# **Producer Price Indexes – April 2009**

The Producer Price Index for Finished Goods increased 0.3 percent in April, seasonally adjusted, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. This rise followed a 1.2-percent decline in March and a 0.1-percent increase in February. At the earlier stages of processing, prices received by producers of intermediate goods moved down 0.5 percent following a 1.5-percent decrease a month earlier, and the crude goods index advanced 3.0 percent after declining 0.3 percent in March. (See table A.)

Among finished goods, prices for consumer foods rose 1.5 percent in April following a 0.7-percent decrease in the previous month. The index for finished energy goods edged down 0.1 percent subsequent to a 5.5-percent decline in March. Prices for finished goods other than foods and energy inched up 0.1 percent compared with no change a month earlier.

Table A. Monthly and annual percent changes in selected stage-of-processing price indexes, seasonally adjusted

			Finishe	ed goods			
Month	Total	Foods	Energy	nergy foods and energy energy ago		Intermediate goods	Crude goods
2008

<sup>1</sup> Some of the figures shown above and elsewhere in this release may differ from those previously reported because data for December 2008 have been revised to reflect the availability of late reports and corrections by respondents.

Before seasonal adjustment, the Producer Price Index for Finished Goods increased 0.6 percent in April to 169.9 (1982 = 100). From April 2008 to April 2009, finished goods prices fell 3.7 percent. Over the same period, the finished energy goods index moved down 25.6 percent. By contrast, prices for finished goods less foods and energy advanced 3.4 percent and the index for finished consumer foods increased 0.2 percent. For the 12 months ended in April, prices received by manufacturers of intermediate goods declined 10.5 percent, and the crude goods index dropped 40.0 percent.

# Finished goods

The index for finished consumer foods moved up 1.5 percent in April following a 0.7-percent decline in the prior month. Prices for eggs for fresh use climbed 43.7 percent compared with a 9.5-percent decrease a month earlier. Similarly, the indexes for beef and veal, packaged fluid milk and related products, pork, young chickens, and manufactured starch also turned up in April. Prices for fresh vegetables, except potatoes, increased more than they had in March. By contrast, partially offsetting the upturn in finished consumer foods prices, the index for cooked or smoked prepared poultry products moved down 4.6 percent in April following a 0.8-percent increase a month earlier. Prices for Irish potatoes for consumer use decreased more than they had in March. (See table 2.)

Prices for finished energy goods inched down 0.1 percent in April subsequent to a 5.5-percent decline in the preceding month. In April, falling prices for residential natural gas, residential electric power, and finished lubricants slightly outweighed rising prices for gasoline, diesel fuel, liquefied petroleum gas, home heating oil, asphalt, and kerosene.

The index for finished goods less foods and energy edged up 0.1 percent in April following no change in the previous month. In April, higher prices for light motor trucks, pharmaceutical preparations, and consumer plastic products slightly outweighed lower prices for civilian aircraft, tobacco products, electronic computers, primary batteries, and non-wood commercial furniture.

Table B. Monthly and annual percent changes in selected price indexes for intermediate goods and crude goods, seasonally adjusted

and crude goods, seasonany adjusted

# **Intermediate goods**

The Producer Price Index for Intermediate Materials, Supplies, and Components moved down 0.5 percent in April following a 1.5-percent decline in March. Excluding foods and energy, the index for intermediate goods decreased 0.9 percent after declining 0.3 percent a month earlier. In April, falling prices for materials for both durable and nondurable manufacturing, as well as for materials and components for construction, outweighed rising prices for intermediate energy goods and intermediate foods and feeds. (See table B.)

The index for materials for nondurable manufacturing fell 1.9 percent in April following a 1.0-percent decrease in March. Prices for industrial chemicals dropped 2.5 percent after no change in the preceding month. The indexes for thermoplastic resins, medicinal and botanical chemicals, and writing and printing papers turned down in April. Prices for agricultural chemicals and chemical products fell more than they had in March. By contrast, partially offsetting the faster rate of decline in the index for materials for nondurable manufacturing, the synthetic rubber index jumped 5.1 percent in April following a 12.8-percent decrease in the previous month. Prices for thermosetting resins, synthetic fibers, and inedible fats and oils also increased after falling in March. (See table 2.)

