quoted limit is from inclusive dijet mass spectrum in $p\bar{p}$ collisions at $E_{cm}=1.8$ TeV. ABBOTT 99C also obtain $\Lambda_{LL}^- > 2.4$ TeV. All quarks are assumed composite.
- ⁴² The quoted limit for ABBOTT 00E is from H_T distribution in $p\bar{p}$ collisions at $E_{cm}=1.8$ TeV. CTEQ4M PDF and $\mu=E_T^{\max}$ are assumed. For limits with different assumptions, see their Tables 2 and 3. All quarks are assumed composite.
- ⁴³ ABBOTT 98G limit is from dijet angular distribution in $p\bar{p}$ collisions at $E_{cm}=1.8$ TeV. All quarks are assumed composite.
- ⁴⁴ BERTRAM 98 obtain limit on the scale of color-octet axial-vector flavor-universal contact interactions: $\Lambda_{A8} > 2.1$ TeV. They also obtain a limit $\Lambda_{V8} > 2.4$ TeV on a color-octet flavor-universal vectorial contact interaction.

SCALE LIMITS for Contact Interactions: $\Lambda(\nu\nu qq)$

Limits are for Λ_{LL}^\pm only. For other cases, see each reference.

Λ_{LL}^+ (TeV)	Λ_{LL}^- (TeV)	CL%	DOCUMENT ID	TECN	COMMENT
>5.0	>5.4	95	45 MCFARLAND 98	CCFR	νN scattering

- ⁴⁵ MCFARLAND 98 assumed a flavor universal interaction. Neutrinos were mostly of muon type.

MASS LIMITS for Excited e (e^*)

Most e^+e^- experiments assume one-photon or Z exchange. The limits from some e^+e^- experiments which depend on λ have assumed transition couplings which are chirality violating ($\eta_L = \eta_R$). However they can be interpreted as limits for chirality-conserving interactions after multiplying the coupling value λ by $\sqrt{2}$; see Note.

Excited leptons have the same quantum numbers as other ortholeptons. See also the searches for ortholeptons in the "Searches for Heavy Leptons" section.

Limits for Excited e (e^*) from Pair Production

These limits are obtained from $e^+e^- \rightarrow e^{*+}e^{*-}$ and thus rely only on the (electroweak) charge of e^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the e^* coupling is assumed to be of sequential type. Possible t channel contribution from transition magnetic coupling is neglected. All limits assume a dominant $e^* \rightarrow e\gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

⁴⁶ From e^+e^- collisions at $\sqrt{s} = 183\text{--}209$ GeV. $f = f'$ is assumed.

⁴⁷ From e^+e^- collisions at $\sqrt{s} = 189\text{--}209$ GeV. $f = f'$ is assumed. ACHARD 03B also obtain limit for $f = -f'$: $m_{e^*} > 96.6$ GeV.

⁴⁸ From e^+e^- collisions at $\sqrt{s} = 192\text{--}202$ GeV. $f=f'$ is assumed. ACCIARRI 01D also obtain limit for $f=-f'$: $m_{e^*} > 93.4$ GeV.

⁴⁹ From e^+e^- collisions at $\sqrt{s}=161\text{--}183$ GeV. $f=f'$ is assumed. ABBIENDI 00I also obtain limit for $f=-f'$ ($e^* \rightarrow \nu W$): $m_{e^*} > 86.0$ GeV.

⁵⁰ From e^+e^- collisions at $\sqrt{s}=189$ GeV. $f=f'$ is assumed. ACCIARRI 00E also obtain limit for $f=-f'$ ($e^* \rightarrow \nu W$): $m_{e^*} > 92.6$ GeV.

⁵¹ From e^+e^- collisions at $\sqrt{s}= 183$ GeV. $f=f'$ is assumed. ABREU 99O also obtain limit for $f=-f'$ ($e^* \rightarrow \nu W$): $m_{e^*} > 81.3$ GeV.

⁵² From e^+e^- collisions at $\sqrt{s}=170\text{--}172$ GeV. ACKERSTAFF 98C also obtain limit from $e^* \rightarrow \nu W$ decay mode: $m_{e^*} > 81.3$ GeV.

