PART III - VOLUME 2

BANK STABILITY ANALYSES - WEST BANK

1. Introduction. This volume of the report presents the plan for bank protection on the West Bank of the Mississippi River from the vicinity of Jesuit Bend, (Mile 66) to Venice, Louisiana (Mile 10), a distance of approximately 56 miles. The data presented includes bank recession rates and stability analyses for bank revetment grading.

The stability analyses presented were performed by personnel of the New Orleans District and were reviewed and approved by representatives of the Mississippi River Commission, during the preparation of the report.

This part was prepared in the Dams, Levees, and Channel Slopes Section by Mr. Nathaniel T. Langlois under the direction of Messrs. Herman A. Huesmann and Stewart E. Worley, Foundations and Materials Branch, Engineering Division, New Orleans District.

District Engineer during the preparation of this report was Colonel Herbert R. Haar, Jr., CE. Chief of the Engineering Division was Mr. Jerome C. Baehr.

2. General. Survey data available prior to the preparation of the report included hydrographic surveys 1961-1963 and revetment surveys. Additional surveys were made at locations where coverage was not available to adequately define the shape of the banks. The bank surveys indicated that the existing riverbank slopes generally range from about 1 on 2 to 1 on 4. Concrete mattress revetment has been placed at four sites on the West Bank, namely; Port Sulphur, Tropical Bend, Buras, and Fort Jackson. For limits see Table 1.
3. Foundation Investigations. See Part I, Volume 2.
4. Laboratory Tests. See Part I, Volume 2 and Appendix A.
5. Soil Conditions. See Part I, Volume 2.
6. Design Shear Strengths. See Part I, Volume 2.
7. Stability analyses of bank slopes for revetment construction were performed in accordance with paragraphs 4 and 5 of LMVD letter dated 5 November 1963, subject "Analysis of Bank Slopes for Revetment Construction" and modifications in LMVD letter dated 27 January 1969. Stability analyses were performed using the soil stratifications and design shear strengths presented in Part 1, Volume 2 at various assumed depths of failure. The section used in each analysis was either a critical section within the reach or a composite section developed by overlaying the sections within the reach at a designated elevation. Various bank degrading slopes were analyzed until a minimum factor of safety of 1.30 was obtained for the "Q" construction case. It was

assumed that the river stage and ground water level in the bank soil were at mean low water elevation of 0.0. Only the "Q" construction case stability analysis was performed since the sudden drawdown and partial pool stability analyses were not critical for the low riverbanks that exist in the study area.

No additional stability analyses were performed for this report on reaches where revetment grading slopes had been previously approved by the Mississippi River Commission as shown on Table 1. Every attempt was made to use a degrading cut point commencing no deeper than elevation -20.0, but in three reaches cuts commencing at -30 and in one reach at -40 were necessary and more economical. The stability analyses are shown on plates 16 through 57 and 59 through 69. A special analysis as shown on plate 58 was made for a reservoir dike located at Tropical Bend, Louisiana. This analysis indicates that the reservoir dike along the riverbank will have to be set back. The bank degrading requirements are listed in Table 1.

8. Bank Recession. Bank recession rates were calculated using available caving bank surveys. Because of the time sequence of performing the construction of the slope protection and the availability of construction funds, bank recession was projected for a 10-year period to 1980, as shown on Table 2. Using this bank recession, a more realistic cost estimate would be made, which would include the need for levee setbacks, relocations and required rights-of-way. As plans and specifications are prepared for levee construction, bank recession will be adjusted to reflect the actual recession at the time the slope protection is installed. Bank recession was assumed to vary linearly between the levee stations shown on Table 2.

9. Recommendations. Based on the results of the stability analyses of the riverbanks presented in this report, the following are recommended:

a. The bank slopes should be degraded according to the slopes and cut points shown in Table 1. Where the existing bank slope has an adequate factor of safety, the bank slope need be dressed only to the extent necessary to facilitate the placing of the concrete mat.

b. The upper part of the bank should be degraded prior to any degrading of the underwater bank slope, and the degraded material should not be deposited on the existing underwater bank slope.

c. The degraded material should be deposited at the maximum distance possible from the bank within the stated limits.

d. Riprap paving will be needed for the degraded slope above the articulated concrete mattress.

