World Agricultural Production

China Rice – Bumper Crop Forecast for 2009/10

China is likely to produce a bumper rice crop this season, the sixth straight increase in production. Farmers were encouraged to increase rice area for 2009/10 by generous government input subsidies and higher procurement prices, and the yield trend over the last six years is rising. China's milled rice production for 2009/10 is forecast at 135.1 million tons (193.0 million tons, rough basis), up 0.7 million or less than 1 percent from both last month and from last year's revised production estimate. Area is estimated at 29.8 million hectares, up 0.2 million from last month and 0.4 million from last year's revised area. The area and production revisions for 2008/09 are based on official Chinese government statistics. China's 2009/10 rice yield is estimated at 6.48 tons per hectare (rough basis), down slightly from last year's record yield but well above the 5-year average. The 2009/10 early rice crop is now in the filling/maturing stage and harvest will begin in about two weeks. Early rice area increased by an estimated 150,000 hectares in 2009 and yields are expected to be higher than last year due to mostly favorable weather throughout the growing season. Planted area also increased for the middle rice crop, which was sown in May/June and is now in the vegetative stage. The weather for the middle rice crop has been unfavorably wet and cool in parts of Northeast China since early June, but

Approved by the World Agricultural Outlook Board

growing conditions in the Yangtze basin and Sichuan have been generally good. The late rice crop will be planted in late July following the early rice harvest. *(For more information, contact Paulette Sandene@202-690-0133).*

EU Wheat Production Continues Downward Slide

The European Union (EU)'s 2009/10 wheat crop is estimated at 134.7 million tons, down 1.3 million from last month and down 17.0 million from last year's record crop. Area is estimated at 25.7 million hectares, down 0.1 million from last month and below last year's record 26.9 million hectares. Yield is estimated at 5.24 tons per hectare, below the five-year average of 5.28 tons per hectare. The 2009/10 harvest is now expected to be an average-size crop because weather and economic variables have reduced earlier expectations. Tight economic conditions have reduced money spent on fertilizer, herbicides, and pesticides. During late spring and early summer, unfavorably dry conditions dominated Europe's weather in several major wheat-growing regions. Spain's central province of Castilla y Leon is the nation's grain belt where half of the country's rain-fed grain is produced. Agriculture in Castilla y Leon has suffered severely from receiving only minimal rainfall this spring and summer. Dryness is also the reason for a 0.3-million-ton reduction in estimated United Kingdom wheat production, to 14.5 million tons. Denmark's estimated production was reduced by 0.4 million tons, to 4.7 million, due to a reduction in estimated area. Eastern Europe experienced unfavorable dryness in April and early May, followed by increased precipitation in the north during May and flooding in Poland during June. Farther south in the Balkans, drought has persisted from April through most of June in Romania, Bulgaria, and Hungary. Soaking rains finally arrived at the end of June but this was too late to benefit mature wheat in Romania and Bulgaria. Estimated wheat production for Romania has decreased every month since May due to persistent dryness, and currently stands at 5.5 million tons. *(For more information, contact Bryan Purcell at 202-690-0138.)*

EU Corn Production Remains Stable with Offsetting Changes

Estimated 2009/10 corn production for the EU-27 decreased 0.1 million tons from last month, to 56.4 million tons, while area increased by 0.1 million hectares to 8.7 million hectares. Yield is estimated at 6.48 tons per hectare, just shy of the five-year average. Within the EU-27, France's estimated corn crop was increased by 1.2 million tons, to 15.9 million, due to an 8-percent increase in estimated area. Meanwhile, Italian corn production was lowered 0.9 million tons to 8.7 million. Area was decreased by 0.05 million hectares to 0.96 million, the lowest level in ten years, due in part to heavy spring rains that delayed planting. Some of the fields that were set to be sown with corn were switched to other crops like soybeans, which could be planted later. In addition, there are reports of root worm attacks in areas of Italy's best farmland, the Po River Valley. Romania's corn crop was reduced by 0.5 million tons to 7.0 million, due to persistent spring and early-summer dryness. Widespread rainfall in the Balkans during late June improved prospects for summer crops, but additional rainfall is needed to replenish the region's soil-moisture reserves. *(For more information, contact Bryan Purcell at 202-690-0138.)*

Argentina Wheat: Dry Weather Reduces Sown Area for 2009/10

The USDA forecasts Argentine wheat production for 2009/10 at 9.5 million tons, down 1.5 million tons or 14 percent from last month's 11.0 million. Area is estimated at 3.5 million hectares, down 0.5 million or 13 percent from last month. Yield is forecast at 2.71 tons per hectare, down from 2.75 tons per hectare last month, compared to the record high 3.03 tons per hectare in 2006/07 and the 5-year average of 2.71 tons per hectare.