The index for materials for durable manufacturing fell 2.1 percent in April following a 0.7-percent decline in March. Leading this faster rate of decrease, prices for steel mill products dropped 6.9 percent in April after edging down 0.1 percent in the previous month. The index for primary nonferrous metals also fell more than it had in March. Prices for thermoplastic resins and original equipment automotive stampings turned down in April. Industrial chemical prices declined following no change in March. By contrast, the index for copper and brass mill shapes climbed 19.5 percent in April after advancing 0.8 percent a month earlier. Prices for nonferrous wire and cable also increased more than they had in March. The indexes for synthetic rubber and synthetic fiber turned up in April.

The index for materials and components for construction decreased 0.9 percent in April after falling 0.3 percent in March. Prices for prepared asphalt and tar roofing and siding products dropped 13.5 percent following a 7.3-percent rise in the prior month. The indexes for prefabricated metal buildings; metal doors, sash, and trim; plastic construction products; and millwork also turned down in April. Prices for steel mill products fell more than they had in March. Conversely, the index for nonferrous wire and cable advanced 8.3 percent after rising 1.1 percent in the preceding month. Softwood lumber prices turned up in April after falling a month earlier. The indexes for concrete products and sheet metal products decreased less than they had in March.

The index for intermediate energy goods increased 0.7 percent in April following a 6.3-percent decrease in the previous month. Diesel fuel prices surged 17.0 percent after dropping 17.2 percent in March. The indexes for gasoline, jet fuel, liquefied petroleum gas, and heating oil also turned up in April. Prices for lubricating and similar oils fell less than they had in March. Conversely, the utility natural gas index decreased 7.2 percent in April following a 2.5-percent decline in the preceding month. Utility electric power prices also fell more than they had in March. The index for residual fuel turned down in April.

The index for intermediate foods and feeds advanced 0.3 percent in April after decreasing 0.5 percent a month earlier. Beef and veal prices rose 4.5 percent following a 3.9-percent decline in March. The indexes for pork; corn, cottonseed, and soybean cake and meal; fluid milk products; processed young chickens; and canned specialty foods also turned up in April. Conversely, prices for shortening and cooking oils fell 1.3 percent after rising 2.4 percent in March. The indexes for processed eggs, cooked or smoked prepared poultry products, and boxed meat also decreased in April following gains in the prior month.

# **Crude goods**

The Producer Price Index for Crude Materials for Further Processing advanced 3.0 percent in April following a 0.3-percent decline in March. The index for crude foodstuffs and feedstuffs turned up after falling a month earlier. Price increases for crude energy materials accelerated from the previous month. The index for crude nonfood materials less energy fell less than in March. (See table B.)

Prices for crude foodstuffs and feedstuffs increased 4.6 percent subsequent to a 1.9-percent decrease in March. Leading this upturn, the index for slaughter steers and heifers climbed 9.0 percent in April after declining 1.8 percent in the preceding month. Prices for soybeans, slaughter broilers and fryers, slaughter cows and bulls, and unprocessed finfish also turned up in April. The indexes for fluid milk and fresh vegetables, except potatoes, rose more than in the prior month. By contrast, partially offsetting the upturn in the crude foodstuffs and feedstuffs index, prices for slaughter hogs turned down 5.7 percent after rising 10.8 percent in March. Prices for alfalfa hay declined more than in the previous month. (See table 2.)

The index for crude energy materials moved up 2.9 percent in April following a 1.6-percent gain a month earlier. The increase in coal prices accelerated to 3.9 percent from 0.5 percent in March. The index for natural gas declined 3.1 percent after dropping 15.6 percent in the prior month. Conversely, prices for crude petroleum rose 9.2 percent in April subsequent to a 30.0-percent increase in the previous month.

