## MEDINA COUNTY REGIONAL WATER PLAN

### SECTION 4 - MEDINA LAKE WATER SYSTEM

#### **INTRODUCTION**

This section provides a summary and evaluation of the current surface water resources available within Medina County, and in particular, the Medina Lake System. This information is used to determine future surface water availability and to formulate the Water Resource Management Plan.

#### **MEDINA AND DIVERSION LAKES**

Medina and Diversion Lakes are located on the Medina River in northeastern Medina County and southeastern Bandera County. Bexar-Medina-Atascosa Water Control and Improvement District No. 1 (BMA) owns and operates both of the lakes and their dam facilities.

Medina Lake was constructed in 1911 to supplement existing irrigation supplies. The Medina River is impounded behind the 164 foot high concrete gravity dam located 14 miles upstream of Castroville. Inflows to the lake originate over a 653 square mile drainage area. When the water surface elevation is 1,072 feet, the lake is approximately 18 miles long and about three (3) miles wide at the widest part. Medina Lake has a maximum capacity of 254,000 acre-feet (at elevation 1,072.0 feet) and a surface area of 5,575 acres. When the dam was built, the large amount of storage was created to conserve the largest possible percentage of the runoff from Medina Basin.

Water from Medina Lake is discharged down a four (4) mile canyon to a smaller impoundment, Diversion Lake. The 50 foot tall dam was built in 1913. The average inflow into the lake between the years 1940 and 1986 was 3,413 acre-feet. At the surface water elevation of 926.5, the lake has a volume of 2,555 acre-feet and a surface area of 169 acres. From Diversion Lake, the water is diverted into a system of irrigation canals also owned and operated by BMA. BMA is authorized to divert up to 66,000 acre-feet per year for irrigation, municipal and industrial purposes from the lakes. Annual diversions have averaged 30,280 acre-feet between 1957 and 1994.

Seepage of the impounded water in both lakes into the underlying bedrock has been documented by various sources. Qualitative assessments have shown that the channel connecting both lakes experiences large seepage losses. Quantitative estimates have shown that seepage losses from Medina and Diversion Lakes averages about 72,000 acre-feet per year. The loss on the Medina Lake varies with the stage in the reservoir, however, the loss from Diversion Lake is relatively constant. Medina Lake leakage losses average about 22,710 acre-feet per year most of which is captured by Diversion Dam.

The average annual inflow to Medina Lake was estimated to be about 94,500 acre-feet measured at the United States Geological Survey (USGS) Pipe Creek gauge located on the Medina River near the upper end of the lake. An average of 2.5 feet of net evaporation occurs each year.

### **Pearson Dam And Reservoir**

Pearson Lake is a small reservoir located off of the main BMA canal. This reservoir provides storage for any water remaining in the canal at the end of the irrigation season or when the water is not used due to adequate rainfall. The water is diverted from the canal and can then be stored until needed. The Pearson reservoir is also used to fill small water orders instead of filling the entire canal system. An earth dam diverts the water from the canals into a 23 acre impoundment. The existing capacity is 250 acre-feet.

### **Chacon Dam and Lake**

The Chacon Dam is an earth dam across the Chacon Creek. Chacon Lake is also used to store excess water from the canal system. In addition to the diverted water, the lake also receives runoff from the 17 square mile Chacon Creek watershed. A spillway allows excess water to continue down Chacon Creek and a gated outlet releases water back into the lower canal system.

## **PLANNED SURFACE WATER FEATURES**

### **WATER CONSERVATION PLAN - PL-566 PROGRAM**

Increasing urbanization within BMA is rapidly shifting the demand for water from agricultural to municipal. Until recently, the entire region depended on the Edwards Aquifer to meet municipal, industrial, and a large portion of agricultural water demands. The Edwards Aquifer is one of the largest sole source aquifers in the United States and the first to be so designated by the Environmental Protection Agency. Rapid growth in the San Antonio region has increased demand on this limited resource, which has led to intervention by the Federal Courts. With increasing demands for water, inefficient use and conveyance wastes this limited resource.

The loss of water along the route of delivery determines the conveyance efficiency. Losses can be determined by measuring the flow at the point of diversion, and again at the field. Whenever the loss exceeds 1/2 to 2 percent per mile, steps should be taken to determine the cause and implement corrective action. Causes may include excessive growth of trees along or in the canal and seepage which can be corrected by lining or sealing.

BMA has been more aggressive recently in improving water conservation and delivery efficiency. These efforts have included:

1. increased maintenance and clearing of canals,
2. replacement of failing canal structures (Natalia Canal Diversion Structure),
3. terminating service to farms that waste water,
4. deleting small tracts from service area, and
5. cooperative efforts with the Soil Conservation Service to implement improved methods of irrigation.

"The main canal system operation will be improved through the continuation of the enhanced canal maintenance program, coupled with a program of lining all channels. Lining the main canal will reduce or eliminate most normal operation losses in the 24 mile system between the Diversion Lake and Pearson Junction, the point where BMA starts to distribute water to the lateral canal system. A loss reduction will, in effect, increase the yield of the system because

Certificate of Adjudication has no minimum stream flow requirement restricting its diversion rights.

