Honorable Christopher Dodd
Chairman
Committee on Banking, Housing,
and Urban Affairs
United States Senate
Washington, D.C. 20510

Honorable Richard Shelby
Ranking Member
Committee on Banking, Housing,
and Urban Affairs
United States Senate
Washington, D.C. 20510

Honorable Barney Frank
Chairman
Committee on Financial Services
United States House of Representatives
Washington, D.C. 20515

Honorable Spencer Bachus
Ranking Member
Committee on Financial Services
United States House of Representatives
Washington, D.C. 20515

Dear Chairmen and Ranking Members:

I am pleased to transmit the Federal Housing Finance Agency's (FHFA) first Report to Congress, which presents the findings of the agency's 2008 annual examinations of Fannie Mae and Freddie Mac (Enterprises), the 12 Federal Home Loan Banks (FHLBanks), and the Office of Finance. This report meets the statutory requirements of the Federal Housing Enterprises Financial Safety and Soundness Act of 1992, as amended by the Housing and Economic Recovery Act of 2008 (HERA). The views in this report are those of FHFA and do not necessarily represent those of the President.

Although this is my first report as Director of FHFA, I previously submitted three reports as the Director of the Office of Federal Housing Enterprise Oversight (OFHEO). In each of these reports, I called for regulatory reform of Fannie Mae and Freddie Mac, including greater authority over the Enterprises' capital requirements and portfolio size.

In July of 2008, the Federal Housing Finance Agency was created by HERA after years of debate and discussion by Congress. Unfortunately, the legislation came too late to prevent the over-leveraging of the Enterprises. Even with OFHEO's extra capital requirements and portfolio restraints, the Enterprises legally held total mortgage credit over 90 times the second quarter shareholders' equity. HERA importantly gave the Treasury Department the ability to fund the housing government-sponsored enterprises (GSEs), if needed. HERA also created an Oversight Board for FHFA, which has had three meetings as required. The members include the Secretary of the Treasury, the Secretary of Housing and Urban Development, the Chairman of the Securities and Exchange Commission and myself.

We publish this report at a time of unprecedented challenges for the GSEs, the United States' economy and the housing and financial markets. The recession that began in December 2007 continued throughout 2008 and worsened in the fourth quarter. In this turbulent environment, FHFA's mission is even more critical—to promote a stable and liquid mortgage market, affordable housing and community investment through safety and soundness oversight of Fannie Mae, Freddie Mac and the Federal Home Loan Banks.

Throughout 2007 and 2008, OFHEO encouraged the Enterprises to conserve and raise additional capital to fulfill their mission as the risks in the mortgage market grew. By the summer of 2008, FHFA had serious concerns about safety and soundness weaknesses at the Enterprises related to credit risk, earnings outlook, capitalization, and the substantial deterioration in the market for their equity, debt, and mortgage-backed securities (MBS). The Enterprises' capital was threatened by increasing credit losses in their guaranteed and investment mortgage portfolios, which totaled $5.2 trillion at year-end. In particular, their private-label MBS holdings, which represented 19 percent of their investments, deteriorated rapidly. Working closely with the Treasury Secretary and the Chairman of the Federal Reserve, I decided there was no other choice than to put Fannie Mae and Freddie Mac into conservatorship if they were going to be able to continue to fulfill their mission of providing stability, liquidity, and affordability to the market. If we had not put the Enterprises in conservatorship, we believe the downward spiral in the economy would have accelerated, because the Enterprises would have had to pull back dramatically from the housing market.

Despite their large losses in 2008, the Enterprises did make strides in fulfilling their key mission of providing stability and liquidity to the conventional conforming loan market and keeping people in their homes through loan modifications and workouts. Their support of the mortgage market grew by 5.6 percent in 2008 versus 14 percent growth in 2007, to a total of $5.2 trillion in guaranteed mortgage-backed securities outstanding and mortgage investments. Their market share of total mortgage originations grew from 37 percent in 2006 to 54 percent in 2007 and 73 percent in 2008. The effective guarantee provided by the Treasury's Senior Preferred Stock facility, plus the Federal Reserve's and Treasury's other facilities have brought mortgage rates down dramatically since the conservatorship. A major challenge going forward will be replenishing their senior management teams and retaining experienced personnel.

The Federal Home Loan Banks play an important role in the mortgage market by providing secured advances to banks, credit unions, and insurance companies. Federal Home Loan Bank advances crossed the trillion dollar mark in October. At year-end, the Federal Home Loan Banks had almost $1.4 trillion in assets. Although only 5 percent of these assets are in originally triple-A private-label mortgage-backed securities, they have presented significant continuing challenges to several Federal Home Loan Banks.

The challenges of the last few years in the financial markets are slowly abating, but the problems in the housing markets continue. It is my hope that all market participants, the government, and the GSEs, will be creative and work together to help the United States economy and housing market recover. The new Financial Stability Plan and the Making Home Affordable mortgage modification and refinancing plans are all extremely important next steps to recovery for the housing markets and the U.S. economy.

FHFA will continue to be very aggressive in finalizing regulations implementing HERA. We look forward to working with you in developing a counter-cyclical, post-conservatorship structure for the Enterprises based upon a well defined mission, sound insurance principles, clear demarcation of private and public sector, and strong regulatory oversight.

James B. Lockhart III
Director, Federal Housing Finance Agency

Federal Housing Finance Oversight Board Assessment

Section 1103 of the Housing and Economic Recovery Act (HERA) of 2008 requires that the Federal Housing Finance Agency (FHFA) Director's Annual Report to Congress include an assessment of the Federal Housing Finance Oversight Board or any of its members with respect to:

- The safety and soundness of the regulated entities;
- Any material deficiencies in the conduct of the operations of the regulated entities;
- The overall operational status of the regulated entities; and
- An evaluation of the performance of the regulated entities in carrying out their respective missions.

Each of these items is described below with separate sections for Fannie Mae and Freddie Mac (Enterprises) and the Federal Home Loan Banks (FHLBanks).

The Enterprises

Safety and Soundness

Substantial deterioration in housing markets throughout 2008, and volatility and liquidity problems in financial markets through much of the year, led to sizeable credit and market losses at the Enterprises, depletion of their capital, and an inability of the Enterprises to raise new capital and to access debt markets in their customary way. The housing market problems led to Congress' final passage of HERA in July. Significant safety and soundness issues and risk that the Enterprises would be unable to fulfill their missions led to FHFA placing each Enterprise into conservatorship in September 2008. The FHFA staff and the staff at each Enterprise have been, and continue to be, working hard to restore safety and soundness to these institutions, however, the consequences of the size and credit characteristics of their mortgage books of business create substantial uncertainty as to the form of the ultimate resolution of the conservatorships.

In HERA, Congress gave the Treasury Department substantial authorities to provide financial support to the housing government sponsored enterprises (GSEs). The Treasury Department has exercised these authorities in establishing three facilities to support the ongoing business operations of the Enterprises and to provide confidence to investors in the Enterprises' debt and mortgage-backed securities.

The first facility is a Senior Preferred Stock Purchase Agreement with each Enterprise (initial commitment of $100 billion) to ensure that they maintain a positive net worth. In February 2009, the Treasury Department, with the support of FHFA, announced a doubling of the financial support available under the Senior Preferred Stock Purchase Agreements to $200 billion per company. While neither Enterprise was near the initial $100 billion commitment level, given disclosures on preliminary loss estimates for the last quarter of 2008, the increased financial commitment helped to maintain confidence in the Enterprises. To date, the Enterprises have drawn about $60 billion on this combined $400 billion commitment.

The second facility is the GSE Mortgage Backed Securities (GSE MBS) Purchase Program, which

was established to purchase GSE MBS at the discretion of the Secretary of the Treasury based on developments in the capital markets and housing markets. Through February 2009, the Treasury Department has purchased more than $100 billion of GSE MBS. In addition, utilizing its separate authorities, the Federal Reserve has established programs to purchase $200 billion of Enterprise and FHLBank debt and $1.25 trillion of GSE and Ginnie Mae MBS. Through March 2009, the Federal Reserve has purchased $300 billion of GSE MBS and $40 billion in Enterprise debt.

The third facility is the Government Sponsored Enterprise Credit Facility (GSE Credit Facility). This credit facility is designed to provide short-term secured funding to the Enterprises and the FHLBanks. To date, there have not been any borrowings under this facility.

The combined actions of the Treasury Department and the Federal Reserve ensure that the Enterprises have significant access to capital. In particular, the Treasury Department has given investors in the Enterprises' debt and mortgage-backed securities confidence that Treasury will provide extraordinary support, if necessary, under the terms of the Senior Preferred Stock Purchase Agreement.

Each Enterprise continues to be a critical player in the functioning of the nation's mortgage market, and their combined share of mortgages originated in the second half of 2008 was 73 percent, up from 67 percent in the second half of 2007 and 37 percent in 2006. While the underlying quality of the Enterprises' credit book is better than the average for all prime conforming mortgages in the country, the sheer size of the Enterprises' credit book will present significant challenges as the financial and housing market turmoil continues to unfold.

The circumstances of conservatorship, with the Treasury Department's Senior Preferred Stock Purchase Agreement, also renders traditional measures of capital and capital adequacy not relevant. As reported by the Enterprises in their year-end financial statements, each company has depleted all of its shareholders' equity, with the negative balance in those accounts being offset by the Treasury Department's Senior Preferred Stock investment. Under the terms of the Senior Preferred Stock Purchase Agreement, this support will continue indefinitely into the future subject to the commitment limit.

Since being placed into conservatorship, each Enterprise has made strides in remediating various areas of weakness and in stabilizing their funding and operations. Still, the companies must continue to make progress in remediating material deficiencies and restoring sound operational systems, business practices, risk management, and accounting and control systems.

Material Deficiencies

The reports of examination describe the scope and depth of material deficiencies in the operations of the Enterprises. Since September, new senior management at each company has worked with FHFA to establish and implement a comprehensive remediation program. Performance targets established for senior managers at each Enterprise are tied to successful remediation efforts. In 2009, FHFA as conservator and regulator is continuing to work with each Enterprise to ensure they remediate the financial and operational deficiencies identified by FHFA's regulatory examinations and by internal and external audit activities.

Significant vacancies at the executive level represent a material deficiency at Freddie Mac. Freddie Mac is operating with an interim Chief Executive Officer, no Chief Operating Officer, and an Acting Chief Financial Officer. The Freddie Mac Board of Directors is working to fill these and other key positions. At Fannie Mae, vacancies for several senior positions (General Counsel, Chief Risk Officer, and Chief Technology Officer) were recently filled after being slowed by compensation issues. In addition, there are many senior vice president and vice president level vacancies.

Operational Status

Since being placed into conservatorship, the Enterprises have each maintained an ongoing presence in the secondary mortgage market. Their combined share of single-family originations, which peaked at 81 percent in the second quarter of 2008, fell slightly in the second half of the year as the activity of Federal Housing Administration (FHA) expanded, but still exceeded 75 percent in the fourth quarter. The Enterprises, though, face numerous, significant challenges to their operations, including:

- remediating the operational, financial, and risk management weaknesses that led to conservatorship;
- building and retaining staff and infrastructure;
- modeling credit risk in this uncertain environment;
- mitigating credit losses, including through loan modifications;
- pricing mortgage products given market uncertainties, modeling difficulties, and the uncertainties of operating in conservatorship;
- buying / guaranteeing mortgages with greater than 80 percent loan-to-value, due to declining house prices and constraints on the availability of private mortgage insurance; and
- providing for mission and public policy objectives of housing market stability, mortgage availability and mortgage affordability.

Beyond these challenges, the Treasury Department has contracted with each Enterprise to act as financial agent for the federal government in implementing the Administration's Making Home Affordable program. Fannie Mae is working with mortgage servicers to implement Home Affordable Modifications, designed to avoid preventable foreclosures for homeowners willing and able to continue making their mortgage payments if those payments are made more affordable. Freddie Mac's role is overseeing the servicers' compliance with program terms and conditions. Both Enterprises also have undertaken a Home Affordable Refinance initiative to enable homeowners with a mortgage owned or guaranteed by an Enterprise who are current on their mortgage to refinance to a lower rate. This program should assist millions of homeowners who otherwise would have difficulty refinancing due to declining house prices and lack of private mortgage insurance.

Both programs have been launched and will be an important part of the Enterprises' business – and mission – activities this year. The goals of the Enterprises participation in this program are to stabilize housing markets while improving the credit position of their respective books of business. Given the Enterprises' substantial market position, with more that $5 trillion in mortgages owned and guaranteed, activities that promote responsible homeownership, reduce preventable foreclosures, and stabilize house prices should help reduce future losses.

Conservatorship cannot be a permanent state for the Enterprises, but getting out of conservatorship awaits a housing market recovery and will likely involve Congressional action. Many observers have warned for years of the weaknesses in the GSE model. Regrettably, those warnings proved true. How Congress chooses to fix or replace the GSE model will guide the future operations of the Enterprises.

Mission

Concern for the Enterprises fulfilling their mission was a key reason for placing the Enterprises into conservatorship. The Treasury Department facilities established at that time were designed to ensure that each Enterprise continued to operate to provide stability, liquidity, and affordability to the secondary mortgage market.

The conservatorships are being operated as Congress originally intended the companies to operate—as private businesses operating with an important public purpose. Still, the current situation poses certain challenges for the Enterprises and the conservator that may not be present in normal times. For instance, assigning economic capital to various business activities and product lines is complicated both by models that have failed to capture the depth and severity of the current mortgage crisis and by the absence of actual private capital at risk. These factors also complicate pricing decisions as model error has been, and may continue to be, very high.

At the same time, the use of taxpayer funds to stabilize the Enterprises demands both the protection of that capital in the business and the assurance that the Enterprises are operating to meet the public purposes for which they were created. In the current mortgage crisis, public policy has focused the Enterprises on mortgage availability, mortgage affordability, and foreclosure mitigation. The Enterprises have been playing an important role in assisting the federal government in foreclosure mitigation activities. Loan modifications undertaken for their own books of business are both critical to mitigating credit losses on those books and meeting the Enterprises' public purposes.

With respect to 2008 housing goals, Fannie Mae failed to meet all but one if its overall housing goals and home purchase subgoals. Freddie Mac missed all of them. Both Enterprises met their multifamily subgoals. As provided for by Congress, FHFA is reconsidering the appropriateness of the goal levels for 2009 in light of this experience and the current state of the mortgage market. Going forward, the housing goals need to be made more responsive to actual market conditions and promote sustainable mortgage options for low- and moderate-income families and neighborhoods.

Consistent with its responsibilities, FHFA suspended Enterprise contributions to the Housing Trust Fund in view of the Enterprises' losses and required draws on the Treasury Department's Senior Preferred Stock Purchase facility.

The FHLBanks

Safety and Soundness

HERA granted the Treasury Department the authority to support the FHLBanks as well as the Enterprises. However, the FHLBanks have access only to the GSE Credit Facility, and they have not used that facility. To date, the FHLBanks have continued to fund themselves in the marketplace. The Federal Reserve has purchased a modest amount—$17 billion through April 2009—of FHLBank System debt.

As financial markets seized in 2007 and 2008, the FHLBanks played a critical role in providing liquidity (advances) to their members, with advances growing to more than $1 trillion at September 30, 2008. The FHLBanks' advance business continues to be a safe and sound business, with no credit losses. During the year, the capital structure of the System ensured that member capital investments in their FHLBanks increased as advances outstanding grew.

In contrast, the quality of the FHLBanks' investments in private-label mortgage-backed securities was revealed to be far worse than their initial triple-A credit ratings would have suggested. By the end of 2008, six FHLBanks had voluntarily or by regulatory requirement ceased paying dividends and repurchasing member stock as means

for conserving capital. With continued uncertainty surrounding the true economic value of private-label mortgage-backed securities, such investments will continue to raise varying degrees of safety and soundness concerns, depending on the particular circumstances of the FHLBank, including the composition of the mortgages underlying the investments and the strength of the FHLBank's retained earnings.

Overall, the FHLBank System with its joint and several liability for System debt remains safe and sound, but the actual and potential losses associated with these private-label securities is a cause for safety and soundness concerns at certain FHLBanks. While recent changes to accounting rules announced by the Financial Accounting Standards Board may result in improved accounting measurement of financial condition and a stronger regulatory capital position at some of the FHLBanks, the governance and credit risk management issues raised by these investments are serious concerns for the affected FHLBanks to address.

Material Deficiencies

Since October 2007, the FHLBank of Chicago has operated under a consent order to cease and desist first established with the Federal Housing Finance Board. The consent order suspended dividend payments and capital repurchases and redemptions and required the FHLBank to address supervisory concerns identified by the Finance Board. While the FHLBank's management has taken positive steps towards remediation, continued deterioration of the FHLBank's private-label mortgage-backed securities portfolio, funding risks associated with its Mortgage Partnership Finance Program, and overall weakness in financial condition remain material deficiencies.

Private-label mortgage-backed security investments are also a key contributor to certain financial or risk management weaknesses at other FHLBanks. The FHLBank of Pittsburgh has risks associated with these investments, which has weakened the FHLBank's earnings stability and capital adequacy. The FHLBank of Seattle reported material weaknesses in its 2008 10-K due to inadequate controls associated with the accounting and management of its securities portfolio. The FHLBank of Seattle also failed to meet its risk-based capital requirement at year-end. As part of the remedy to this situation, Seattle cannot pay dividends or redeem stock. In all, six FHLBanks reported losses in the fourth quarter of 2009 and three FHLBanks (Boston, Chicago, and Seattle) reported losses for the year, principally due to impairments of private-label mortgage-backed securities. Eight FHLBanks reported other-than-temporary impairments on private-label mortgage-backed security investments, for a total of $2 billion.

Operational Status

In 2008, the FHLBanks operations served the liquidity function Congress created for them. This has been particularly so since the mortgage crisis began in the summer of 2007, and was especially true during the critical liquidity stresses in financial markets in the early autumn of 2008. Although several members, including some large ones, became troubled in 2008, the advance business remains free of credit losses.

However, as described above, dividend payments and capital redemptions and repurchases at some FHLBanks have been hampered by the significant deterioration in value of the private-label mortgage-backed securities portfolios. Improvements in the FHLBank System's financial reporting controls/systems along with remediating weakness at certain FHLBanks will be critical issues to address in 2009.

Mission

Despite market turmoil in late 2008, the FHLBanks met their essential public purpose of providing liquidity to their members. For the first time ever, System advances exceeded $1 trillion at September 30, 2008, although they have declined more than 20 percent since then.

The FHLBanks' Affordable Housing Program (AHP) continues to be a source of funds to support local affordable housing initiatives being funded by member institutions. However, the decline in FHLBank income in 2008 will reduce the amount of AHP funding the FHLBanks will award in 2009. HERA provided that AHP Affordable Housing funds may be used to support loan modification activities. Through an interim final rule implementing this temporary authority, FHLBanks may subsidize closing costs or further buy-down principal in Hope for Homeowners mortgages through FHA. The final rule, which is under review, will expand the program to other loan modification efforts.

Year In Review

Economic Recession and Deepening Financial Crisis

The recession that began in December 2007 continued throughout 2008 and worsened in the fourth quarter. Lower interest rates and the boost in consumer spending provided by a federal fiscal stimulus package enacted in February had masked the economic decline during the first half of the year. The shrinking housing sector continued to be a major drag on GDP. Spending on purchases of new homes and renovations (known as residential fixed investment) fell for the third consecutive year, dropping 22.2 percent. The economic downturn spread from housing to other industries, as evidenced by declines in vehicle and retail sales and industrial production.

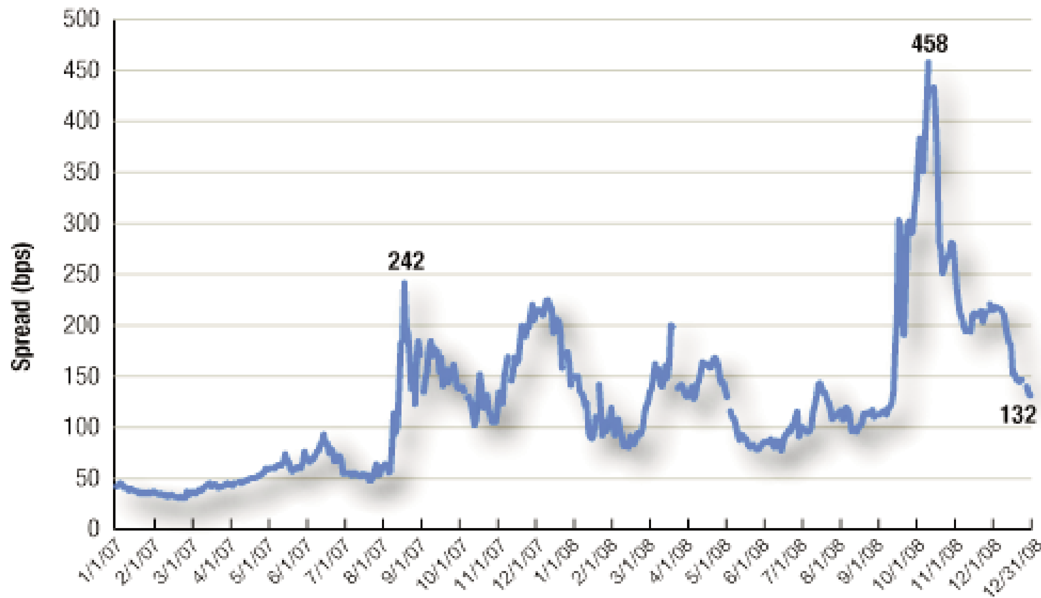
Inflation accelerated in the first half of the year, as measured by the Consumer Price Index (CPI), driven by rising energy and food prices. However, energy prices declined in the third and fourth quarters as global economic growth slowed and demand for oil fell, which helped dampen inflation and caused the CPI to fall in the fourth quarter. The United States lost approximately three million jobs in 2008, and the unemployment rate rose from 4.9 percent in December of 2007 to 7.2 percent one year later, the highest rate since January 1993. The nation's bleak unemployment picture, loss of equity in homes and investments, and tight credit markets caused consumer confidence to plummet and led many to curb spending.

Financial market distress continued throughout 2008 and worsened in mid-September. Continuing declines in asset values in mortgage and equity markets, tight credit conditions, and provisioning for credit losses led to growing concerns about the solvency and liquidity of important financial institutions. Those factors eventually led to the sale of Bear Stearns in March, and conservatorships for Fannie Mae and Freddie Mac, the bankruptcy of Lehman Brothers, and the rescue of AIG in September. The fate of those institutions and general uncertainty about future losses intensified concerns about credit and liquidity risks and resulted in a sharp reduction in market liquidity, evidenced by widening risk spreads. During the early part of October, the spread between the three-month London Interbank Offered Rate (LIBOR) and the three-month Treasury bill rate rose to almost twice its level at an earlier stage of the crisis in August 2007 (see Figure 1).

Concerns about fragile conditions in financial markets led the Federal Reserve to continue the policy of monetary easing begun in mid-2007. The federal funds target rate was lowered 225 basis points in the first four months of 2008 to 2.0 percent. The economy briefly showed signs of improving during the summer, but despite fiscal stimulus financial markets continued to deteriorate, both in the United States and abroad. Short-term funding markets froze. In October, the Federal Reserve collaborated with other central banks to cut interest rates. The federal funds target rate was lowered an additional 100 basis points in October and even further in December to a target range of zero to 25 basis points. In addition, the Federal Reserve announced or introduced several unprecedented programs designed to increase liquidity in specific credit markets and ease lending terms for specific types of institutions. Those included lending facilities for primary dealers, depository institutions, bank holding companies, eligible commercial paper issuers, and special-purpose vehicles established to purchase unsecured asset-backed commercial paper and to finance the purchase of money market instruments from eligible investors.

Because of growing safety and soundness issues at both Fannie Mae and Freddie Mac (Enterprises), on September 6, 2008, the Federal Housing Finance Agency (FHFA), with the concurrence of the Secretary of the Treasury and the Chairman of the Board of Governors of the Federal Reserve System, placed each Enterprise in conservatorship. In conjunction with that action, Treasury initiated individual agreements with Fannie Mae and Freddie Mac to purchase senior preferred

Figure 1 • Spread Between Three-Month LIBOR and Treasury Bill Rate



Sources: Bloomberg Financial LP and Federal Reserve Board

stock and established special facilities to purchase mortgage-backed securities (MBS) guaranteed by the Enterprises and debt issued by the three housing government-sponsored enterprises (GSEs)—Fannie Mae and Freddie Mac, and the Federal Home Loan Banks (FHLBanks). Those actions were taken to enable the Enterprises to continue to fulfill their mission of providing liquidity and stability to mortgage markets. The Treasury support for the Enterprises in conservatorship is discussed in more detail below.

On November 25, the Federal Reserve announced a program to purchase up to $100 billion in debt securities issued by the housing GSEs and up to $500 billion in MBS guaranteed by the Enterprises and Ginnie Mae. The goal of those purchases is to reduce the cost of mortgages and increase the availability of credit for home purchases. Purchases of GSE debt in particular were intended to lower the spreads between the yields of those obligations and Treasury debt, which had widened to historic highs. Prior to that action, the Emergency Economic Stabilization Act (EESA), enacted in October, had authorized the Treasury to establish a $700 billion Troubled Assets Relief Program (TARP) to help stabilize financial markets and support financial institutions. By the end of 2008, the Federal Reserve had purchased $15 billion in GSE debt securities. The Federal Reserve began purchasing Enterprise and Ginnie Mae MBS in early January 2009 and had bought $333.2 billion of those securities through April 8, 2009, more than one-half of the total purchase commitment.

Signs of improvement in some credit market indicators followed the Federal Reserve and Treasury actions in the fourth quarter of 2008, especially in the latter part of the quarter. For instance, the spread between three-month LIBOR and the three-month Treasury bill rate, which had reached 458 basis points on October 10, narrowed to 132 basis points by the end of the year, a level below its 2007 peak but still much higher than its average of about 38 basis points from 2000 through mid-2007. The one-year Constant Maturity Treasury (CMT) yield fell from a high of 3.17 percent in January to a low of 0.34 percent in December 2008. Long-term interest rates rose modestly in the first half of 2008. The yield on the 10-year CMT peaked in June at 4.27 percent,

declined thereafter, and ended the year at 2.25 percent or 179 basis points lower than at the end of 2007. Because short-term interest rates fell more than long-term rates, the Treasury yield curve steepened over the course of the year.

Mortgage interest rates, which generally follow the trend of long-term Treasury rates, were volatile in 2008, especially during the first nine months of the year, due in part to uncertainty about the stability of Fannie Mae and Freddie Mac. According to Freddie Mac's Primary Mortgage Market Survey (PMMS), the average 30-year fixed-rate mortgage (FRM) commitment rate reached a high of 6.63 percent in July but then fluctuated. Mortgage rates declined after the establishment of conservatorships for Fannie Mae and Freddie Mac, rose after the bankruptcy of Lehman Brothers and the rescue of AIG, and declined sharply after the Federal Reserve announced it would purchase GSE debt securities and MBS. The 30-year FRM commitment rate fell in the final weeks of the year to a record low at year-end 2008, 107 basis points lower than at year-end 2007. During 2008, the 30-year FRM commitment rate averaged 6.03 percent, 31 basis points below the average for 2007. Likewise, the average commitment rate on one-year Treasury-indexed adjustable-rate mortgages (ARMs) increased through July, then decreased toward the end of the year. For the year, the one-year ARM commitment rate averaged 5.17 percent, 39 basis points lower than the year before (see Figure 2).

Deteriorating Housing and Mortgage Markets

Conditions in housing and mortgage markets deteriorated sharply throughout 2008, especially in the fourth quarter. House prices continued to fall, with many areas experiencing record rates of decline. Significant inventories of unsold homes, increasing foreclosures, and tightening credit conditions put downward pressure on prices, even in areas that suffered substantial price declines in 2007.

As measured in FHFA's national seasonally adjusted, purchase-only house price index (HPI), home prices fell 8.2 percent between the fourth quarters of 2007 and 2008—the largest decrease in the period covered by the index (1991–2008). That decline contrasts sharply with the modest

Figure 3 • FHFA House Price Index History for United States

Seasonally Adjusted Price Change Measured in Purchase-Only Index

Source: Federal Housing Finance Agency

national decrease over the prior four-quarter period, when United States prices fell only 0.7 percent. Quarterly price changes were negative in all four quarters, with seasonally adjusted declines ranging between 1.4 percent and 3.4 percent (see Figure 3). The largest quarterly price drop in 2008 occurred in the fourth quarter.

Although home values fell throughout the country, there were vast differences in the magnitude of regional price declines. The West Coast states, Alaska, and Hawaii, which make up the Pacific Census Division, suffered the worst house price decreases (see Figure 4). Prices fell 22.1 percent between the fourth quarters of 2007 and 2008 in those states, adding to the 4.8 percent decline in the prior four-quarter period. Conditions in California were particularly weak, with homes in that state experiencing an average price decline of 25.5 percent.

The Mountain and South Atlantic Census Divisions saw price declines of 8.4 and 11.2 percent, respectively. As with the Pacific Division, substantial variation existed across states within those divisions. In the Mountain Census Division, for example, Arizona and Nevada markets were much softer than markets in other states. Florida house prices sustained by far the greatest declines in the South Atlantic Division.

While its aggregate price decline was not as great as in some other areas, the East North Central Division (comprising Michigan, Wisconsin, Illinois, Indiana, and Ohio) is notable because, unlike other divisions, it experienced substantial price declines without having seen significant price increases during the housing boom early in this decade. Particularly high unemployment and rising foreclosures caused prices to fall from relatively modest levels in that division.

Falling home prices caused equity in homes to decline sharply in 2008. The resetting of the interest rates on poorly underwritten ARMs originated in recent years, deteriorating household balance sheets, rising unemployment, continued credit tightening, and the deepening recession contributed to increases in mortgage delinquency and home foreclosure rates as well as sharply

Figure 4 • Four-Quarter Price Change in Purchase-Only Index By Census Division; Period Ending Fourth Quarter 2008

lower housing starts and sales and mortgage lending activity.