The index for crude nonfood materials less energy moved down 0.6 percent compared with a 1.6-percent decrease in March. In April, falling prices for iron and steel scrap; phosphates; gold ores; hides and skins; and logs, bolts, timber, and pulpwood more than offset rising prices for nonferrous scrap, copper ores, soybeans, high grade wastepaper, and corn.

# **Net output price indexes**

Mining, Utilities, and Manufacturing Industries. The Producer Price Index for the Net Output of Total Mining, Utilities, and Manufacturing Industries moved up 0.2 percent in April after falling 0.9 percent in March. (Net output price indexes are not seasonally adjusted.) Most of this upturn can be attributed to prices received by petroleum refineries, which advanced 11.5 percent after decreasing 6.8 percent in the prior month. The indexes for livestock slaughtering; automobile, light truck, and utility vehicle manufacturing; and fluid milk manufacturing also turned up in April. Prices received by pharmaceutical preparation manufacturers rose more than they had in March. By contrast, partially offsetting the upturn in the index for total mining, utilities, and manufacturing industries, the index for phosphatic fertilizer manufacturing dropped 38.6 percent in April after advancing 2.5 percent in the previous month. Prices received by manufacturers of cigarettes and petrochemicals also turned down after rising in March. The indexes for natural gas distribution and for gasoline engine and engine parts manufacturing fell more than they had in the prior month. In April, the Producer Price Index for the Net Output of Total Mining, Utilities, and Manufacturing Industries was 104.1 (December 2006 = 100), 6.9 percent below its year-ago level.

**Trade Industries.** The Producer Price Index for the Net Output of Total Trade Industries declined 0.5 percent following a 0.2-percent gain in March. (Trade indexes measure changes in margins received by wholesalers and retailers.) Margins received by supermarkets fell 4.8 percent in April after advancing 5.1 percent in the previous month. The margin indexes for non-store retailers and women's clothing stores also turned down after rising in March. Margins received by non-discount department stores increased less than a month earlier. By contrast, the margin index for gasoline stations fell 5.1 percent after declining 12.1 percent in the prior month. Margins received by wholesalers of durable goods and new car dealers rose more than they had in March. The margin indexes for radio, television, and other electronic stores and for warehouse clubs and supercenters turned up after decreasing in the preceding month. In April, the Producer Price Index for the Net Output of Total Trade Industries was 111.4 (December 2006 = 100), 4.5 percent above its year-ago level.

Transportation and Warehousing Industries. The Producer Price Index for the Net Output of Total Transportation and Warehousing Industries rose 0.4 percent in April compared with a 1.3-percent decline in March. Prices received by the scheduled air transportation industry group increased 1.3 percent following a 2.6-percent decrease in the previous month. The industry indexes for both local and long distance trucking of specialized new freight, inland water freight transportation, and line-haul railroads also turned up in April. Prices received by the general freight trucking industry group fell less than in March. By contrast, prices received by couriers decreased 1.1 percent after edging up 0.1 percent in the preceding month. The industry index for nonscheduled air passenger chartering also turned down in April following an increase a month earlier, and prices received by the freight transportation arrangement industry fell more than they had in March. In April, the Producer Price Index for the Net Output for Total Transportation and Warehousing Industries was 107.1 (December 2006 = 100), 3.1 percent below its year-ago level.

Traditional Service Industries. The Producer Price Index for the Net Output of Total Traditional Service Industries increased 0.5 percent in April after falling at the same rate in March. The index for the depository credit intermediation industry group advanced 2.8 percent following a 5.7-percent decrease a month earlier. Prices received by the securities, commodity contracts, and other financial investments and related activities industry group; direct life insurance carriers; and the temporary help services industry also turned up in April. Conversely, the advance in the index for the direct health and medical insurance carriers industry slowed to 0.4 percent in April from 1.4 percent in the preceding month. Prices received by office of lawyers also rose less than in March. The industry indexes for non-casino hotels and motels and for lessors of nonresidential buildings turned down after rising a month earlier. In April, the Producer Price Index for the Net Output of Total Traditional Service Industries was 102.0 (December 2006 = 100), 0.1 percent below its year-ago level.

