REFERENCE OR OFFICE SYMBOL	SUBJECT
LMNED-DD	Appl by S&WB of NO to install pile supported floodwall, discharge pipes and fill for hurricane protection at the 17th St. Canal Pumping Station

TO C/Ops Div FROM C/Engr Div DATE 27 Jul 83 CMT 11

Ch Mr. Romero/cmr/2647

1. Reference is made to CMT 10 dated 11 Jul 83 on the subject request.

2. A copy of the letter dated 18 Jul 83, from Burk & Associates, Inc. to Mr. Ronald Ventola of your office was hand delivered to Mr. Jorge Romero of this office by Burk. This letter included copies of revised P&S incorporating the comments we submitted in the referenced DF. We reviewed the revised P&S and verbally recommended to Burk to provide a "T" connector on the steel sheet piling to facilitate tying in future flood protection work at the pumping station. Copies of supplemental drawings, which addressed this recommendation were delivered to Mr. Romero on 21 Jul 83 (inc 1) by Burk and Associates. These drawings have been reviewed and all comments have been satisfactorily resolved.

3. As a result, Engineering Division no longer has any adverse comments relative to the subject permit request.

OD-S
A-11

LMNED-DD (21 Oct 82)
SUBJECT: (17th St. Canal 3) CMT 9 - Appl S&WB of NO to install pile supported floodwall, disch pipes & fill for hurr prot near Metairie

TO C/Ops Div FROM C/Engr Div DATE 11 Jul 83 CMT 10
Mr. Guggenheimer/cmr/2645

The following are comments made as a result of a review of resubmitted drawings and computations relative to the permit for the subject pumping station. The resubmitted drawings include new details and drawings along with corrected drawings as a result of our comments presented in CMT 6. Conversations have been held with Burk & Associates, concerning the following comments in an effort to resolve them as soon as possible. Accomodation of the following comments, each of which has been previously coordinated with Burk & Associates, will preserve the opportunity for local interests to receive credit for the construction under the high level plan of the Lake Pontchartrain project in the event the high level plan is adopted.

a. The PZ-32-1 and PZ-32-4 sheet pile wall alinement has been changed from the previous submittal. The PZ-32-4 sheet pile wall now ties into an existing concrete discharge tube. A continuous sheet pile cutoff wall under the concrete discharge tube should be provided to prevent seepage from passing around the PZ-32-4 sheet pile wall by going below the concrete discharge. If there is an existing sheet pile cutoff wall under the discharge tube, the plans should show how the sheet pile cutoff will be connected.

b. Dwg. S-1 and Burk's Computations.

(1) Monolith "C". Design and analysis of pile foundation was based on 30^k comp. and 21^k tens. using a FS = 2. Burk's computations indicate maximum loads of 43^k comp. Our analysis indicate max loads of 40^k comp. and 20^k tens. Loads would be within the minimum F.S. of 1.5 comp. and 1.75 tens., if pile test verifies design pile capacity assumptions. Test results should be furnished for our review. The format should be similar to that provided by Burk for Pump Station No. 4 in Jefferson Parish. If the pile tests indicate lower pile capacities, additional piles or longer piles will be required for this monolith.

(2) Monolith "A".

(a) Batter piles on East end of this monolith interfere with vertical piles on monolith "B". It is suggested that the last 6 batter piles on the East end of monolith "A" be changed to a 1 on 10 batter towards the West. The change in batter and direction will help in taking East-to-West lateral water loads and will eliminate the pile interference.

(b) The 12th vertical pile from the East end on the protected side of monolith "A" falls within a monolith joint. This pile can be deleted.

c. Dwgs. S-1, S-6, S-8, S-9 and S-10. Provide a monolith joint between the T-wall base slab and the 2' concrete cap for the steel sheet piling. Extend the joint around the South end of monolith "C" up to the wall stem (otherwise slip joint provided is ineffective). Provide a 3-bulb waterstop at this monolith joint.

