

January 31, 1984

Foundations & Materials Branch
Engineering Division

Mr. G. Joseph Sullivan
General Superintendent
New Orleans Sewerage and Water Board
City Hall, Civic Center
New Orleans, LA 70165

Dear Mr. Sullivan:

Reference is made to the attached Modjeski and Masters letter of January 17, 1984 forwarding the Eustis Engineering report on the 17th Street Outfall Canal Test Section.

We have reviewed the test section report and concur with the conclusions presented on page six. We also concur with the recommendation of installing piezometers to monitor the uplift pressures along the entire reach where the sand stratum is exposed. A contingency plan should be developed to eliminate excess uplift pressures at the landside toe during construction and presented to this office for approval.

We further concur that the recommendations of the Eustis report adequately address comments 1 and 3 on page 2 of our September 7, 1983 letter to Modjeski and Masters (copy attached). It should be noted that the test data indicate the hydrostatic head in the sand under the levee is approximately elevation 18 CD (-2.4 N.G.V.D.). This data should be considered in future stability analyses.

In regard to your permit application, technical comments 2b through 2f forwarded to you by Operations Division's letter of January 20, 1983 (copy attached) have been satisfactorily resolved. However, comment 2a concerning the gap at Veterans Highway remains to be addressed.

JR

I wish to point out that this letter does not necessarily imply credit for construction toward the High Level Plan.

If we can be of any further assistance please do not hesitate to call.

Sincerely,

Frederic M. Chatry
Chief, Engineering Division

Enclosures

- 1) The water elevation in the piezometers was not affected by the water level in the canal because the surface of the underlying sand has become intermixed with fines to some depth below design grade (el 4.0 C.D.). This layer of contaminated sand acts as a seal preventing the water in the canal from influencing the hydrostatic head at and beyond the levee toe.
- 2) Upon completion of the proposed dredging to design grade in the canal, sedimentation will probably deposit on the bottom in a relatively short period of time further sealing off the water pressure in the canal from the surrounding ground water.

The preceding conclusions may be supported by the present thickness of sedimentation on the canal bottom which suggest that at one time the bottom of the canal was as deep if not deeper than the proposed design grade. Such a situation could account for the layer of contaminated sand at the surface of this stratum, and confirm that sedimentation will deposit on the canal bottom after excavation to design grade. It should also be noted that the location of the test section was selected where the surface of the underlying sand is at the highest elevation based on borings in the canal. If the surface of the sand was deeper than the design grade, there will be many areas in which the sand stratum will not be exposed by the proposed dredging.