\*\*\*\*

Producer Price Index data for May 2009 are scheduled to be released on Tuesday, June 16, 2009 at 8:30 a.m. (EDT).

### **PPI Introduces Wherever Provided Services Indexes**

Effective with the release of July 2009 data on August 18, 2009, the Producer Price Index (PPI) program will begin publishing Wherever Provided (WEP) Services indexes. Similar to current PPI commodity indexes, the new WEP service indexes are constructed with pricing information collected from PPI's industry-based survey, aggregated on a service-specific basis rather than by industry of origin. Therefore, the WEP services indexes measure price changes for specific services, regardless of the type of companies providing the services.

Since the WEP services indexes are conceptually similar to traditional PPI commodity indexes, they will be included in Table 6 of the PPI Detailed Report, with major WEP services grouping codes ranging from 30 through 80.

Since the WEP services indexes do not include data for physical products, they will not contribute to the PPI's current Stage-of-Processing structure.

Further information is available from the PPI Section of Index Analysis and Public Information, at *ppi-info@bls.gov* or (202) 691-7705.

# **PPI Expands Commodity Code Detail**

Effective with the release of July 2009 data on August 18, 2009, the Producer Price Index (PPI) program will have the capability to publish commodity indexes at a greater level of detail than previously has been available. As such, the July 2009 data release will include some newly introduced commodity indexes associated with 9-digit or 10-digit commodity codes. (The maximum code length permitted for commodity indexes will become 12 digits.) These indexes will be available in both the PPI Detailed Report and on the BLS website at **www.bls.gov/ppi**, using the current commodity data retrieval tools.

Further information is available from the PPI Section of Index Analysis and Public Information, at *ppi-info@bls.gov* or (202) 691-7705.

# **Technical Note**

# **Brief Explanation of Producer Price Indexes**

The Producer Price Index (PPI) of the Bureau of Labor Statistics (BLS) is a family of indexes that measure the average change over time in the prices received by domestic producers of goods and services. PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI). CPIs measure price change from the purchaser's perspective. Sellers' and purchasers' prices can differ due to government subsidies, sales and excise taxes, and distribution costs.

More than 8,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors of the U.S. economy. New PPIs are gradually being introduced for the products of industries in the construction, trade, finance, and services sectors of the economy.

More than 100,000 price quotations per month are organized into three sets of PPIs: (1) Stage-of-processing indexes, (2) commodity indexes, and (3) indexes for the net output of industries and their products. The stage-of-processing structure organizes products by class of buyer and degree of fabrication. The commodity structure organizes products by similarity of end use or material composition. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

# **Stage-of-Processing Indexes**

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final-demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, as well as nondurable goods such as apparel and home heating oil. Capital equipment includes durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

# **Commodity Indexes**

The commodity classification structure of the PPI organizes products by similarity of end use or material composition, disregarding industry of origin. Fifteen major commodity groupings (two-digit commodity codes) make up the All Commodities Index. Each major commodity grouping includes (in descending order of aggregation) subgroups (three-digit codes), product classes (four-digit codes), subproduct classes (six-digit codes), item groupings (seven-digit codes) and individual items (eight-digit codes).

# **Industry Net-Output Price Indexes**

PPIs for the net output of industries and their products are grouped according to the North American Industry Classification System (NAICS). Prior to the release of January 2004, industry-based PPIs were published according to the Standard Industrial Classification (SIC) system. Industry price indexes are compatible with other economic time series organized by industry, such as data on employment, wages, and productivity. Table 5 of the *PPI Detailed Report* includes data for NAICS industries and industry groups (3-, 4-, 5-, and 6-digit codes); Census product classes (7- and 8-digit codes), products (9-digit codes), and more detailed subproducts (11-digit codes); and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product categories. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products make up a plurality of its total shipment value. In addition, most industries have secondary product indexes that show changes in prices received by establishments classified in the industry for products chiefly made in some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products—for example, resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

### **Data Collection**

PPIs are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms also are chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices submitted by survey respondents are effective on the Tuesday of the week containing the 13th day of the month. This survey is conducted primarily through the mail.