Provide a slip joint for the sheet piling at the Northwestern corner of monolith "A" (sheet piling on North side of base slab is embedded in a 2' cap, the sheet pile on the West end of the monolith is embedded into the base slab).

Encl 1 to appl
14 Dec 83

LMNED-DD
SUBJECT: (17th St. Canal 3) CMT 9 - Appl S&WB of NO to install pile supported floodwall, disch pipes & fill for hur prot near Metairie 11 Jul 83

d. Dwgs. E-2 and E-3. (Note: dwgs. E-1 thru E-3 were not included in previous review). The two light post assemblies cannot be supported on the T-wall stem as shown on these drawings. The loads induced by the light standards during high winds can damage the concrete wall.

e. All remaining comments in CMT 6 have been satisfied.

Pumping Station No. 6
Construction of 250 CFS Pumps and Floodwall
Job No. 8133
June (, 1983
Response to Comments from
Corps of Engineers, Engineering Division

Comment

2a. Analyses are submitted on sheet pile walls PZ-32-1, PZ-32-4

b. The steel sheet pile is embedded 12 in. into concrete. Also, when the concrete floodwall base for monoliths A and B are poured at El. 21.50, the sand backfill will be replaced with cohesive material for at least 5 feet below the base.

c. See comment 2b.

d. The steel sheet piling receives a 16 mil coating of coal tar epoxy, and the tops of all permanent sheet piling are embedded in concrete.

e. This detail was changed after the first set of plans was submitted.

f. The transition detail is changed.

g. Existing sheet piling on the 1000 cfs pump are shown to a tip of El. (-) 25.0.

h. Seepage collar detail is added.

i. New calculations for monoliths A, B, and C are submitted. New pile foundation analyses are submitted.

j. A note to remove conflicting existing piling is added to this sheet.

k. Calculations are provided.

l. The pipe support is moved from monolith B to monolith A. Because the dimensions of the monoliths change, new calculations are submitted for the redesign.

m. New T-wall base slab calculations are submitted.

n. All concrete design calculations submitted show the Corps design parameters.

o. Three copies of final plans and specifications are submitted herein to the Operations Division.

A row of 10 ft. long PSA-23 has been added for seepage cut-off. Calculations are submitted.

Attention Mr. Jens Nielsen

Gentlemen:

Additional Information
Sewerage and Water Board of New Orleans
Proposed Additions to Drainage Pumping Station No. 6
New Orleans, Louisiana

In accordance with a request by Mr. Jens Nielsen, we have reviewed the comments made by the Corps of Engineers pertaining to the subject project and offer the following response.

In regard to Comment (a), analyses were made to determine the required penetration and maximum bending moment for sheetpile walls PZ-32-1 and PZ-32-4 considering both "Q" and "S" shear strengths. The computations include a factor of safety of 1.5 applied to the soil shear strengths to determine the required penetration and 1.0 to determine the maximum bending moment. It is understood that the contractor will be required to properly brace sheetpile wall PZ-32-1 during construction, and, therefore, only the final condition was analyzed for this wall. The construction condition and final condition were analyzed for sheetpile wall PZ-32-4. Results of the computations for both walls indicate a sheetpile penetration to el -27.5 Cairo Datum is more than adequate and the maximum bending moment is 23.3 ft-kips per linear foot.

In regard to Comments (b) and (c), it is understood that design plans will be revised to provide a positive connection by embedding the top of the sheetpiles into the base of the concrete floodwall. It is also understood

that revised plans will provide for a minimum 5-ft thickness of clay cover between the base of the concrete floodwall and the granular backfill material beneath the floodwall. Further, a 10-ft long steel sheetpile cutoff will be located beneath the floodwall near the heel. Computations for this sheetpile seepage cutoff indicate a value of 2.6 for LWCR, which is considered acceptable.

In regard to Comment (g), it is understood that the tip penetration of the existing sheetpiles has been furnished to the Corps of Engineers by Burk and Associates.