 AUGUST 1971 FILE NO. H-2-25275

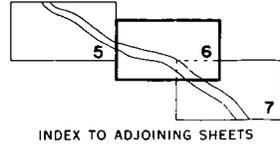

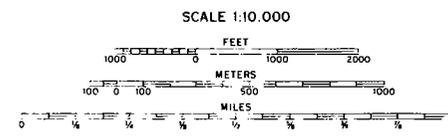

All elevations are expressed in feet and refer to Mean Sea Level.
 Contours below Average Low Water Plane are expressed in feet at 5 and 10 ft. intervals.
 Contours above Average Low Water Plane are expressed in feet at 5 ft. intervals.
 Planimetry from aerial photographs flown November 1962.
 Distances on Mississippi River above Head of Passes are shown at 1 mile intervals.
 1962 and 1942 surveys.
 Polyconic Projection, North American Datum
 Polyconic Projection, Gulf Coast Datum is indicated by ticks.
 A.L.W.P.—Average Low Water Plane.

GENERAL NOTES

CLASSIFICATION, STRATIFICATION, SHEAR STRENGTHS, AND UNIT WEIGHTS OF THE SOIL WERE BASED ON THE RESULTS OF THE UNDISTURBED BORINGS, SEE BORING DATA PLATES 37 & 39, PART I, VOL. II.

SHEAR STRENGTHS BETWEEN VERTICALS 1 AND 2 WERE ASSUMED TO VARY LINEARLY BETWEEN THE VALUES INDICATED FOR THESE LOCATIONS.

THE EXISTING SECTION SHOWN IS A COMPOSITE OF ALL SECTIONS WITHIN THE LIMITS OF THIS REACH, OVERLAID AT ELEVATION -20.0.

CLASSIFICATION, STRATIFICATION, SHEAR STRENGTHS, AND UNIT WEIGHTS OF THE SOIL WERE BASED ON THE RESULTS OF THE UNDISTURBED BORINGS, SEE BORING DATA PLATES 48 & 50, PART I, VOL.II.

SHEAR STRENGTHS BETWEEN VERTICALS 1 AND 2 WERE ASSUMED TO VARY LINEARLY BETWEEN THE VALUES INDICATED FOR THESE LOCATIONS.

THE EXISTING SECTION SHOWN IS A COMPOSITE OF ALL SECTIONS IN THE REACH OVERLAID AT ELEVATION -20.0.

GENERAL NOTES

CLASSIFICATION, STRATIFICATION, SHEAR STRENGTHS, AND UNIT WEIGHTS OF THE SOIL WERE BASED ON THE RESULTS OF THE UNDISTURBED BORINGS, SEE BORING DATA PLATE 52, PART I, VOL. II.

SHEAR STRENGTHS BETWEEN VERTICALS 1 AND 2 WERE ASSUMED TO VARY LINEARLY BETWEEN THE VALUES INDICATED FOR THESE LOCATIONS.

THE EXISTING SECTION SHOWN, IS A COMPOSITE OF ALL SECTIONS WITHIN THE LIMITS OF THE REACH OVERLAID AT ELEVATION -20.0.

AUGUST 1971 FILE NO. H-2-25275

GENERAL NOTES

CLASSIFICATION, STRATIFICATION, SHEAR STRENGTHS, AND UNIT WEIGHTS OF THE SOIL WERE BASED ON THE RESULTS OF THE UNDISTURBED BORINGS. SEE BORING DATA PLATES 59 & 60, PART I, VOL. II.

SHEAR STRENGTHS BETWEEN VERTICALS 1 AND 2 WERE ASSUMED TO VARY LINEARLY BETWEEN THE VALUES INDICATED FOR THESE LOCATIONS.