Price data are provided on a voluntary and confidential basis; only sworn BLS employees are allowed access to individual company price reports. BLS publishes price indexes instead of actual prices. All PPIs are subject to revision 4 months after original publication to reflect the availability of late reports and corrections by respondents.

BLS periodically updates the PPI sample of survey respondents to better reflect current conditions when the structure, membership, technology, or product mix of an industry shifts significantly and to spread reporting burden among smaller firms. Results of these resampling efforts are incorporated into the PPI with the release of data for January and July.

As part of an ongoing effort to expand coverage to sectors of the economy other than mining and manufacturing, an increasing number of service sector industries have been introduced into the PPI. The following list of recently introduced industries includes the month and year in which an article describing the industry's content appeared in the *PPI Detailed Report*.

Service sector industries introduced into the Producer Price Index, by SIC or NAICS code and the *PPI Detailed Report* that announces their introduction

# Weights

Weights for most traditional commodity groupings of the PPI, as well as weights for commodity-based aggregate indexes calculated using traditional commodity groupings, such as stage-of-processing indexes, currently reflect 2002 values of shipments as reported in the *Census of Manufactures* and other sources. From January 2002 through December

2006, PPI weights were derived from 1997 shipment values. Industry indexes now are calculated with 2002 weights and 1997 net output ratios. This periodic update of the value weights used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy. Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments within the industry to buyers outside the industry. However, weights for commodity price indexes are based on gross shipment values, including values of shipments between establishments within the same industry. As a result, broad commodity grouping indexes, such as the PPI for All Commodities, are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct for this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

### **Price Index Reference Base**

Effective with publication of January 1988 data, many important PPI series (including stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982 = 100. From 1971 through 1987, the standard reference base for most PPI series was 1967 = 100. Except for rounding differences, the shift to the new reference base did not alter any previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The 1982 reference base is not used for commodity indexes with a base later than December 1981 or for industry net output indexes and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, "Producer Prices," in *BLS Handbook of Methods* (April 1997), Bulletin 2490. This document can be downloaded from the BLS Web site at **www.bls.gov/opub/hom/homch14\_itc.htm**. Reprints are available on request.

# **Calculating Index Changes**

Each PPI measures price changes from a reference period that equals 100.0. An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change also can be expressed in dollars, as follows: prices received by domestic producers of a sample of finished goods have risen from \$100 in 1982 to \$105.50. Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods are 10 percent lower than they were in 1982.

Movements of price indexes from one month to another are usually expressed as percent changes, rather than as changes in index points. Index point changes are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes.

### *Index point change*

Equals percent change

Finished Goods Price Index Less previous index Equals index point change	107.5 104.0 3.5
Index percent change	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100 0.034	4 x 100

# Seasonally Adjusted and Unadjusted Data

3.4

Because price data are used for different purposes by different groups, BLS publishes seasonally adjusted and unadjusted changes each month. Seasonally adjusted data are preferred for analyzing general price trends in the economy because these data eliminate the effect of changes that normally occur at about the same time, and in about the same magnitude, every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts. and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends. Unadjusted data are of primary interest to users who need information that can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited when escalating longterm contracts such as purchasing agreements or real estate leases. For more information, see Escalation and Producer Price Indexes: A Guide for Contracting Parties, BLS Report 807. September 1991. on the Web www.bls.gov/ppi/ppiescalation.htm. Reprints are available on request.