Yours very truly,

EUSTIS ENGINEERING COMPANY

COMPUTATION SHEET

LMNED-DD (21 Oct 82)
SUBJECT: Appl by Sewerage and Water Board of New Orleans, to install and maintain a pile supported floodwall, discharge pipes and fill for hurricane protection, near Metairie, Louisiana, in Jefferson Parish

TO C/Ops Div

FROM C/Engr Div

DATE 4 May 83 CMT 6
Mr. Romero/cmr/2647

1. At present the west bank levee is the only Federal item on the 17th Street Canal which would be impacted by the proposed work. We have therefore reviewed the proposed work relative to its potential impact on the west bank levee and have no adverse comments to offer in this regard.

2. If the applicant wishes to construct the subject work in compliance with the Lake Pontchartrain Hurricane Protection project criteria, the following comments would have to be resolved:

a. No analysis was presented for the steel sheet pile walls PZ-32-4 and PZ-32-1 which tied the new floodwall adjacent to the 48-inch diameter steel discharge tube to the existing concrete wall. This analysis should be presented for our review.

b. Since the base of the floodwall will be placed 12 feet above the groundline on a backfill consisting of pervious material adjacent to the cutoff wall, piping may develop from seepage through the sheet pile interlocks and from seepage between the base slab and the sheet piles. Therefore, a positive means of seepage cutoff should be presented.

c. No analysis was presented for the steel sheet pile retaining wall used for seepage cut-off around the floodside edge of the T-wall base slab. An arbitrary deflection of 1/2-inch on the steel sheet piling was used to design the tension load for the welded studs which anchor the sheet piling to the concrete base slab. The actual deflection could be much larger which would impose a greater load on the studs. This connection could separate creating a seepage path between the concrete base and the sheet piling. The top of this cut off wall should be embedded into the bottom of the concrete base slab as shown in the soils report plates.

d. The steel sheet pile cutoff and the #6 rebars used for cathodic protection will be exposed to the weather. Since the sheet piling specified consists of A328 steel, it would be subject to severe corrosion. Additional provisions must be provided to protect the #6 rebars from the weather by their embedment in the concrete base slab and the steel sheet piling from corroding by either coal tar epoxy coating or changing to Mariner sheet piling.

e. Drawings S-3 and S-6, detail 1 - S-3/S-6, and drawing S-10, detail 3. The steel sheet piling connection details presented allowed a seepage path through the gaps. These details should be revised to eliminate the gaps.

f. Drawing S-10, section B, and details 2A and or 2B. The transition joint details between the concrete wall and the steel sheet pile wall will allow the walls to separate at the slip joint when deflected under hurricane loading. The concrete wall should be extended around the corner and the transition made in a straight wall section in lieu of in perpendicular walls.

Mel wrote ltr
Ing draws on Mels desk

g. No analysis was presented to verify the adequacy of the existing cutoff wall under the discharge culvert on the west end of the wall. The cutoff wall may not be adequate under the higher level of hurricane protection required. The analysis for this cutoff wall should be presented for our review.

h. Details of the seepage collar for the discharge pipe through the floodwall stem were not shown on the drawings.

i. The pile foundation layout presented was analyzed only for hurricane loading. The pile layout should also be analyzed under normal, non-hurricane conditions since reversal in pile reactions can occur. The analysis presented did not include the weight of soil backfill over the T-wall base, nor the lateral pressure exerted on the base slab by the retaining/cut-off sheet pile wall. The lateral water load should include the water pressure on the vertical face of the slab. The pile foundation re-analysis should be presented for our review.

j. Drawing S-2, slab "C". The batter piles on this monolith interfere with the foundation piles under the existing concrete platform.

k. No design computations nor details of the floodwall stem over the existing discharge culvert on the west end were presented. These computations and details, as well as details of the wall connection of the existing concrete floodwall should be presented for our review.