According to the Mortgage Bankers Association's (MBA's) National Delinquency Survey, the percentage of single-family mortgages that were seriously delinquent (past due 90 days or more or in foreclosure) increased rapidly in 2008 (see Figure 5). The serious delinquency rate for all loans rose 268 basis points to 6.3 percent from the fourth quarter of 2007 to the fourth quarter of 2008. The delinquency rate for prime loans increased from 167 basis points in the final quarter of 2007 to 3.7 percent one year later. By contrast, the serious delinquency rate for subprime mortgages continued in double-digit rates, rising 867 basis points from the fourth quarter of 2007 to 23.1 percent at the end of the fourth quarter of 2008. Serious delinquencies of loans owned or guaranteed by Fannie Mae and Freddie Mac also increased, but remained much lower than the rate for all prime mortgages at 2.4 percent and 1.7 percent, respectively.

Home foreclosures continued to rise in 2008, with California and Florida experiencing the largest increases. More than one percent of all loans went into foreclosure in each quarter of 2008. However, foreclosures slowed toward the end of the year as a result of various foreclosure moratorium programs initiated by the states, the Enterprises, and other financial institutions. At

Source: *Inside Mortgage Finance Publications*

the end of the fourth quarter, 3.3 percent of all loans were in the process of foreclosure, up from 2.0 percent one year earlier.

Single-family housing starts declined for the third consecutive year, falling 40.7 percent to 639,500 units—the biggest percentage decline ever recorded. Home sales also dropped sharply, despite lower prices and generally low mortgage interest rates. Sales of new homes posted their third consecutive double-digit decline, falling 37.5 percent to 485,000 units, the lowest volume since 1982. Sales of existing homes slid 13.1 percent to 4.9 million units, the lowest level since 1997 (see Figure 6).

Falling house prices, tightening credit market conditions, and the recession contributed to a further decline in single-family mortgage lending in 2008. According to *Inside Mortgage Finance*, originations of single-family mortgages fell 38.9 percent—the third consecutive annual decline—reaching an eight-year low of $1.485 trillion. That was slightly more than one-third of the record volume of originations in 2003 (see Figure 7).

The mix of single-family mortgages originated changed significantly in 2008, a reflection of the collapse of nontraditional lending. Whereas activity in the subprime sector had dominated in the early part of the decade, subprime lending all but dried up in 2008. Similarly, there was not much Alternative-A (Alt-A) lending. By contrast, mortgages insured by the Federal Housing Administration (FHA) increased substantially. Total FHA endorsements (insurance policies) increased more than threefold to $253.1 billion. Those endorsements represented 17 percent of single-family mortgages originated in 2008, up from 3.3 percent in 2007. An increase in the FHA loan limit, which made FHA financing available to more borrowers, was one of the factors that contributed to the increased popularity of FHA insurance. The Department of Veterans Affairs' (VA's) share of originations also increased. Mortgages insured or guaranteed by VA and FHA accounted for 19.5 percent of single-family mortgages originated in 2008, compared with 4.8 percent in 2007 and 2.7 percent the year before. The volume of conventional conforming mortgages originated in 2008 declined by 20 percent. However, the conventional conforming share of total single-family lending increased to 62 percent, compared with 47.4 percent the year before. That change reflects significantly lower volumes

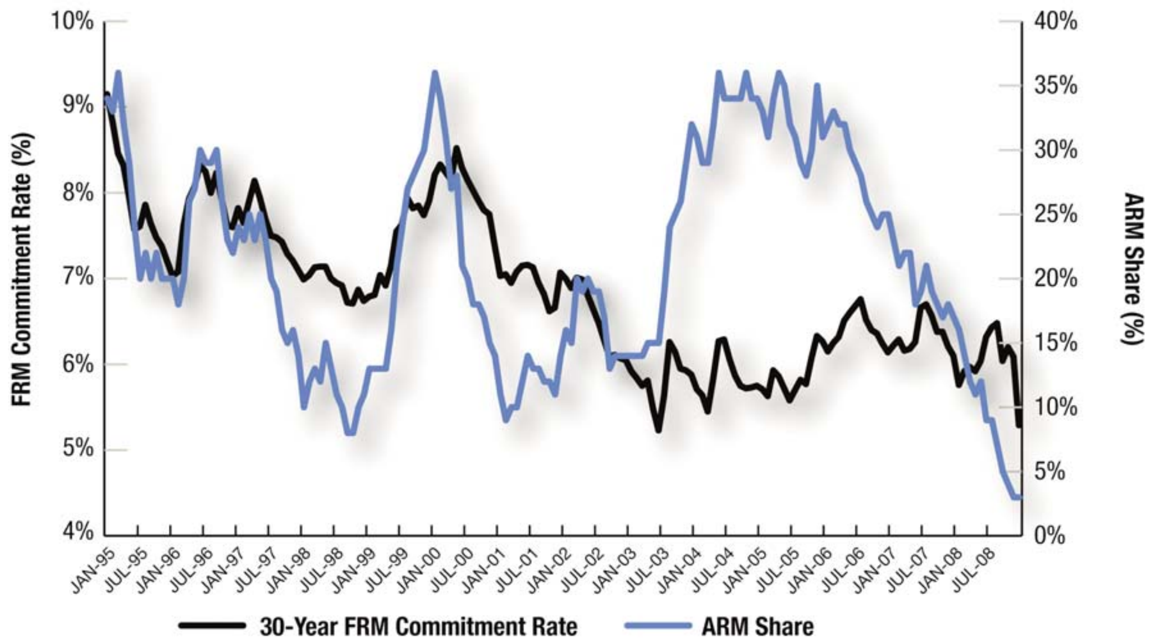
Figure 9 • ARM Share of Conventional Nonjumbo Single-Family Loan Applications and Commitment Rates on 30-Year Fixed-Rate Mortgages



Source: Freddie Mac's Primary Mortgage Market Survey

of jumbo, subprime, and Alt-A lending (see Figure 8).

Applications for single-family mortgages with adjustable rates declined sharply in 2008. According to Freddie Mac's PMMS, single-family ARM applications dipped to three percent in December, the lowest share since the Enterprise began its survey and far below the peak months in 2005, 2004, 2000, and 1995 of 36 percent. The PMMS indicates that the ARM share of conventional nonjumbo single-family loan applications was 9 percent in 2008, down from 20 percent in 2007 (see Figure 9). Refinancings accounted for about 50 percent of single-family mortgages originated in 2008, but many borrowers who refinanced their resetting ARMs chose to convert those mortgages into FRMs. Narrowing spreads between FRMs and ARMs gave borrowers an incentive to lock in fixed rates.

The credit quality of conventional fixed-rate originations improved in 2008 because of tighter underwriting standards and a sharp decline in the volume of subprime, Alt-A, and other nontraditional mortgages. Consequently, the loan-to-value (LTV) ratios of conventional fixed-rate loans improved. According to FHFA's Monthly Interest Rate Survey (MIRS), the average LTV ratio of single-family conventional, purchase-money mortgages, which increased rapidly from 73.6 percent in 2003 to 79.3 percent in 2007, fell to 76.7 percent in 2008. The proportion of such loans with LTV ratios greater than 90 percent dropped sharply from 2007's level of 29 percent—the highest level recorded—to 18 percent in 2008 (see Figure 10).

Growing concern about mortgage foreclosures, continuing house price depreciation, the declining economy, and investors' preference for safe, highly liquid debt reduced activity in the secondary mortgage market in 2008. Only $58.2 billion of private-label MBS were issued, compared with $707 billion in 2007 and $1.1 trillion in 2006. Low demand for private-label securities (PLS) and declining performance of collateral underlying

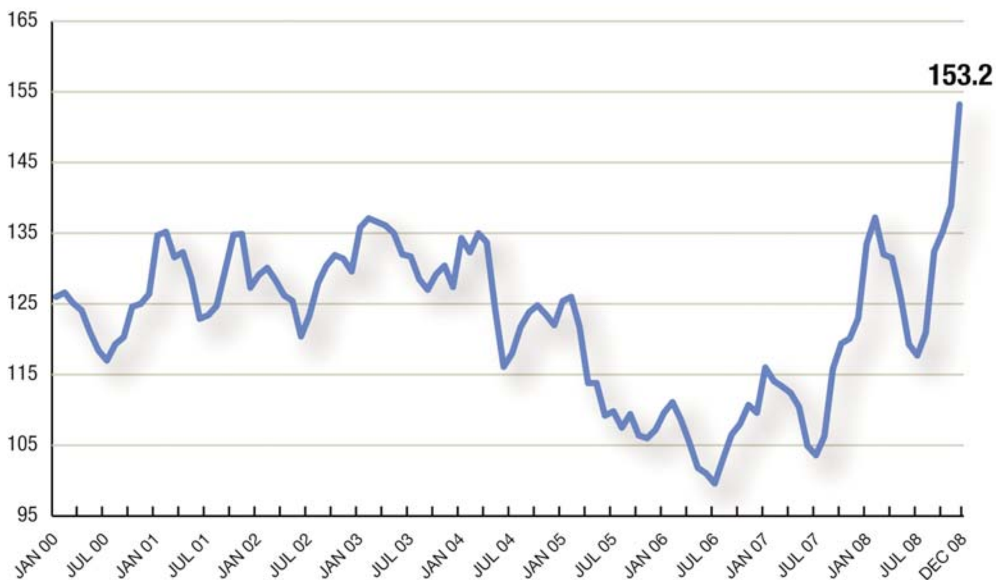
Figure 12 • United States Composite Housing Affordability Index, 2000 – 2008



Source: National Association of Realtors

prior years' issuances depressed prices for those securities in 2008. Enterprise MBS also suffered from price depreciation in 2008 as investors lost confidence in Fannie Mae and Freddie Mac. Foreign investors, in particular, reduced purchases of Enterprise MBS and debt. Capital-starved banks and the Enterprises were unable to increase their purchases to make up for diminished foreign investment, and, in the third quarter, spreads between the yields of Enterprise MBS and Treasuries soared (see Figure 11). Yields of Enterprise MBS dropped after the conservatorships, rose following the bankruptcy of Lehman Brothers, and started a steady decline following the November 25 announcement of the Federal Reserve purchase programs.

Despite the rise in foreclosures in 2008, the homeownership rate and rental and homeowner vacancy rates generally held steady. Another bright spot in the struggling United States housing market in 2008 was an increase in housing affordability, as measured by the National Association of Realtors' composite housing affordability index. That index rose from 123 in December 2007 to 153.2 in December 2008, an increase of 25 percent (see Figure 12). The higher value of the index mainly reflects a further decline in the median price of existing single-family homes in 2008 and lower mortgage interest rates.

Enterprise Conservatorships and Treasury Support

Because of growing safety and soundness issues at both Fannie Mae and Freddie Mac, on September 6, 2008, FHFA placed each Enterprise in conservatorship. Both the Secretary of the Treasury and the Chairman of the Board of Governors of the Federal Reserve System concurred with that decision. In conjunction with placing the Enterprises into conservatorship, Treasury initiated individual agreements to purchase senior preferred stock in Fannie Mae and Freddie Mac. Pursuant to those agreements, Treasury committed to invest up to $100 billion in each Enterprise to ensure each maintains a positive net worth, determined in accordance with generally accepted accounting principles (GAAP).[1]

As compensation for entering into these agreements and to protect taxpayers, Treasury received $1 billion in senior preferred stock and warrants for the purchase of common stock representing 79.9 percent of outstanding common stock from each Enterprise. In addition, the agreements placed some limitations on the Enterprises' business activities. For example, while the agreements do not restrict how each Enterprise can grow its net MBS outstanding (MBS held by others), they do limit the growth of each Enterprise's retained mortgage portfolio to a maximum balance of $850 billion at the end of 2009. Thereafter, the agreements stipulate that the retained mortgage portfolios must shrink by 10 percent per year until each Enterprise's holdings of mortgage assets reach a balance of $250 billion.[2] As of December 31, 2008, Treasury had acquired $14.8 billion of senior preferred stock from Freddie Mac and $1 billion from Fannie Mae.

The Treasury also established two special facilities to purchase Enterprise MBS (the GSE MBS Purchase Facility) and housing GSE debt (the GSE Credit Facility). Loans under the GSE Credit Facility will be short term and will not be made with a maturity date beyond December 31, 2009. All loans will be collateralized by MBS guaranteed by Freddie Mac and Fannie Mae or advances made by the FHLBanks. The interest rate on loans will be based on the daily LIBOR rate for a term similar to that of the loan, plus 50 basis points. The housing GSEs have not made any draws under the GSE Credit Facility. Treasury had purchased $71.6 billion in MBS under the GSE MBS Purchase Facility by the end of December 2008.

1 In February 2009, the Treasury Department announced amendments to the agreements that would increase the potential investment in senior preferred stock in each Enterprise to $200 billion.

2 In February 2009, the Treasury Department announced amendments to the agreements that would increase the permitted size of each Enterprise's retained mortgage portfolio to a maximum balance of $900 billion at the end of 2009.

Business Volumes

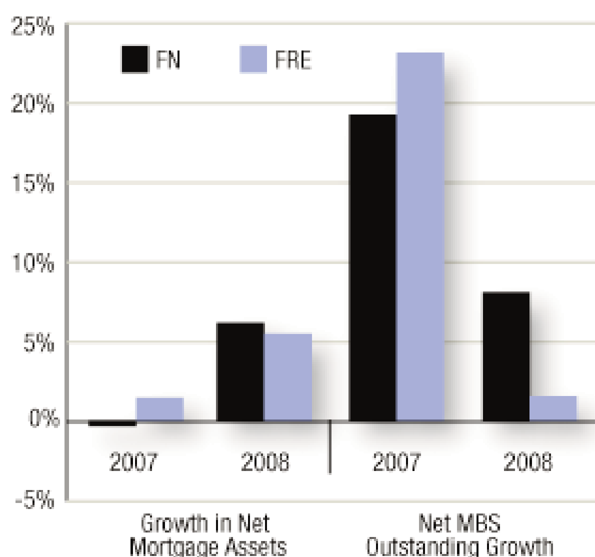
Despite turbulent housing and mortgage markets in 2008, Fannie Mae and Freddie Mac continued to provide substantial liquidity to the secondary mortgage market. Enterprise new business acquisitions (defined to include cash purchases from lenders, swaps of whole loans for MBS, and purchases of MBS) represented over 73 percent of total single-family originations, up from 54 percent in 2007. That growth in market share paralleled the sharp increase in the conventional conforming share of the primary market in 2008.

The Office of Federal Housing Enterprise Oversight (OFHEO), a predecessor to FHFA, lifted limits on the total dollar amount of mortgage assets the Enterprises could hold effective at the end of the first quarter, as they became timely in filing their financial statements. The lifting of the limits and the partial relaxation of capital surcharges before and the suspension of all regulatory capital requirements following the conservatorships paved the way for additional growth in the Enterprises' mortgage asset investments. Both Enterprises grew those investments at a much faster pace than in the recent past. Fannie Mae had not grown its holdings of mortgage assets since 2004, whereas Freddie Mac's holdings of mortgage assets had not shown any appreciable growth since 2005, due to the caps on growth of their mortgage assets agreed to in 2006 (see Figure 13).

The composition of both Enterprises' mortgage investments also changed in 2008. At year-end, Fannie Mae showed a slight increase in its holdings of whole loans—driven by higher volumes of multifamily and FHA/VA loans—and a slight decrease in PLS. Freddie Mac showed a noticeable decline in holdings of PLS offset by a higher volume of whole loans. At year-end, MBS guaranteed by Freddie Mac comprised more than half of its mortgage asset holdings.

Given the 38.9 percent drop in single-family mortgage originations, both Enterprises grew

Figure 13 • Enterprise Growth in Business Volume



Sources: Fannie Mae and Freddie Mac

their credit guarantee businesses at a much slower pace in 2008 than in the previous year. Fannie Mae MBS issuances declined 13.8 percent, while purchases of its own securities increased. For the year, Fannie Mae showed an increase in its net MBS outstanding of 8.1 percent, down from 19.2 percent the year before (see Figure 13). Freddie Mac's MBS issuances decreased as well, by 24 percent, while holdings of its own MBS increased 18.9 percent. For the year, Freddie Mac showed a 1.5 percent increase in its net MBS outstanding, down from growth of 23.1 percent in the prior year.

Despite the drop in mortgage originations, each Enterprise's total mortgage book of business—mortgage assets held for investment plus MBS held by others—grew in 2008, albeit at a much slower pace than in 2007. Fannie Mae grew its total book of business by 7.6 percent to $3.1 trillion, as compared with 13.5 percent the previous year. Freddie Mac's total book of business grew 2.9 percent to $2.2 trillion, as compared with 14.8 percent in 2007. Despite their slower growth, the Enterprises' share of the total mortgage market increased. Fannie Mae and Freddie Mac ended

the year holding and guaranteeing the highest level of the nation's outstanding residential mortgage debt since 2003, approximately 43.7 percent.

To help restore liquidity to the secondary mortgage market, in March 2008 the Federal Housing Finance Board, a predecessor to FHFA, authorized the FHLBanks to increase temporarily their holdings of MBS guaranteed by the Enterprises and Ginnie Mae from 300 to 600 percent of capital. At year-end, the FHLBanks held $96 billion of those securities, up from $55 billion one year earlier.

The FHLBanks continued to be a major source of liquidity to their member financial institutions and, thereby, the primary mortgage market in 2008. Advances outstanding reached an all-time high of $1,012 billion (at par) in the third quarter but contracted in the fourth quarter as member institutions drew on other funding sources. Demand for long-term debt issued by the housing GSEs declined and the yields on consolidated obligations issued by the FHLBanks increased, making advances a less attractive source of funding for members (see Figure 14). At the end of 2008, FHLBank advances outstanding totaled $928.6 billion (at par), up 6.1 percent from the end of 2007 and 44.9 percent from the end of 2006.

Report of the Annual Examination of Fannie Mae (Federal National Mortgage Association)

Examination Authority and Scope

This Report of Examination contains the results and conclusions of FHFA's 2008 annual examination of the Federal National Mortgage Association (called Fannie Mae, or the Enterprise) performed under section 1317(a) of the Federal Housing Enterprises Financial Safety and Soundness Act of 1992, as amended (12 USC § 4517(a)). FHFA's annual examination program assesses the Enterprise's financial safety and soundness and overall risk management practices. The framework FHFA uses to report examination results and conclusions to the Board of Directors and Congress is known as GSEER, which stands for Governance, Solvency, Earnings, and Enterprise Risk (Enterprise Risk comprises credit, market, and operational risk management).

2008 Examination Scope

In 2008 FHFA dedicated significant resources to analyzing the Enterprise's levels and trends in asset quality and their impact on loan loss reserves, earnings, and capital adequacy. Once the Director appointed FHFA as conservator, examination activities shifted to monitoring rapidly changing market conditions, management actions, and their effect on the Enterprise's risk profile and condition.

Other examination activities during 2008 assessed actions of the Board of Directors, quality of executive management, enterprise-wide risk management and audit functions, accounting estimates and their effect on capital, key model performance, loan delinquency and foreclosure management, counterparty exposure, liquidity and interest rate risk profiles and risk management practices, the internal control environment, and risks in information technology, data quality, and business continuity.

Rating

Fannie Mae's composite rating is *critical concerns*. An Enterprise with critical safety and soundness concerns exhibits severe financial, nonfinancial, operational, or compliance weaknesses. An Enterprise with this rating requires more than normal supervision to ensure deficiencies are addressed. Definitions for all composite ratings can be found in FHFA's *Supervision Handbook* on the agency's Web site www.fhfa.gov.

FHFA communicated to the Enterprise a mid-year rating and it was a contributing factor in the appointment of FHFA as conservator in early September. The appointment of FHFA as conservator, combined with Treasury financial support, Federal Reserve actions, and new management at the Enterprise have stabilized the Enterprise's condition. While the critical concerns rating at year-end reflects the fact that the Enterprise is not currently capable of operating without government assistance, FHFA also acknowledges the strides the Fannie Mae Board, management, and staff have made under conservatorship to help stabilize the Enterprise and maintain its ongoing support of the secondary mortgage market.

Examination Conclusions

The Enterprise exhibits critical safety and soundness concerns primarily owing to the weak housing market exacerbated by weak legislative capital requirements, resulting in severe financial weaknesses that worsened to unprecedented levels during 2008. Certain risk management decisions that occurred before the conservatorship, coupled with continued financial market deterioration, led to net losses and eroded capital. Weakened earnings and market conditions led to difficulties in raising capital and issuing long-term debt, which contributed to the Director's decision to appoint FHFA as conservator.

In prior years, management expanded product eligibility to include nontraditional mortgage products, particularly Alt-A mortgages, and private-label securities containing subprime and Alt-A mortgages. These products have been the source of a disproportionate share of delinquencies, foreclosures, and credit-related expenses. Moreover, the Enterprise did not require originators to fully assess borrower capacity. Certain decisions, including the underestimation of risk associated with these products, coupled with changes in the economy, led to escalating increases in delinquencies, foreclosures, credit-related expenses and losses, and $26 billion of losses from impairments and mark-to-market accounting in the private-label securities portfolio.

Enormous net losses in 2008 resulted from a confluence of events: soaring mark-to-market losses, escalating credit-related expenses, and a large partial valuation allowance for deferred tax assets.

Market illiquidity, combined with aggressive Board and management risk limits, significantly increased risks in market risk management. The lack of significant investor support for the Enterprise long-term debt markets before the conservatorship revealed weaknesses in management's liquidity strategies; the volatile mortgage basis diminished the reliability of hedging decisions. Uncertain model results combined with aggressive limits and hedging strategies led to critical levels of interest rate risk relative to the Enterprise's weak earnings and capital.

Operational risk increased during 2008, but FHFA acknowledges improvements to mitigate risk. The Enterprise has certain manual controls that are a concern, and the operational risk oversight function is incomplete. The business process mapping initiatives have not been consolidated, which limits the enterprise-wide perspective on internal controls. Remediation of issues relating to internal controls and information technology is continuing.

Accounting policies and estimates, which are inherently high risk given current market conditions, continue to raise concerns. These areas include credit and guarantee loss reserves, securities valuation, and deferred tax assets. In addition, some of management's accounting decisions were insufficiently documented.

Financial Performance

Enormous net losses in 2008 resulted from a confluence of events: soaring mark-to-market losses, escalating credit-related expenses, and a large partial valuation allowance for deferred tax assets. The earnings outlook for 2009 is poor. Credit-related expenses and mark-to-market losses are influenced by market conditions that are expected to remain difficult during 2009. Continued poor financial performance could result in additional request for funds from the United States Treasury during 2009.

Asset Quality

During 2008, asset quality continued its precipitous decline begun in 2006. Underwriting decisions in prior years did not require originators to fully assess borrower repayment capacity. Problems from credit losses and related expenses contributed to weakened earnings and a significantly weakened capital base. Specific credit problems were manifested in significant increases in delinquencies, foreclosures, and credit expenses. Weakened counterparties, including mortgage insurers, servicers, and financial guarantors, significantly contributed to the reduction in asset quality of the Enterprise.

Later in 2008, the credit risk models of the Enterprise substantially under-predicted the housing market downturn and the resulting credit losses. During 2008, key credit applications in guarantee fee pricing and automated underwriting were substantially updated, improving performance. In addition, new models were developed to assist in loss mitigation and property disposition. Unfortunately, these improvements came too late, after hundreds of billions of dollars in risky loans had been acquired or guaranteed. While the credit models in place at the beginning of 2008 indicated that guarantee fees did not fully cover estimated credit risk, the more conservative models deployed later in the year sent a stronger message that returns had been inadequate.

The Enterprise will continue to be challenged as it works with servicers in providing assistance to borrowers experiencing payment difficulties. Simultaneously, the Enterprise must also manage and sell an increasing inventory of foreclosed properties while minimizing the negative impact on neighborhoods that foreclosures often pose. Prospects for future asset quality are poor in the short term, as declining economic factors continue to impair the financial capacity of borrowers and counterparties.

Internal Controls

Risks in internal controls, information technology, and the information management environments increased due to the Enterprise's deteriorating financial condition, significant safety and soundness concerns, numerous organizational changes, and the uncertain markets. FHFA acknowledges significant investment and improvements, largely in information technology, to better identify, manage, and mitigate risk. However, despite these improvements, the Enterprise has certain manual controls that require automation. In addition, the operational risk oversight organization, which is not fully developed, needs to be completed. The scale and scope of remediation needed in internal controls and information technology is considerable, requiring multiyear plans to address the deficiencies. These internal and external challenges could delay or derail needed enhancements.

The Enterprise will continue to be challenged as it works with servicers in providing assistance to borrowers experiencing payment difficulties.

FHFA terminated the May 23, 2006, consent order based on the determination that the Enterprise was in compliance with the terms of the order and had put in place methods for facilitating ongoing supervision of remediated items. However, progress in implementing the plan to build out one item—the operational risk function as required by the Director of Supervision's letter dated May 6, 2008—is lagging.

Summary

At year-end 2008, the Enterprise had (1) a new Board and chief executive officer working with the conservator to restore the Enterprise's long-term viability; (2) depleted capital but a substantial backstop from the United States Treasury; (3) poor earnings from unprecedented credit expenses and declines in loan and securities prices; (4) high and increasing credit risk, primarily from declining performance in the single-family business line and concentrations in counterparties; (5) high market risk from aggressive interest rate risk limits and hedging strategies compounded by significant model risk; and (6) high operational risk that can be improved through additional automation of the control environment and a fully developed operational risk oversight function.

Matters Requiring Oversight

The following key matters highlighted in this report require strong management and Board oversight:

Governance

- Work in cooperation with the conservator to continue to recruit and retain qualified senior executive officers to ensure that management is strengthened; ensure appropriate management succession planning and officer accountability.
- Adopt and implement corporate strategies and business plans that reflect the Enterprise's conservatorship status as well as the dramatic changes in the Enterprise's financial condition and the mortgage finance industry.

Credit Risk

- Regularly discuss the allowance for loan losses (ALL) in Board or audit committee meetings. A quarterly ALL report should be provided prior to meetings. The report package should include quantitative and qualitative summary information on levels and trends in the allowance, as well as the dollar impact of key judgments and decisions.
- Revise the private-label securities policy to provide meaningful, enforceable limits with defined oversight roles and responsibilities for the chief risk officer, and develop a risk mitigation plan.
- Ensure that key vacancies are filled, including the positions of credit risk oversight and single-family risk oversight.

Market Risk

- Revise the liquidity management plan for 2009, along with appropriate policies and procedures, to better reflect current market conditions. The plan should address the fact that, under stress, Fannie Mae could not convert its high-quality collateral to cash through repurchase agreements or sales.
- Revise the aggressive interest rate risk limits, particularly the convexity and volatility limits.
- Improve Fannie Mae's analytical capabilities to achieve comprehensive and effective risk measurement, management, and reporting.
- Complete Fannie Mae's plan to securitize its $256 billion single-family whole loan portfolio and its $108 billion multifamily loan portfolio.

Operational Risk

- Monitor progress of developing, documenting, and implementing a robust operational risk oversight framework, including effective key risk indicators, trend analysis, an actionable operational risk profile, and a reliable data collection process. Ensure that management's communication to the Board adheres to operational risk oversight's charter requirements.
- Strengthen staffing levels to allow for the frequent updating of key models for risk, pricing, and loss mitigation/property disposition.
- Improve the controls over the loss forecasting process, and enhance the loss reserving models to make them more comprehensive and less reliant on management judgment.

Governance

The new Board of Directors, the new chief executive officer and management face significant challenges in addressing complex governance issues in the midst of significant industry upheaval. The board and management have demonstrated their willingness to address governance issues in a timely manner. However, the complexity of the issues and other complicating factors may impede or delay their efforts.

Board of Directors

The Board has successfully re-established the committee infrastructure and other processes necessary to fulfill the Board's responsibilities, and has made substantial progress in a short period of time. The Board should also continue to enhance its practices as appropriate to address the heightened demands of the current environment and Enterprise responsibilities.

The Board faces significant challenges in its efforts to strengthen management, given the Enterprise's condition and the business environment. Long-term success requires a strong, stable, and deep management team. Management reports to the Board should highlight matters that deserve Board attention, and should help the Board monitor efforts to remediate supervisory issues.

Management

Since conservatorship, senior management has been evaluating and implementing personnel changes, as well as changes to committee structures and reporting lines. Turnover and vacancies create significant disruption in Enterprise processes and contribute to the uncertainties inherent in the Enterprise's condition. The Enterprise is challenged in its efforts to strengthen management, but the Board and management have made significant progress in filling key positions. However, compensation remains a significant risk factor.

In May 2008, the Director terminated the May 23, 2006, consent order because the Enterprise was in compliance with the terms of the order and implemented methods for ongoing supervision of remediated items in the order. This represented a major milestone for the Enterprise. However, management has not achieved sufficient progress in implementing the plan to build out the Enterprise's operational risk oversight function.

Corporate policy and risk management practices are being revised as necessary to be consistent with the objectives of the conservatorship, guidance received from the conservator, and related Enterprise strategies.

Enterprise Risk Management

New management continues to work on establishing an effective enterprise risk oversight function. However, the Enterprise does not have stable market risk oversight or operational risk oversight functions.

Audit

The audit committee of the Board was re-established and is fully functioning. The reconstituted committee approved a new charter and has been addressing key matters, including the approval of the 2009 audit plan. The internal audit department has the appropriate stature within the Enterprise, is meeting its objectives, and meets applicable professional standards.

Compliance

The audit committee also oversees compliance matters and is fully functioning. The compliance program appears to be functioning effectively based primarily on the compliance division's contribution in the termination of the 2006 consent order.

Accounting

Accounting policies and estimates, which are inherently high risk, especially in the current market conditions, continue to raise concerns. The Enterprise implemented Section 404 of the Sarbanes-Oxley Act. The external auditor conduct-

ed an integrated audit, and was able to rely on some of the work done by internal audit.