THE EXISTING SECTION SHOWN IS A COMPOSITE OF ALL SECTIONS WITHIN THE LIMITS OF THE REACH OVERLAID AT ELEVATION -200.

GENERAL NOTES

CLASSIFICATION, STRATIFICATION, SHEAR STRENGTHS, AND UNIT WEIGHTS OF THE SOIL WERE BASED ON THE RESULTS OF THE UNDISTURBED BORINGS. SEE BORING DATA PLATES 62, 63 & 64, PART I, VOL. II.

SHEAR STRENGTHS BETWEEN VERTICALS 1 AND 2 WERE ASSUMED TO VARY LINEARLY BETWEEN THE VALUES INDICATED FOR THESE LOCATIONS.

THE EXISTING SECTION SHOWN IS A COMPOSITE OF ALL SECTIONS WITHIN THE LIMITS OF THE REACH OVERLAID AT ELEVATION -400.

GENERAL NOTES

CLASSIFICATION, STRATIFICATION, SHEAR STRENGTHS, AND UNIT WEIGHTS OF THE SOIL WERE BASED ON THE RESULTS OF THE UNDISTURBED BORINGS, SEE BORING DATA PLATE 64, PART I, VOL. II.

SHEAR STRENGTHS BETWEEN VERTICALS 1 AND 2 WERE ASSUMED TO VARY LINEARLY BETWEEN THE VALUES INDICATED FOR THESE LOCATIONS.

THE EXISTING SECTION SHOWN IS A COMPOSITE OF ALL SECTIONS WITHIN THE LIMITS OF THE REACH OVERLAID AT ELEVATION -200.

AUGUST 1971 FILE NO. H-2-25275

GENERAL NOTES

CLASSIFICATION, STRATIFICATION, SHEAR STRENGTHS, AND UNIT WEIGHTS OF THE SOIL WERE BASED ON THE RESULTS OF THE UNDISTURBED BORINGS. SEE BORING DATA PLATE 76, PART I, VOL. II.

SHEAR STRENGTHS BETWEEN VERTICALS 1 AND 2 WERE ASSUMED TO VARY LINEARLY BETWEEN THE VALUES INDICATED FOR THESE LOCATIONS.

THE SECTION SHOWN IS A COMPOSITE OF ALL SECTIONS WITHIN THE LIMITS OF THIS REACH OVERLAID AT EL-20.0.

GENERAL NOTES

CLASSIFICATION, STRATIFICATION, SHEAR STRENGTH, AND UNIT WEIGHTS OF THE SOILS WERE BASED ON THE RESULTS OF THE UNDISTURBED BORINGS, SEE BORING DATA PLATES 81 & 82, PART I, VOL. II.

SHEAR STRENGTHS BETWEEN VERTICALS 1 AND 2 WERE ASSUMED TO VARY LINEARLY BETWEEN THE VALUES INDICATED FOR THESE LOCATIONS.