l. Pipe support saddles should be provided on both sides of the T-wall stem, on the same monolith slab to support the steel discharge pipes. The wall stem should not bear the weight of the pipes since cracking of the concrete can occur.

m. The design of the T-wall base slab reinforcement was based on soil pressures. Since these are pile supported structures, the T-walls should be designed for pile reactions into the base slab using factored loads.

n. The reinforced concrete floodwalls were designed with Grade 60 steel reinforcement using a yield strength of 60 ksi, a reinforcement ratio equal to 75% of the balanced ratio and factored loads as per the ACI code. The reinforced concrete floodwalls should be redesigned utilizing the following design parameters.

Dead loads x 1.5
Live loads x 1.9 (includes water pressures)
Grade 60 steel: fy = 48 ksi (use 60 ksi to determine development lengths)
Maximum steel ratio = 0.25 of balanced ratio.

CMT 2

The Engineering Division has no adverse comments regarding the subject permit request provided the following requirements are included in the final permit.

a. The plans and specifications along with the computations and design criteria relative to the soil mechanics for the work that would affect the existing Federal levees on the west bank of the canal should be submitted and reviewed prior to approval of the permit.

b. It should be recognized that the existing pumping station and levees along the canal are in the alinement of the Federally authorized Lake Pontchartrain, Louisiana and Vicinity Hurricane Protection project. Under the authority of that project, hurricane protection will be provided at the 17th Street Canal, but the form and location of protection have not been defined. The applicant should be advised that construction done now can be credited as a local interests contribution only if the work meets hurricane protection project design criteria and is ultimately incorporated into the hurricane protection project. Furthermore, the applicant should be advised that the proposed floodwall appears to be deficient in grade to provide protection against the design hurricane, which calls for a maximum still water elevation in Lake Pontchartrain of 11.5 N.G.V.D.

RE: Floodwall Pump Station No. 6
LMNED-DD
B&A Job No. 8133

Dear Mr. Ventola:

As required by the conditions of the COE permit, I am submitting the pile tests for construction of the floodwall at Drainage Pumping Station No. 6 on behalf of the Sewerage and Water Board of New Orleans.

The COE memo of July 11, 1983, stated the following requirements:

MONOLITH	DESIGN LOAD COMP.	DESIGN LOAD TENSION	REQUIRED ULTIMATE LOAD COMP.	REQUIRED ULTIMATE LOAD TENSION	MIN. SAFETY FACTOR COMP.	MIN. SAFETY FACTOR TENSION
A	15 Tons	10.2 Tons	30 Tons	20.5 Tons	2.0	2.0
B	15 Tons	10.2 Tons	30 Tons	20.5 Tons	2.0	2.0
C	20 Tons	14.0 Tons	30 Tons	24.5 Tons	1.5	1.75

Test pile nos. 2 and 4 were loaded as indicated herein. Test pile reports state the following:

PILE	TEST	YIELD POINT OR ULTIMATE LOAD	PILE TIP
TP-2	Comp.	30.0 Tons	-16.75 C.D.
TP-4	Comp.	35.0 Tons	-16.75 C.D.
TP-2	Tension	28.5 Tons	-16.75 C.D.

Locations are shown on the enclosed drawings.

To reach a tip elevation of -16.75, the pile lengths were increased from 35 feet to 40 feet. The enclosed letter to the contractor, Atlas Construction Co., details the pile requirements.

If you require any further information or if I can be of further assistance, please call.

Sincerely,

RE: Floodwall at Pumping Station
No. 6 - Phase I
Contract No. 5103
B&A Job No. 8133

Gentlemen:

Based on our review of pile test data with Eustis Engineering Company, we have concluded the following:

1. The base length of 35 feet for treated timber piles shall be increased to 40 feet.

2. Prior to placing each pile, prudently pre-jet to elevation (-) 13.0, using a water jet with only a bottom discharge point.