During the third quarter of 2008, Fannie Mae met FHFA's expectations in meeting a minimum safety and soundness threshold for the application of Generally Accepted Accounting Principles (GAAP), and consistency in approach between the two Enterprises. In addition, the Enterprise properly implemented FAS 159, *The Fair Value Option for Financial Assets and Financial Liabilities*, as well as FHFA's Fair Value Option guidance issued in April 2008.

FHFA's review of reserves for credit default and guarantee costs revealed the following:

- Accounting policies in this area are in accord with GAAP.
- Management initiated steps to enhance the reserve analysis and reporting process, and improved reporting of the impact of assumptions and decisions on the reserve calculation.
- In the first half of 2008, weaknesses were noted in the process used to calculate reserves, but documentation was improved later in the year. A more conservative approach or enhanced documentation may have been warranted to meet an enhanced safety and soundness standard.
- In 2008, there were large but expected differences between GAAP-based reserves and other measures of credit loss, because reserves follow GAAP guidelines and are calculated differently than total future expected losses. Regular reconciliation of the different measures will inform and enhance the GAAP reserve process.

The Enterprise first established a valuation allowance for the deferred tax assets (DTA) for the third quarter of 2008 of $21.4 billion, which is 82 percent of the $26 billion DTA, because it was not certain it would be able to earn sufficient future taxable income needed to realize the entire DTA. The Securities and Exchange Commission did not object to the Enterprise's method.

A proposed change by FASB to FIN 46(R), *Consolidation of Variable Interest Entities*, would result in the consolidation of $2 trillion in loans, currently in off-balance-sheet trusts. Depending on the implementation date, which is expected to be January 1, 2010, it will be difficult for the Enterprise to implement the proposed amendments in a controlled manner.

Solvency

FHFA's Office of Capital Supervision formally classifies capital adequacy quarterly in accordance with Subtitle B of the Federal Housing Enterprises Financial Safety and Soundness Act of 1992 and with the requirements set forth in FHFA's minimum and risk-based capital regulations. The Enterprise is required by federal statute to meet both minimum and risk-based capital standards to be classified as adequately capitalized. Through the second quarter of 2008, Fannie Mae remained subject to an Office of Federal Housing Enterprise Oversight-directed capital requirement from 2004 that was subsequently modified twice in 2008.

On September 6, 2008, the FHFA Director appointed FHFA conservator for the Enterprise. Subsequently, the Director suspended capital classifications for the conservatorship period. The Director made this determination based on the fact that the purpose of the classifications—prompt corrective action—is moot during conservatorship, and because the capital, or GAAP net worth, position of the Enterprise would be supported by the United States Treasury's Senior Preferred Stock Purchase Agreement. The action to place the Enterprise into conservatorship is supported by the Treasury agreement, which ensures that the Enterprise will maintain a positive net worth through Treasury's commitment to provide up to $200 billion of capital.

FHFA classified Fannie Mae as adequately capitalized for year-end 2007 and the first quarter of 2008. Fannie Mae issued $7.0 billion in preferred stock in December 2007 to bolster its surplus. Although Fannie Mae met all FHFA capital requirements for the second quarter 2008, the Director used his discretionary authority to classify Fannie Mae as undercapitalized for that quarter, citing concern about the sufficiency of capital given the continuing market downturn during July and August. Fannie Mae completed an issuance of common, preferred, and mandatory convertible preferred stock totaling $7.4 billion in May 2008. However, credit losses resulted in rapid depletion of capital throughout the summer. The Enterprise could not raise additional capital, which was a key factor in the decision by the Director to appoint FHFA as conservator for the Enterprise.

FHFA did not classify Fannie Mae's capital for the third quarter 2008. Fannie Mae maintained positive GAAP net worth throughout the third quarter. Although GAAP net worth remained positive, it deteriorated significantly during the quarter when Fannie Mae recorded a negative deferred tax asset adjustment of $21.4 billion. A draw on the Treasury commitment of $15.2 billion was required to eliminate the negative balance of GAAP net worth at year-end 2008, again owing to continuing significant credit losses and negative mark-to-market adjustments.

Earnings

Fannie Mae reported a historic annual net loss of $58.7 billion. Financial results, which were poor in the first half of the year, dropped to unprecedented levels in the second half of the year, as the downturn in housing, mortgage, and credit markets accelerated.

The plunging market adversely affected key market drivers, yielding high mark-to-market losses, credit-related expenses and losses (the provision for credit losses, foreclosed property expense and losses on certain guarantee contracts), and impairments of deferred tax assets in 2008.

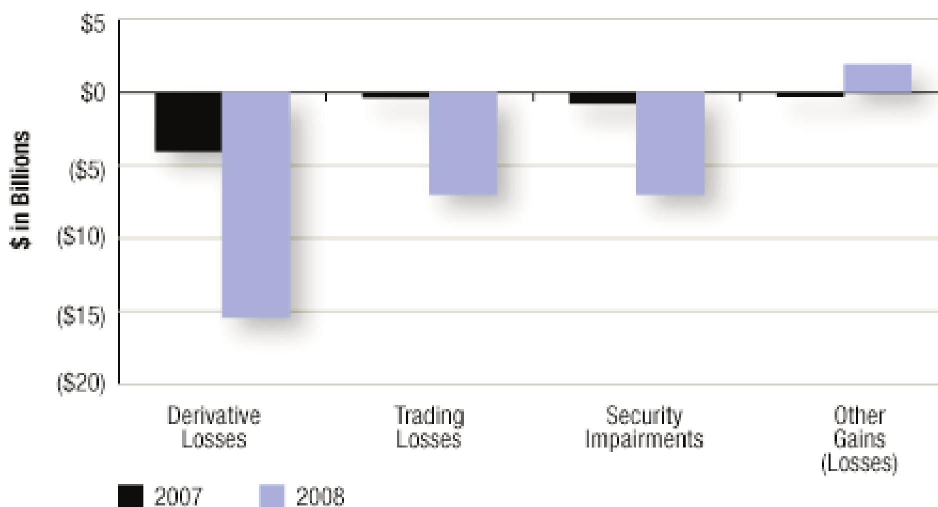
Revenue

Revenue was a bright spot for earnings in 2008 despite the decline in the size of the mortgage market. Fannie Mae reported increases in revenue from both the investment portfolio business and the credit guarantee business.

Net interest income increased to $8.8 billion from $4.6 billion in 2007. The disruption in credit markets that started in mid-2007 increased the cost of long-term funding and resulted in a shift to more short-term debt funding. Beginning in July 2008, extended market turmoil reduced demand for the Enterprises' long-term debt and callable debt. As a result, Fannie Mae substantially increased its reliance on short-term debt funding. Greater reliance on short-term debt at lower borrowing rates decreased the average cost of debt and increased net interest yield during the year.

Guarantee fee income increased to $7.6 billion from $5.1 billion in 2007. Significant decreases in mortgage rates in the second half of the year increased expected prepayments and accelerated recognition of guarantee fee income.

Figure 18 • Fannie Mae Mark-to-Market Losses Detail



Source: Federal Housing Finance Agency

Mark-to-Market Losses

Mark-to-market losses rose in 2008 as market conditions impacted key drivers of losses. Fannie Mae incurred mark-to-market losses of $27.6 billion in earnings in 2008, compared to $5.6 billion of mark-to-market losses in 2007.

Mark-to-market losses on derivatives, which are used to hedge mortgage investments, were substantial in the second half of the year, driven by historic declines in interest rates.

Market values of private-label mortgage-backed securities held by the Enterprise plummeted during the year. Consequently, Fannie Mae incurred substantial trading losses and other-than-temporary impairments on securities. Declining security market valuations also drove a substantial increase in unrealized losses on available-for-sale securities, reported in shareholders' equity but not in earnings. Realized and unrealized losses on nonagency securities totaled $26.3 billion in 2008.

Credit-Related Expenses and Losses

Increasing unemployment rates and declining house prices contributed to higher delinquency and default rates on mortgages, and increased the severity of credit losses. Accordingly, Fannie Mae substantially increased its loan loss reserves during the last half of the year to reflect higher expectations of credit losses.

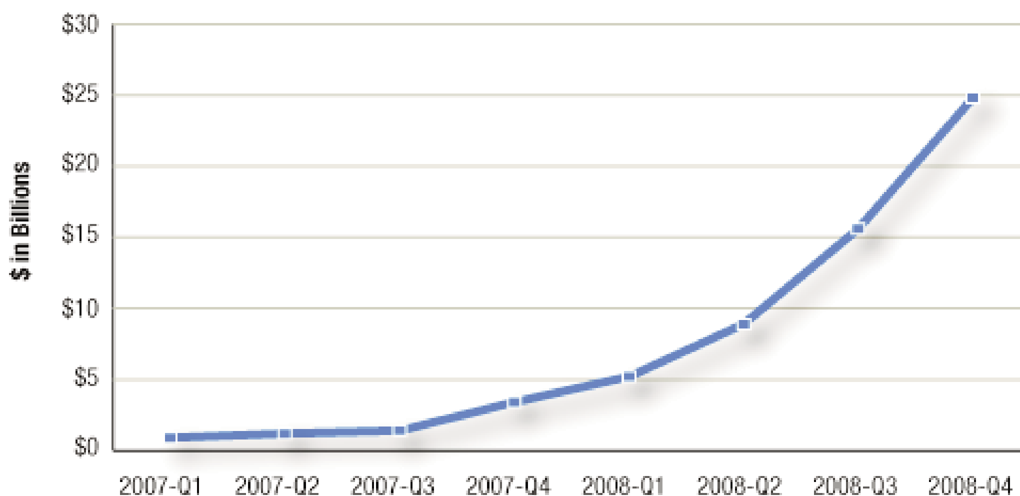
The market downturn resulted in more properties entering foreclosure, which increased foreclosure-related expenses. Credit losses from purchases of delinquent loans increased as the prices of these loans declined.

These factors led to higher credit-related expenses and losses compared to the previous year. Fannie Mae reported credit-related expenses and losses in earnings of $29.8 billion in 2008 compared to $6.4 billion in 2007.

Provision for Federal Income Taxes

In 2007, Fannie Mae recorded a benefit for federal income taxes, which increased earnings. But in 2008, Fannie Mae incurred substantial provisions for federal income because it established a partial valuation allowance for deferred tax assets during the third quarter of 2008. The decision to establish the valuation allowance to reduce deferred tax assets was based on management's conclusion that Fannie Mae was not likely to generate suffi-

Figure 19 • Fannie Mae Credit Loss Reserve



Source: Federal Housing Finance Agency

cient future taxable income to realize the full amount of its deferred tax assets.

Summary

In 2008, high mark-to-market losses, credit-related expenses and losses, impairments of deferred tax assets, and higher unrealized losses on available-for-sale securities depleted shareholders' equity and led Fannie Mae to request $15.2 billion from the Treasury Senior Preferred Stock Purchase Agreement.

Credit Risk Management

The Enterprise experienced rapidly declining credit performance, primarily in the single-family business line. The declining performance affected earnings and capital through increased credit expenses, including large additions to the loan loss reserve, severely weakening the Enterprise.

Many of the Enterprise's recent credit losses are the result of higher-risk lending through the increased acquisition of nontraditional products, particularly Alt-A mortgages. Prudent underwriting and eligibility standards were not in place for these products, and consequently a disproportionate amount of delinquencies, foreclosures, and losses come from these products. Like many other mortgage investors, Fannie Mae did not anticipate the substantial and sustained nationwide decline in house prices and the realized poor creditworthiness of many recent homebuyers. During 2008, both before and after the conservatorship, Fannie Mae took steps to strengthen its underwriting standards to respond to the market.

Counterparty risk is increasing because of the problems faced by mortgage insurers, servicers, and loan originators. Mortgage insurers and financial guarantors experienced rating downgrades and capital erosion that place the viability of many of these companies in jeopardy. In addition, many seller/servicers also experienced capital, liquidity, and operational issues that increase counterparty risk. Several loan originators were financially weak and merged. However, this has resulted in even fewer and larger mortgage originators, which has increased concentration risk for Fannie Mae.

Credit risk management has been responsive to the current crisis, but the effectiveness of its actions begun in 2007 to address the crisis are not yet measurable nor proven sustainable. Credit risk management created avenues for borrowers needing assistance, tightened credit underwriting for new acquisitions, and ceased the acquisition of higher-risk mortgage products. Counterparty risk management identifies exposures from counterparties and takes appropriate actions to protect Fannie Mae's interest. Similarly, management in Housing and Community Development has been responsive to the deterioration in the multifamily business line.

Single-Family Credit

Performance reflected the significant deterioration of the single-family business line in 2008, consistent with the decline of the mortgage market generally. The potential for further earnings deterioration is high due to the large inventory of foreclosed assets coupled with house price depreciation. A significant portion of the delinquent mortgages is credit enhanced, but the companies providing the enhancement are experiencing financial difficulties.

The single-family business continues to address rising delinquencies, losses, foreclosures, and counterparty issues. Management devised programs to assist troubled borrowers, such as the HomeSaver Advance (HSA) program. HSA is showing high redefault rates on the early offerings. Performance on the February through April offerings shows a redefault rate of almost 70 percent, which calls into question the program's assumption that borrowers have the capacity to make payments going forward.

Management is responding to the increase in problem mortgages and the economic downturn

by increasing the loan loss reserve against the single-family book of business. In addition, management is aggressive in developing and promoting loss mitigation strategies aimed at helping troubled borrowers and reducing credit losses. Fannie Mae's management demonstrated leadership in this domain by its work in 2008 on the development and implementation of the Streamlined Modification Program. More recently, Fannie Mae has played a key role in the Making Home Affordable initiative.

Counterparty Credit

Counterparty credit risk is high and increasing. Several counterparties, including mortgage insurers, financial guarantors, and seller/servicers, are facing tremendous volumes of potential claims because of the downturn in single-family credit.

The mortgage insurance industry is troubled with one company in run-off. The condition of the mortgage insurers hinders the mortgage market recovery because of their weakened financial condition and their changes to underwriting standards which limit coverage. Consequently, some borrowers have been unable to refinance high-cost mortgages because of the decline in home prices and the Charter Act requirements for Fannie Mae. Fannie Mae's recent refinance program will help alleviate this problem.

Uncertainty exists with financial guarantors, reflecting problems associated with their concentrated exposure to structured assets and stressed mortgage risk. Accordingly, Fannie Mae wrote down its wrapped portfolio of private-label mortgage-backed securities.

Many seller/servicers are facing operational challenges, including staffing levels to handle increasing volume, and they lack sufficient liquidity and capital reserves to support continued operations and claims-paying ability. Several large seller/servicers received funding from the Troubled Assets Relief Program to boost capital levels. However, institutional failures and mergers raise concern over outstanding representation and warrant claims and the ability to collect on these claims.

Counterparty risk oversight is taking action to better identify counterparty exposure. Fannie Mae's risk measurement database quantifies the outstanding exposure to counterparties by using a conservative approach to risk measurement.

Counterparty credit risk is high and increasing. Several counterparties including mortgage insurers, financial guarantors, and seller/servicers are facing tremendous volumes of potential claims because of the downturn in single-family credit.

The need for business plans governing large relationships is more critical as concentrations to single parties are increasing because of institutional failures and mergers, and the overall strength of several seller/servicers is declining. Counterparty risk management recognizes the large concentrations and is working toward improved concentration management.

Multifamily Credit

Housing and Community Development (HCD) is experiencing the effects of the national economic downturn. While the acquisition profile for HCD is good, the business faces challenges in pricing, the use of Low Income Housing Tax Credits (LIHTC), and acquisitions. Management is responding to the increase in problem credits

and the economic downturn by increasing the loan loss reserve against the HCD book of business.

HCD continues to strengthen its risk management function. Personnel changes and additions strengthened risk management, internal controls, technology, and financial oversight. However, additional improvement is necessary to address deficiencies and inefficiencies in risk identification, measurement, and management. Data and systems deficiencies prevent Fannie Mae from having a strong risk management framework; reporting needs better granularity and accuracy to identify and control the risk. Risk reporting to senior management is still untimely. Management is working to correct these deficiencies.

The disruption in the single-family market affects the current credit environment for multifamily housing. Lenders continue to tighten credit for commercial properties, including multifamily housing. Moreover, there is pressure on available multifamily housing as single-family homeowners displaced by foreclosures seek rental housing. HCD is addressing changing market conditions by developing new or expanding existing products. The division is controlling the risk by ensuring borrowers have sufficient repayment capacity and equity in their projects. While pricing structures are meant to compensate Fannie Mae for the risk incurred, prices often are higher than those of the competition and put Fannie Mae at a competitive disadvantage. Management is challenged to manage and price increasing credit risk while continuing to provide liquidity to the market.

Private-Label Securities

Significant mark-to-market losses in 2008 in the nonagency securities portfolio of more than $26 billion (including accumulated other comprehensive income, trading, and impairment expenses) and continued depreciation of the collateral underlying the private-label securities portfolio are the primary sources of concern.

A combination of continued unprecedented spread widening in mortgage assets along with deteriorating performance in nontraditional, riskier products, including subprime, Alt-A, option ARM and commercial mortgage-backed securities, resulted in significant mark-to-market losses. Most of these securities losses were recorded in the stockholders' equity portion of the balance sheet (i.e., accumulated other comprehensive income).

In 2008, Fannie Mae needed a stronger policy or strategy for unwinding its private-label securities position as prices and performance deteriorated. The deteriorating performance resulted in $19.4 billion of roughly $52 billion in Alt-A, subprime, and option ARM securities as of year-end 2008, almost all of which were rated triple-A at purchase, being downgraded below investment grade. Similar deterioration in the Alt-A, option ARM, and subprime private-label securities portfolio resulted in a cumulative other than temporary impairment of $6.9 billion at year-end 2008. As another measure of poor bond performance, Fannie Mae's private-label securities with original ratings below triple-A (purchased as part of a small pilot program in early 2007) have lost more than 90 percent of their value since their purchase.

Market Risk Management

FHFA conclusions are based on the following: (1) the continued lack of significant investor support for the agency long-term debt market; (2) the extreme volatility of the value of mortgage securities relative to those of other fixed-rate instruments; (3) the unprecedented risk arising from Fannie Mae's market risk models that diminished the reliability of its interest rate risk estimates (a problem throughout the industry); and (4) weaknesses in a significant number of risk management practices.

Liquidity and Funding Risks

The continued lack of depth in the longer-term agency debt market and the need for a more effective liquidity policy that reflects current market

realities drive concerns. Liquidity and funding risks continue to represent a critical risk as the market for Fannie Mae bullet and callable long-term debt deteriorated during 2008 through late November. Market access to long-term debt was virtually closed until the Federal Reserve's announcement that it would purchase up to $100 billion of agency debt securities, subsequently increased in March 2009 to $200 billion.

As a result, Fannie Mae is more exposed to discount note roll-over risk, with short-term debt representing a greater portion of the debt funding mix. The ratio of short-term debt to total debt increased from 39 percent on June 30 to 47 percent at year-end 2008. Also, Fannie Mae stopped efficiently exercising in-the-money options on callable debt during the third quarter of 2008 because of the uncertainty of issuing long-term debt to replace it.

If Fannie Mae could not issue debt and borrow through mortgage repurchase agreements, the Enterprise would be reliant upon the Treasury Department for its GSE credit facility to provide secured funding in an emergency. This facility is scheduled to end at year-end 2009. The Enterprise has tested some of the operations for this facility. However, management cannot completely evaluate the facility operations until a draw from the Treasury Department is effectuated.

Fannie Mae needs to revise its liquidity management plan for 2009, along with appropriate policies and procedures, to reflect current market conditions. At the end of 2008, the liquidity portfolio included corporate bonds and asset backed securities, which are held in a trading account. Since conservatorship, some of these relatively illiquid securities were sold, mitigating some of its concern.

Fannie Mae cannot securitize its $256 billion single-family whole loan portfolio, although it expects to be able to securitize a substantial portion of its portfolio during the first or second quarter of 2009. During the first quarter of 2009, Fannie Mae conducted a successful pilot test of its ability to securitize its existing whole loan portfolio.

Coordination between senior managers of Capital Markets, and Housing and Community Development did not identify significant contingent obligations in variable-rate demand bonds that impacted potential net cash needs. This reporting error was corrected in 2008, but effective communication is still a concern.

Severe credit, market, and liquidity events critically impeded Fannie Mae's modeling and hedging capabilities.

Market Risk Oversight (MRO) needed additional resources to fully oversee liquidity risk and cash management. However, in the first quarter of 2009, Market Risk Oversight hired a director for liquidity risk oversight.

Interest Rate Risk Management

Severe credit, market, and liquidity events critically impeded Fannie Mae's modeling and hedging capabilities. Also, the highly volatile mortgage basis had a profound impact on duration and volatility, making modeling results less reliable and hedging decisions less effective. Nevertheless, Fannie Mae's market risk position was excessive in relation to earnings and capital. Despite aggressive risk limits, Fannie Mae exceeded these limits 11 times during 2008. However, post conservatorship, Fannie Mae became more conservative and lowered its volatility exposure by purchasing a significant amount of long-dated swaptions.

The interest rate risk limits were aggressive, particularly the convexity and volatility limits, given capital and earnings for 2008. Also, MRO resources need to be strengthened for the aggressive limits and challenging market conditions.

Despite improvement to proprietary risk management systems, analytical capabilities fall short of that needed for a comprehensive risk and effective risk measurement, management, and reporting. Market extremes led to calibration issues in the term structure model, misestimating volatility exposure. After conservatorship began, the Enterprise began evaluating the use of third-party proprietary risk analytics and management practices.

MRO must be responsible for generating risk metric reporting and ensuring compliance with market risk limits. Reports must provide adequate information so that the chief risk officer, executive committee and Board can effectively monitor all components of market risk, including daily profit and loss attribution.

Fannie Mae has substantial and increasing derivatives counterparty exposure and must develop and implement a strategy to reduce such exposure. Fannie Mae should continue to explore expanded use of exchanges or central clearing houses for interest rate swaps and swaptions to further mitigate counterparty exposures.

Fannie Mae has yet to effectively address duration estimation issues arising from its $58 billion private-label securities portfolio, which impeded its ability to hedge duration and volatility.

Portfolio Management

The ability to manage the investment portfolio was adversely impacted for a number of reasons including funding pressures, at times the illiquid derivatives markets, and the continual decline in PLS prices limiting portfolio growth to $25 billion post-conservatorship. The accounting treatment, market illiquidity and inability to securitize its whole loan portfolio impede Fannie Mae's ability to actively manage a significant portion of its retained portfolio for risk, return and liquidity.

The reverse mortgage portfolio has liquidity, modeling, and reputational risks, but the credit risk is mitigated by a Federal Housing Administration guarantee. Also, Fannie Mae owns 90 percent of the market share and is the dominant buyer in this market. Fannie Mae should explore the possibility of securitizing the reverse mortgage portfolio, as Ginnie Mae has.

Operational Risk Management

The deteriorating financial condition of the Enterprise, significant safety and soundness concerns, numerous organizational changes, and the uncertain market increase risk to the information technology (IT), internal control, and information management environments. While overall risk increased, Fannie Mae made significant investment and achievements, largely in information technology, to better identify, manage, and mitigate risk. Despite enhancements, the Enterprise relies on manual controls in some areas, and the scale and scope of information technology and internal control remediation that remains is considerable.

Information Technology

Technology has maintained an effective internal control environment while continuing to make progress on multiyear plans for remediating and replacing legacy applications, reduce complexity, and improve IT planning and governance functions. However, successfully managing these initiatives will be challenging.

IT divisions successfully implemented a number of high-profile and critical business unit application development projects, improving processing efficiency, expanding functionality, and reducing complexity. Technology infrastructure and governance projects helped increase capacity. The system development life cycle, incorporated new standards for problem, incident, configuration,

and change management. The technology risk control self-assessment process was enhanced, and role-based access management improved automated internal controls.

Legacy applications and IT infrastructure continued to provide stable performance. No major operational incidents or IT outages occurred in 2008. However, controls did not prevent a contractor from inputting malcode into the network. Fannie Mae identified the malcode through their quality control process, avoiding potentially severe damage. System availability across the major platforms and networks was consistently rated excellent. Operational effectiveness continued to be monitored through monthly reporting. No material weaknesses or significant deficiencies were identified in IT.

Disaster recovery and incident management is well controlled, with recovery plans addressing redundant data, systems, and locations. Management has remediated several of the identified technology issues in credit loss management, and expects to complete remediation in late 2009.

The departure of several managers, and significant staff reductions across several technology divisions, resulted in a new, consolidated technology division, which realigned the application development, risk management, and governance functions. Also, a consultant assessed the operations and technology environment and cost structure in late 2008 to identify opportunities to improve the efficiency and effectiveness of Technology and Enterprise Operations.

Data Quality

Fannie Mae made some progress in 2007 to improve data quality measurement by leveraging its successes in returning to timely financial reporting. However, progress lagged in 2008, when resources were diverted away as other projects were viewed as higher priorities. Policies and standards were approved in early 2009. Only when processes can be integrated into well-designed applications within an evolving, robust, and flexible architecture will efforts move from mitigation to remediation.

Certain business processes and internal controls remain manually intensive. Enterprise Operations has reduced the level of key person dependence, but the concern still exists at the manager level.

Internal Controls

Risks to the internal control environment have increased with the deteriorating financial condition of the Enterprise, the uncertain market, significant safety and soundness concerns, lower employee morale, and multiple organizational changes. Certain business processes and internal controls remain manually intensive. Enterprise Operations has reduced the level of key person dependence, but the concern still exists at the manager level. Internal controls are largely detective, rather than preventive. Business process mapping exists, but the efforts have not been consolidated to provide a complete Enterprise-wide view on internal controls.

Although there are deficiencies in the internal control environment, Enterprise operations, information technology, the business units continue to improve internal controls. Despite the recent market and internal challenges, Fannie Mae continues to comply with Sarbanes-Oxley Act requirements and manage timely financial reporting.

Operational Risk Oversight

Significant work remains to develop and implement a robust operational risk oversight (ORO) function. Initiatives in development or in process include control self-assessments, key risk indicators, trend analysis, analysis of the operational risk profile, and improved measurement of economic capital.

In mid-2008, ORO announced personnel and organizational changes and proposed enhancements to the original three-year plan, but the new strategy means further delays in completing its oversight program. ORO established its infrastructure and a fundamental program only in the last year. Key second-year goals for risk identification, metrics, and reporting are incomplete. Documentation needs strengthening to summarize the current state of operational risk. ORO should report to the Board quarterly, but reported to the Board only once during 2008.

To enhance the original program design and the Enterprise's assessment of operational risk, ORO is partnering with Lean Six Sigma, Information Technology, Internal Audit and Compliance. However, since the announcement of the integration plans, limited progress has been made.

Model Risk and Management

At the start of 2008, many of Fannie Mae's key credit models had not been recently updated and tended to understate credit risk. During the course of the year, these models were substantially improved. Unfortunately, these improvements came too late, after the Enterprise had already bought or guaranteed hundreds of billions of dollars in risky loans.

Unprecedented conditions in the housing and mortgage markets during the year posed significant challenges to prepayment and interest rate models. Fannie Mae updated key prepayment models several times to attempt to capture shifting borrower behavior. These models performed reasonably well and outperformed some dealer benchmark models in the last half of the year. However, the models continue to produce faster-than-actual prepayment estimates for particular products, highlighting potential issues that need to be researched and addressed.

The credit crisis has highlighted the importance of frequently reevaluating credit valuation models. In early 2008, credit models throughout the industry and at the Enterprise substantially under-predicted credit losses. But during the year, several older key credit models were updated, improving model results. Fannie Mae should strengthen staff levels to help in developing models used in managing the dramatic increase in delinquencies and foreclosures.

Controls and Governance

The Enterprise risk office's responsibility for model risk oversight should be more comprehensive, model risk oversight responsibilities currently focus on independent model validation and should be expanded to better cover other aspects of model risk management. Fannie has made good progress in this area, but the process is not yet fully mature.

Credit-related expenses and losses are defined as the sum of the provision for credit losses, foreclosed property expense, and losses on certain guarantee contracts.

Report of the Annual Examination of Freddie Mac (Federal Home Loan Mortgage Corporation)

Examination Authority and Scope

This Report of Examination contains the results and conclusions of FHFA's 2008 annual examination of the Federal Home Loan Mortgage Corporation (called Freddie Mac, or the Enterprise) performed under section 1317(a) of the Federal Housing Enterprises Financial Safety and Soundness Act of 1992 as amended (12 USC § 4517(a)). FHFA's annual examination program assesses the Enterprise's financial safety and soundness and overall risk management practices. The framework FHFA uses to report examination results and conclusions to the Board of Directors and Congress is known as GSEER, which stands for Governance, Solvency, Earnings, and Enterprise Risk (Enterprise Risk comprises credit, market, and operational risk management).

2008 Examination Scope

In 2008, FHFA dedicated significant resources to analyzing the Enterprise's levels and trends in asset quality and their effect on loan loss reserves, earnings, and capital adequacy. Once the Director appointed FHFA as conservator, examination activities shifted to monitoring rapidly changing market conditions, management actions, and their effect on the Enterprise's risk profile and condition.

Other examination activities during 2008 assessed actions of the Board of Directors, quality of executive management, enterprise-wide risk management and audit functions, accounting estimates and their effect on capital, key model performance, loan delinquency and foreclosure management, counterparty exposure, liquidity and interest rate risk profiles and risk management practices, the internal control environment, and risks in information technology, data quality, and business continuity.

Rating

Freddie Mac's composite rating is *critical concerns.* An Enterprise with critical safety and soundness concerns exhibits severe financial, nonfinancial, operational, or compliance weaknesses. An Enterprise with this rating requires more than normal supervision to ensure deficiencies are addressed. Definitions for all composite ratings can be found in FHFA's *Supervision Handbook* on the agency's Web site www.fhfa.gov.