⁵³ BARATE 98U obtain limits on the form factor. See their Fig. 14 for limits in mass-form factor plane.

⁵⁴ From e^+e^- collisions at $\sqrt{s}=161$ GeV.

⁵⁵ ABREU 97B also obtain limit from charged current decay mode $e^* \rightarrow \nu W$, $m_{e^*} > 70.9$ GeV.

⁵⁶ ABREU 97B also obtain limit from charged current decay mode $e^* \rightarrow \nu W$, $m_{e^*} > 44.6$ GeV.

Limits for Excited e (e^*) from Single Production

These limits are from $e^+e^- \rightarrow e^*e$, $W \rightarrow e^*\nu$, or $ep \rightarrow e^*X$ and depend on transition magnetic coupling between e and e^* . All limits assume $e^* \rightarrow e\gamma$ decay except as noted. Limits from LEP, UA2, and H1 are for chiral coupling, whereas all other limits are for nonchiral coupling, $\eta_L = \eta_R = 1$. In most papers, the limit is expressed in the form of an excluded region in the $\lambda-m_{e^*}$ plane. See the original papers.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

⁵⁷ AARON 08A search for single e^* production in ep collisions with the decays $e^* \rightarrow e\gamma$, eZ , νW . The quoted limit assumes $f = f' = \Lambda/m_{e^*}$. See their Fig. 3 and Fig. 4 for the exclusion plots in the mass-coupling plane.

⁵⁸ ABAZOV 08H search for single e^* production in $p\bar{p}$ collisions with the decays $e^* \rightarrow e\gamma$. The e^* production is assumed to be described by an effective four-fermion interaction. See their Fig. 5 for the exclusion plot in the mass-coupling plane.

⁵⁹ ACOSTA 05B search for single e^* production in $p\bar{p}$ collisions with the decays $e^* \rightarrow e\gamma$. $f = f' = \Lambda/m_{e^*}$ is assumed for the e^* coupling. See their Fig.3 for the exclusion limit in the mass-coupling plane.

⁶⁰ ACHARD 03B result is from e^+e^- collisions at $\sqrt{s} = 189-209$ GeV. See their Fig. 4 for the exclusion plot in the mass-coupling plane.