3. Place the pile in the pre-jetted hole and drive this piling with the specified Vulcan No. 1 hammer to elevation (-)18.0(±), or to refusal (30 blows per foot). Additional jetting will be allowed only if approved by the engineer. The Vulcan No. 1 Hammer should be operating efficiently with a 3 foot stroke at approximately 50 to 55 blows per minute.

Please price the additional cost for the two additional compression pile tests, and additional Class B pile lengths based on the price quoted in your proposal to establish the cost of a change order.

Your cooperation is appreciated.

Yours very truly,

BURK AND ASSOCIATES, INC.
Engineers, Planners and

REPORT NO. 2 October 15, 1984 DNO-7153

DESCRIPTION	:	FOUNDATION PILE -- COMPRESSION TEST ON S.Y.P. ASTM D-25 UNTREATED ROUND TIMBER PILE X -16.75' TIP ELEVATION
PROJECT	:	PUMPING STATION NO. 6 FLOODWALL CONSTRUCTION PHASE I -- CONTRACT NO: 5103 NEW ORLEANS, LOUISIANA
CONSULTING ENGINEER	:	BURK AND ASSOCIATES
GENERAL CONTRACTOR	:	ATLAS CONSTRUCTION CO., INC.
PILE DRIVING CONTRACTOR	:	ATLAS CONSTRUCTION CO., INC.
REPORTED TO	:	SEWERAGE AND WATER BOARD OF NEW ORLEANS ROOM 5W02, CITY HALL CIVIC CENTER NEW ORLEANS, LA 70165 ATTN: MR. G. JOSEPH SULLIVAN

MATERIAL:

Three S.Y.P. ASTM D-25 Untreated Round Timber Piles, were originally driven on September 13, 1984 at the above referred to project. Test pile No. 2 was further driven to -16.75' elevation on September 27, 1984 as directed by Burk and Associates. Log of driving, attached hereto, reflects pile dimensions, penetration driven and blows per foot for test piles.

Test pile No. 2 was selected by the consulting engineer to be tested on October 9, 1984.

EQUIPMENT:

Pile was further driven using a conventional crane rig with swinging leads attached and a Vulcan No. 1 hammer air activated and at full stroke to produce 15,000 foot pounds of energy per blow.

Test was conducted using a single calibrated hydraulic jack bearing against a steel cross beam anchored to four wood reaction piles.

Settlement measurements were made using a Surveyor's Level, a scale fixed to the test pile proper and two referenced bench marks. Scales were read to the nearest 1/100 inch.

RESULTS OF TEST:

TEST PILE NO. 2

FOUNDATION PILE -- COMPRESSION TEST ON S.Y.P. ASTM D-25 UNTREATED ROUND TIMBER PILE X -16.75' TIP ELEVATION

LOAD TEST PROCEDURE:

The loading procedure, received from the consulting engineer, was as follows for T.P. 2:

A.) Three and three quarters (3.75) ton increments to thirty (30.0) tons.
B.) Maintain forty-eight (48.0) hold at thirty (30.0) tons, final twenty-four (24.0) hour free of movement.
C.) Seven and one-half (7.5) ton decrements to zero (0.0) tons.

Each increment and decrement was held for one hour free of movement before applying the next increment.

The above test was to be conducted in accordance with the City of New Orleans Building Code, Article 2805, Method 1, Forty-eight (48.0) hour hold procedure.

LOAD TO FAILURE -- (CONTINUED)

Field Book No. 107
Supervisor: 4.0 hours

Burk and Associates called our office on October 11, 1984 and directed us to go out on Friday, October 12, 1984 and push the pile down until the pile would sustain forty (40.0) tons. Once forty tons is established and sustained to hold forty tons in accordance with the original Load Procedure.