In 1998, the PPI implemented the X-12-ARIMA Seasonal Adjustment Method; prior to that year, the PPI employed the X-11 method. Each year, the seasonal status of most commodity indexes is reevaluated to reflect more recent price behavior. Industry net output indexes are not seasonally adjusted. For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data for the previous 5 years. These updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or an aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than does the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for stage-of-processing indexes are derived indirectly through an aggregative method that combines movements of a wide variety of subproduct class (six-digit) series.

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it adequately; if the pattern keeps shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products, but has more often affected manufactured products such as automobiles and steel.

Since January 1988, the PPI has used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of nearly 800 seasonally adjusted series, only 16 were subject to intervention in 2008.

For more information relating to seasonal adjustment methods, see (1) "Appendix A: Seasonal Adjustment Methodology at BLS," in the *BLS Handbook of Methods* (April 1997), Bulletin 2490 and (2) "Summary of Changes to the PPI's Seasonal Adjustment Methodology" in the January 1995 issue of *Producer Price Indexes*.

### **Producer Price Index Data on the Internet**

In 1995, the BLS began posting PPI series, news releases, and technical information to both a World Wide Web (WWW) site and a file transfer protocol (FTP) site. During the years following the introduction of PPI Internet services, use of these sites eclipsed more traditional methods of data dissemination, such as subscriptions to the *PPI Detailed Report*. There were more than 2.1 million instances of PPI series being downloaded from the Internet during the 12 months ended December 31, 2007.

# Retrieving PPI data from the PPI Web site

PPI data can be obtained from the WWW address (www.bls.gov/ppi). Clicking on the "PPI Databases" link reveals the following methods of data retrieval:

- Top Picks is a form-based application for both Industry Data and Commodity Data that allows the user to quickly obtain PPI time series data by selecting the most commonly requested time series, including the All Commodities Index and the stage-of-processing indexes (for example, Finished Goods). Within each list, any one—or all—of the time series shown can be selected. A user can modify the date range and output options after executing the query, using the reformat button above the data output table.
- One-Screen Data Search and Multi-Screen Data
   Search are form-based query applications for both
   Industry Data and Commodity Data designed for
   users unfamiliar with the PPI coding structure. These

applications guide a user through the PPI classification system by listing index titles and do not require knowledge of commodity or industry codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. Two options are available to create customized tables, depending on a user's browser capability. The one-screen option is a JavaScript application that uses a single screen to guide a user through the available time series data. The second option is a multiplescreen, non-Java-based application. Both methods allow a user to browse the PPI coding structure and select multiple series codes. Using the one-screen option, users can modify the date range and output options after executing the query using the reformat button above the data output table.

Series Report is a form-based application that uses formatted PPI time series identifiers (commodity or industry codes) as input in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for users who are familiar with the format of PPI time series identifiers. Up to 300 indexes can be extracted at a time.

There are five alphabetic prefixes used to create unique PPI time series identifiers: WP, WD, PC, PD, and ND. Each provides the user access to a different PPI database. Adding either a "u" (not seasonally adjusted) or an "s" (seasonally adjusted) to the end of these prefixes further specifies the type of data needed.

### **EXAMPLES**

For commodity and stage-of-processing indexes, series identifiers combine a "wpu" prefix (not seasonally adjusted) or a "wps" prefix (seasonally adjusted) with a commodity code.

Commodity code	Provides data for:
wps141101	Passenger cars, seasonally
	adjusted
wpu141101	Passenger cars, not
	seasonally adjusted
wpusop3000	Finished goods, not
	seasonally adjusted

**For discontinued commodity indexes**, series identifiers combine a "wdu" prefix (not seasonally adjusted) or a "wds" prefix (seasonally adjusted) with a commodity code.

Commodity code	Provides data for:
wds019	Other farm products,
	seasonally adjusted
wdu0635	Preparations, ethical
	(prescription), not
	seasonally adjusted
wdusi138011	Stainless steel mill
	products, not seasonally
	adjusted

Current price indexes grouped by industry according to NAICS have series identifiers that begin with the prefix "pcu." After the prefix, there are 12 digits (the 6-digit industry code is listed twice) followed by up to 7 alphanumeric characters identifying product detail. Dashes are used as placeholders for higher-level industry group codes.