FHFA communicated to the Enterprise a mid-year rating and it was a contributing factor to the appointment of FHFA as conservator in early September. The appointment of FHFA as conservator, combined with Treasury financial support, Federal Reserve actions, and new management at the Enterprise have stabilized the Enterprise's condition. While the critical concerns rating at year-end reflects the fact that the Enterprise is not currently capable of operating without government assistance, FHFA also acknowledges the strides the Freddie Mac Board, management, and staff have made under conservatorship to help stabilize the Enterprise and maintain its ongoing support of the secondary mortgage market.

Examination Conclusions

The Enterprise exhibits critical safety and soundness concerns primarily owing to the weak housing market, exacerbated by weak legislative capital requirements, resulting in severe financial weaknesses that worsened to unprecedented levels during 2008. Certain risk management decisions prior to the conservatorship, coupled with continued financial market deterioration, contributed to net losses and eroded capital. Weakened earnings and market conditions led to difficulties in raising capital and issuing long-term debt, which contributed to the Director's decision to appoint FHFA as conservator.

In prior years, management expanded product eligibility to include nontraditional mortgage products, particularly Alt-A and interest-only mortgages, and private-label securities containing subprime and Alt-A mortgages. Moreover, the Enterprise did not require originators to fully assess borrower capacity. Certain decisions, coupled with deterioration in the economy and house prices, led to escalating increases in delinquencies, foreclosures, and credit expenses, on top of $53 billion of losses from impairments and mark-to-market accounting in nonagency securities.

Market illiquidity significantly increased risks in market risk management. The lack of significant investor support for the Enterprise long-term debt markets before conservatorship revealed weaknesses in management's liquidity strategies, and the volatility of the mortgage market reduced the reliability of hedging decisions. Uncertain model results led to high realized levels of interest rate risk relative to the Enterprise's common economic capital.

Internal control weaknesses continue to require remediation, and information technology and related architecture require modernization. The Enterprise is largely dependent on a manual internal control environment. Substantial work remains to resolve these issues.

Accounting policies and estimates that are inherently high-risk given current market conditions continue to raise concerns. Under previous management, FHFA found that the Enterprise had taken a less than conservative approach in the application of generally accepted accounting principles (GAAP), which in FHFA's view was not in line with safety and soundness in regard to other than temporary impairment (OTTI) and the implementation of the fair value option.

Financial Performance

Historically large net losses in 2008 resulted from a confluence of significant fair value losses, escalating credit-related expenses, and a large partial valuation allowance for deferred tax assets. The earnings outlook for 2009 is poor. The Enterprise's return to financial health may well require major financial restructuring.

Asset Quality

The Enterprise's credit performance is expected to remain stressed for the next one to two years due to rapidly growing credit losses and the increasing concentrations and exposure to counterparties with declining financial capacity. Management has taken steps to strengthen underwriting standards and other practices to reduce losses. However, these improvements only partially mitigate the increasing losses.

In early 2008, credit risk models substantially under-predicted credit losses. Later in 2008, key credit applications in guarantee fee pricing and automated underwriting were substantially updated, improving performance. Unfortunately, these improvements came too late, after hundreds of billions of dollars in risky loans had already been acquired or guaranteed.

Internal Controls

Risks in internal controls, information technology, and the information management environments increased due to the Enterprise's deteriorating financial condition, significant safety and soundness concerns, key personnel vacancies, and the uncertain markets. Improvements in the internal control structure have reduced the likelihood of operational failures relating to the financial reporting process. Despite these improvements, the Enterprise has certain manual controls that require automation. Reliance and sustainability of the control environment are

challenged by the large number of manual controls. Considerable work remains to improve information technology systems, remediate known control weaknesses, and address issues in the design of internal controls. Correction requires multiyear plans to address the deficiencies. These internal and external challenges could delay or derail needed enhancements.

The external auditor did not express an opinion on the effectiveness of internal controls over financial reporting (ICFR) because the Enterprise was unable to complete its assessment of the effectiveness of ICFR as of year-end 2008. Without an independent opinion, there is uncertainty about the overall control environment at Freddie Mac.

Summary

At year-end 2008, the Enterprise had (1) new management and a new Board working with the conservator to stabilize the Enterprise; (2) depleted capital but a substantial backstop from the United States Treasury; (3) losses from unprecedented credit expenses arising from loan losses and declines in the value of securities; (4) rapidly growing credit losses and the declining financial capacity of counterparties; (5) high market risk from reduced liquidity, interest rate risk limits and significant model risk-leading to the need for on-top adjustments in hedging; and (6) heightened operational risk from growing transaction volumes in defaulted loan processing, combined with recent management and organizational changes.

Matters Requiring Oversight

The following key matters highlighted in this report require strong management and Board oversight:

Governance

- Work in cooperation with the conservator to recruit and retain qualified senior executive officers including, as of March 2009, a CEO to strengthen management and ensure appropriate succession planning.
- Adopt and implement corporate strategies and business plans that reflect the Enterprise's conservatorship status as well as the dramatic changes in the Enterprise's financial condition and the mortgage finance industry.
- Continue to develop a framework for management reporting to the Board that draws attention to internal and external conditions that potentially threaten the achievement of corporate objectives.

Credit Risk

- Ensure that weaknesses in the process for determining single-family loan loss reserves are addressed under the ownership of an independent risk management function.
- Revise private-label securities policies to provide meaningful, enforceable limits with defined oversight roles and responsibilities for the Enterprise risk officer, portfolio, and develop a risk mitigation plan.

Market Risk

- Revise the liquidity management plan, policies, and procedures to better reflect market conditions.
- Improve efficiency and address independence in cash management reporting.
- Reduce the convexity and volatility Board limits and identify an effective replacement denominator for common economic capital that improves the resulting equity-at-risk metric.

Operational Risk

- Oversee progress in improving core systems and architecture, promptly comply with Section 404 of the Sarbanes-Oxley Act, remediate known control weaknesses, address the external auditor's comments on the design of internal controls, and continue to make progress in improving data quality.
- Strengthen staffing levels to allow for the frequent updating of key models for risk and pricing, and the development of loss mitigation/property disposition models.

Governance

The new Board of Directors, the new chief executive officer, and management face significant challenges in addressing complex governance issues in the midst of significant industry upheaval. The Board and management have demonstrated their willingness to address governance issues in a timely manner. However, the complexity of the issues and other complicating factors may impede or delay their efforts.

Board of Directors

The new Board has successfully reestablished the committee infrastructure and other processes necessary to fulfill the Board's responsibilities, and has made substantial progress in a short period of time. The Board should also continue to enhance its practices as appropriate to address the heightened demands of the current environment and Enterprise responsibilities.

The Board faces significant challenges in its efforts to strengthen management, given the Enterprise's condition and the current business environment. Long-term success requires a strong, stable, and deep management team. Reports should highlight matters that deserve Board attention and that also help the Board monitor efforts to remediate supervisory issues, a process that is well under way.

Management

Since conservatorship, senior management has been evaluating and implementing changes to personnel, organizational and committee structures, and reporting lines and practices as part of

the restructuring process. Turnover and vacancies on the scale the Enterprise has experienced create significant disruption in Enterprise processes and contribute to the uncertainties inherent in the Enterprise's condition. The Enterprise is challenged in its efforts to strengthen management given the current environment. Compensation remains a significant risk factor.

Corporate policy and risk management practices are being revised as necessary to be consistent with the objectives of the conservatorship, guidance received from the conservator, and related Enterprise strategies.

Enterprise Risk Management

The risk oversight framework which facilitates an integrated evaluation of each of the Enterprise's main risk areas needs to be strengthened. Separate sections of this report identify examination concerns, such as limit levels and enforcement, exposure measurement, policy development, and staffing.

Audit

The audit committee of the Board was reestablished and is fully functioning. The reconstituted committee approved a new charter, has been addressing key matters, and approved the 2009 audit plan, although there was a change in the head of internal audit. Internal audit has the appropriate stature within the Enterprise, is meeting its objectives, and meets applicable professional standards.

Compliance

The audit committee oversees compliance matters and is fully functioning. The compliance program appears to be effective. The compliance division plays a significant role in remediating the Enterprise's supervisory matters and deficiencies. The chief compliance officer leads the remediation committee, which ensures, in part, that senior management creates and implements action plans to resolve identified deficiencies. The committee has enhanced the level of management discipline in remediating issues.

Accounting

Accounting policies and estimates, which are inherently high risk given current market conditions, continue to raise concerns. The external auditor did not express an opinion on the internal controls for financial reporting (ICFR) because the Enterprise was unable to complete its assessment of the effectiveness of ICFR at year-end 2008. An integrated audit is planned for 2009, as required by the Securities and Exchange Commission (SEC) and Sarbanes-Oxley Act.

During the first half of 2008, FHFA noted the Enterprise's reluctance to recognize declines in value as OTTI despite clear signals from the markets and the rating agencies.[1] FHFA raised significant safety and soundness concerns regarding the Enterprise's implementation and judgments used in its OTTI assessment, including the consistency between its OTTI assessment and written policies. FHFA also found inconsistencies between Fannie Mae's and Freddie Mac's OTTI assessments. To address these findings, FHFA provided the Enterprises with its guidance in this area, and Freddie Mac made significant progress in implementing the standards and addressing issues needing attention.

The Enterprise adopted FAS 159, *The Fair Value Option (FVO) for Financial Assets and Financial Liabilities.* The Enterprise applied it principally to securities with unrealized gains, although the portfolio held securities with many more unrealized losses. A more balanced application of FVO would have produced lower regulatory capital. FHFA finalized a draft FVO guidance for both Enterprises in April 2008 to establish consistency and a minimum threshold for the application of GAAP. Freddie Mac has made progress in complying with the guidance.

[1] The value of a security is impaired when its fair value falls below its carrying value on the books. When this occurs, an assessment must be made to determine whether the impairment is other than temporary. If an impairment is determined to be other than temporary, the decline in value must be recognized by writing the book value down to its fair value through earnings. The process of making the determination is referred to as the OTTI assessment and is carried out at least quarterly for accurate financial reporting purposes.

FHFA's review of reserves for credit default and guarantee costs revealed the following:

- Accounting policies in this area are in accord with GAAP.
- Management initiated steps to enhance the reserve analysis and reporting process, and improved reporting of the impacts of assumptions and decisions on the reserve calculation.
- In the first half of 2008, weaknesses were noted both in the process and judgments used to calculate reserves, given the uncertainties in current market conditions. A more conservative approach is more consistent with safety and soundness.
- In 2008, there were large but expected differences between the GAAP-based reserves and other measures of credit loss because reserves follow GAAP guidelines and are calculated differently than total future expected losses. Regular reconciliation of the different measures will inform and enhance the GAAP reserve process.

The Enterprise first established a valuation allowance of $14.1 billion, or 54 percent of the $26 billion deferred tax assets (DTA), for the third quarter of 2008, because it was not certain it would be able to earn sufficient future taxable income needed to realize DTA. The SEC did not object to the Enterprise's method.

A proposed change by FASB to FIN 46(R), *Consolidation of Variable Interest Entities*, would result in the consolidation of well over a trillion dollars of mortgages in off-balance-sheet trusts. It will be difficult for the Enterprise to meet the expected January 1, 2010 date due to the systems changes required to comply with the proposed amendments in a controlled manner.

Solvency

FHFA's Office of Capital Supervision formally classifies capital adequacy quarterly in accordance with Subtitle B of the Federal Housing Enterprises Financial Safety and Soundness Act of 1992 and with the requirements set forth in FHFA's minimum and risk-based capital regulations. The Enterprise is required by federal statute to meet both minimum and risk-based capital standards to be classified as adequately capitalized. Through the second quarter of 2008, Freddie Mac remained subject to an Office of Federal Housing Enterprise Oversight (OFHEO)-directed capital requirement imposed by a letter of agreement that was subsequently modified in March 2008.

On September 6, 2008, the FHFA Director appointed FHFA as conservator of the Enterprise. Subsequently, the Director suspended capital classifications for the conservatorship period. The Director made this determination based on the fact that the purpose of the classifications—prompt corrective action—is moot during conservatorship, and because the capital, or GAAP net worth, position of the Enterprise would be supported by the United States Treasury's Senior Preferred Stock Purchase Agreement. The action to place the Enterprise into conservatorship is supported by the Treasury agreement, which ensures that the Enterprise will maintain a positive net worth through Treasury's commitment to provide up to $200 billion of capital.

FHFA classified Freddie Mac as adequately capitalized for year-end 2007 and also for the first quarter of 2008. Freddie Mac actually fell below the OFHEO-directed requirement in November 2007, which was 30 percent above the legal requirement, but was able to issue $6 billion of preferred stock in December to come back into compliance before the end of that quarter. Although Freddie Mac met all FHFA capital requirements for the second quarter of 2008, the Director used his discretionary authority to classify Freddie Mac as undercapitalized for that quar-

ter, citing concern about the sufficiency of capital given the continuing mortgage market downturn during July and August.

Freddie Mac had announced its intention to raise additional capital following a March 2008 agreement with FHFA, but by late summer it was clear that the Enterprise's efforts to raise private capital had failed. Risk to capital increased dramatically during this period because of increasing projected credit losses, which directly affected capital through reduced current and future earnings. Freddie Mac's inability to raise capital during the summer of 2008 was a significant contributing factor in the Director's decision to appoint a conservator for the Enterprise.

FHFA did not classify Freddie Mac's capital for the third quarter 2008. Under the terms of the Treasury agreement, a draw on the Treasury commitment of $13.8 billion was required in November 2008 to eliminate Freddie Mac's negative balance of GAAP stockholders' equity as of the end of the third quarter. A deferred tax asset partial valuation allowance of $14.1 billion, along with significant credit and mark-to-market losses, accounted for the substantial drop in capital during the third quarter. Another draw on the Treasury commitment of $30.8 billion will be needed to eliminate the negative balance of GAAP stockholders' equity as of year-end, again caused by continuing significant credit losses and negative mark-to-market adjustments, and an additional deferred tax partial valuation adjustment.

Earnings

Freddie Mac reported a historic annual net loss of $50.1 billion. Although poor in the first half of the year, financial results deteriorated even more sharply to record levels in the second half of the year as the downturn in housing, mortgage, and credit markets accelerated.

The plunging market adversely affected key market drivers, yielding high mark-to-market losses, credit-related expenses and losses (the provision for credit losses, foreclosed property expense, losses on loans purchased and losses on certain credit guarantees), and high taxes in 2008, as compared to the previous year.

Source: Federal Housing Finance Agency

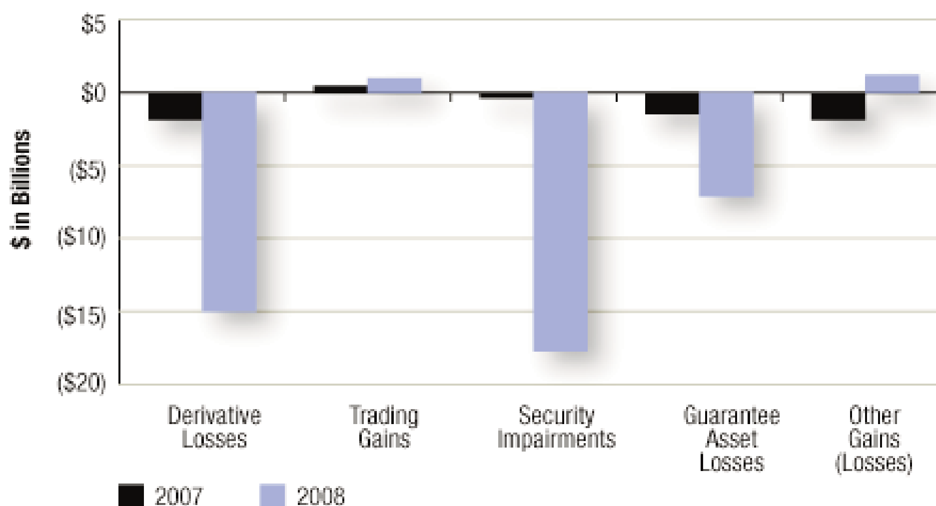
Revenue

Revenue was a bright spot for earnings in 2008 despite the decline in the size of the mortgage market. Freddie Mac reported increases in revenue from both the investment portfolio business and the credit guarantee business.

Net interest income increased to $6.8 billion from $3.1 billion in 2007. Much of this increase can be attributed to a steeper yield curve, as well as increases in the proportion of short-term to long-term funding, along with short-term funding rates that were further below LIBOR than normal.

Management and guarantee income increased to $3.4 billion from $2.6 billion in 2007 primarily due to an increase in the average balance of guaranteed Participation Certificates (PC). In addition, significant decreases in mortgage interest rates in the second half of the year increased expected prepayments, which accelerated the recognition of guarantee income deferred fees. Income flowing from the guarantee obligation more than doubled to $4.8 billion from $1.9 billion as declines in house prices triggered the accelerated of the amortization of the guarantee obligation.

Figure 23 • Freddie Mac Mark-to-Market Losses Detail



Source: Federal Housing Finance Agency

Mark-to-Market Losses

Mark-to-market losses rose in 2008 as market conditions impacted key drivers of losses. Mark-to-market losses grew significantly in 2008, reducing earnings by $37.5 billion in 2008, compared to $5.1 billion in 2007.

Mark-to-market losses on derivatives, which are used to hedge mortgage investments, were substantial in the second half of the year, driven by historic declines in interest rates, which also drove losses on the guarantee asset.

Market values of private-label mortgage-backed securities held by the Enterprise in their retained portfolios plummeted during the year. As a result, Freddie Mac incurred substantial levels of other-than-temporary impairments on these securities. Declining security market values also drove a substantial increase in unrealized losses on available-for-sale securities, reported in shareholders' equity but not in earnings. Realized and unrealized losses on non-agency securities totaled $53.1 billion in 2008.

Credit-Related Expenses and Losses

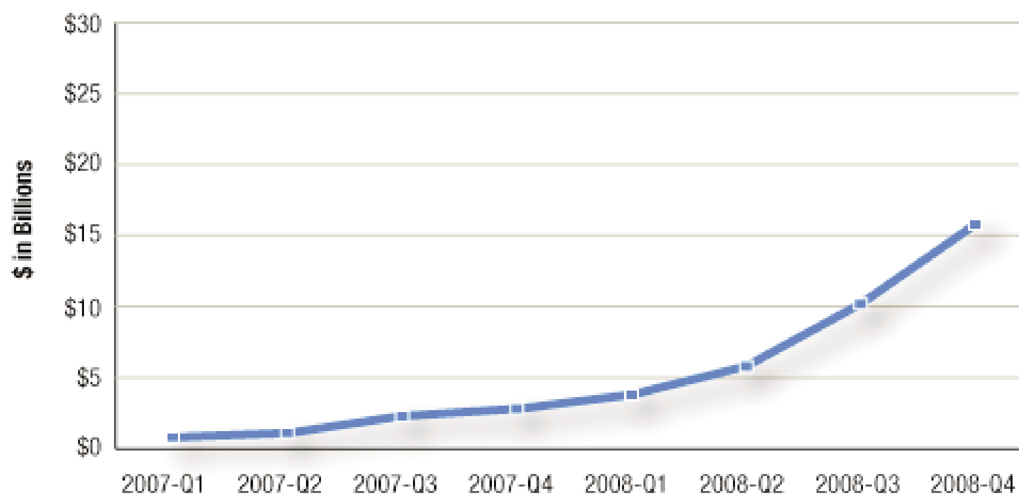
Increasing unemployment rates and declining house prices contributed to higher delinquency and default rates on mortgages and increased the severity of credit losses. Accordingly, Freddie Mac increased its loan loss reserves substantially during the year to reflect higher expectations of credit losses. The provision for loan losses escalated during the last half of the year as a consequence of building the loan loss reserve.

The market downturn resulted in more properties entering foreclosure, increasing foreclosure-related expenses. Credit losses from purchases of delinquent loans increased as the values of the underlying properties dropped. These factors led to much higher credit-related expenses and losses compared to the previous year. Freddie Mac reported credit-related expenses and losses in earnings of $18.7 billion in 2008, compared to $6.4 billion in 2007.

Provision for Federal Income Taxes

In 2007, Freddie Mac recorded a benefit for federal income taxes, which increased earnings. But in 2008, Freddie Mac incurred substantial provisions for federal income taxes because it established a partial valuation allowance for deferred tax assets during the third quarter of 2008. The decision to establish the valuation allowance to reduce deferred tax assets was based on management's

Figure 24 • Freddie Mac Credit Loss Reserve



Source: Federal Housing Finance Agency

conclusion that Freddie Mac was not likely to generate sufficient future taxable income to realize the full amount of its deferred tax assets.

Summary

In 2008, high mark-to-market losses, credit-related expenses and losses, impairments of deferred tax assets, and higher unrealized losses on available-for-sale securities eliminated shareholders' equity and led Freddie Mac to draw $44.6 billion under the Treasury Senior Preferred Stock Purchase Agreement.

Credit Risk Management

The credit function experienced rapidly growing credit losses, which are expected to continue for one to two years. Nonagency securities experienced $53 billion in losses from impairments and mark-to-market accounting at year-end 2008. Also, the weakened financial condition of several counterparties and the consolidation of some seller/servicers continue to increase counterparty concentration and exposure. Like many other mortgage investors, Freddie Mac did not anticipate the substantial and sustained nationwide decline in house prices.

Freddie Mac has taken steps to strengthen underwriting standards and other practices to reduce losses, which include the new chief credit officer position, and the establishment of a corporate credit risk committee, as well as underwriting and pricing changes. However these improvements only partially offset increasing losses from worsening markets.

Freddie Mac is developing a plan to strengthen its credit management reporting, including reporting on portfolio and purchase information, performance results and asset disposition, top counterparty exposure detail, credit loss drilldown, profitability and return analysis, segment earnings, forecasts, and a comparison of actual versus planned performance.

Single-Family Credit

Single-family credit risk is high and continues to increase. Rising levels of housing supply continue to lower house prices, resulting in growing levels of serious delinquencies and real estate owned (REO).

The fourth quarter 2008 credit loss forecast showed sharply rising credit losses over time. During that quarter, management recommended a single-family loss reserve of more than fivefold increase from the same quarter in 2007, reflecting the deterioration in the credit markets. Also, year-over-year serious delinquency rates were nearly two and a half times the previous year's performance level. The 2006 and 2007 book years are significantly contributing to the rising serious delinquency rates, representing about two-thirds of all seriously delinquent loans. Moreover, the 2006 and 2007 book years comprise 71 percent of the losses at year-end 2008. Alt-A mortgages remain leading contributors to serious delinquency rates and credit losses. The portion of the single-family portfolio characterized as Alt-A is responsible for 49 percent of total credit losses at year-end 2008.

Freddie Mac's quality control group (QC) is endeavoring to keep up with the unprecedented volume of nonperforming loans requiring review. The quality control department must combine data from other databases and manual processes to generate quality control reporting. Freddie Mac has taken proactive steps to meet this challenge, including the addition of staff to assist QC in its efforts.

State regulatory changes and conservator requests lengthen foreclosure timelines, and foreclosure laws limit Freddie Mac's ability to dispose of properties, but allow borrowers to stay in their homes. Freddie Mac's risk and credit losses increase as the holding period for nonperforming loans is extended.

Freddie Mac is approving, settling, and booking record levels of mortgage loan workouts and

related foreclosure avoidance activities. Freddie Mac management has been working closely with FHFA, the United States Treasury, the Federal Deposit Insurance Corporation and other constituents to design and implement new initiatives for streamlining modifications and preventing foreclosures.

Freddie Mac's loan loss reserve accounting policies are in accordance with GAAP. However, the surrounding processes for determining the single-family loan loss reserve are a concern.

Counterparty Credit

Counterparty risk has increased as several counterparties face capital and liquidity challenges. Freddie Mac relies on its counterparties for credit enhancements, loan repurchases, portfolio servicing, default asset management, and loss mitigation. Their weakened condition casts doubt on the full collectability of potential obligations, thereby creating an unsafe and unsound condition for transacting business.

The weakened condition of mortgage insurers has hindered the mortgage market recovery. In 2008, the rating agencies significantly downgraded all major mortgage insurers. As of year-end 2008, top MI ratings ranged from A+ to BBB+, below Freddie Mac's type I AA- threshold.

Uncertainty exists over the financial guarantors, reflecting capital adequacy and substantial performance volatility associated with their concentrated exposure to structured assets and stressed mortgage risk. The bankruptcy of Lehman Brothers in September 2008 resulted in Freddie Mac having to write down more than $1 billion of a $1.2 billion short-term unsecured investment with that institution.

Freddie Mac has taken steps to mitigate its counterparty risks by increasing due diligence and risk assessments for high-risk counterparties and decreasing limits when appropriate. Management has recently formed a steering team to identify and raise issues relating to counterparty risk.

Multifamily

Multifamily credit risk and losses increased due to rising capitalization rates and property level expenses, as well as slower rent growth in certain areas. Freddie Mac has begun to address these concerns by strengthening underwriting standards and pricing of multifamily products. Freddie Mac also is developing a loss mitigation plan to address growing delinquencies and real estate owned, and expects to mitigate future losses by raising prices but staying focused on helping the market stay liquid.

Freddie Mac has taken steps to strengthen underwriting standards and other practices to reduce losses, which include the new chief credit officer position, the establishment of a corporate credit risk committee as well as underwriting and pricing changes.

Private-Label Securities

The nonagency securities portfolio experienced significant losses from impairments and mark-to-market accounting of more than $53 billion during 2008 and home price depreciation continued to adversely impact the collateral underlying the private-label portfolio; these are the primary sources of concern. Mark-to-market gains of almost $1 billion were offset by OTTI losses exceeding $17.7 billion, which were recognized in earnings.

Policies for private-label securities and commercial mortgage-backed securities need strengthening to provide more meaningful and enforceable limits and oversight responsibilities for the enterprise risk officer. The enterprise risk officer needs improved authority to force securities sales and limit purchases based on pre-purchase analysis.

Reporting to monitor the portfolio's historical trends and compare it to industry averages is limited, although there was improvement during 2008. Staffing for the credit analysis of private-label residential mortgage-backed securities requires improvement.

Management policy needs expansion to include appropriate escalation procedures to mitigate losses.

Market Risk Management

FHFA conclusions are based on the following: (1) the continued lack of significant investor support for the agency long-term debt market; (2) extreme volatility of the value of mortgage securities relative to those of other fixed-rate instruments; (3) unprecedented model risk arising from Freddie Mac's market risk models that reduced the reliability of its interest rate risk estimates; (4) multiple risk limit exceptions; and (5) weaknesses in a significant number of risk management practices.

Liquidity and Funding Risks

The continued lack of depth in the longer-term agency debt market and the need for a more effective liquidity policy that reflects current market realities drive concerns. Liquidity and funding risks represent a critical risk as the market for Freddie Mac bullet and callable long-term debt deteriorated until late November. Market access to long-term debt was virtually closed until the Federal Reserve's announcement that it would purchase up to $100 billion of agency debt securities.

Freddie Mac is more exposed to discount note roll-over risk with short-term debt representing a greater portion of the debt funding mix. The ratio of short-term debt to total debt increased from 38 percent on June 30 to 52 percent at year-end 2008. Also, Freddie Mac stopped efficiently exercising options on callable debt during the third quarter of 2008 because of the uncertainty over replacing it with long-term debt.

Freddie Mac is reliant upon the Treasury Department for its GSE credit facility for emergency funding. Treasury's support is scheduled to end at year-end 2009. The Enterprise has tested most of the operations but cannot complete the testing of its emergency plan without an actual draw from the Treasury Department.

Freddie Mac needs to revise its liquidity management plan for 2009, along with appropriate policies and procedures, to reflect current market conditions. Cash management reporting is manually intensive and should be independent of the cash investment function and the funding desk. Freddie Mac has improved its cash forecasting processes.

At the end of 2008, Freddie Mac had approximately $9.8 billion of illiquid assets in its liquidity portfolio. These securities are not in a trading account, which adds to FHFA concerns. Most of these securities should not be treated as a source of liquidity, particularly those with a weighted average life longer than one year.

Market Risk Oversight should improve its oversight of liquidity management and reporting to include a clear, specific, and timely process for reviewing and analyzing cash management and liquidity reports.

Interest Rate Risk Management

Severe credit, market, and liquidity events critically impeded Freddie Mac's risk measurement and hedging capabilities. Also, the highly volatile

mortgage basis had a profound impact on duration and volatility, making models and risk measurement results less reliable and hedging decisions less effective. Freddie Mac exceeded its daily market value of equity limits during much of the fourth quarter of 2008, largely driven by declining, or negative, economic common equity estimates.

Freddie Mac needs to revise its liquidity management plan for 2009, along with appropriate policies and procedures, to reflect current market conditions.

Low or negative economic capital during 2008 made interest rate metrics with economic capital in the denominator unreliable. Also, term structure calibration issues resulted in significant volatility exposure measurement errors when short-term interest rates were extremely low and volatile. Until meaningful measures are developed, the Board and management must implement alternative measures, operate with lower risk, and properly manage any interim adjustments or solutions.

Freddie Mac has substantial and increasing derivatives counterparty exposure and must develop and implement a strategy to reduce such exposure. Freddie Mac should also continue to explore expanded use of exchanges and/or central clearinghouses for interest rate swaps and swaptions to further mitigate counterparty exposures.

Portfolio Management

Freddie Mac's ability to manage the investment portfolio was adversely impacted during 2008. Early in 2008, Freddie Mac grew the portfolio significantly, but growth slowed in mid-2008 when Freddie Mac did not raise capital and market conditions made it harder to fund mortgages profitably. After conservatorship began, Freddie Mac increased its portfolio by $50 billion.

Operational Risk Management

Structural, management, and organizational changes have contributed to Freddie Mac's increased operational risk profile. Also, operational risk increased during the year as growing processing volumes for defaulted loans amplified the potential for internal control problems and manual processing errors. However, Freddie Mac achieved certain milestones, including its registration with the SEC.

Information Technology

During 2008, Freddie Mac made improvements in information technology (IT), but significant risks remain. FHFA noted some progress in IT governance processes, functions, and activities during 2008. However, legacy technology systems are inflexible and thus not easily adaptable to support changing business needs. Legacy systems are out-of-date, costly, and time-consuming to support. As a result, Freddie Mac relies on manual processes, work-arounds, and data handoffs to accommodate changing business needs and volume fluctuations. This decreases efficiency and increases the risk of processing errors.