### **BMA'S CONTRACTUAL OBLIGATIONS**

BMA has entered into a series of agreements with the Bexar Metropolitan Water District (Bexar-Met). These agreements provide for the sale of water from BMA's water system to Bexar-Met and for payments by Bexar-Met to BMA to ensure future water availability for sale to Bexar-Met. In summary, a 1991 agreement provides for the sale of "excess water" (as determined by BMA) at a fixed price on a take-or-pay basis; a 1992 agreement suspends for five years certain provisions of the 1991 agreement delaying the sale of excess water to Bexar-Met, with Bexar-Met making fixed annual payments for maintenance, repairs, and improvements to BMA's water system; and a 1995 agreement provides that BMA will sell specified amounts of water on a "priority basis" before determining the amount of excess water as defined in the 1991 agreement.

#### **1991 Long-Term Water Sales Agreement**

The 1991 agreement provides for the sale of excess water from BMA's adjudication of 20,000 acre-feet of M&I water per year. The agreement is effective from September 1, 1991, for a period of twenty years with the option to extend the agreement for an additional ten years. Several options to terminate the agreement are available to BMA. Bexar-Met may terminate the agreement effective December 31 of the year after Bexar-Met gives proper notices. In February 1995, BMA's Certificates of Adjudication were amended by the TNRCC to authorize dual use of its water for both irrigation and municipal purposes.

Excess water is determined at BMA's sole discretion. The agreement requires BMA to evaluate the availability of excess water at least twice a year in the months of February and August. Bexar-Met agrees to purchase during each contract year all excess water as determined by BMA whether or not Bexar-Met takes delivery of the water. The price of the water for the first term contract years shall be \$56.00 for each metered acre-foot, subject to adjustments thereafter and for water resold by BMA. BMA is committed to deliver the excess water only by gravity flows to Bexar-Met's designated point of diversion from BMA's system.

## **1992 Water Conservation Agreement**

In 1992, BMA entered into a water conservation agreement with Bexar-Met as a result of the water sales agreement. The agreement provides that BMA will take certain steps to ensure future excess waters, as defined in the water sales agreement, including measures to conserve water in BMA's irrigation system. The agreement became effective September 1, 1992, for a period of five years. Bexar-Met will pay BMA \$300,000 each year that the contract is in effect. This water conservation agreement requires BMA to waive its right to declare excess water during the five-year term of the agreement.

## **1995 Water Availability Contract**

In 1995, BMA completed an agreement with Bexar-Met to make additional water available to Bexar-Met. The parties agreed that, in addition to other water deliverable to Bexar-Met as excess water pursuant to the 1991 agreement, BMA would deliver on a priority basis up to 6,000 acre-feet of water per year, to the extent water is available in accordance with conditions stated in the 1995 agreement. The potential availability of excess water pursuant to the 1991 agreement is directly reduced on an acre-foot basis.

On each anniversary date, Bexar-Met will pay BMA the purchase price for the entire quantity of water deliverable under the 1995 agreement during the twelve months following November 1, 1996. BMA is entitled to the entire purchase price for the stated quantity of priority water whether or not Bexar-Met accepts BMA's tender of the water.

## **BANDERA COUNTY**

In 1996 BMA entered into an agreement with Bandera County to provide the County with up to 5,000 acre feet per year of water, to the extent water is available, in accordance with conditions stated in the 1996 agreement. The contract runs for 50 years.

A portion of this water (estimated to be 30%) will be taken out of the Medina River prior to entering the Medina Lake System. The remaining portion (estimated to be 70%) will be diverted from the lake for use by residences adjacent to the lake.

## **WATER MANAGEMENT - COMPUTER MODELING**

The SIMYLD-II computer program, which was developed in 1972 by the TWDB for analyzing reservoir systems, was applied to describe and simulate the operations and behavior of the various elements of the water resources system that presently is available, or is to be developed, to serve Medina County. This water resources system operations model includes the following components:

1. Medina Lake;
2. Diversion Lake;
3. Pearson Lake;
4. Ground Water Resources;
5. Aquifer Storage Recovery

The physical and hydrologic characteristics of Medina Lake, Diversion Lake and Pearson Lake are described in the model, and the hydraulic behavior of these reservoirs, under a defined set of specified annual withdrawals and operating rules (including provisions for environmental water needs), have been simulated with the SIMYLD model using a monthly time step over a prescribed period of 50 years with historical watershed inflows and Rainfall evaporation conditions. Ground water resources have also been included in the model as a defined source(s) of water, with specified allowable annual withdrawal amounts. The aquifer storage-recovery (ASR) project was linked to the availability of water from Medina Lake and Pearson Lake, after treatment at the proposed Pearson Junction water treatment plant.

The SIMYLD model was structured so as to accommodate, the analysis and simulation of the following water supply scenarios:

1. Medina Lake System without Pearson Lake and ASR, and without water conservation (PL-566 Canal Refurbishment Program).
2. Medina Lake System with Pearson Lake and ASR, but without water conservation (PL-566 Canal Refurbishment Program).
3. Medina Lake without Pearson Lake and ASR, but with water conservation (PL-566 Canal Refurbishment Program).

4. Medina Lake System with Pearson Lake and ASR, and with water conservation (PL-566 Canal Refurbishment Program).

For each of these scenarios, the SIMYLD model was operated to determine the characteristics of the system based on the period from 1940 to 1989, which includes the historical drought of the 1950's.

Figure 1 represents the basis of the model for the system without conservation, while Figure 2 represents the system with conservation. The BMA conservation program will conserve approximately 15,000 Ac.-Ft. per year.

For the modeling period (1940 to 1989), the relationship between historical annual irrigation canal diversions (BMA Irrigation Demand) and the historical inflows to Medina Lake were developed (See Figure 3). This relationship was used to determine the projected Irrigation Demand for any given inflow quantity to the lake (See Table 1).

The results of the modeling are detailed in the attached four sections.