- 61 ABBIENDI 02G result is from e^+e^- collisions at $\sqrt{s} = 183\text{--}209$ GeV. $f = f' = \Lambda/m_{e^*}$ is assumed for e^* coupling. See their Fig. 4c for the exclusion limit in the mass-coupling plane.
- 62 ADLOFF 02B search for single e^* production in ep collisions with the decays $e^* \rightarrow e\gamma, eZ, \nu W$. $f = f' = \Lambda/m_{e^*}$ is assumed for the e^* coupling. See their Fig. 3 for the exclusion plot in the mass-coupling plane.
- 63 CHEKANOV 02D search for single e^* production in ep collisions with the decays $e^* \rightarrow e\gamma, eZ, \nu W$. $f = f' = \Lambda/m_{e^*}$ is assumed for the e^* coupling. See their Fig. 5a for the exclusion plot in the mass-coupling plane.
- 64 ACCIARRI 01D result is from e^+e^- collisions at $\sqrt{s} = 192\text{--}202$ GeV. $f=f'=\Lambda/m_{e^*}$ is assumed for the e^* coupling. See their Fig. 4 for limits in the mass-coupling plane.
- 65 ABBIENDI 00I result is from e^+e^- collisions at $\sqrt{s}=161\text{--}183$ GeV. See their Fig. 7 for limits in mass-coupling plane.
- 66 ACCIARRI 00E result is from e^+e^- collisions at $\sqrt{s}=189$ GeV. See their Fig. 3 for limits in mass-coupling plane.
- 67 ADLOFF 00E search for single e^* production in ep collisions with the decays $e^* \rightarrow e\gamma, eZ, \nu W$. $f=f'=\Lambda/m_{e^*}$ is assumed for the e^* coupling. See their Fig. 9 for the exclusion plot in the mass-coupling plane.
- 68 ABREU 99O result is from e^+e^- collisions at $\sqrt{s}= 183$ GeV. See their Figs. 4 and 5 for the exclusion limit in the mass-coupling plane.
- 69 ACCIARRI 98T search for single e^* production in quasi-real Compton scattering. The limit is for $|\lambda| > 1.0 \times 10^{-1}$ and non-chiral coupling of e^* . See their Fig. 7 for the exclusion plot in the mass-coupling plane.
- 70 ACKERSTAFF 98C from e^+e^- collisions at $\sqrt{s}=170\text{--}172$ GeV. See their Fig. 11 for the exclusion limit in the mass-coupling plane.
- 71 BARATE 98U is from e^+e^- collision at $\sqrt{s}=M_Z$. See their Fig. 12 for limits in mass-coupling plane
- 72 From e^+e^- collisions at $\sqrt{s}= 161$ GeV.
- 73 See Fig. 4a and Fig. 5a of ABREU 97B for the exclusion limit in the mass-coupling plane.
- 74 See Fig. 2 and Fig. 3 of ACCIARRI 97G for the exclusion limit in the mass-coupling plane.
- 75 ACKERSTAFF 97 result is from e^+e^- collisions at $\sqrt{s}= 161$ GeV. See their Fig. 3 for the exclusion limit in the mass-coupling plane.
- 76 ADLOFF 97 search for single e^* production in ep collisions with the decays $e^* \rightarrow e\gamma, eZ, \nu W$. See their Fig. 4 for the rejection limits on the product of the production cross section and the branching ratio into a specific decay channel.
- 77 BREITWEG 97C search for single e^* production in ep collisions with the decays $e^* \rightarrow e\gamma, eZ, \nu W$. $f=f'=2\Lambda/m_{e^*}$ is assumed for the e^* coupling. See their Fig. 9 for the exclusion plot in the mass-coupling plane.

Limits for Excited e (e^*) from $e^+e^- \rightarrow \gamma\gamma$

These limits are derived from indirect effects due to e^* exchange in the t channel and depend on transition magnetic coupling between e and e^* . All limits are for $\lambda_\gamma = 1$. All limits except ABE 89J and ACHARD 02D are for nonchiral coupling with $\eta_L = \eta_R = 1$. We choose the chiral coupling limit as the best limit and list it in the Summary Table.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

⁷⁸ ABDALLAH 04N also obtain a limit on the excited electron mass with $e e^*$ chiral coupling, $m_{e^*} > 295$ GeV at 95% CL.

⁷⁹ ACCIARRI 00G also obtain a limit on e^* with chiral coupling, $m_{e^*} > 213$ GeV.

⁸⁰ BARATE 98U is from $e^+ e^-$ collision at $\sqrt{s}=M_Z$. See their Fig. 5 for limits in mass-coupling plane

Indirect Limits for Excited e (e^*)

These limits make use of loop effects involving e^* and are therefore subject to theoretical uncertainty.

VALUE (GeV)	DOCUMENT ID	TECN	COMMENT
-------------	-------------	------	---------

• • • We do not use the following data for averages, fits, limits, etc. • • •

⁸¹ DORENBOS...	89	CHRM	$\bar{\nu}_\mu e \rightarrow \bar{\nu}_\mu e$ and $\nu_\mu e \rightarrow \nu_\mu e$
⁸² GRIFOLS	86	THEO	$\nu_\mu e \rightarrow \nu_\mu e$
⁸³ RENARD	82	THEO	$g-2$ of electron

⁸¹ DORENBOSCH 89 obtain the limit $\lambda_\gamma^2 \Lambda_{\text{cut}}^2 / m_{e^*}^2 < 2.6$ (95% CL), where Λ_{cut} is the cutoff scale, based on the one-loop calculation by GRIFOLS 86. If one assumes that $\Lambda_{\text{cut}} = 1$ TeV and $\lambda_\gamma = 1$, one obtains $m_{e^*} > 620$ GeV. However, one generally expects $\lambda_\gamma \approx m_{e^*} / \Lambda_{\text{cut}}$ in composite models.