Progress related to several key IT governance processes is as follows:

- Freddie Mac continues to face the challenge of building an effective and sustainable information security program. A key management position

was vacant during the second half of 2008 but filled in January 2009.

- In 2008, Freddie Mac implemented an effective system development life cycle (SDLC) process and launched an internal quality review function to validate that systems under development follow SDLC requirements. However, outside of the operations and technology group, a standard governance process for developing software tools is not used. Some Enterprise functions develop these tools following a well-designed governance process but others do not, resulting in errors that affect decision-making and reporting.

Data Quality

Data quality is a long-standing issue at Freddie Mac. The Enterprise has made efforts to better manage data and measure its quality, but progress has been slow and uneven. In 2007, Freddie Mac began to adopt data management approaches based on industry standards and best practices. The Enterprise continued to build the foundation of a strong data management program in 2008.

The Enterprise is developing the capacity to measure and report on data quality and has taken the first steps in integrating data reviews into the application development process. Progress is real, but several significant issues need to be overcome in order for progress to continue.

Internal Controls

Improvements in the control structure have reduced the likelihood and severity of operational failures in financial reporting processes. Work remains to address operational risks including remediating known control weaknesses, addressing issues in the design of internal controls and updating business processes and control documentation for automation and business process changes.

During 2008, Freddie Mac registered with the SEC. This registration requires Freddie Mac to comply with Section 404 of the Sarbanes-Oxley Act by the end of 2009. To do this, management must remediate existing control weaknesses and test the Enterprise's internal controls and procedures for financial reporting.

Unprecedented conditions in the mortgage market during the year posed significant challenges to prepayment and interest rate models.

The Enterprise was unable to complete a comprehensive management assessment of the effectiveness of internal control over financial reporting as of year-end 2008. Thus, the external auditor did not issue an independent opinion on the internal controls for financial reporting. Delays in completing business process documentation, addressing the external auditor's comments on control designs for business processes, and incomplete remediation of IT general controls all contributed to the decision that an integrated audit was not possible for 2008. Without an independent opinion, there is uncertainty about the Enterprise's overall control environment.

Operational Risk Management Oversight

The operational risk management division satisfactorily informs management about the level and types of operational risks at Freddie Mac. In 2008, Freddie Mac further developed the operational risk program, with particular progress

made on loss data collection, baseline risk assessments, and scenario analyses. However, the resignation of the senior vice president of Enterprise operational risk oversight in the third quarter of 2008 slowed progress on the program.

Model Risk and Management

At the start of 2008, many of Freddie Mac's key credit models had not been recently updated or tended to understate credit risk. During the course of the year, these models were substantially improved. Unfortunately, these improvements came too late, after the Enterprise had already bought or guaranteed hundreds of billions of dollars in risky mortgage products.

Unprecedented conditions in the mortgage market during the year posed significant challenges to prepayment and interest rate models. Freddie Mac updated key prepayment models several times to capture changing borrower behavior. The models performed better as a result of the updates.

Market dislocations challenged interest rate models. The mortgage propagation model did not perform well during the year, exhibiting error well outside management thresholds. Historically low interest rates and extreme volatility also challenged the two-factor term structure model. The model exceeded management performance tracking thresholds for most of the year. An improvement to the current model was implemented near the end of the year, and a new model was deployed in December 2008.

The credit crisis underscores the need to frequently reevaluate credit valuation models. In early 2008, credit models throughout the industry and at the Enterprise substantially under-predicted credit losses. However, during the year management substantially updated key credit applications. Freddie Mac should strengthen staff levels devoted to all phases of credit model development to continue progress.

Controls and Governance

Internal audit's (IA) model audit function needs strengthening in its numbers of individuals with the appropriate skills and backgrounds, to improve its ability to evaluate the reliability of Freddie Mac's independent model validation function. Also, IA activities should include the regular monitoring of model risk exposures or attending senior management meetings covering model risk. IA has committed to addressing these issues in 2009.

Report of Examinations of the Federal Home Loan Banks

Examination Authority and Scope

Section 20 of the Federal Home Loan Bank Act (12 USC 1440) requires examinations of each Federal Home Loan Bank (FHLBank) at least annually. The Federal Housing Finance Agency's Division of FHLBank Regulation is responsible for carrying out the on-site examinations and the ongoing supervision of the FHLBank System. The FHLBank System includes the Office of Finance and 12 Federal Home loan Banks: Atlanta, Boston, Cincinnati, Chicago, Dallas, Des Moines, Indianapolis, New York, Pittsburgh, San Francisco, Seattle, and Topeka. Through its examinations, data analysis, and risk monitoring activities, the division identifies matters requiring corrective action by the FHLBanks and monitors steps taken to correct deficiencies. The examination program is intended to promote the continued safe and sound condition of each FHLBank and the achievement of their housing finance and community investment mission.

In 2008, the Federal Housing Finance Agency (FHFA) examined all FHLBanks and the Office of Finance. On-site comprehensive annual examinations normally take 5 to 15 weeks. In addition, FHFA examiners visit the FHLBanks between examinations. Examiners-in-charge communicate regularly with FHLBank management.

FHFA examiners use a risk-based approach to supervision. Examinations focus on the principal risks at the particular FHLBank and are intended to assess the role of the FHLBank's Board and management in overseeing the FHLBank's activities, to evaluate the quality and effectiveness of risk management at the FHLBank, and to review the FHLBank's financial condition and performance.

In addition to examinations, the FHFA Division of FHLBank Regulation's supervisory program includes off-site monitoring and analysis of the FHLBanks. The off-site monitoring activities include reviews of monthly and quarterly financial information submitted in call reports and available in the FHLBanks' securities filings. The division also monitors the debt issuance activities carried out by the Office of Finance, a joint office of the FHLBanks, and tracks financial market trends. The division reviews FHLBank documents, such as the Board of Directors' packages for each FHLBank, and analyzes responses to a wide array of periodic and ad hoc information and data requests, including an annual survey of FHLBank collateral and collateral management practices and weekly data on the FHLBanks' holdings of private-label mortgage-backed securities (PLS).

Governance

Effective corporate governance at the FHLBanks involves engaged, capable, and experienced directors and senior management; a coherent strategy and business plan; effective and appropriate risk limits and controls; and strong lines of responsibility and accountability. While those attributes exist to a degree among the FHLBanks, our 2008 examinations identified several governance shortcomings. Some FHLBanks paid insufficient attention to the credit risk associated with PLS and relied too heavily on credit ratings in making investment decisions. Many did not adjust their retained earnings targets in response to deterioration in the credit quality of their PLS holdings. Some were slow to adopt policies with respect to the acceptance of subprime or nontraditional mortgage loans as collateral for advances. In some FHLBanks the Board of Directors provided insufficient oversight of hedging programs and did not ensure full separation between risk taking

and risk management, reporting, and control. In a few instances, shortcomings in staffing and resources allocated to the Affordable Housing Program (AHP) reflected Board of Director and management inattention to the program and the information management systems needed to support an effective AHP. A number of FHLBanks allocated insufficient resources to information technology.

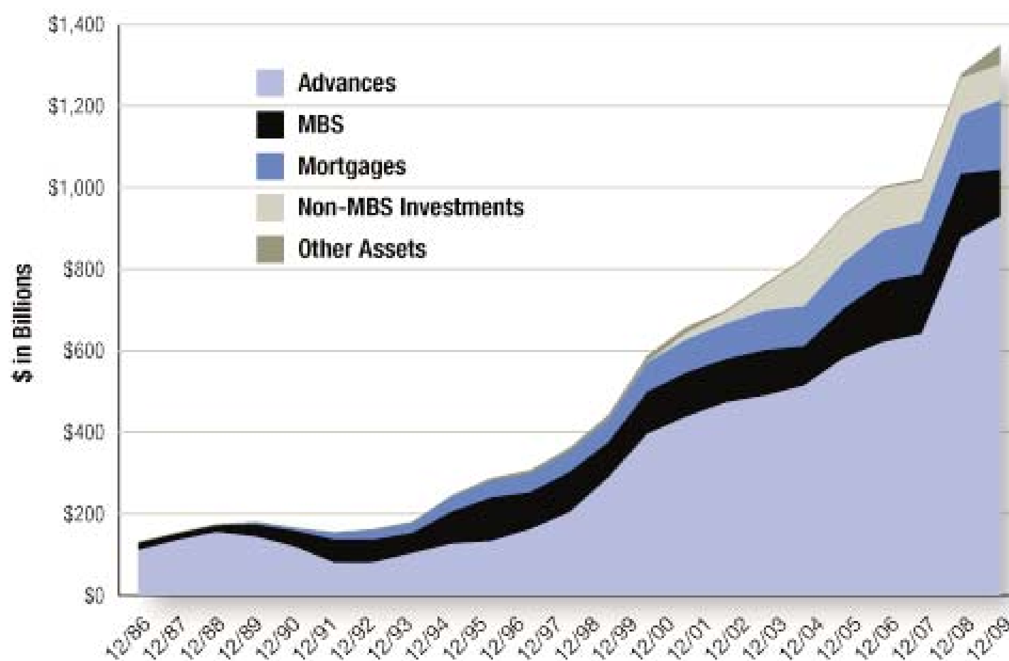
In general, operation of the Boards of Directors of the FHLBanks has improved now that nearly all independent director positions are filled. For several years, most of the independent director positions had been vacant. Formerly, the Federal Housing Finance Board (FHFB) appointed independent directors to each FHLBank's Board of Directors, but the Housing and Economic Recovery Act of 2008 (HERA) requires FHLBank member institutions to elect their own independent directors, subject to certain qualifications standards in FHFA regulations.

Financial Condition and Performance

The financial condition and performance of the FHLBanks deteriorated in 2008, particularly during the fourth quarter, principally because of their exposure to PLS, relatively high legacy funding costs, wider funding spreads, and shorter maturities on debt. Net income declined in 2008, and three FHLBanks recorded a loss for the year. At year-end 2008, all FHLBanks met the minimum statutory leverage capital requirement of 4 percent of total assets.

The FHLBanks ended 2008 with total assets of $1.35 trillion, up from $1.27 trillion at the end of 2007, but down from the record level of $1.43 trillion reached at the end of September 2008. Loans to member institutions (advances) are the largest balance-sheet item, and they were $928.6 billion at year-end, up from $875.1 billion at the end of 2007, but down from the October peak of $1.01 trillion.

Figure 25 • Portfolio Composition of the Federal Home Loan Banks



Source: Federal Housing Finance Agency

Mortgage loans held by the FHLBanks were $87.4 billion at the end of 2008, down from $91.6 billion one year earlier. Mortgage loans have been trending downward since the middle of 2004 when mortgage balances were $115.9 billion. The FHLBanks acquired $7.7 billion of mortgage loans in 2008. Repayments and prepayments were $12.0 billion.

As was the case with Fannie Mae and Freddie Mac, economic conditions in the second half of 2008 adversely affected the funding of the FHLBanks. For several months, the FHLBanks and Enterprises had only limited access to the capital markets in maturities greater than six months. The unsettled financial markets exposed the FHLBanks to basis risk as traditional relationships among interest rates broke down. A combination of basis risk, negative carry on liquidity portfolios, mismatch of timing of resets on interest-rate swaps, and other-than-temporary impairment (OTTI) contributed to six FHLBanks reporting losses in the fourth quarter of 2008.

Figure 26 • Selected Financial Data

(Dollar amounts in millions)

Selected Statement of Condition Data at December 31, 2008	2008	2007	2006	2005	2004

Source: Federal Housing Finance Agency

Net income for 2008 was $1.25 billion, down from the 2007 level of $2.83 billion. The largest factor in the income decline was the $1.92 billion in charges related to OTTI on private-label mortgage-backed securities. The return on average assets was 0.09 percent, compared to 0.26 percent in 2007. The net interest spread, which is the difference between the weighted average yield on assets and the weighted average cost of liabilities, increased to 0.23 percent for 2008, up from 0.16 percent in 2007.

Holdings of private-label mortgage-backed securities are currently the most significant factor affecting the financial condition and performance of the FHLBanks. As of December 31, 2008, the FHLBanks held $95.6 billion of agency mortgage-backed securities and $73.1 billion of private-label mortgage-backed securities. During 2008 and continuing in the first quarter of 2009, the quality of the FHLBanks' PLS portfolio deteriorated, as measured by a decline in market value and an increase in the number of bonds downgraded by a Nationally Recognized Statistical Rating Organization (NRSRO).

An FHLBank must hold sufficient regulatory capital to meet the greater of either the leverage capital requirement or risk-based capital requirements. The only exception is the FHLBank of Chicago. The Chicago FHLBank has not converted its capital structure to comply with the Gramm-Leach-Bliley Act of 1999. The Chicago FHLBank is operating under a cease-and-desist order that includes a minimum capital level and a minimum capital-to-assets ratio with which it must comply.

The FHLBanks' regulatory capital generally consists of the amounts paid by member institutions for FHLBank capital stock and the retained earnings of the FHLBank. As of December 31, 2008, all 12 FHLBanks exceeded the minimum leverage ratio by having at least 4 percent capital-to-assets. The FHLBanks' regulatory capital at December 31, 2008, was $58.7 billion, consisting of $49.6 billion of capital stock, $3 billion of retained earnings, and $6.1 billion of mandatorily redeemable capital stock, which arises typically out of capital stock redemption requests by members or any capital stock held by a nonmember, including the

Federal Deposit Insurance Corporation as a receiver for former members. The weighted average regulatory capital to assets ratio for the FHLBank System was 4.35 percent.

One FHLBank, the FHLBank of Seattle, did not meet its minimum risk-based capital requirement as of December 31, 2008. The FHLBank of Seattle failed to meet it risk-based capital requirement when its required risk-based capital was $2.71 billion and its permanent capital was $2.55 billion. This occurred because OTTI charges reduced total capital and the continued depreciation of its PLS increased its market risk capital requirement. OTTI charges also exhausted the Seattle FHLBank's retained earnings.

Credit Risk Management

Credit risk generally increased among the FHLBanks in 2008 as financial and mortgage market instability affected the value of certain assets, particularly PLS, and led to an increase in financial institution failures, including some FHLBank member institutions. Counterparty risk increased, particularly in conjunction with the bankruptcy of Lehman Brothers.

Several FHLBank members are less credit-worthy than in previous years. The collateral commonly pledged by members—mortgage loans and mortgage-backed assets—has become more difficult to value, heightening the credit risk on advances. FHFA examinations concluded that some FHLBanks need more frequent on-site collateral inspections, more frequent and conservative assessments of member condition, and stronger collateral policies.

Advances carry low credit risk. To obtain an advance, members must pledge eligible collateral with a market value that exceeds the amount of the advance. The FHLBanks either (1) perfect a blanket lien on all or a portion of the member's

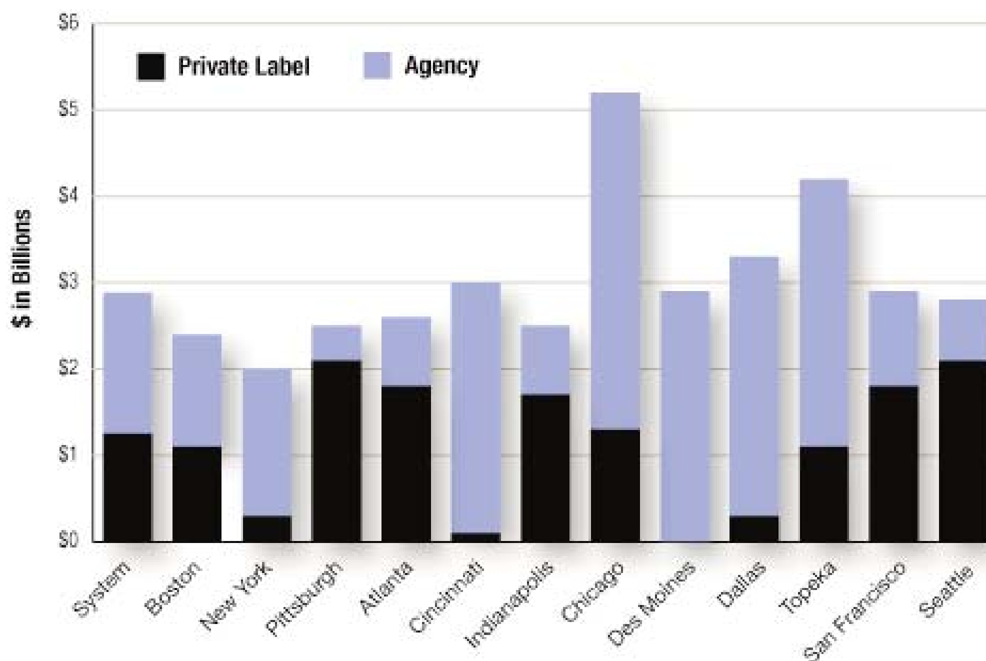
assets, (2) require the member to list specific assets as collateral, or (3) take delivery of the collateral. If a member's financial condition deteriorates, collateral status normally changes from blanket to listing to delivery. Collateral "haircuts" or protective reductions in borrowing capacity relative to the value of the collateral, are typically adjusted depending on the quality of the pledged assets and the financial condition of a member. In addition, most FHLBanks take delivery of all securities pledged as collateral, and most require insurance company and some other members to deliver collateral. Although examinations identified deficiencies in collateral management practices at some FHLBanks, no FHLBank has incurred a loss on an advance to a member institution.

As the credit crisis worsened and the credit worthiness of many financial market participants became suspect, counterparty exposure on derivatives and on unsecured lending (such as federal funds) increased. When Lehman Brothers failed in September 2008, all 12 FHLBanks were in derivative counterparty contracts with Lehman Brothers. The Lehman Brothers failure caused the FHLBanks of Atlanta and New York to incur charges totaling $235 million. The FHLBank of Pittsburgh had exposure of $42 million to Lehman Brothers, which it has not yet written off. The remaining nine FHLBanks were either in a net position of owing money to Lehman Brothers or in possession of sufficient collateral from Lehman Brothers to avoid a loss.

Deterioration in the quality of the FHLBanks' PLS, as measured by adverse rating actions, accelerated in early 2009. Several FHLBanks have sufficient holdings of downgraded or impaired private-label mortgage-backed securities to warrant supervisory concern. As noted above, the FHLBanks held $95.6 billion of agency mortgage-backed securities and $73.1 billion of private-label mortgage-backed securities as of December 31, 2008.

The FHLBanks carry 99.8 percent of their private-label mortgage-backed securities in held-to-maturity accounts. They do not recognize market depreciation unless the impairment is other than temporary. The FHLBanks recognized $1.7 billion in OTTI in the fourth quarter of 2008 and $1.9 billion for the year.

Figure 29 • Mortgage-Backed Securities as a Multiple of Capital



Source: Federal Housing Finance Agency

The FHLBanks have mortgage loan holdings of $87.4 billion. These portfolios do not present significant credit risks. The loans are fixed-rate amortizing loans, well-seasoned, written to traditional underwriting standards, have high credit scores and relatively low loan-to-value ratios, and are credit enhanced either by the member who sold the loan to the FHLBank or by supplemental mortgage insurance. At the end of 2008, only 0.19 percent of these portfolios were on non-accrual status, though that is up from 0.09 percent in 2007. Foreclosures during the fourth quarter of 2008 were $164 million, and net charge-offs were $31,000.

Market Risk Management

Mortgage assets continue to be the greatest source of market risk for the FHLBank System. Mortgage assets are typically longer-dated instruments than most other FHLBank assets, have less predictable cash flows, and, in the case of private-label securities, have experienced the greatest swings in market value. Several FHLBanks are managing declining mortgage portfolios that should ultimately reduce the market risk profiles of the FHLBanks, but which expose them to asset and liability mismatches in the shorter term. Some FHLBanks with significant mortgage holdings hedge the market risk by extensive use of callable bonds, often with American call options, to fund those assets. Other FHLBanks, the FHLBank of Chicago in particular, use a more complicated hedging strategy that involves using interest-rate swaps, swaptions (options to enter into interest-rate swaps), and options. As of 2008, the FHLBanks were parties to interest-rate derivative contracts with a notional value of $1.0 trillion.

The System's market value of equity, which is the market value of the System's assets less the market value of its liabilities, was $49.2 billion at the end of 2007, or 90 percent of the book value of equity. By the end of 2008, the market value of equity fell to $30.5 billion, or 53 percent of the book value of System equity. The majority of the market value shortfall is associated with the decline in the market value attributed to the FHLBanks' private-label mortgage-backed securities portfolios.

Duration of equity, which is one measure of the sensitivity of market value of equity to changes in interest rates, was 5.9 years at the end of 2008. By comparison, duration of equity was 1.9 years at the end of 2007. The year-over-year increase in duration of equity is in part driven by the overall decline in value of mortgage assets—particularly PLS. To the extent that values of PLS have been depressed by illiquidity in the market for their securities, duration of equity may overstate interest rate risk faced by an FHLBank.

Because several FHLBanks are holding PLS valued at low prices relative to par, and because their models assume that prepayments of these mortgage assets would be at par, the market value of PLS and equity would improve should mortgage rates decline and prepayments increase. Even without the presence of heavily discounted PLS, use of duration as the only measure of interest-rate risk potentially masks an unfavorable mismatch between mortgage assets and the liabilities that fund them. Heavily discounted securities make this problem worse. The most severely affected FHLBanks are making adjustments to their market risk modeling to work around this problem when making their market risk management choices, though the issue remains a cause of uncertainty and concern.

Examinations identified concerns about the ability of some FHLBanks to measure and manage market risk. One important concern involves several FHLBanks using hedging strategies that rely on short-term options to limit their exposure to large, immediate changes in interest rates but not to more realistic, gradual movements in rates. Such a strategy can be expensive because the options often expire worthless, leaving the FHLBank exposed to further rate moves or requiring it to purchase replacement options often at higher premiums. FHFA believes this strategy choice stems from FHLBanks' undue concern

about immediate income rather than income over the longer term and a failure either to measure or understand the risks they are taking.

Operational Risk Management

Operational risk is the risk of losses due to failures of integral processes or systems, fraud, or human error, or external events. High levels of operational risk may lead to reporting errors to members, investors, and regulators.

In 2008, the FHLBanks did not suffer operational failures that caused substantial losses apart from the losses or potential losses at three FHLBanks associated with the Lehman Brothers failure. The FHLBanks are large financial institutions with inherent operational risk magnified by manual processes and user-developed applications. They need to employ financial models, enterprise resource systems, and ledger accounting systems under adequate supervision and have appropriate policies or procedures.

Over the past several years, examiners have frequently criticized the number of user-developed applications at the FHLBanks, their critical role in management information systems, and the generally slow pace at some FHLBanks in replacing them with better solutions.

The FHLBanks have addressed certain FHLBank system-level operational risks by adopting procedures to ensure all required payments for principal and interest on consolidated obligations arrive at the Federal Reserve Bank of New York on schedule. All FHLBanks have sufficient business continuity plans and back-up locations. Examiners regularly evaluate these plans.

Finally, affordable housing and community investment activities present the potential for operational risk that could affect an FHLBank's reputation. FHFA's examinations have recently cited concerns about scoring of competitive applications for AHP funding, the slow disbursement of AHP funds, inadequate monitoring of projects receiving AHP funds, and shortcomings in the oversight of the AHP set-aside program.

FHLBanks' Examination Conclusions

FHLBank of Boston

The Boston FHLBank is the seventh largest FHLBank with assets of $80.5 billion as of December 31, 2008. Although the the FHLBank is considered satisfactory overall, examiners cited weaknesses in credit risk and risk management of its private-label securities portfolio, noncompliance with certain regulations and supervisory guidance, and outdated retained earnings assumptions. As financial market conditions deteriorated in the second half of the year, the FHLBank's condition worsened. In December 2008, the FHLBank placed a moratorium on excess stock repurchases and restricted its quarterly dividend payout to preserve capital.

Governance

FHLBank governance is satisfactory, although risk management of the PLS portfolio is insufficient and the retained earnings methodology is outdated. Before 2008, the FHLBank did not update its retained earnings methodology for several years and did not adequately account for the increased level of credit risk in the PLS portfolio in setting its retained earnings target. In 2008, the FHLBank reevaluated its methodology and increased its retained earnings target. Examiners cited a violation for giving one member preferential overnight advance rates and a lack of sufficient procedures, standards, or criteria to justify the price difference.

Financial Condition and Performance

Although the FHLBank's financial condition and performance were adequate when examined, they worsened throughout 2008 and are now considered weak. The FHLBank holds $4.1 billion in PLS and faces significant exposure to losses from OTTI charges. Retained earnings are inadequate and remain well below the FHLBank's target levels.

Credit Risk

The FHLBank's overall level of credit risk is moderate and increasing because of deterioration in the FHLBank's PLS portfolio, 25 percent of which was classified as below investment grade at the end of 2008. There is potential for continued deterioration in this portfolio due to the high volume of nontraditional mortgage collateral originated in 2005 through 2007 and the deteriorating residential real estate environment.

Market Risk

Market risk was not reviewed during the 2008 examination because this area has historically been strongly managed, and there were no changes in management or negative changes in market risk exposure or practices. However, the FHLBank's market-to-book value of equity (MVE/BVE) declined materially during 2008. From year-end 2007 to year-end 2008, the FHLBank's MVE/BVE ratio fell to 50 percent from 96 percent, reflecting a high level of unrealized losses associated with the PLS portfolio. The FHLBank's duration of equity increased, but it remains low in comparison to the rest of the System.

Operational Risk

Operational risk is moderate. The FHLBank has made sufficient progress in correcting previous examination deficiencies, chiefly in the information technology area. However, the Boston FHLBank is exposed to reputational risk from the deteriorating PLS portfolio.

FHLBank of New York

The FHLBank of New York is the third largest FHLBank with total assets of $137.5 billion. The FHLBank has maintained high profitability and relatively low risk despite high levels of market volatility and adverse movements in the agency debt market. The FHLBank's overall condition and performance is satisfactory. Although the quality of certain of its private-label mortgage-backed securities has deteriorated, because total exposure is small, retained earnings are likely sufficient to cover potential losses should market conditions deteriorate further.

Governance

Corporate governance is satisfactory but shows some weaknesses. The FHLBank's Board and management maintained a conservative risk profile. However, the following areas should be strengthened: collateral and member policies and practices, including review of adherence to guidance on nontraditional and subprime mortgage loans; accounting documentation procedures; strategic planning; management committee oversight; and the adequacy of AHP staffing levels and management information systems.

Financial Condition and Performance

The FHLBank's financial condition and performance are satisfactory. It continues to exhibit strong net interest spreads, capital and retained earnings levels, and a conservative market risk profile. However, in the third quarter 2008, the FHLBank recognized losses of $64.4 million associated with the Lehman Brothers bankruptcy, reducing net income for the quarter to $39.8 million. Higher funding costs, a less lucrative asset mix as higher-yielding MBS and option-embedded advances are reduced, and a moderate risk of OTTI in its small PLS portfolio may affect future earnings.

Credit Risk

The level of credit risk is moderate and increasing. The quality of credit risk management is adequate. The FHLBank has low levels of PLS. The credit risk focus is on collateral securing advances. The FHLBank has generally strong collateral policies, but to promote liquidity, the FHLBank accepts some hard-to-price assets as collateral.

Market Risk

The level of market risk is moderate and increasing. The quality of market risk management is satisfactory. The FHLBank's market risk increased during 2008 because of changing interest rates, widening mortgage spreads, and the unsettled funding market. Market risk indexes remain favorable relative to other FHLBanks.

Operational Risk

The level of operational risk is moderate and stable. The quality of operational risk management is satisfactory. Increased transactional, accounting, and regulatory risks are by-products of the current financial crisis. Decreased market liquidity and, in certain cases, reduced access to observable market data could make the pricing of collateral and securities less reliable. Although the FHLBank's internal controls are strong, it lacks integrated systems and relies too heavily on manual controls.

FHLBank of Pittsburgh

The FHLBank of Pittsburgh is the sixth largest FHLBank with assets of $90.8 billion. Chief among the risks to the FHLBank is its $8.5 billion PLS portfolio, which has weakened the FHLBank's earnings stability and capital adequacy. To preserve capital, the FHLBank suspended dividends and capital stock repurchases in December 2008. Substantial fourth quarter OTTI charges on the portfolio led to a $188 million quarterly loss, reducing retained earnings by more than half and nearly eliminating all earnings for the year. As such, its overall condition is less than satisfactory. Further OTTI determinations are possible, which would jeopardize the FHLBank's remaining $170 million retained earnings and could put the FHLBank at risk of failing its risk-based capital test.

Corporate Governance

Governance risk is fair. The FHLBank at times has emphasized short-term earnings and returns to member institutions, rather than moderating longer-term risks and ensuring the FHLBank's financial stability. Its MVE has previously been low, but has recently deteriorated further relative to book value, becoming a significant concern for the FHFA and for the FHLBank.

Financial Condition and Performance

The FHLBank's financial condition and performance are weak due principally to weaknesses in the PLS portfolio. Earnings from the remainder of the FHLBank's assets, which constitute the vast majority of the FHLBank's balance sheet are not sufficient to offset the risks to earnings from potential future losses associated with the PLS portfolio. Retained earnings are inadequate to buffer against those potential future losses. The FHLBank's fourth-quarter loss and prospects of additional losses force the FHLBank to concentrate on capital recovery, which may mean a prolonged period without dividends, with low dividend payouts, or with higher member capital requirements.

Credit Risk

Credit risk management is inadequate, and risk is increasing. Although the FHLBank has increased the amount of resources dedicated to credit analysis of PLS, the risks from this portfolio will likely follow the negative trends of the nation's housing sector. In addition, some member borrowers and some derivative counterparties have also experienced financial weaknesses in recent quarters. The Lehman Brothers failure may still result in charges against income and capital. In response, member and counterparty collateral—in particular mortgage collateral—requires an increased level of scrutiny. The FHLBank has improved its collateral policies, execution systems, and reporting structure to control these risks.