Continued dry conditions have hampered wheat sowing due to very low topsoil moisture. Subsoil moisture is even more critical. Recent rain showers have replenished surface soil moisture in southeastern and southern Buenos Aires and eastern Entre Rios, and farmers in these regions have begun planting. In Cordoba, La Pampa, Santa Fe, and other provinces, however, the weather remains drier than normal with little planting. Although some commercial analysts expect much less area to be planted this season, recent rains in Buenos Aires, where 60 percent of all Argentina wheat is grown, has resulted in additional planting. Some farmers who originally did not plan to plant wheat due to the dryness are now sowing wheat, and additional rain could stimulate more planting. Limited rain is expected in the near future, and a forecast resurgence of the El Niño weather pattern could bring more rain to wheat-growing regions of Argentina.

In addition to the weather-related area reduction, high taxes on wheat exports and low wheat prices have also discouraged farmers from planting as much wheat this season as in previous years. The window of optimum sowing in many regions does not close until after the first week of August. *(For additional information, contact Dr. Denise McWilliams, at 202-720-0107.)*

Canadian Wheat Production Down

The USDA forecasts 2009/10 Canadian wheat production at 23.5 million metric tons, down 6 percent from last month and down 18 percent from last year. The month-to-month reduction is due to regional drought in the Canadian prairies. Alberta and western Saskatchewan have not received significant rainfall since the 2008 harvest. This area comprises approximately a quarter of Canada's total wheat production. In addition, the crop experienced abnormally low temperatures throughout June and in some areas temperatures plunged to freezing. Planting is around two weeks behind schedule across the Canadian prairie increasing the possibility of damage from an early autumn. Assuming normal weather throughout the remainder of the growing season, yield for 2009/10 will likely be below the 5-year average level.

Statistics Canada released preliminary 2009/10 crop-area estimates in late June. Sown wheat was estimated at 10.08 million hectares, but the data were collected from May 25 to June 3, before the late freeze that impacted the western Canadian prairies. According to provincial government reports, some farmers subsequently reseeded damaged wheat fields with barley. *(For more information, contact Arnella Trent at 202-720-0881.)*

Canadian Barley Production Down

The USDA forecasts 2009/10 Canadian barley production at 9.4 million metric tons, down nearly 6 percent from last month, due to regional drought in the Canadian prairies. Alberta and Western Saskatchewan have not received significant rainfall since the 2008 harvest. Soil moisture is rated as fair to poor in some of the major barley producing areas. In addition, temperatures plunged to freezing, or below freezing, across the western prairies during the first part of June. This area comprises approximately 85 percent of Canadian barley production. Currently, planting is 7 to 10 days later than usual across the Canadian Prairie Provinces, which could increase possible damage in the event of an early autumn frost.

Statistics Canada released preliminary 2009/10 crop-area estimates in late June, with sown barley area reported at 3.5 million hectares – the smallest area seeded to barley since 1967. The data, however, were collected from May 25 to June 3, prior to the late freeze that impacted the western Canadian prairies. Since barley has a shorter growing season than other crops, some farmers reportedly reseeded damaged wheat fields with barley. *(For more information, contact Arnella Trent at 202-720-0881.)*

Kazakhstan: Higher Sown Area Boosts Wheat Forecast for 2009/10

The USDA estimates Kazakhstan wheat production for 2009/10 at 14.5 million tons, up 0.5 million or 4 percent from last month and up 2.0 million or 16 percent from last year. Estimated area is increased to 14.2 million hectares, compared to 13.5 million last month and 12.9 million last year, based chiefly on preliminary data from the Ministry of Agriculture. Yield remains essentially unchanged from last month at 1.02 tons per hectare, against 0.97 tons per hectare last year. June precipitation was minimal – less than 50 percent of normal in a substantial portion of the prime spring wheat zone in north-central Kazakhstan – but temperatures were not excessively high. Final yield will depend largely on precipitation during July and August. Spring wheat comprises over 95 percent of Kazakhstan's wheat output. *(For more information, contact Mark Lindeman at 202-690-0143.)*

Russia: Higher Estimated Area for 2009/10 Wheat and Barley Boosts Production Forecasts