Industry-product code,	
current NAICS series	Provides data for:
pcu325325	Chemical manufacturing,
226110226110	not seasonally adjusted
pcu336110336110	Automobile and light duty
	motor vehicle
	manufacturing
pcu621111621111411	Offices of physicians, one-
pcu021111021111411	and two-physician
	practices and single-
	specialty group practices,
	general/family practice
pcu325412325412A	Pharmaceutical
	preparation
	manufacturing,
	pharmaceuticals acting on
	the respiratory system

**Discontinued industry-product codes based on SIC** combine a "pdu" prefix and "#" between the fourth and fifth characters of the product code. Series identifiers for the discontinued dataset use underscores as placeholders to complete a reference to an SIC industry group code of fewer than four digits. (All PPI industry-based indexes organized by SIC were discontinued with the introduction of NAICS.)

Industry-product code,	
discontinued SIC series	Provides data for:
pdu28#	Chemicals and allied
	products, not seasonally
	adjusted
pdu331_#	Blast furnaces, steel
	works, and rolling and
	finishing mills, not
	seasonally adjusted
pdu3711#111	Passenger cars

Price indexes for discontinued series grouped by industry according to NAICS have identifiers that begin with the prefix "ndu." After the prefix, there are 12 numeric digits (the 6-digit industry code is listed twice), and up to 7 additional alphanumeric characters that identify product detail. Dashes are used as placeholders for higher-level industry group codes.

Industry-product code,	
discontinued NAICS series	Provides data for
ndu212231212231	Lead ore and zinc
	ore mining
ndu2122312122312	Lead and zinc
	concentrates
ndu212231212231214	Lead
	concentrates

• Text Files (FTP) and the FTP server are best suited for users requiring access to either a large volume of time series data or other PPI-related documentation (such as seasonal factor and relative importance tables). The FTP sites can be accessed at ftp://ftp.bls.gov or directly from the links on the "PPI Databases" page or the PPI homepage. Data and documentation available for download include the following:

	Directory:
Industry Data	/pub/time.series/pc
Industry Data - Discontinued	
(NAICS basis)	/pub/time.series/nd
(SIC basis)	/pub/time.series/pd
Commodity Data	/pub/time.series/wp
Commodity Data - Discontinued	l
Series	/pub/time.series/wd
Special requests	/pub/special.requests/ppi

The FTP site maintains files to help with searches and downloads. These files are centrally located in the /pub/doc directory. Within this directory, the overview.txt file contains an overview relating to all BLS data available through the FTP site. For current commodity-based PPI data, the program help file is wp.txt; for discontinued commodity series, wd.txt; for current industry-based PPI data based on NAICS, pc.txt; for industry-based SIC time series that have been discontinued, pd.txt; and for industry-based NAICS series that have been discontinued, nd.txt.

Users who prefer downloading PPI datasets as individual ZIP files should go to the directory labeled /pub/time.series/compressed/tape.format/ on the FTP site. This directory includes six PPI-specific ZIP files, one for each of the PPI databases—WP, WD, PC, ND, and PD—and a ZIP file for the annual 5-year revision to historical seasonal PPIs.

### Other Sources of PPI Data

PPI data can also be accessed via the BLS homepage (www.bls.gov). Clicking on the "Databases & Tables" tab at the top of the homepage calls up a listing all available BLS programs.

# **Additional information**

The PPI homepage (www.bls.gov/ppi) contains additional information regarding PPI data and methodology. The top section of the homepage provides PPI news releases, both current and archived, as well as general PPI information. The "Tables Created by BLS" section found beneath the

statistics section provides relative importance and seasonal factor tables. The remaining sections offer special notices and publications pertaining to PPI methodology and applications.

For questions or comments regarding PPI data classification, methodology, or data availability on the Internet, call or e-mail the Section of Index Analysis and Public Information at (202) 691-7705 or *ppi-info@bls.gov*.