Market Risk

Market risk is high, and market risk management is weak. The decline in the FHLBank's MVE and increase in the FHLBank's overall risk profile require the FHLBank to improve market risk management. The FHLBank needs enhanced internal risk metrics and a more conservative approach in its scenario analyses. The FHLBank's typical market risk measurements, such as duration of equity, are higher than appropriate.

Operational Risk

Operational risk management is fair. The FHLBank depends too heavily on manual processes and spreadsheets. It also needs to better define and report policy exceptions when they occur. In addition, internal risk assessments do not adequately portray operational risks.

FHLBank of Atlanta

The FHLBank of Atlanta is the second largest FHLBank with total assets of $208.6 billion. The FHLBank is considered satisfactory overall, but FHFA is concerned about the FHLBank's risk of loss on its $15.9 billion private-label mortgage-backed securities portfolio. This portfolio has increased credit and market risk at the FHLBank and exposes the FHLBank to OTTI-related income fluctuations, as was particularly evident in the third quarter of 2008. Further deterioration of market conditions will negatively affect the FHLBank's condition and performance.

The FHLBank's permanent capital exceeds its leverage and risk-based capital requirements. Retained earnings decreased during the third quarter of 2008 to absorb the net losses in the quarter but increased again in the fourth quarter. The FHLBank recognizes the need to build retained earnings and capital, and it has temporarily suspended dividends and the repurchase of capital stock.

Governance

Governance is satisfactory and has improved with management changes in the past two years. The FHLBank hired or redeployed six new senior managers, including a new chief executive officer (CEO), in 2007 and 2008. The Board also reorganized the FHLBank, separating the chief risk officer function from the general counsel function. The Board and the CEO have each established new committees to meet regularly and discuss emerging issues.

Financial Condition and Performance

Financial condition and performance is moderate and worsened in 2008. The FHLBank recognized $186 million in OTTI charges related to PLS and $171 million in counterparty losses during 2008. Market conditions also contributed to income volatility through funding and hedging activities.

Credit Risk

Credit risk management is weak but improving. The FHLBank has weak positions in mortgage-backed securities credit, supplemental mortgage insurance credit protection on its mortgage portfolio, and advance collateral. Management experience is limited—the chief credit officer has only been in the position since December 2007. Credit risk exposures to large member institutions are high, with 66 percent of advances going to the top 10 members and 27 percent of advances to Countrywide Bank as of the end of 2008. Bank of America acquired Countrywide Bank in July 2008, reducing the credit risk associated with advances to Countrywide.

Market Risk

Market risk management is adequate, but risk is increasing. The FHLBank separated the risk-monitoring function and the investment risk-taking function and bolstered staffing levels and technical expertise after the 2007 examination. Market risk increased primarily because of widening mortgage option-adjusted spreads and increased valuation of liabilities that contributed to the MVE/BVE decline.

Operational Risk

Operational risk was low, and the quality of operational risk management was adequate when the 2008 examination was conducted early in the year. However, the loss reserves associated with the Lehman Brothers failure reflected operational shortcomings because the FHLBank did not have a third-party fiduciary hold the collateral.

FHLBank of Cincinnati

The FHLBank of Cincinnati is the fourth largest in the System with total assets of $98.2 billion. Cincinnati reported $236 million of net income in 2008, a return on equity of 5.73 percent and a return on assets of 25 basis points. The FHLBank has only $304 million of exposure to PLS. None were purchased since 2003, and NRSROs have not downgraded any of the securities. Overall the FHLBank is considered satisfactory.

Governance

Governance is satisfactory but some improvements are needed. The directors and senior management exhibit a conservative risk tolerance, and the FHLBank did not invest heavily in PLS. The FHLBank exhibits deficiencies in credit risk administration of its advances and inadequate AHP governance. In particular, weaknesses exist in oversight of ongoing AHP projects, reallocation of deobligated funds, management information systems, departmental policies and procedures, and project file organization.

Financial Condition and Performance

Financial condition and performance are satisfactory. Despite a distressed environment, the FHLBank compares favorably to System averages in profitability, capital, and market risk. The FHLBank has an $8.6 billion mortgage portfolio. However, it manages the associated market risk and credit risk adequately.

Credit Risk

Credit risk is moderate but increasing, and the quality of credit risk management needs improvement. The number of members on the FHLBank's watch list has grown since 2007, and this trend will likely continue in 2009. Member assets are concentrated in Ohio institutions. Although Ohio continues to experience a slow economy and high foreclosure rates, weaknesses in larger member institutions stem significantly from activity outside the state.

Market Risk

Market risk is moderate, and the direction of market risk is stable. At the end of 2008, the FHLBank's MVE/BVE ratio was 95 percent. Historically, the FHLBank's market risk metrics compare favorably to System averages. The FHLBank hedges mortgage commitments with to-be-announced mortgage-backed securities, which is a transparent and straightforward strategy relying more on a mix of callable and noncallable debt instead of derivatives. The FHLBank's general strategy is to keep mortgage loan portfolio balances to less than 10 percent of total assets.

Operational Risk

Operational risk is moderate, and risk management is adequate. The FHLBank's internal controls have been effective in detecting and preventing operational problems. Risk is rated moderate because of dependence on legacy programming language and end-user computing, the volume of internal development activity, and needed improvements for the IT security program. Business continuity planning remains adequate.

FHLBank of Indianapolis

The FHLBank of Indianapolis is the smallest FHLBank with $56.9 billion in total assets. Approximately 27 percent of its portfolio consists of mortgage-backed securities and whole loans. This portfolio of high-yield, long-term mortgage assets, combined with other factors, have generated a high profit margin in a low interest-rate environment. The FHLBank has traditionally funded its mortgage assets with a high proportion of callable debt. Although vulnerable to further deterioration in mortgage markets, the FHLBank is considered satisfactory overall.

Governance

Governance is satisfactory, but exhibits weaknesses in succession planning and allocation of resources to enterprise risk management.

Financial Condition and Performance

The FHLBank's financial condition and performance are satisfactory. The 2008 net interest spread was the FHLBank's highest in the most recent four years. The discount note funding advantage, the mortgage portfolio's high yields relative to funding costs, and the liquidity premium for advances all contributed to the increased profit margin. The FHLBank traditionally has returned the benefits of membership in the form of higher dividends rather than through low pricing on advances.

Although the FHLBank did not incur any OTTI charges in 2008, it holds $978 million of PLS subject to some form of rating action, including $454 million rated below investment grade. Those below-investment-grade securities represent a significant risk to future performance. At the end of 2008, the FHLBank's retained earnings were $283 million, and its permanent capital was 182 percent of its required risk-based capital.

Credit Risk

Credit risk is moderate but increasing due to the higher delinquency rates on mortgage assets, advance collateral valuation complexity, counterparty risk, and member financial condition. In addition, the FHLBank holds downgraded PLS that could cause losses in the future.

Market Risk

Market risk is high, and the management of market risk is adequate. The FHLBank analyzes and monitors market risk using a range of metrics on a regular basis. However, the FHLBank's MVE/BVE was 55 percent as of fourth quarter of 2008, reflecting unrealized losses associated with the PLS portfolio and the valuation of its liabilities. This ratio is down dramatically from the 2007 level of 91 percent.

Operational Risk

Operational risk is moderate, and risk management practices are adequate. The increased transactional, accounting, and regulatory risks are by-products of the current financial crisis. Decreased market liquidity that results in data on security prices being derived from models instead of market transactions makes the pricing of securities and collateral less reliable. The FHLBank's information technology reporting needs to improve.

FHLBank of Chicago

The FHLBank of Chicago is the fifth largest FHLBank in the System with assets of $92.1 billion. The FHLBank has been subject to a consent order to cease and desist since October 10, 2007, which prohibits the repurchase of capital stock at the FHLBank absent regulatory approval. In 2008, the FHLBank posted a $118.7 million net income loss and recognized $292 million in OTTI from its private-label securities portfolio. As of year-end 2008, the market value of the the FHLBank's portfolio equity was negative, though the figure fluctuates, particularly with changes in interest rates. Overall, the FHLBank demonstrated some improvement in risk management and cost controls in 2008, but it is considered to be less than satisfactory overall.

The FHLBank of Chicago has the largest mortgage portfolio of any FHLBank. Its mortgage assets were $32.1 billion, or 35 percent of total assets, at year-end. In 2008, advance growth exceeded 25 percent, which may not be sustainable. Mergers involving members of the FHLBank could lead to a further loss of members and membership assets. Two of the largest members recently merged with out-of-district institutions. Pursuant to the cease-and-desist order, the redemption of the capital stock of these and other members is prohibited absent regulatory approval.

Governance

Governance is improving as the Board and senior management display both a greater sense of urgency and increased focus on the critical issues facing the FHLBank. The FHLBank of Chicago's senior management team changed dramatically during 2008, including the appointment of a new CEO. FHFA continues to monitor the results of these staff changes. The FHLBank's Board has increased its attention to risk management issues, but more work is needed, particularly related to the hedging practices and PLS portfolio. Over the long-term, the decision to terminate purchases of mortgages as investments should lower the risk profile of the FHLBank. In the interim, however, challenges continue.

Financial Condition and Performance

The financial condition of the Chicago FHLBank is weak. The FHLBank's net interest margin has declined steadily since the third quarter of 2007 because of higher debt refunding costs and yield adjustments related to prior-period hedging costs. This trend reversed in the third and fourth quarters of 2008 due to lower funding costs and more disciplined portfolio segmentation and funding, but opportunities to improve the trend significantly are limited. Overhead expenses remain excessive, but the FHLBank has made some progress in cutting expenses through outsourcing, preparing to move to new offices, and reengineering certain business practices.

Credit Risk

Credit risk management has improved and the current monitoring processes are satisfactory, but the credit quality of the FHLBank's PLS is weak. As of December 31, 2008, the FHLBank's PLS portfolio totaled $4.2 billion, including approximately $1.5 billion of subprime securities. More than half of the Chicago's FHLBank's PLS portfolio has been downgraded—15 percent below investment grade. The FHLBank now actively manages credit exposures associated with the PLS portfolio. During 2008, the FHLBank stopped purchasing mortgages for investment. Mortgage Partnership Finance (MPF®), the FHLBank's purchase program for whole mortgage loans, has moved to an off-balance-sheet arrangement called MPF Xtra®. The credit quality of these assets remaining on the FHLBank's books is strong.

Market Risk

Market risk remains high, and the hedging and risk management practices remain unresolved. Throughout 2008, the FHLBank's market value position deteriorated significantly. Efforts to maintain market value have not been successful,

because market conditions have been challenging. Because of its funding, the FHLBank is at risk of further losses if mortgage rates fall further and remain low for an extended period of time.

Operational Risk

Operational risk exposure is high. Efforts to streamline and better integrate stand-alone IT applications are ongoing, but as new IT needs arise, the FHLBank often addresses them with end-user applications or other workarounds. These stop-gap measures increase the level of operational risk and require further manual intervention to maintain data integrity. The FHLBank needs to commit additional resources to this area.

FHLBank of Des Moines

The FHLBank of Des Moines is the ninth largest FHLBank with assets of $68.1 billion, and has the System's second largest mortgage loan portfolio of $10.7 billion.

Heightened market risks may cause earnings to be volatile. The FHLBank needs to improve credit risk management, particularly with respect to its insurance company membership segment and to focus on automating its operations. The FHLBank's profitability has been modest for several years, but it holds a relatively small amount of PLS and is not exposed to potential OTTI charges. Overall the FHLBank is considered to be less than satisfactory. The FHLBank has temporarily suspended dividends and excess stock repurchases given the heightened level of risks facing the FHLBank and the FHLBank System.

Governance

Governance is fair. FHFA's principal supervisory concern at this examination related to a failure by both the Board and management to sufficiently identify emerging risks within the credit area, particularly as it relates to insurance companies. However, over the past several years, the Board of Directors continued to build retained earnings despite relatively low financial returns. Consequently, the FHLBank's retained earnings are currently high relative to its assets, providing some protection against member credit risks, market risks, and other potential losses.

Financial Condition and Performance

Financial condition and performance are adequate. The FHLBank does not face the same risk of PLS write-downs as some other FHLBanks, but the FHLBank's high market risk position may lead to additional earnings volatility. The Des Moines FHLBank reported fourth-quarter net income of $2 million, down from $29 million in the fourth quarter of 2007. The decline in earnings was due, in part, to maintaining increased liquidity levels. Full-year net income was $127.4 million, which was up from $101.4 million in 2007.

Credit Risk

The level of credit risk is moderate. The FHLBank has little exposure to PLS. However, some members have pledged high-risk mortgage assets as collateral, testing the FHLBank's collateral policies and systems. Overall, the FHLBank's collateral practices need improvement, especially those for nontraditional collateral.

Market Risk

Market risk is high. The FHLBank's large mortgage holdings, combined with a highly volatile financial market, generate an elevated level of risk as indicated by a high negative convexity. Earnings and market values have been and may continue to be volatile.

Operational Risk

The level of operational risk is moderate. The FHLBank developed its first IT strategic plan in 2007 and refined that plan in 2008. However, user-developed applications continue to be used in key areas where more automated processes are appropriate.

FHLBank of Dallas

The FHLBank of Dallas has $78.9 billion in assets, making it the eighth largest FHLBank. The FHLBank has historically maintained a stable return on capital stock that generally rises and falls with short-term interest rates because the FHLBank attempts to convert a substantial amount of its assets and liabilities to floating-rate instruments. However, large swings in short-term rates and changes in spreads during the latter half of 2008 led to significant earnings volatility in the third and fourth quarters. Nevertheless, the FHLBank is considered satisfactory overall.

Governance

Governance is satisfactory. Senior management and the Board effectively understand, measure, monitor, and control risks. Both tactical and strategic business planning are core strengths for the FHLBank.

Financial Condition and Performance

The FHLBank's financial condition is satisfactory. Fourth quarter 2008 losses and projections of limited income during the first quarter of 2009 are likely to be transitory. The FHLBank does, however, face several challenges that generally reflect overall financial services industry conditions, including mergers of its members, potential future PLS losses, and financial market conditions.

Credit Risk

Credit risk is moderate but increasing. The economy in this FHLBank's district has held up relatively well. Only a few of the FHLBank's members have material exposure to higher-risk markets outside of the district, but some are showing declining financial condition and performance. Still, the value of collateral pledged to secure advances should be more than adequate to protect against credit losses on advances to members.

Residential PLS of $677 million represents less than 6 percent of the FHLBank's total mortgage-backed securities portfolio. The FHLBank stopped purchasing PLS in 2005 because of increasing risk. Nearly all of its residential PLS are rated triple-A by at least one credit rating agency. The FHLBank has not added whole loan mortgages to its portfolio since 2003, which now comprise less than 0.5 percent of total assets. The whole loan mortgages perform well and exhibit little credit risk.

Market Risk

Market risk is moderate. Market risk has increased due to volatility in the financial markets, including extreme fluctuations in the levels of and relationship between short-term interest rates and one- and three-month LIBOR and limited access to long-term funding for the FHLBank System. However, the FHLBank has maintained relatively conservative interest-rate risk management practices. The structure of the FHLBank's balance sheet, the underlying interest-rate risk profile of the balance sheet, and the FHLBank's market risk management strategies have remained stable.

Operational Risk

Operational risk is low. The FHLBank has sound infrastructure with up-to-date and secure systems providing high levels of automation and integration. Operational controls are strong, with effective oversight by both management and internal audit.

FHLBank of Topeka

The FHLBank of Topeka is the tenth largest FHLBank in the System with $58.6 billion in assets. Although adequately capitalized, the FHLBank reported $28 billion in net income for 2008, a sharp decline from the prior year, though the decline was primarily due to accounting adjustments. Overall, the FHLBank is considered satisfactory.

Governance

Governance is satisfactory, although some areas need improvement. The FHLBank has an experienced management team. FHFA's principal concerns are credit and collateral administration and AHP policies and procedures, AHP set-aside program disbursements, and management information systems.

Financial Condition and Performance

Financial condition and performance are satisfactory. Net income was affected by relatively large derivative losses at year-end. The FHLBank also reported $4.8 million in OTTI on PLS. However, the FHLBank currently has adequate retained earnings to absorb anticipated future losses.

Credit Risk

Credit risk is moderate and increasing. The number of members on the FHLBank's watch list has increased since the last examination. Credit risk has also increased from exposure to illiquid and hard-to-price PLS collateral from some members. Collateral policies also need to be updated to reflect declining trends in collateral credit risk and illiquidity in the market for certain types of securities.

The FHLBank's PLS portfolio totals $2.7 billion, with gross unrealized losses of $397 million as of December 31, 2008. The FHLBank stopped buying PLS in early 2006 because of increasing risk. The FHLBank's largest member/borrower, U.S. Central Corporate Federal Credit Union, received a $1 billion capital note from the National Credit Union Administration Board in January 2009 to provide reserve funds to offset anticipated realized losses on some of the credit union's mortgage- and asset-based securities. U.S. Central was subsequently placed in conservatorship, but the FHLBank's collateral position is secure.

Market Risk Management

Market risk is moderate, and market risk management practices are satisfactory. Approximately three-fourths of the FHLBank's balance sheet matures or reprices within one year, which is higher than the FHLBank System average. The short-term nature of the balance sheet can reduce market risk exposure in the near term, but presents other risk management challenges. The FHLBank's MVE/BVE was 91 percent at the close of the third quarter of 2008, compared to a System average of 76 percent. However, at year-end 2008, the FHLBank's MVE had declined to 75 percent, primarily because of declines in mortgage-backed securities values.

Operational Risk Management

Operational risk is moderate. Controls are adequately monitored by management and internal audit. Management has made satisfactory progress in correcting problems found in previous examinations. FHFA noted areas for improvement in information technology governance during the examination.

FHLBank of San Francisco

The FHLBank of San Francisco is the largest FHLBank with assets of $321.2 billion. FHFB has cited the FHLBank for its low level of retained earnings for the past five years. Before 2008, the FHLBank of San Francisco paid out approximately 90 percent of earnings as dividends resulting in a slow increase in retained earnings over that time. By the third quarter of 2008, San Francisco's retained earnings relative to asset size were the lowest of any FHLBank, and retained earnings declined further in the fourth quarter as the FHLBank incurred a net loss due to charges for OTTI of PLS. Overall the FHLBank is considered satisfactory, but its earnings and capital are vulnerable if its large PLS portfolio deteriates further.

The FHLBank of San Francisco's risk profile has increased. Following the OTTI charge taken in the fourth quarter of 2008, its retained earnings are inadequate because of financial volatility, increased counterparty credit risk, and significant PLS exposure. The FHLBank temporarily suspended dividends and capital stock repurchases in the fourth quarter of 2008 to preserve capital.

Potential OTTI losses could be substantial if market conditions continue to deteriorate. The FHLBank will need to extend its suspension of dividends and restrict capital stock repurchases to preserve and ultimately rebuild its retained earnings.

Governance

Governance needs improvement. The FHLBank of San Francisco's Board missed an opportunity to build retained earnings early in 2008 when the FHLBank posted a profit of $240 million in the first quarter and $223 million in the second quarter. In the first half of the year, the FHLBank paid out $400 million in dividends, an average of 5.90 percent, which exceeded the average federal funds rate of 2.63 percent and the FHLBank's dividend benchmark of 3.34 percent. The FHLBank's concentration of large member institutions is among the highest in the System. Credit and collateral resources may be insufficient in light of increasing risk. The FHLBank's enterprise risk management function is not independent from the credit department.

Financial Condition and Performance

Financial condition and performance are fair after deteriorating in 2008. The FHLBank has minimal direct exposure to mortgage loans but significant indirect exposure to the depressed real estate markets of California, Nevada, and Arizona in the form of collateral and PLS. At December 31, 2008, San Francisco held $24.5 billion in PLS—more than 50 percent is backed by hybrid adjustable-rate mortgage loans. The market value of the FHLBank's PLS relative to book value declined significantly during 2008.

Credit Risk

Credit risk is increasing. Exposure to credit risk in the PLS portfolio increased in 2008 and resulted in a $590 million OTTI charge in the fourth quarter. While the San Francisco FHLBank has estimated that its credit losses will be substantially less than the OTTI charge, the portfolio has experienced rating agency downgrades and the FHLBank could potentially face negative cash flow on some securities. Exposures to large member institutions in weakened financial condition and risk from certain nontraditional loan products are high. In some cases, hard-to-price, relatively illiquid nontraditional mortgage collateral secures advances.

Market Risk

Market risk is increasing. The FHLBank's MVE/BVE ratio is down dramatically from its high of 102 percent at March 31, 2007. The FHLBank's base-case MVE/BVE ratio was 77 percent as of June 30, 2008, but fell to 46 percent at year-end, reflecting the high level of unrealized losses associated with its PLS portfolio. Traditional duration and convexity measures are similarly off from the FHLBank's historical levels.

Operational Risk

Operational risk is moderate. Operational risk management is satisfactory, but increased transactional, accounting, and regulatory risks are by-products of the current financial crisis. Financial reporting, audit, and operational incident oversight are strong, but the FHLBank's IT systems are aging. There have been vacancies in key IT leadership positions, but the CIO position was filled before year-end 2008.

FHLBank of Seattle

With $58.4 billion in assets, the Seattle FHLBank is the second smallest FHLBank. The FHLBank is considered less than satisfactory overall. FHFA has supervisory concerns about the FHLBank's $5.6 billion PLS portfolio. Risks from weakened housing and financial markets intensified late in 2008 and affected several areas of the FHLBank. Financial performance had otherwise been improving over the past two years from very depressed levels. Following a large fourth quarter loss, the FHLBank's retained earnings became a negative $79 million, the only the FHLBank with negative retained earnings.

The FHLBank suffered losses in two successive quarters because of OTTI charges on PLS. This slowed efforts to build retained earnings and prompted a suspension of dividends in addition to the FHLBank's existing suspension of repurchases of Class B capital stock. Further OTTI charges are possible, and the FHLBank's negative retained earnings at year-end are particularly troubling given the potential for further losses. The FHLBank's risk-based capital requirement has increased substantially as market prices in the FHLBank's PLS portfolio have fallen, which depresses the FHLBank's MVE relative to BVE. At year-end, the FHLBank failed its risk-based capital test, an event that requires the FHLBank to cease repurchases and redemptions of stock and the payment of dividends, at least until the deficiency is corrected.

Governance

Governance is unsatisfactory. The Board of Directors and management did not respond promptly or with appropriate strategies to the elevated credit risks posed by the PLS portfolio. The Board depended too heavily on NRSRO ratings, and its investment choices, policies, and monitoring are poor. The FHLBank's retained earnings policy, which should determine the appropriate level of retained earnings based on the risks to the FHLBank, does not consider PLS impairments in its calculation.

Financial Condition and Performance

The FHLBank's financial condition is weakening. FHLBank returns had generally been improving since 2006. However, core earnings did not cover recent losses from OTTI on PLS, resulting in a significant fourth quarter net loss of $241 million. Earnings probably will not be sufficient to cover additional OTTI should it occur. Future losses could be substantial, and the FHLBank has no retained earnings with which to buffer additional losses. Mergers are adversely affecting the FHLBank's customer base.

Credit Risk

Credit risk is high and increasing. PLS represented 9.6 percent of its assets as of year-end, which was the highest relative exposure in the System. Many of the FHLBank's PLS holdings have been downgraded—in some cases, below investment grade. Counterparty risk also affected the FHLBank—it booked a $4.2 million loss on a swap after the failure of a counterparty.

Market Risk

Market risk is moderate, and the quality of market risk management is adequate. The FHLBank's financial modeling practices are satisfactory. Going forward, the FHLBank needs to expand its market risk parameters, improve its method of valuing advances for regulatory reporting, and establish a process to monitor the profitability of

portfolio segments. Market risk should be closely monitored as financial market volatility continues.

Operational Risk

Operational risk is high, and the quality of operational risk management is weak. The FHLBank's information systems are antiquated and rely heavily on end-user developed applications, which causes control deficiencies and frequent system failures. Shortcomings in information technology have been evident for years. The FHLBank plans to address IT-related problems, but it needs to improve IT governance and planning.

Office of Finance

The Office of Finance, a joint office of the FHLBanks, is charged with issuing and servicing consolidated obligations on behalf of the FHLBanks. No FHLBank may issue debt on its own. Located in Reston, Virginia, the Office of Finance issues consolidated obligations when requested by one or more FHLBanks. It has no portfolio of its own and faces no credit or market risks. The Office of Finance has approximately 75 employees and assesses the FHLBanks for the cost of its operations.

In 2008, the Office of Finance issued $562 billion worth of bonds in 5,346 separate transactions. It issued $2.7 trillion of nonovernight discount notes. Overnight discount notes outstanding averaged $32.4 billion. The Office of Finance prepares and distributes the combined financial reports used in the offerings and sales of consolidated obligations. Overall, operations and management of the Office of Finance are satisfactory.

Governance

Governance is satisfactory. The Office of Finance has effectively met the increasingly challenging demands of raising debt during difficult market conditions. Supervisory activities focus on the increased reliance on discount notes and short-term bonds to refund bond maturities and ensure sufficient System liquidity needs. FHLBank funding alternatives are much more limited than in the past because of the stressed conditions in capital markets. However, the Office of Finance has managed to market the System's debt and meet liquidity goals. In 2008, debt pricing spreads relative to benchmark rates for both the FHLBanks and the Enterprises were much worse than 2007 averages.

The Office of Finance may need to take a stronger role in promoting consistency in accounting practice, PLS valuation, and impairment analysis among the FHLBanks. Because the authority of the Office of Finance is limited, FHFA support will be necessary. However, delays in issuing the FHLBank System's combined financial report in the third and fourth quarter of 2008 bring attention to the shortcomings in the current process. Such delays in the future could affect market perceptions of and interest in the System's consolidated obligations.

Operational Risk

Operational risk is moderate. The Office of Finance has historically met the needs of the FHLBanks by issuing debt at competitive yields and has maintained proper documentation to support debt issuance. The Office of Finance provides market data to each FHLBank in a timely fashion. Internal audit reviews debt issuance activities thoroughly, but no significant finding has been uncovered.

The Office of Finance is highly dependent on information technology to service and issue consolidated obligations, and it has a number of outstanding information technology-related deficiencies, including some that have been unresolved for extended periods. The majority of these deficiencies are considered low risk, but as a group, they could present a higher degree of risk to IT operations.

Director Compensation

The FHLBanks are governed by Boards ranging in size from 14 to 19, all of whom are elected by the member institutions, and a majority of whom are directors or officers of member institutions. The remainder are independent— they are neither directors nor officers of any of the FHLBanks' member institutions. Since 1999, the annual salaries of the FHLBank directors have been subject to statutory caps. For 2008, those caps were $31,232 for a chair, $24,986 for a vice chair, and $18,739 for all other directors. With the enactment of HERA, Congress repealed the statutory caps and authorized the FHLBanks to pay reasonable compensation to their directors. Because the caps were repealed mid-year, the compensation amounts paid by some FHLBanks during 2008 exceeded the amounts that would have been allowed had the caps remained.

In 2008, the chairs and vice chairs at 10 of the 12 FHLBanks earned fees which were at or below the statutory cap. At the Boston FHLBank and the Atlanta FHLBank, the compensation was higher because both FHLBanks revised their compensation limits for all directors after HERA took effect. The Boston FHLBank set a new compensation limit of $60,000 for all directors on December 12, 2008, and the Atlanta FHLBank set a new limit of $45,000 for all directors on September 1, 2008. These new compensation limits were not previously approved by FHFA, but FHFA is currently developing a regulation that will implement approval authority over compensation of FHLBank directors.

The total fees paid by the 12 FHLBanks to directors during 2008 were $4.3 million, ranging from a low of $197,635 at Chicago to a high of $618,425 at Boston. With the exception of the Boston and Atlanta FHLBanks, a director (excluding chair and vice chair) received on average between $17,178 and $18,508 in compensation during 2008. On average, chairs were paid about 67 percent more and vice chairs were paid about 33 percent more than other FHLBank directors. The chairman of the Board of the Office of Finance was paid $31,232 in 2008. The other Board members of the Office of Finance are bank presidents who receive no additional compensation for their additional duty on the Board of the Office of Finance. (See Figure 30.)

Figure 30 • Director Fees Earned in 2008

	BOS	NYK	PIT	ATL	CIN	IND	CHI	DSM	DAL	TOP	SFR	SEA

Accounting

Accounting for Financial Assets

The current financial crisis has highlighted the fact that United States generally accepted accounting principles (GAAP) for financial assets and the impairment framework are under stress. Fannie Mae and Freddie Mac (Enterprises), and the Federal Home Loan Banks (FHLBanks) all report financial assets and impairment in accordance with GAAP. Nevertheless, reported performance can differ for similar financial assets because of individual facts and circumstances. Consequently, the comparability of financial reports may be significantly reduced.

Accounting for financial assets follows a mixed attribute model. The accounting framework is based on mixed attribute because companies can account for some financial assets at market, or fair, value while other assets are measured at historical, or amortized, cost.

Fair value accounting measures financial assets at their current market value, with changes in value reflected in earnings. Under fair value accounting, a company's financial performance is influenced by changes in interest rates and market prices for risk-taking. In comparison, the amortized-cost accounting model typically reflects changes in fair value only when it is doubtful that the cost of an asset will be recovered. Earnings measured at amortized cost do not reflect transitory price changes.

An asset's legal form and management intent regarding the investment affect how it will be reported under amortized-cost accounting. These differences can be illustrated by a pool of mortgage loans that can be held either outright or in the legal form of a security.

Mortgage loans are measured differently depeding on whether management's intent is to sell the loans or hold them as long-term investments. Held-for-sale loans are reported at the lower of cost or market value, which ever is lower. This means gains are not recorded, but any unrealized loss in fair value of the pool is reported in earnings. Loans that are held for investment are reported at cost. Fair value is not used to measure impairment; rather, impairment is based on probable credit losses inherent in the pool on the reporting date.