The USDA estimates Russia wheat production for 2009/10 at 60.0 million tons, up 1.0 million or 2 percent from last month but down 3.7 million or 6 percent from last year's record crop. Barley production is estimated at 17.0 million tons, up 0.5 million or 3 percent from last year but down 6.1 million or 26 percent from last year. The production increases for both crops are based on revised estimates of sown area. Planting-progress reports from the State Statistical Committee indicate a 1.0-million-hectare year-to-year increase in spring wheat area on agricultural enterprises, which account for about 75 percent of the country's spring wheat. Russia's total wheat area is estimated at 28.6 million hectares, up 1.2 million from last month, and up 1.9 million from last year due to higher estimated area for both winter and spring wheat. Specialists attribute the increased wheat area in part to high prices for government intervention purchases of milling-quality wheat. Barley area is estimated at 9.7 million hectares, matching last year's level

but up 0.3 million from last month. Wheat yield for 2009/10 is estimated at 2.10 tons per hectare, second only to last year's record 2.39 tons per hectare. Conditions have been generally favorable for winter wheat in European Russia and winter losses were low. June precipitation was substantially below normal in some key spring-wheat production regions, including parts of the Volga Valley, but temperatures were not excessively high and the crop has not yet suffered irreversible damage. Conditions in the Siberian District, the top spring wheat region, are generally good. Spring barley accounts for about 95 percent of Russia's total barley area, and is grown in all of the country's main grain-production regions. Total barley yield is estimated at 1.75 tons per hectare, down from last year's record 2.38 tons per hectare but reasonably typical for a normal year. *(For more information, contact Mark Lindeman at 202-690-0143.)*

China Cotton – Lower Area but Higher Yield Forecast for 2009/10

China's 2009/10 cotton production is forecast at 33.0 million bales (7.19 million tons), unchanged from last month but down 2.8 million or 8 percent from last year. Area is estimated at 5.4 million hectares, down 0.55 million or 9 percent from last year. Farmers were discouraged from planting cotton in 2009 because of high production costs, labor shortages, declining cotton prices, and the weak global demand for textiles at the end of 2008. Initial planting intention surveys suggested that 2009/10 area would drop by more than 20 percent in 2009, but subsequent government and industry surveys indicated that area had dropped by only 11 to 12 percent. Farmers were encouraged to maintain cotton acreage for several reasons, including stable cotton prices, generous government subsidies for improved seed and inputs, rising demand for cotton textiles, and generally favorable planting weather. The cotton crop is currently in the vegetative to flowering stage and will enter the open boll stage in August. Harvesting will take place from September through November. There have been reports of isolated insect outbreaks as well as localized storm and hail damage this summer. However, government and industry sources report that the overall 2009/10 crop is growing well and yields are expected to match or exceed last year's level. *(For more information, contact Paulette Sandene@202-690-0133).*

Canadian Rapeseed Area Planted Forecast Slightly Up from June

The USDA forecasts 2009/10 Canadian rapeseed production at 10.5 million metric tons, up about 1 percent from last month and down about 17 percent from the record 2008/09 crop. This year-to-year reduction is due to a 5-percent decrease in planted area and lower estimated yields. Regional drought in the western prairies combined with wetness in the eastern prairies has reduced Canadian rapeseed prospects. Flooding in Manitoba caused farmers to delay planting, and temperatures across the prairies plunged to below freezing conditions in June. Some frost-damaged rapeseed was reseeded last month. As a result, crop development is 7 to 10 days behind normal, which increases its potential vulnerability in the event of excessive July heat or an early autumn frost.

Statistics Canada released preliminary 2009/10 crop-area estimates in late June, with sown rapeseed area reported at 6.4 million hectares. The data, however, were collected from May 25 to June 3, and do not reflect the flooding and frost damage that occurred later in June. *For more information, contact Arnella Trent at 202-720-0881.)*

This report uses information from the Foreign Agricultural Service's (FAS) global network of agricultural attachés and counselors, official statistics of foreign governments and other foreign source materials, and the analysis of economic data and satellite imagery. Estimates of foreign area, yield, and production are from the International Production Assessment Division, FAS, and are reviewed by USDA's Inter-Agency Commodity Estimates Committee. Estimates of U.S. area, yield, and production are from USDA's National Agricultural Statistics Service. Numbers within the report may not add to totals because of rounding. This report reflects official USDA estimates released in the World Agricultural Supply and Demand Estimates (WASDE-468) July 10, 2009.

Printed copies are available from the National Technical Information Service. Download an order form at http://www.ntis.gov/products/specialty/usda/fas_a-g.asp, or call NTIS at 1-800-363-2068.

The FAS International Production Assessment Branch prepared this report. The next issue of World Agricultural Production will be released after 9:30 a.m. Eastern Time, August 12, 2009.

TABLE 18

The table below presents a 27-year record of the differences between the July projection and the final estimate. Using world wheat production as an example, changes between the July projection and the final estimate have averaged 13.4 million tons (2.4 percent) and ranged from -34.6 to 23.7 million tons. The July projection has been below the final 16 times and above the final 12 times.

RELIABILITY OF PRODUCTION PROJECTIONS

1/ The final estimate for 1981/82-2007/08 is defined as the first November estimate following the marketing year.

2/ May not total 27 if projection was the same as the final.

3/ Includes corn, sorghum, barley, oats, rye, millet, and mixed grain.