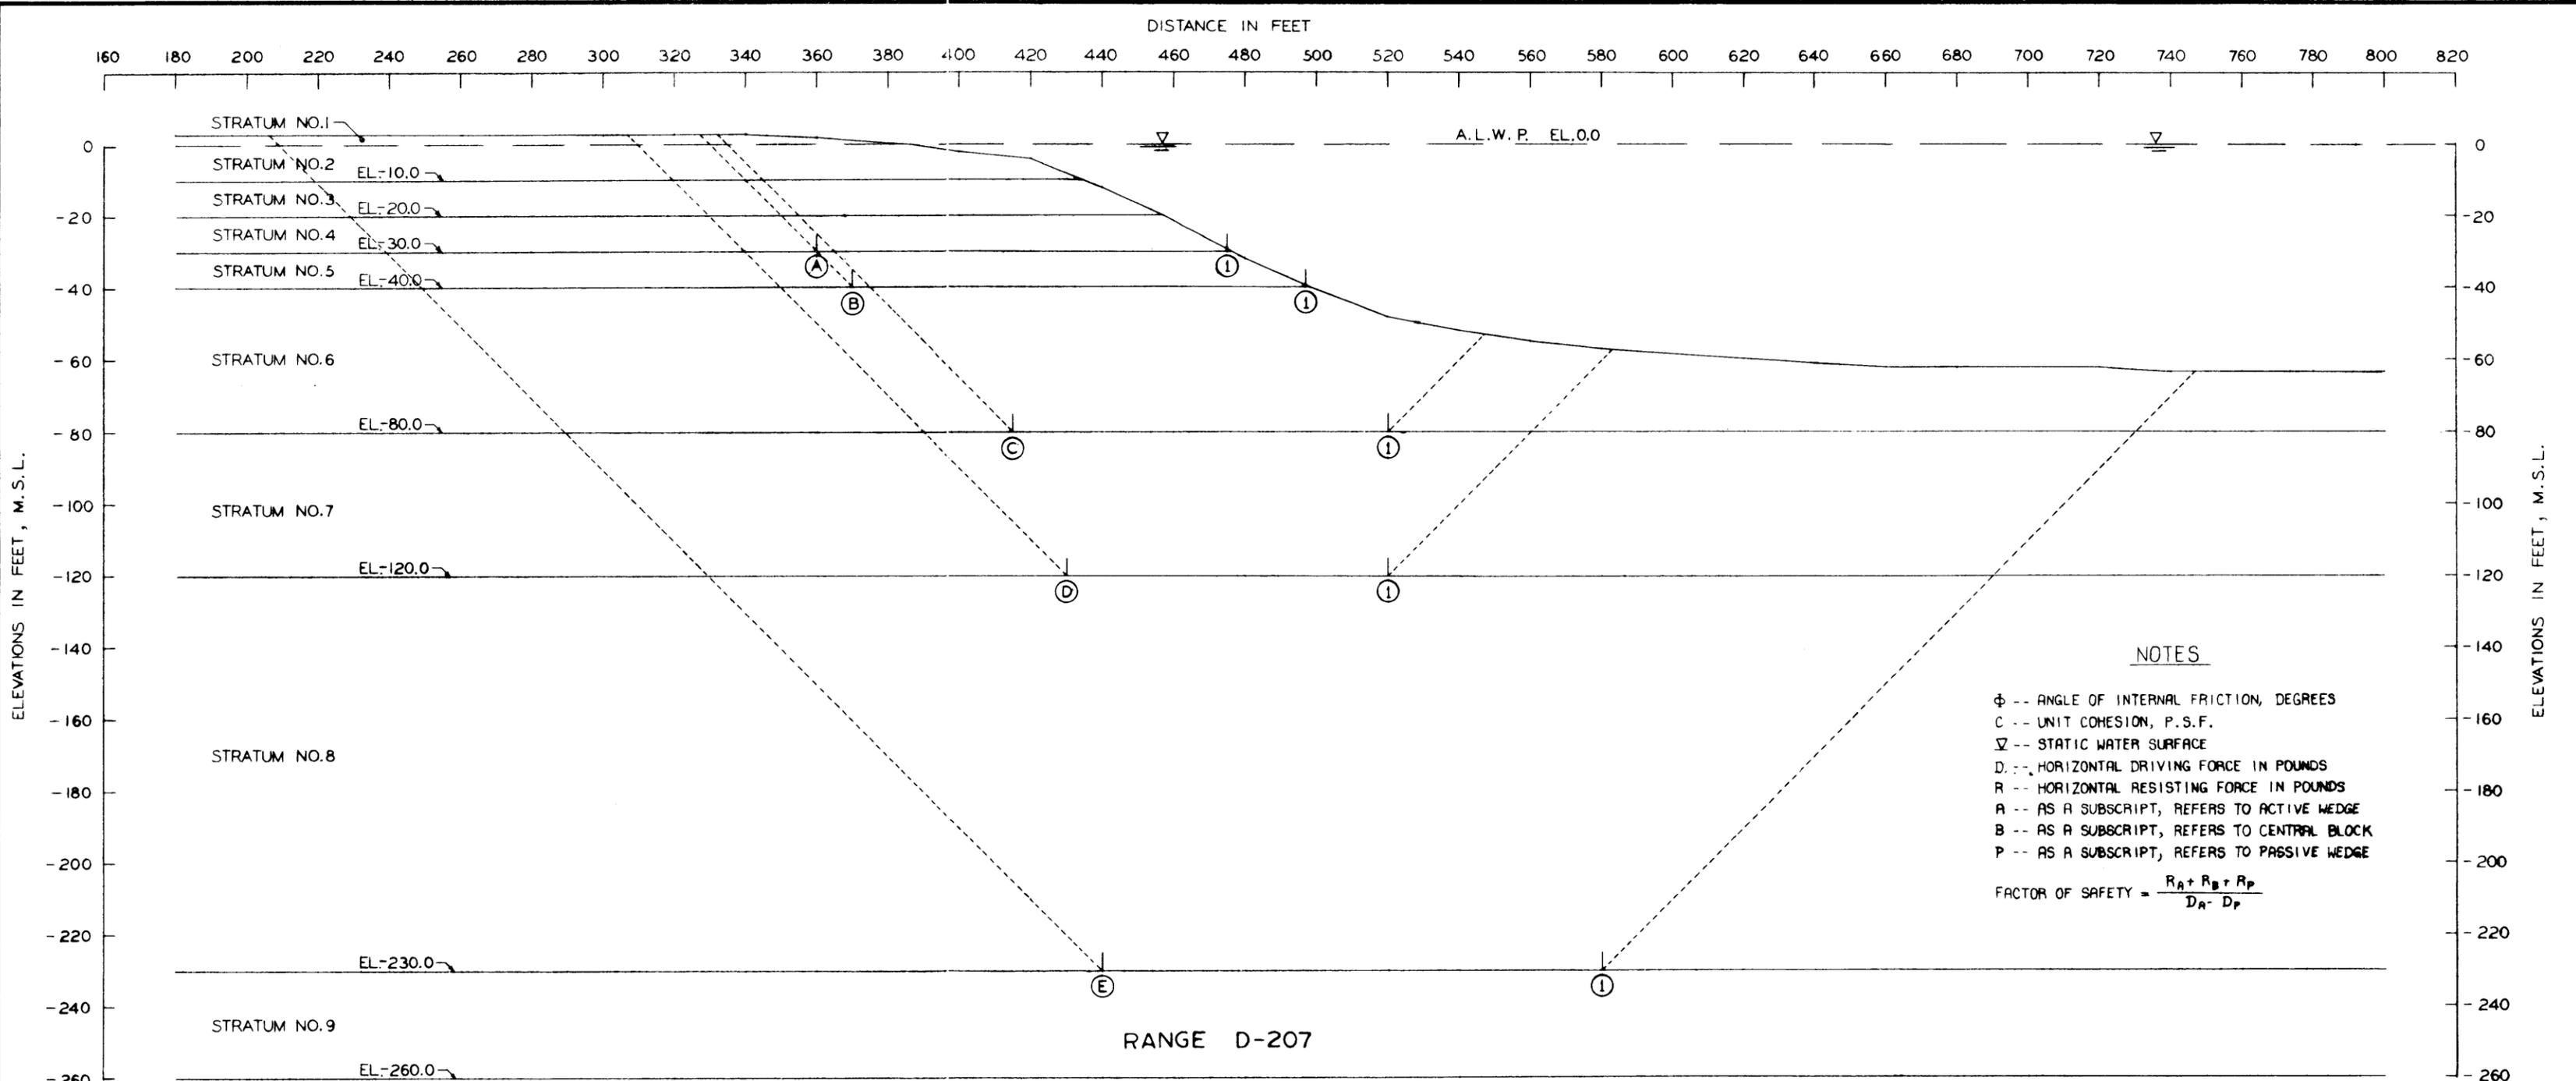

THE EXISTING SECTION SHOWN IS THE MOST CRITICAL WITHIN THE LIMITS OF THIS REACH.