If the same pool of loans is structured in mortgage-backed securities, they can be measured three different ways, depending on management intent. Securities designated held-to-maturity are reported at amortized cost. For securities designated available-for-sale, only the balance sheet reflects the securities' fair value. Impairment of held-to-maturity and available-for-sale securities is measured at fair value only if it is probable the investor will not recover the cost of its investment. Securities are routinely measured at fair value through earnings only if they are designated as trading assets.

For this national pool of loans, the impairment trigger points and resultant losses under an amortized-cost regime are different depending on the investment's legal form and management intent. In a fair value regime, form and intent have little or no effect on the accounting. The wide variety of accounting choices, all sanctioned by GAAP, can be seen in financial statements of financial institutions, including the FHLBanks and the Enterprises. The variety of accounting treatments available adds to the challenge of assessing solvency and financial performance.

Standards Setters Would Eliminate Mixed-Attribute Accounting

The long-standing coexistence of the fair value and amortized-cost measurements is seen by accounting standards setters as problematic. More than 20 years ago, the Financial Accounting Standards Board (FASB) began to move toward more widespread use of fair value.

FASB took a big step 10 years ago when it required that all derivatives be accounted for at fair value. Concurrently, it designed hedge accounting to bridge the gap between derivatives and the items they hedge, which are generally assets and liabilities reported at historical cost. More recently, FASB issued a standard that permits companies to voluntarily apply fair value accounting to a broad range of financial assets and liabilities. The fair value option was intended, in part, to simplify hedge accounting. FASB saw the fair value option as an interim step to mandatory fair value measurement for all financial assets and liabilities.

Controversy Over Fair Value Accounting

Fair value accounting has always been controversial because it introduces market volatility into earnings, and valuation issues for illiquid financial assets. It has become more controversial in the current economic climate. Some blame fair value accounting, even with today's limited use, for leading to a downward spiral of writedowns that has caused several bank failures. Many of these critics also view fair value as promoting "procyclical" behavior on the part of banks. That is, over a credit cycle, banks take excessive risks during good times as asset values increase, then they become excessively risk averse during bad times as asset values decrease.

Comprehensive fair value accounting would reduce the impact differences in legal form and management investment intent have on accounting measurements. Proponents of fair value accounting claim it provides the most relevant information regarding the performance of a company's financial instrument portfolio and best represents the solvency of the company itself. Some supporters regard amortized-cost accounting as a means of earnings management, creating rainy day funds, and obscuring problems from investors. In theory, fair value accounting reflects market expectations regarding probability of default and resultant losses, volatility of future losses, risk-reward trade-offs in the current financial environment, and competing returns available to investors for holding alternative investments.

Controversy Over Amortized-Cost Accounting

Historical cost accounting has engendered its own share of controversy. A long-standing issue for prudential supervisors has been loan impairment. Under GAAP, a loss is recognized only when its occurrence is probable, meaning an event that is highly likely to occur rather than a statistically expected outcome. Thus, the loan loss allowance only represents a company's credit loss arising from both identified problem loans and latent problem loans in the portfolio that the company has not identified as such. The assumptions regarding loan performance are supposed to take into account credit characteristics and relevant economic conditions existing on the financial report date. Future events or trends that are expected to continue into the future are generally not permitted to be considered in setting the reserve. The rationale under GAAP is that the reserve should not reflect losses attributable to future events, but rather actual events that have already occurred.

Many financial statement users expect the allowance to adequately cushion a company from predictable, expected losses. Critics have called on standards setters to change the rules to permit the allowance to reflect expected losses over some

time horizon. Banking supervisors see the incurred loss model for loans as another accounting convention that contributes to procyclical behavior. That is, banks must take provisions to build the allowance when the credit cycle is at its worst and the banks are under dire financial distress.

Supporters of the existing rules believe the allowance should reflect the characteristics of the loan portfolio on the date of the financial statements. In their view, an expected-loss approach would amount to rainy day reserves "cookie jar" accounting that obscures the company's actual financial condition and financial performance from investors.

A parallel controversy has erupted over the recognition of securities impairment. Similar to loans, a loss is recognized on available-for-sale or held-to-maturity securities when loss is probable. Once the impairment threshold has been reached, though, impairment is measured as the unrealized loss in affected securities' fair value. The substantial discounts that exist for mortgage-backed securities in the present market cause impairment writedowns to be large. Critics point out that, since impairment is based on fair value, it reflects the illiquidity and higher risk premiums on the asset class in addition to the credit losses inherent in the securities. Consequently, these critics believe the current accounting rules exaggerate the losses they will eventually bear by having invested in the securities.

What many view as a shortcoming to the mixed-attribute accounting model, the incurred loss concept, is common to both securities and whole loans. However, the measurement guidance results in substantially different outcomes. For loans, the reserves are too small, while for securities, the reserves are too large.

Response by FASB

In mid-March 2009, FASB issued for comment changes to fair value measurement and recognizing securities impairment. The change proposed for fair value measurement is in response to views that accounting guidance requires companies to consider transactions by distressed market participants in their own valuations of financial assets. The change proposed for securities impairment would more closely align the rules with how loan losses are measured.

Conclusion

The variety of accounting choices and impairment rules has been illustrated with only mortgage loans. Differences exist for other assets within the mixed-attribute system. The myriad accounting rules surrounding asset impairment negatively affects companies' ability to communicate their financial performance and solvency to investors, creditors, and other stakeholders. Financial transparency would be improved by rationalizing these many different ways of representing impairment.

FASB has seen comprehensive fair value accounting as the solution to these ills. Some proponents of fair value claim it reduces subjective judgments in accounting. Skeptics believe judgment is transferred from accounting decisions to valuation decisions. Furthermore, opponents see fair value accounting as causing rather than merely reflecting financial distress of companies. Given the level of controversy, the path to improving financial reporting for financial assets is uncertain.

Supervisory Actions

Conservatorship

On September 6, 2008, FHFA placed both Fannie Mae and Freddie Mac in conservatorships. Conservatorship is a statutory process designed to restore safety and soundness while carrying on the business of a regulated entity and perserving and conserving its assets and property. It was a significant step, reflecting the economic turmoil in 2008.

FHFA had serious concerns about safety and soundness weaknesses at the Enterprises related to credit risk, earnings outlook and capitalization, and the continued and substantial deterioration in the market for their equity, debt, and mortgage-backed securities (MBS). Their capital was threatened by increasing credit losses in their guaranteed and investment mortgage portfolios. Moreover, the Enterprises were unable to raise capital or issue debt with normal terms, including tenure and amounts. The debt they were able to issue was expensive.

During the months preceding the conservatorship, FHFA, assisted by the Federal Reserve Board and Office of the Comptroller of the Currency, conducted intense supervisory reviews of the deteriorating credit environment and other risks to the Enterprises. These reviews and rising yields on Enterprise debt and MBS relative to other benchmarks confirmed FHFA's concerns. By September, it was clear the agency had to act to ensure Fannie Mae and Freddie Mac could continue to serve their mission and to prevent the risk of a systemic failure.

After consulting with the Chairman of the Board of Governors of the Federal Reserve System and the Secretary of the Treasury, Director Lockhart, using authorities granted by the Housing and Economic Recovery Act of 2008 (HERA), appointed FHFA as conservator of the Enterprises. All lobbying and political contributions by the Enterprises were immediately ordered stopped. New CEOs were selected. Neither departing CEO received a "golden parachute" (severance) payment. The Director also eliminated dividends on all common and preferred stock.

FHFA had serious concerns about safety and soundness weaknesses at the Enterprises related to credit risk, earnings outlook and capitalization, and the continued and substantial deterioration in the market for their equity, debt, and mortgage-backed securities.

As conservator, FHFA is responsible for the overall management of the institutions and may delegate operational and other duties to the Enterprises' directors and officers as deemed appropriate. All existing contracts remain in effect, with the exception of lobbying contracts, which the conservator disaffirmed. Both Enterprises continue to carry on their business under the conservator's oversight. FHFA continues to monitor capital levels, but regulatory capital requirements are not binding during the conservatorship.

The Treasury Department provided liquidity to the Enterprises through three facilities:

- The MBS Purchase Program allows Treasury to purchase Fannie Mae or Freddie Mac MBS directly.
- The Senior Preferred Stock Purchase Agreement allows Treasury to inject up to $200 billion each to the Enterprises in exchange for senior preferred stock to ensure the Enterprises maintain a positive net worth. The original Senior Preferred Stock Facility (September 2008) totaled $100 billion. In February 2009, Treasury announced that the facility would be increased to $200 billion for each Enterprise.This facility supports all past and future senior and subordinated debt and MBS issuances until the terms of the facility are fully satisfied.
- The credit facility allows Treasury to make short-term loans to Fannie Mae, Freddie Mac or the 12 Federal Home Loan Banks using MBS and advances as collateral.

Under the Senior Preferred Stock Purchase Agreement, the Treasury Department allowed each Enterprise to increase its portfolio of mortgages up to $900 billion through 2009 in order to support the troubled mortgage market, before requiring declines of 10 percent per year. Portfolio limits were originally set at $850 billion in September 2008. In February 2009, Treasury announced that the limits would be increased to $900 billion under the Treasury Department's Financial Stability Plan. Each Enterprise can guarantee unrestricted amounts of MBS.

The Enterprises opened for business as usual on September 8, 2008, with FHFA personnel on-site at their headquarters and other key locations to ensure a smooth transition.

Subsequent Events

Since the conservatorships began in September, FHFA has achieved a number of significant accomplishments in its work to stabilize and restore safety and soundness to the Enterprises.

1. **FHFA changed Enterprise management and governance practices.**

   FHFA appointed new CEOs, nonexecutive chairmen, and Boards of Directors to both Enterprises. FHFA also worked with both Enterprises to establish a new Board committee structure, including key changes in charters and responsibilities. In March 2009, Freddie Mac's CEO resigned. The chairman became the interim CEO while a search for a replacement began. The Board then began searching for a replacement. FHFA continues to work with the new CEOs, Board chairmen, and executive leaders to retain key Enterprise staff.

2. **FHFA redirected decisions and refocused the Enterprises on strategic and mission-related goals.**

   On September 12, 2008, FHFA issued a statement supporting continuation of the multifamily activities of the Enterprises. It affirmed the importance of multifamily activities supporting low-income housing tax credits and remarketed mortgage revenue bonds.

   The Enterprises reversed a previously announced 25 basis point across-the-board adverse market charge in favor of a more carefully targeted price adjustment that better aligns prices with relative risk and increases mortgage affordability. FHFA continues to monitor and review proposed credit and pricing changes to ensure these changes are consistent with market conditions and support mission-related activities.

FHFA is actively working with the Enterprises and with stakeholder groups to establish housing goals for 2009 that encourage the Enterprises to assist foreclosure prevention efforts, support important initiatives such as low-income housing tax credits and revenue bonds, and aid congressionally mandated neighborhood stabilization efforts.

3. **FHFA used new statutory authorities to ensure the Enterprises' effective transition to conservatorship. Specifically, FHFA**
   - Oversaw public release of each Enterprise's 2007 and 2008 charitable giving reports.
   - Reviewed charitable contribution plans, internal controls, and associated processes for charitable contributions to eliminate politically related giving.
   - Initiated a quarterly reporting and certification process of charitable giving.
   - Determined it was not in the Enterprises' best interests to begin setting aside money for the Housing Trust and Capital Magnet funds as required by section 1337 of the Federal Housing Enterprises Financial Safety and Soundness Act of 1992, as amended.
   - Worked with the Enterprises to improve accounting consistency.
   - Intervened in a number of legal cases to assert special conservatorship authorities and defenses and minimize liabilities and litigation expenses.
   - Worked with Treasury on Freddie Mac's initial capital draw request in November, as well as both Enterprises' draws following the release of fourth quarter 2008 financial results.
   - Resolved potential legal conflicts between the Treasury agreements, which require payment of dividends to Treasury, and state laws limiting such payments.
   - Provided a process in the absence of audit committees at both Enterprises to produce third quarter financial results.
   - Released the Enterprises from the regulatory capital classification process.

FHFA appointed new CEOs, nonexecutive chairmen, and Boards of Directors to both Enterprises. FHFA also worked with both Enterprises to establish a new Board committee structure, including key changes in charters and responsibilities.

4. **FHFA encouraged Fannie Mae and Freddie Mac to lead foreclosure prevention initiatives. FHFA also worked with the new Administration, the Enterprises, and other industry participants on a plan to address the economic crisis and keep people in their homes.**

   FHFA worked with HOPE NOW, the Treasury Department, the Department of Housing and Urban Development (HUD), the Federal Housing Administration (FHA), and the Enterprises to design and implement the comprehensive Streamlined Modification Program (SMP), which was announced November 11, 2008. SMP is designed to reduce preventable foreclosures by moving struggling homeowners into mortgages they can afford. FHFA also coordinated with the

Enterprises to suspend foreclosures of owner-occupied homes from November 26, 2008, until January 31, 2009, and encouraged both Enterprises to update their tenant eviction and foreclosure sale suspension plans.

FHFA worked with the White House, the Treasury Department, HUD, other regulators, and Fannie Mae and Freddie Mac to develop the Making Home Affordable loan modification program that Treasury announced in March 2009. This program, which streamlines the process for modifying mortgages in danger of default, is a major step forward in reducing preventable foreclosures and stabilizing the housing market. Fannie Mae and Freddie Mac will participate for loans they own or guarantee and as administrators on behalf of the Treasury Department for all other loan modifications under this program.

FHFA began publishing the monthly and quarterly Foreclosure Prevention Report detailing the Enterprises' borrower assistance data and foreclosure prevention activities on the agency's Web site. These reports detail information from more than 3,000 approved servicers on 30.4 million first-lien mortgages.

Under HERA, FHFA became a federal property manager in its role as conservator and began required reporting to Congress in December 2008. As a federal property manager, FHFA will continue to press the Enterprises to accelerate programs to prevent foreclosures.

FHFA also provided directives and guidance to the Enterprises to implement credit risk management changes and pricing decisions and held meetings with various industry representatives to discuss ways to support and strengthen the housing industry. In addition, FHFA and the Enterprises are working with other industry segments to exercise existing authorities under pooling and servicing agreements.

5. **FHFA encouraged the Enterprises to set best practices and be market leaders.**

   Fannie Mae and Freddie Mac have taken a leadership role with all mortgage participants to never let the market abuses from earlier in this decade recur. Actions they have taken include issuing guidance on nontraditional and subprime mortgages, mortgage fraud guidance, and implementing loan level indicators of originators and appraisers to reduce fraud.

   In late December, FHFA announced that Fannie Mae and Freddie Mac would implement a revised Home Valuation Code of Conduct, which became effective May 1, 2009. The code enhances protections for the independence of appraisers while maintaining lenders' ability to address unprofessional appraisal practices and ensure appraisal quality. The code also requires appraisal quality control testing, reporting on appraiser misconduct, and the creation of the Independent Valuation Protection Institute.

Consent Orders and Other Supervisory Agreements

In the May 2006 Fannie Mae consent order, and in a voluntary agreement with Freddie Mac of June 2006, the Enterprises agreed to restrict the growth of their retained mortgage portfolios. In February 2008, the Office of Federal Housing Enterprise Oversight (OFHEO) lifted the constraints on the retained mortgage portfolios per the agreement that OFHEO would do so when they became timely financial filers.

On March 19, 2008, OFHEO also announced that Freddie Mac and Fannie Mae had made substantial strides toward the fulfillment of their consent orders relating to accounting, internal control, and other failures that had led to restating financial results and reporting significant losses. Fannie Mae had consented to remediate the problems and agreed to pay a $400 million penalty to the government. OFHEO reached an

Consent Order Timeline

FEBRUARY 2008 • OFHEO lifts constraints on the retained mortgage portfolios of the Enterprises.

MARCH 2008 • OFHEO announces that the Enterprises have made substantial strides toward fulfilling their respective consent orders.

APRIL 2008 • OFHEO announces consent orders settling administrative enforcement actions against former Fannie Mae executives.

MAY 2008 • OFHEO lifts 2006 consent order with Fannie Mae.

JULY 2008 • FHFB amends an October 2007 cease-and-desist order against the FHLBank of Chicago.

NOVEMBER 2008 • FHFA lifts consent order against Freddie Mac.

agreement with the Enterprises to reduce the OFHEO-directed capital requirement from 30 percent to 20 percent in return for the Enterprises' commitments to raise significant additional capital, to maintain overall capital levels well in excess of regulatory requirements, and to support GSE regulatory reform.

Fannie Mae completed its capital raise on May 19, 2008, with the addition of approximately $7.4 billion in new capital. As a result of this capital raise, Fannie Mae's OFHEO-directed requirement was reduced to 15 percent. Freddie Mac committed to raise an additional $5.5 billion in new capital following their completion of the SEC registration process. Freddie Mac's commitment to raise captial was never fulfilled. Both Enterprises experienced increasing credit losses, resulting in the rapid depletion of their capital during the summer of 2008. Neither Enterprise was able to raise additional private equity, a key factor in the decision to place both Enterprises into conservatorship. Following the conservatorship, the Director suspended capital classifications. Positive net worth is maintained through the Treasury agreement providing support up to $200 billion in capital for each Enterprise.

In April 2008, OFHEO announced three consent orders against former Fannie Mae Board Chairman and CEO Franklin D. Raines, former Chief Financial Officer J. Timothy Howard, and former Controller Leanne Spencer. The orders settled OFHEO's administrative enforcement actions for accounting and internal control problems at Fannie Mae, detailed in the agency's two special examination reports.

On March 19, 2008, OFHEO also announced that Freddie Mac and Fannie Mae had made substantial strides toward the fulfillment of their consent orders relating to accounting, internal control, and other failures that had led to restating financial results and reporting significant losses.

The administrative actions alleged that the former executives had inappropriately managed earnings, failed to put adequate internal controls in place, released misleading financial reports, and operated the accounting function without adequate resources, all of which represented misconduct and unsafe and unsound practices that led to financial losses.

Under the consent orders, the former executives agreed to make payments to the federal government and to surrender and relinquish claims related to stock options. They also agreed not to work at Fannie Mae or receive compensation

from Fannie Mae in the future. Mr. Raines agreed to pay or surrender a total of $24.7 million, Mr. Howard agreed to pay or surrender a total of $6.4 million, and Ms. Spencer agreed to pay a total of $275,000.

On May 6, 2008, the agency lifted its 2006 consent order with Fannie Mae, but continued to require a surplus over minimum capital. In June 2008, OFHEO lowered the directed capital requirement for Fannie Mae to 15 percent above the minimum capital level after the Enterprise successfully raised capital.

On July 23, 2008, the Federal Housing Finance Board, a predecessor of FHFA, amended an October 2007 cease-and-desist order against the FHLBank of Chicago to permit the FHLBank to repurchase capital stock it had issued to support new advances, subject to certain conditions.

Freddie Mac completed its one remaining consent order item, separating the CEO and Chairman of the Board positions, during conservatorship. FHFA lifted the consent order on November 21, 2008.

Other Supervisory Actions

Executive Compensation

The Housing and Economic Recovery Act of 2008 (HERA) granted the Director of FHFA the authority to prohibit and withhold compensation of executive officers of the regulated entities, and to limit and prohibit golden parachutes and indemnification payments by the regulated entities to entity-affiliated parties. HERA also provided the Director with temporary authority to approve, disapprove, or modify the executive compensation of the regulated entities for named executive officers. HERA expanded and clarified prior regulatory controls on executive compensation at the Enterprises and for the first time extended these controls to cover the Federal Home Loan Bank System.

When conservatorship began in September 2008, the Enterprises still needed to be able to attract, retain, and reward skilled officers and other personnel. Working closely with senior officials of the Treasury Department, FHFA designed and implemented an incentive-based retention plan for the Enterprises. Bonuses were not paid for the 2008 performance year.

During 2008, the agency reviewed and decided on 20 requests from the Enterprises regarding compensation actions involving new hires, termination benefits, and other nonsalary compensation. The agency also reviewed annual 2007 performance year compensation recommendations for 32 executive officers at Fannie Mae and 17 officers at Freddie Mac.

Housing Mission and Goals

Affordable Housing Goals

In 2008, Fannie Mae and Freddie Mac (Enterprises) were charged with meeting ambitious housing goals set by the Department of Housing and Urban Development (HUD) in 2004. Previously the Enterprises had missed two home purchase subgoals in 2007, which in April 2008 HUD determined were infeasible. Shortly after the enactment of the Housing and Economic Recovery Act of 2008 (HERA), FHFA began monthly meetings with the Enterprises. During these meetings, FHFA determined that both Enterprises would likely miss most housing goals and subgoals in 2008.

In December 2008, FHFA wrote to the Enterprises requesting detailed reasons for failing to meet certain 2008 affordable housing goals, and the Enterprises responded soon thereafter. Although most affordable housing goals set by HUD for 2008 were unattainable, FHFA expects each Enterprise to develop and implement ambitious plans to support the targeted borrowers and markets.

HERA extended HUD's 2008 housing goals to apply in calendar year 2009, subject to modification by FHFA after review of market conditions. FHFA initiated that review in the fourth quarter of 2008. FHFA has also begun preparations for rulemaking and public comment on substantial statutory revisions to the housing goals scheduled to go into effect in 2010.

HERA requires four single-family goals and one multifamily special affordable goal for 2010. For single-family purchase money mortgages, there will be goals based on three types of families—those who are classified as low- or very low-income and those residing in low-income areas. The statute also requires a low-income, single-family refinance goal, as well as a multifamily special affordable goal for low- and very low-income families.

HERA also requires the Enterprises to provide market leadership in developing loan products and flexible underwriting guidelines to facilitate a secondary market for mortgages for low-, very low-, and moderate-income families with respect to manufactured housing, affordable housing preservation, and rural housing. FHFA must set standards for the evaluation of the Enterprises' duty to serve these markets.

Multifamily mortgages are an important component of affordable housing. Six days after FHFA became conservator of the Enterprises, the agency released a statement to assure market participants that the Enterprises would continue to be a source of underwriting and financing for multifamily loans. Senior FHFA managers and staff have been meeting since August 2008 with stakeholders in the multifamily market to discuss concerns.

Enterprises are also subject to minimum dollar-based special affordable multifamily subgoals—$5.49 billion per year for Fannie Mae and $3.92 billion per year for Freddie Mac. Both Enterprises surpassed these subgoals in 2007 and 2008.

Enterprise Housing Goals

The Federal Housing Enterprises Financial Safety and Soundness Act of 1992 required HUD to set annual housing goals for Fannie Mae and Freddie Mac.

HUD also was required to monitor their performance in achieving these goals and ensure that the Enterprises' business activities complied with charter provisions and met public purposes.

HERA transferred these responsibilities to FHFA. FHFA has initiated a process to ensure the prompt and thorough review of new products and activities by the Enterprises as part of this responsibility.

Figure 31 • Enterprises' Housing Goals and Performance for 2007–2008

Category	2007 Goal/Subgoal	2007 Performance		2008 Goal/Subgoal	2008 Performance[1]	
		Fannie Mae	Freddie Mac		Fannie Mae	Freddie Mac
Overall goals:[2]						
Low-mod income[4]	55%	55.5%	56.1%	56%	53.6%	51.5%
Underserved areas	38%	43.4%	43.1%	39%	39.4%	37.7%
Special affordable[4]	25%	26.8%	25.8%	27%	26.0%	23.0%
Home purchase subgoals:[3]						
Low-mod income[4]	47%	42.1%	43.5%	47%	38.9%	39.4%
Underserved areas[4]	33%	33.4%	33.8%	34%	30.4%	30.2%
Special affordable[4]	18%	15.5%	15.9%	18%	13.6%	15.1%

1 Performance as reported by the Enterprises; official performance will be determined by FHFA after review of Enterprise loan-level data.
2 Minimum percentage of all dwelling units financed by each Enterprise.
3 Minimum percentage of all home purchase mortgages financed.
4 Goal/subgoal declared infeasible for 2008 by FHFA; low-mod income and special affordable home purchase subgoals also declared infeasible for 2007 by HUD.

Foreclosure Prevention

As house prices fell, delinquencies on mortgages tripled, not just on subprime and Alt-A mortgages, but also on prime mortgages. Foreclosures in 2008 increased almost 150 percent over the two previous years.

On November 11, 2008, FHFA Director Lockhart announced a program designed to reduce preventable foreclosures by streamlining loan modifications to get struggling homeowners into mortgages they could afford. The Enterprises, HOPE NOW and its 27 servicer partners, the Department of the Treasury, the Federal Housing Administration (FHA), and FHFA collaborated on the Streamlined Modification Program (SMP) to design a uniform, efficient process approved by key industry participants.

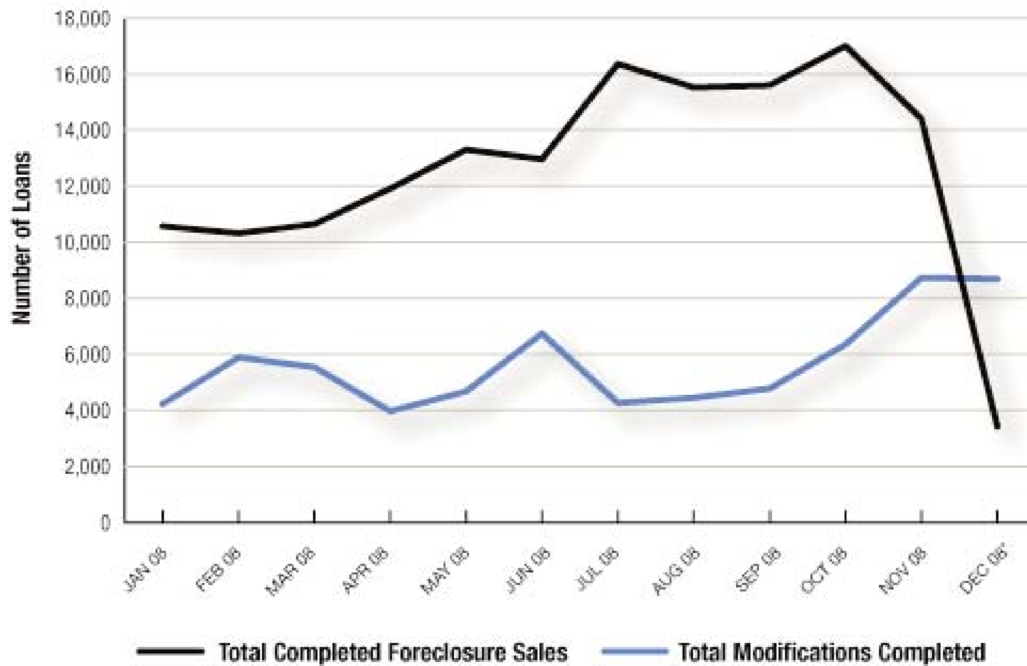
The program targeted the highest-risk borrower who had missed three payments or more, owned and occupied the property as a primary residence, and had not filed for bankruptcy. Seriously delinquent borrowers had to contact their servicers and provide income information. The program fast tracked troubled borrowers into an affordable monthly payment. Affordable was defined as a first mortgage payment, including homeowner association dues, of no more than 38 percent of the household's monthly gross income. This can be achieved by reducing the interest rate, extending the life of the loan, or even deferring payment on part of the principal. Servicers have flexibility in the mix used or whether to customize a process.

Borrowers who participated in SMP were strongly encouraged to seek financial counseling through HUD-approved agencies—particularly if the default was a result financial mismanagement or overextension.

In 2008, FHFA began issuing the monthly and quarterly *Mortgage Metrics Report*, later renamed the *Foreclosure Prevention Report*, which summarizes data provided by Fannie Mae and Freddie Mac and gives a comprehensive view of their efforts to assist borrowers, including forbearance plans, short sales, deeds in lieu, assumptions, and charge-offs in lieu of foreclosure. The report focuses on the delinquencies, loss mitigation actions, and foreclosure data reported by more than 3,000 approved servicers.

Section 110 of the Emergency Economic Stabilization Act of 2008 (EESA) directed federal property managers (FPMs) to develop and implement plans to maximize assistance for home-

Figure 32 • 2008 Enterprise Foreclosures Completed and Loan Modifications



Source: Federal Housing Finance Agency

*The Enterprises each announced moratoriums on foreclosure sales on occupied properties beginning November 26, 2008.

owners and encourage servicers of underlying mortgages to take advantage of programs to minimize foreclosures. As conservator for Fannie Mae and Freddie Mac, FHFA is a designated FPM. Each FPM is required to report to Congress about the number and types of loan modifications and the number of foreclosures during the reporting period. FHFA submitted two federal property manager reports to Congress in 2008.

Homeowner Affordability and Stability Plan

In early 2009, FHFA played a major role in designing the new Administration's Homeowner Affordability and Stability Plan (HASP), which is a major step in reducing preventable foreclosures and stabilizing the housing market.

In the Making Home Affordable refinance initiative, Fannie Mae and Freddie Mac will provide access to low-cost refinancing for responsible homeowners with loans the Enterprises already own or guarantee. This will help up to four to five million homeowners avoid foreclosure and reduce their monthly payments. The Making Home Affordable modification initiative is a comprehensive $75 billion loan modification plan designed to reach up to three to four million at-risk homeowners. This program will be a national standard for loan modifications that will be applied to borrowers uniformly to help homeowners stay in their homes and protect neighborhoods. Incentives built into the program will encourage servicers and lender/investors to restructure loans to achieve lower payments for homeowners and borrowers to stay current on their mortgages.

Fannie Mae and Freddie Mac are essential to the success of the program. They have assumed responsibilities in the implementation and ongoing oversight of the modification and refinancing programs. Given the Enterprises' roles in the industry as leaders in establishing best practices and standards, their involvement brings the necessary accountability that would be required for any federal program supported with taxpayer dollars.

FHLBanks' Targeted Affordable Housing and Community Investment Activities

The Federal Home Loan Banks (FHLBanks) administer three housing and community investment programs: the Affordable Housing Program (AHP), the Community Investment Program (CIP), and the Community Investment Cash Advances (CICA) program. Using these programs, FHLBanks provide financing for targeted community investment projects and expand homeownership and rental opportunities for low- or moderate-income households (80 percent of area median income or below) and middle-income households (115 percent of area median income).