⁸² GRIFOLS 86 uses $\nu_\mu e \rightarrow \nu_\mu e$ and $\bar{\nu}_\mu e \rightarrow \bar{\nu}_\mu e$ data from CHARM Collaboration to derive mass limits which depend on the scale of compositeness.

⁸³ RENARD 82 derived from $g-2$ data limits on mass and couplings of e^* and μ^* . See figures 2 and 3 of the paper.

MASS LIMITS for Excited μ (μ^*)

Limits for Excited μ (μ^*) from Pair Production

These limits are obtained from $e^+ e^- \rightarrow \mu^{*+} \mu^{*-}$ and thus rely only on the (electroweak) charge of μ^* . Form factor effects are ignored unless noted. For the case of limits from Z decay, the μ^* coupling is assumed to be of sequential type. All limits assume a dominant $\mu^* \rightarrow \mu \gamma$ decay except the limits from $\Gamma(Z)$.

For limits prior to 1987, see our 1992 edition (Physical Review **D45** S1 (1992)).

MASS LIMITS for Excited Neutrino (ν^*)

Limits for Excited ν (ν^*) from Pair Production

These limits are obtained from $e^+e^- \rightarrow \nu^*\nu^*$ and thus rely only on the (electroweak) charge of ν^* . Form factor effects are ignored unless noted. The ν^* coupling is assumed to be of sequential type unless otherwise noted. All limits assume a dominant $\nu^* \rightarrow \nu\gamma$ decay except the limits from $\Gamma(Z)$.

		170 KIM	90 AMY	$e_8: e^+e^- \rightarrow gg; R$

- 167 ABE 89D look for pair production of unit-charged particles which leave the detector before decaying. In the above limit the color octet lepton is assumed to fragment into a unit-charged or neutral hadron with equal probability and to have long enough lifetime not to decay within the detector. The limit improves to 99 GeV if it always fragments into a unit-charged hadron.
- 168 ABT 93 search for e_8 production via e -gluon fusion in ep collisions with $e_8 \rightarrow eg$. See their Fig. 3 for exclusion plot in the $m_{e_8} - \Lambda$ plane for $m_{e_8} = 35\text{--}220$ GeV.
- 169 KIM 90 is at $E_{\text{cm}} = 50\text{--}60.8$ GeV. The same assumptions as in BARTEL 87B are used.
- 170 KIM 90 result $(m_{e_8} \Lambda_M)^{1/2} > 178.4$ GeV (95%CL, $\alpha_S = 0.16$ used) is subject to the same restriction as for BARTEL 85K.

MASS LIMITS for Color Octet Neutrinos (ν_8)

$$\lambda \equiv m_{\ell_8}/\Lambda$$

VALUE (GeV)	CL%	DOCUMENT ID	TECN	COMMENT
>110	90	171 BARGER	89	RVUE $\nu_8: p\bar{p} \rightarrow \nu_8\bar{\nu}_8$

• • • We do not use the following data for averages, fits, limits, etc. • • •

none 3.8–29.8 95 172 KIM 90 AMY $\nu_8: e^+e^- \rightarrow$ acoplanar jets

none 9–21.9 95 173 BARTEL 87B JADE $\nu_8: e^+e^- \rightarrow$ acoplanar jets

171 BARGER 89 used ABE 89B limit for events with large missing transverse momentum. Two-body decay $\nu_8 \rightarrow \nu g$ is assumed.

172 KIM 90 is at $E_{\text{cm}} = 50\text{--}60.8$ GeV. The same assumptions as in BARTEL 87B are used.

173 BARTEL 87B is at $E_{\text{cm}} = 46.3\text{--}46.78$ GeV. The limit assumes the ν_8 pair production cross section to be eight times larger than that of the corresponding heavy neutrino pair production. This assumption is not valid in general for the weak couplings, and the limit can be sensitive to its $SU(2)_L \times U(1)_Y$ quantum numbers.

MASS LIMITS for W_8 (Color Octet W Boson)