RETEST PILE NO. 4

FOUNDATION PILE -- COMPRESSION LOAD TEST ON S.Y.P. ASTM D-25
UNTREATED TIMBER PILE X 15.5' TIP ELEVATION

LOAD TEST PROCEDURE:

The loading procedure, received from the consulting engineer, was as follows for the retest of T.P. 4:

A.) Apply forty (40.0) tons to pile in one continuous increment until 40.0 tons is sustained or 1.5' of settlement occurs, should the pile fail.
B.) Maintain forty-eight (48.0) hold at forty (40.0) tons, with no movement in the final twenty-four (24.0) hour hold.
C.) Ten (10.0) ton decrements to zero (0.0) tons.

REPORT NO. 5 October 29, 1984 DNO-7153

DESCRIPTION	:	FOUNDATION PILE -- TENSION TEST ON S.Y.P. ASTM D-25 UNTREATED ROUND TIMBER PILE X -16.75' TIP ELEVATION
PROJECT	:	PUMPING STATION NO. 6 FLOODWALL CONSTRUCTION PHASE I -- CONTRACT NO: 5103 NEW ORLEANS, LOUISIANA
CONSULTING ENGINEER	:	BURK AND ASSOCIATES
GENERAL CONTRACTOR	:	ATLAS CONSTRUCTION CO., INC.
PILE DRIVING CONTRACTOR	:	ATLAS CONSTRUCTION CO., INC.
REPORTED TO	:	SEWERAGE AND WATER BOARD OF NEW ORLEANS ROOM 5W02, CITY HALL CIVIC CENTER NEW ORLEANS, LA 70165 ATTN: MR. G. JOSEPH SULLIVAN

MATERIAL:

Three S.Y.P. ASTM D-25 Untreated Round Timber Piles, were originally driven on September 13, 1984 at the above referred to project. Test pile No. 2 was further driven to -16.75' elevation on September 27, 1984 as directed by Burk and Associates. Log of driving, attached hereto, reflects pile dimensions, penetration driven and blows per foot for test piles.

Test pile No. 2 was selected by the consulting engineer to be tension tested on October 23, 1984, which has already been tested in compression on October 9, 1984.

EQUIPMENT:

Pile was further driven using a conventional crane rig with swinging leads attached and a Vulcan No. 1 hammer air activated and at full stroke to produce 15,000 foot pounds of energy per blow.

Test was conducted using a single calibrated hydraulic jack bearing against a steel cross beam anchored to four wood reaction piles.

Uplift measurements were made using a Surveyor's Level, a scale fixed to the test piles proper and two referenced bench marks. Scales were read to the nearest 1/100 inch.

RESULTS OF TEST:

TEST PILE NO. 2

FOUNDATION PILE -- TENSION TEST ON S.Y.P. ASTM D-25 UNTREATED ROUND TIMBER PILE X -16.75' TIP ELEVATION

LOAD TEST PROCEDURE:

The loading procedure, received from the consulting engineer, was as follows for T.P. 2:

A.) One (1.0) increment to two and one-half (2.5) tons.
B.) Two (2.0) ton increments to twenty and one-half (20.5) tons.
C.) Maintain forty-eight (48.0) hold at twenty and one-half (20.5) tons with no movement in the final twenty-four (24.0) hours.
D.) Five (5.0) ton decrements to zero (0.0) tons.
E.) One (1.0) increment to two and one-half (2.5) tons.
F.) Two (2.0) ton increments to eighteen and one-half (18.5) tons.
G.) Two (2.0) ton increments to Failure.

Each increment and decrement in A, B, D and G was held one (1.0) hour free of movement.

LOAD TO FAILURE -- (CONTINUED)

NOTE: The hydraulic ram became fully extended at this point. Contractor was called out to jobsite. Contractor placed shoring between the reaction beam and bearing block to support the load at 20.5 tons, while the piston was withdrawn into the ram and steel shims added to fill the void. The ram was loaded back to 20.5 tons and the shoring removed. The pile uplift reading showed no change after this procedure was accomplished. Forty-eight (48.0) hour hold period was restarted at this point.