AHP Regulatory Initiatives

In 2008, FHFA approved and implemented initiatives designed to enhance its regulation of AHP, CIP, and CICA programs. These initiatives are:

FHLBank Mortgage Refinancing Authority— HERA amended the Federal Home Loan Bank Act (FHLBank Act) by adding a provision that requires FHFA to allow FHLBanks to use subsidy funds from their AHP homeownership set-aside programs to refinance low- and moderate-income households' first mortgage loans on a primary residence until July 30, 2010. In October 2008, FHFA published an interim final rule that allows an FHLBank to use all or part of its homeownership set-aside allocation (up to 35 percent of its statutory contribution) to assist households that qualify for refinancing under FHA's Hope for Homeowners program when additional subsidy is needed to bring down the household's mortgage debt-to-income ratio to an affordable level.

AHP, CIP, and CICA Program Data Integrity Review— In 2008, FHFA completed its implementation of expanded and enhanced AHP and CICA databases. The new system uses a Web application for FHLBanks to submit data for the AHP competitive and set-aside programs, CIP, and other CICA programs.

January 2008 marked the first time that FHLBanks reported data for all the programs into the new databases. To ensure that the new databases accurately capture and report on the progress of the AHP, CIP, and other CICA programs in 2009, FHFA will conduct on-site data integrity reviews at all 12 FHLBanks. The reviews will validate the 2008 AHP and CICA program data submissions to FHFA and clarify reporting requirements in the agency's data reporting manual.

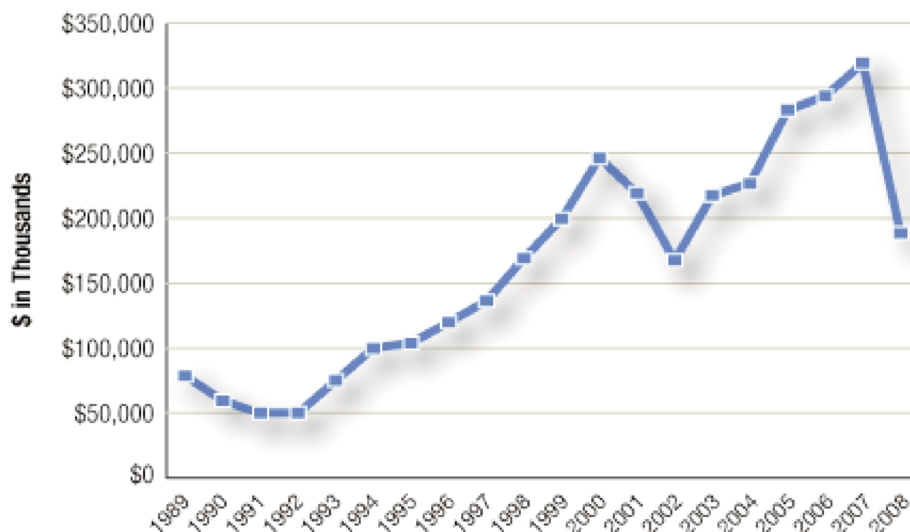
Affordable Housing Program

The FHLBank Act requires each of the 12 FHLBanks to establish an AHP to be used for the construction, purchase or rehabilitation of housing addressing a wide range of needs. AHP funds help subsidize the cost of owner-occupied housing targeted to households with incomes at or below 80 percent of area median income, and rental housing in which at least 20 percent of the units are reserved for households with incomes at or below 50 percent of area median income. The subsidy may be in the form of a grant or a subsidized interest rate on an advance from an FHLBank to a member.

The FHLBank Act requires each FHLBank to contribute annually at least 10 percent of its previous year's net earnings to AHP, subject to a minimum annual combined contribution by the 12 FHLBanks of $100 million. From 1990 to 2008, the FHLBanks contributed more than $3 billion to AHP (see Figure 33). In 2009, FHFA expects approximately $188 million in AHP subsidies to be available nationwide, compared to over $319 million in 2008, a decrease of 41 percent.

In 2008, each FHLBank administered two AHPs, a competitive application program and a homeownership set-aside program. An FHLBank may set aside annually up to the greater of $4.5 million or 35 percent of the FHLBank's annual statutory AHP contribution to assist low- or moderate-income households in purchasing or rehabilitating homes, provided that at least one-third of the FHLBank's aggregate annual set-aside contribution is allocated to first-time homebuyers.

Figure 33 • AHP Statutory Contributions ($ in Thousands)



Source: Federal Housing Finance Agency

Homeownership set-aside programs are voluntary. In 2008, each FHLBank offered at least one set-aside program.

AHP Competitive Application Program

Under the competitive application program, an FHLBank's member financial institutions submit applications to the FHLBank on behalf of one or more sponsors of eligible housing projects. Projects must meet certain statutory and regulatory requirements to be eligible for AHP funding under this program.

AHP Homeownership Set-Aside Program

An FHLBank may establish one or more AHP homeownership set-aside programs. Members obtain the set-aside funds from the FHLBank and use them for grants of up to $15,000 to eligible households. In 2008, a majority of the set-aside disbursements were used for downpayment and closing cost assistance.

Community Investment Program and Community Investment Cash Advances Programs

CIP and other CICA programs offer funding, including low-cost, long-term funding, for members and housing associates to use for financing community investment projects for targeted beneficiaries or targeted income levels. Members may use CICA funds to provide financing through loan originations, loan participations, revolving loan funds, and purchases of low-income housing tax credits and mortgage securities.

In 2008, the FHLBanks made nearly $3 billion in CIP and CICA advances for community investment and mixed-use projects and more than $2 billion in CIP advances for housing. To address the mortgage crisis, some FHLBanks made special CIP advances available to members to assist households facing mortgage delinquency or foreclosure to restructure or refinance their mortgages.

FHLBank Affordable Housing Examination Conclusions

FHFA's Division of Bank Regulation assesses the effectiveness of the FHLBanks' affordable housing and community investment programs, plans, and activities to meet the requirements and goals articulated in the FHLBank Act. Each FHLBank's affordable housing and community investment activities must meet applicable FHFA regulations and be consistent with safety and soundness. Assessment of the affordable housing and community investment activities factors into the examination component ratings for corporate governance and operational risk as well as the overall composite rating for each FHLBank.

An FHLBank's Board must, in conjunction with senior management, ensure the institution's affordable housing and community investment activities effectively support the FHLBank's housing finance mission. When developing and revising an FHLBank's AHP implementation plan, the Board of Directors must consult with its advisory council to ensure the plan sets out priorities to address the district's housing needs.

In 2008, FHFA's Division of Bank Regulation examined affordable housing programs at 11 FHLBanks and in midcycle visited programs with heightened supervisory concerns or program deficiencies. In general, the FHLBanks' affordable housing programs are effective, but some have nominal regulatory compliance issues. A few of the FHLBanks' programs would benefit from strengthened policies and procedures and enhanced automated monitoring and reporting systems. The agency found that management at all the FHLBanks is committed to appropriately solving issues identified.

Regulatory Guidance

Regulations: Enterprises

Risk-Based Capital Amendments

On June 25, 2008, the Office of Federal Housing Enterprise Oversight (OFHEO) published Risk-Based Capital Regulation–Loss Severity Amendments, a final rule in the *Federal Register*. This amendment corrected the loss severity equations that currently understate losses on certain defaulted single-family conventional and government-guaranteed loans and amended treatment of Federal Housing Administration (FHA) insurance to conform to current law. The final amendments, which also addressed comments, became effective June 25, 2008. A correction to the final rule was published July 15, 2008, to insert preamble footnotes that had been omitted in the final publication.

Flood Insurance

On October 10, 2008, the Federal Housing Finance Agency (FHFA) published a proposed rule, Flood Insurance, in the *Federal Register* for public notice and comment. Section 1161(e) of HERA amended section 102(f)(3)(A) of the Flood Disaster Protection Act of 1973, as amended (42 U.S.C. 4012a(f)(3)(a)), by replacing OFHEO with FHFA as the agency responsible for determining compliance of the Enterprises' flood insurance responsibilities. The purpose of the proposed rule was to codify the authority and responsibility of FHFA to oversee and enforce the statutory requirements affecting the operations of the Enterprises under the Flood Disaster Protection Act of 1973, as amended, and to effect congressionally mandated adjustments to the civil money penalties applicable to violations. The comment period ended December 9, 2008. The final rule was published in the *Federal Register* on January 15, 2009.

Regulations: Federal Home Loan Banks

Affordable Housing Programs: Refinancing Mortgages

On April 16, 2008, the Federal Housing Finance Board (FHFB) published a proposed regulation amending its Affordable Housing Program (AHP) regulation in the *Federal Register* for public notice and comment. The purpose of the amendment was to authorize the Federal Home Loan Banks (FHLBanks) to establish AHP homeownership set-aside programs to refinance or restructure eligible households' nontraditional or subprime owner-occupied residential mortgage loans. The impetus for the amendment was a waiver request submitted by the FHLBank of San Francisco. Through Resolution 2008-01, dated January 15, 2008, FHFB approved the waiver request to allow the FHLBank of San Francisco to establish a temporary pilot program to provide direct AHP subsidies to members for the purpose of refinancing or restructuring eligible loans into affordable long-term fixed-rate mortgages.

The rule was not made final, and on October 17, 2008, FHFB published an interim final rule to implement section 1218 of the Housing and Economic Recovery Act of 2008 (HERA) in the *Federal Register*. That section requires FHFA to authorize the FHLBanks until July 30, 2010, to use AHP homeownership set-aside funds to refinance low- or moderate-income households' mortgage loans. The interim final rule relocated the AHP rule from part 951 of the FHFB regulations to part 1291 of the FHFA regulations. FHFA regulation

§1291.6(f) authorizes each FHLBank to establish a program to use AHP direct subsidy to assist in refinancing eligible loans under the FHA's HOPE for Homeowners Program. The regulation allows AHP direct subsidy to reduce the outstanding principal balance of the household's loan or pay FHA-approved loan closing costs.

Annual assessments fund FHFA's costs and expenses, as well as a working capital fund. In addition, the regulation establishes the allocation of the annual assessments, collection procedures, and procedures to adjust the required payment.

Director Eligibility and Elections

On September 26, 2008, FHFA published an interim final rule to implement section 1202 of the Housing and Economic Recovery Act of 2008 (HERA) in the *Federal Register*. Section 1202 revises Section 7 of the Federal Home Loan Bank Act, which governs the eligibility and election of individuals to serve on the Boards of Directors of FHLBanks. In addition, the interim final rule removed part 915 of the FHFB regulations and established part 1261 of the FHFA regulations.

Regulations: Enterprises and Federal Home Loan Banks

Golden Parachute and Indemnification Payments

On November 14, 2008, FHFA published Golden Parachute and Indemnification Payments, a proposed amendment to the interim final rule Part 1231, in the *Federal Register* for public notice and comment. The interim final rule had an effective date of September 16, 2008, but was subsequently amended on September 23, 2008, to rescind portions that addressed indemnification payments. The proposed amendment described prohibited and permissible indemnification payments that a regulated entity could make to an affiliated party in connection with administrative proceedings or civil actions instituted by FHFA. The comment period regarding the proposed amendment closed on December 29, 2008. The final rule was published in the *Federal Register* on January 29, 2009.

Regulations: Agency Operations

Assessments

On September 30, 2008, FHFA published in the *Federal Register* a final rule authorizing annual assessments of its regulated entities. Annual assessments fund FHFA's costs and expenses, as well as a working capital fund. In addition, the regulation establishes the allocation of the annual assessments, collection procedures, and procedures to adjust the required payment.

FOIA

On October 10, 2008, FHFA published a proposed rule, Freedom of Information Act, in the *Federal Register* for public notice and comment. The purpose of the proposed rule was to implement the Freedom of Information Act (FOIA) (5 U.S.C. 552) for FHFA. The proposed rule established procedures for information required to be disclosed under FOIA and procedures to protect business confidential and trade secret information from disclosure as appropriate. The comment period ended November 10, 2008. The final rule was published in the *Federal Register* on January 15, 2009.

Policy Guidance: Enterprises

Mortgage Fraud

On January 10, 2008, OFHEO issued the Policy Guidance Examination of Mortgage Fraud Programs–PG-08-001, which superseded the July 2005 Policy Guidance on Mortgage Fraud Reporting–PG-05-003. The new guidance set standards for examining Enterprise mortgage fraud programs under 12 C.F.R. part 1731, consistent with the safety and soundness responsibilities of OFHEO under the Federal Housing Enterprises Financial Safety and Soundness Act of 1992. The new guidance detailed the standards for overseeing and evaluating policies and programs the Enterprises had developed to minimize mortgage fraud.

Conforming Loan Limit Calculations

On March 31, 2008, OFHEO issued and published in the *Federal Register* the final Examination Guidance Conforming Loan Limit Calculations-EG-08-001 addressing the handling of decreases in the house price data used to set the conforming loan limit, as well as procedures to calculate the limit that determines the size of mortgages eligible for purchase by the Enterprises. OFHEO solicited public comments on this final guidance in two comment periods. On June 20, 2007, OFHEO released on its Web site for public comment a proposed guidance, and on October 22, 2007, OFHEO published in the *Federal Register* for public comment a revised version. Based on comments received, OFHEO issued the final guidance that the conforming loan limit would not decrease from the current level of $417,000 in 2009 and subsequent years. However, the conforming loan limit would not increase until cumulative increases in house prices exceeded cumulative decreases since the $417,000 limit had first been reached. The final guidance also provided for rounding down increases in the conforming loan limit to the nearest $100 instead of $50.

(The guidance) detailed OFHEO's expectations for practices that (1) promoted sound risk management and controls, (2) supported the integrity of regulatory capital measures, and (3) fostered transparent and consistent financial reports by the Enterprises.

Fair Value Accounting Option

On April 21, 2008, OFHEO issued the Examination Guidance Standards for Enterprise Use of the Fair Value Option-PG-08-002, setting forth examination guidance and standards on the Statement of Financial Accounting Standards No. 159 (FAS 159). This guidance outlined standards for OFHEO examiners to apply when overseeing and evaluating the use of the fair value option already adopted by the Enterprises. It detailed OFHEO's expectations for practices that (1) promoted sound risk management and controls, (2) supported the integrity of regulatory capital measures, and (3) fostered transparent and consistent financial reports by the Enterprises. In addition, the guidance specified that OFHEO could require supplemental information for use in assessing how the Enterprises used the fair value option and its impact on their reporting of financial condition.

Policy Guidance: Federal Home Loan Banks

Nontraditional and Subprime Mortgages

On April 12, 2007, FHFB issued Advisory Bulletin 2007-AB-01, Nontraditional and Subprime Residential Mortgage Loans, which required each FHLBank to implement policies and practices to establish risk limits for, and mitigation of, credit exposure on nontraditional and subprime mortgage loans. On July 1, 2008, FHFB issued supplemental guidance with Advisory Bulletin 2008-AB-02, Application of Guidance on Nontraditional and Subprime Residential Mortgage Loans to Specific FHLBank Assets, communicating FHFB's expectation that residential mortgage loans (a) purchased under the FHLBanks' Acquired Member Assets programs, (b) backing private-label MBS in which the FHLBanks invest, or (c) serving as collateral securing advances must conform to the bank regulatory agencies' guidance that emphasizes underwriting requirements and risk management standards.

Expanded Authority to Purchase Mortgage-Backed Securities

On March 24, 2008, the FHFB Board of Directors adopted Resolution 2008-08, temporarily expanding the authority of FHLBanks to purchase mortgage-backed securities (MBS) under certain conditions. The resolution allowed FHLBanks to increase investments in MBS issued by Fannie Mae and Freddie Mac (agency MBS) by an amount equal to three times their existing capital. The resolution permitted FHLBanks to purchase and hold MBS in an amount up to six times their capital, provided that all such purchases be limited to agency MBS once an FHLBank's MBS investments exceeded three times its capital. The authority expires on March 31, 2010. On April 3, 2008, FHFB issued Advisory Bulletin 2008-AB-01, Temporary Increase in Mortgage-Backed Securities Investment Authority, detailing applicable standards for reviewing an FHLBank's notice of intention to exercise the temporary investment authority.

FHFA Research and Publications

During 2008, the Federal Housing Finance Agency (FHFA) and a predecessor, the Office of Federal Housing Enterprise Oversight (OFHEO), focused their research plans and activities on topics that assisted the agencies in achieving their strategic goals. FHFA's three strategic goals were to (1) enhance supervision to ensure that Fannie Mae and Freddie Mac (Enterprises) and the Federal Home Loan Banks (FHLBanks) operate in a safe and sound manner, are adequately capitalized, and comply with legal requirements; (2) promote homeownership and affordable housing and support an efficient secondary mortgage market; and (3) through conservatorship, preserve and conserve the assets and property of Fannie Mae and Freddie Mac and enhance their ability to fulfill their mission.

OFHEO and FHFA placed a priority on research and analysis of issues for their internal use, primarily related to analyzing risk and capital adequacy and improving the House Price Index (HPI). OFHEO and FHFA also published reports and papers and posted information on their Web sites to better inform interested parties about the issues OFHEO addressed and FHFA addresses regarding the Enterprises and the secondary mortgage market. The papers and reports were the result of research and analysis accomplished throughout the year. OFHEO and FHFA research papers, reports, and related information are available at www.fhfa.gov. FHFA researchers also presented papers and led discussions at professional and industry conferences on topics related to housing finance and regulation of the Enterprises.

Research Products

FHFA and OFHEO produced several research products in 2008. In January, OFHEO released a staff working paper, "Real Estate Futures Prices as Predictors of Price Trends," which examines whether real estate futures traded on the Chicago Mercantile Exchange provide unbiased estimates of future home prices. Another staff working paper, "Enterprise Credit Default Swaps and Market Discipline: Preliminary Analysis," was published in July. That paper explores whether the market for credit default swaps contains information pertaining to the Enterprises' default risk beyond the information contained in equity and bond prices.

OFHEO also published three research papers in 2008. The first, "Revisiting the Differences between the OFHEO and S&P/Case-Shiller House Price Indexes: New Explanations," was published in January and attempts to identify the source of divergence between the HPI and the S&P/Case-Shiller index. The next section provides more detail on that paper. "Mortgage Markets and the Enterprises in 2007," released in July, reviews developments in the housing sector, activity in the primary and secondary mortgage markets, and the financial performance of Fannie Mae and Freddie Mac in 2007. The paper is the most recent in an annual series. A third research paper, "Recent Trends in Home Prices: Differences across Mortgage and Borrower Characteristics," was published in August. That paper compares the recent performance of house prices in California across different loan types and borrower credit characteristics.

In addition, in 2008 OFHEO published three mortgage market notes, and FHFA published a fourth note. Those notes are the most recent in a series aimed at providing background information on select topics related to mortgage markets and the role of the Enterprises. The first, "Potential Implications of Increasing the Conforming Loan Limit in High-Cost Areas," published in January, uses data on securitized jumbo mortgages to examine the potential effects

of raising the conforming loan limit in high-cost areas. Two mortgage market notes were published in July: "Fannie Mae and Freddie Mac Capital" and "A Primer on the Secondary Mortgage Market." The first clarifies the various measures of Enterprise capital as well as their capital requirements and classifications, whereas the second gives a broad overview of the secondary market for home mortgages. Finally, in December FHFA released a mortgage market note, "U.S. Treasury Support for Fannie Mae and Freddie Mac," which outlines the various facilities introduced by the Treasury Department to support the Enterprises in conservatorship.

The most significant change to the HPI in 2008 was the addition of monthly indexes…In addition to the monthly house price measures, OFHEO published a series of nonmetro indexes for 48 states in 2008.

FHFA also released data on the Enterprises' foreclosure prevention activities. In September, FHFA released the first of a series of quarterly *Market Metrics Reports*, detailing the Enterprises' delinquencies and foreclosure prevention activities. The quarterly *Market Metrics Reports* were complemented with less detailed monthly *Foreclosure Prevention Reports*, first released in October. In December, FHFA released its first report to Congress on homeowner assistance in accordance with its statutory obligation as a federal property manager. That report outlined the various actions taken by FHFA and the Enterprises under conservatorship to reduce foreclosures.

In addition to those research products, OFHEO and FHFA made public updated estimates of single-family mortgages originated and outstanding and the Enterprises' combined share of residential mortgage debt outstanding. FHFA and a predecessor, the Federal Housing Finance Board (FHFB), also reported a Monthly Interest Rate Survey (MIRS) of purchase-money mortgages.

House Price Index and Related Research

OFHEO and FHFA continued to publish the HPI in 2008. Although the index was relabeled the FHFA HPI late in the year, the data and methodology used in constructing it remained the same. Historical and recent house price information from Fannie Mae and Freddie Mac are used to form repeat-transactions price indexes for 381 metropolitan statistical areas (MSA) or divisions, as well as for every state and the District of Columbia. The index was originally developed as an input for the OFHEO risk-based capital stress test. In addition to being used by FHFA to monitor the capital adequacy of the Enterprises, the index is used by industry participants, financial modelers, members of the media, and the public at large to monitor house price trends and housing market conditions.

The most significant change to the HPI in 2008 was the addition of monthly indexes. In response to strong demand for more frequent and timely house price information, OFHEO initiated public release of monthly indexes in February. The monthly measures, which are released about three or four weeks into each month, are produced for census divisions and the United States as a whole. Downloadable seasonally adjusted and unadjusted monthly indexes are provided to supplement the usual quarterly index.

In addition to the monthly house price measures, OFHEO published a series of nonmetro indexes for 48 states in 2008. Those indexes reflect home price trends in relatively rural counties—counties not in MSAs—and are useful to researchers because house price metrics are difficult to obtain for those areas. The nonmetro indexes also played a critical role in establishing local conforming loan limits under the Economic Stimulus Act of 2008. Under that legislation, because conforming loan limits were set as a function of median home prices in high-cost areas, median home values needed to be estimated for areas across the United States. The Department of Housing and Urban Development, which was tasked with estimating the median values, used the nonmetro indexes in conjunction with other data to calculate median prices for many rural areas.

Beginning with the February 2008 release of the fourth quarter 2007 data, OFHEO made two modest but significant changes in the manner in which the national HPI is calculated. The changes, which were described in the "Highlights" article incorporated in the HPI release, enhanced the weighting system used to construct the national index out of the nine census division indexes. Better measures of the housing stock are now used to weight the census division estimates. Also, a determination was made to set the quarterly change in the national index equal to the weighted change for the census divisions. Previously, the level of the national index was a weighted average of the levels of the census division indexes. That alteration was an improvement because the previous, levels-based weighting system up-weighted areas of the country that experienced greater historical appreciation. The resulting appreciation-related "drift" in weights did not reflect the intent of the original weighting system.

Continuing a trend from prior years, the price declines reflected in the HPI were much more modest in 2008 than declines reflected in other house price measures, particularly indexes reported by S&P/Case-Shiller. In response to the growing divergence, as mentioned above, OFHEO published a research paper, "Revisiting the Differences between the OFHEO and S&P/Case-Shiller House Price Indexes: New Explanations," that discussed reasons for the phenomenon and measured the impact of specific methodological and data differences on the gap between the two measures. The research included a "reconciliation" table that ultimately accounted for a significant portion of the difference. The analysis, which had been originally performed in the summer of 2007 but was enhanced significantly in January 2008, garnered a great deal of attention. In response to public demand, the reconciliation table was updated as new data became available throughout the year.

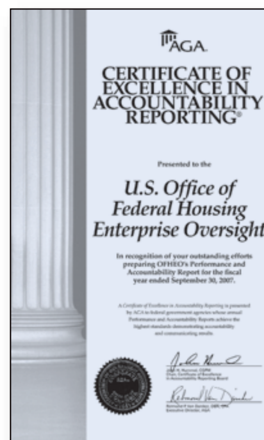
The empirical results in the published reconciliation tables suggested that relatively inexpensive homes financed with nonconforming mortgages were experiencing greater price declines than other homes in the same geographic area. The implied relationship between home financing and observed price changes was surprising and spurred additional OFHEO research, which was published in the summer of 2008. That research confirmed that, for California, homes financed with greater loan-to-value mortgages and whose borrowers had lower FICO scores had seen relatively large price declines in prior quarters.

FHFA Operations and Performance

Performance and Program Assessment

For FY 2008 reporting requirements, the agency was faced with a unique challenge: should it publish one combined annual Performance and Accountability Report (PAR) or three separate reports to cover the agencies affected by enactment of the Housing and Economic Recovery Act (HERA)? Although HERA provided for a year to transfer the staff and resources of Federal Housing Finance Board (FHFB) and Office of Federal Housing Enterprise Oversight (OFHEO) to the Federal Housing Finance Agency (FHFA), that was accomplished in less than three months. FHFA published a combined annual PAR that detailed the yearly performance of the two original agencies and the newly merged entity's first few months.

FHFA has submitted the combined PAR to the Association of Government Accountants for consideration for the Certificate for Excellence in Accountability Reporting for 2008. OFHEO was one of only 17 agencies to win the award for FY 2007.



In 2008, OFHEO was one of only 17 agencies to win the CEAR award for its FY 2007 Performance and Accountability Report.

During 2008, FHFB and OFHEO both received unqualified opinions on their financial statements. FHFB achieved all of its performance goals in FY 2008, and OFHEO achieved or substantially achieved all but one of its performance goals.

In 2008, OFHEO engaged an independent auditor to perform an Agreed upon Procedures review of the performance information used for 12 key performance measures. The goal of this process was to verify and validate the performance information and to assist FHFA in preparation for an Office of Management and Budget (OMB) Circular A-123 audit. The results of the review indicated no significant issues with regard to the effectiveness of internal controls over the management, monitoring, and tracking processes. In FY 2008, FHFB also evaluated its internal controls in accordance with the requirements of OMB Circular A-123 and found no material weaknesses.

Since FHFA's creation on July 30, 2008, there has been no audit of its internal controls. However, FHFA initiated and achieved significant activities since its inception. Highlights of FHFA's 2008 key activities are as follows:

- Placed both Fannie Mae and Freddie Mac under conservatorship in September 2008 to ensure that they could continue to fulfill their missions.
- Published a "Notice of Establishment" in the *Federal Register* on September 9, 2008, establishing the Federal Housing Finance Agency as the regulator of the 14 housing-related GSEs, outlining the scope of its authority, and referencing the public law and the portion of the United States code that applies to FHFA.
- Authorized increases in the Enterprises' portfolios to encourage purchase of their mortgage-backed securities (MBS).
- Issued an interim final regulation on golden parachutes to GSE executives.
- Released its first *Mortgage Metrics Report* giving a comprehensive view of Fannie Mae's and Freddie Mac's (Enterprises) borrower assistance efforts, including forbearance plans, short sales, deeds in lieu, assumptions, and charge-offs in lieu of foreclosure.
- Transitioned the critical oversight role of the affordable housing program at the Enterprises and the FHLBanks to the new agency.

In 2007, OMB completed its Performance Assessment Rating Tool (PART) assessment of FHFB with a rating of "Result Not Demonstrated." OMB's PART assessment and rating were completed without the active participation of FHFB. FHFB was unable to develop quantifiable performance measures that OMB would consider meaningful without revealing confidential bank examination information. However, FHFB worked during FY 2008 to address issues that affected performance results. FHFB's key accomplishments in 2008 included the following:

- Examined all 12 Federal Home Loan Banks (FHLBanks) and the Office of Finance for safety and soundness and appointed a full slate of public interest directors at each FHLBank.
- Conducted Affordable Housing Program (AHP) examinations at 11 of the 12 FHLBanks. The FHLBank of Chicago did not undergo AHP examination due to safety and soundness issues. Drafted an AHP examination manual and trained AHP examiners to assess FHLBanks' implementation plans.
- Strengthened its supervisory program through more intense integration of its off-site monitoring program and tools into the examination program.
- Formalized the organization of its Office of Supervision into two principal functional areas: Examinations and Off-Site Monitoring and Analysis.
- Ensured that each FHLBank continuously met or exceeded its minimum capital requirements, conducted all planned safety and soundness and affordable housing program examinations, expanded and enhanced AHP data collection, and ensured that the FHLBanks awarded more than $115 million in AHP subsidies.
- Expanded the ability of the FHLBanks to invest in MBS to support the housing market.

During FY 2008, OFHEO continued its efforts under an improvement plan developed to address a 2006 OMB PART rating of "Adequate." OFHEO's key accomplishments in 2008 included the following:

- Achieved passage and enactment of HERA, which created FHFA as a strong regulator of Fannie Mae, Freddie Mac, and the Federal Home Loan Banks.
- Enhanced the oversight and supervision of the Enterprises through the development and implementation of new measures of risk, issuance of new supervision guidance, and revision of the supervision handbook.
- Identified the Enterprises as having significant supervisory concerns citing deteriorating credit conditions in housing as a key factor.
- Released a new monthly HPI for the nation and each of the nine census divisions. This significant achievement provides more timely and detailed information on house prices, which is critical in this challenging market.
- Increased temporarily the conforming loan limit in designated high-cost areas in order to provide liquidity and stability to the jumbo portion of the residential mortgage market, which had been severely affected by the credit problems throughout the economy.
- Took steps to combat appraisal fraud by signing an agreement with the New York Attorney General and OFHEO to strengthen the independence of the appraisal process.

- Began evaluating agency effectiveness at achieving mission by reviewing quality assurance programs at other federal financial regulatory agencies and identifying best practices.

Details of FHFB and OFHEO plans and program assessments are available online at www.ExpectMore.gov and www.fhfa.gov.

Financial Operations

For the first seven months of 2008, OFHEO and FHFB operated independently of each other as separate and distinct federal regulatory agencies. OFHEO regulated Fannie Mae and Freddie Mac, and FHFB regulated the 12 Federal Home Loan Banks.

Although funded through assessments on Fannie Mae and Freddie Mac, OFHEO's budget was determined through the appropriations process. For FY 2008, OFHEO operated with a congressionally approved budget of $66 million. FHFB was funded through assessments on the 12 Federal Home Loan Banks. It operated as a non-appropriated agency, and a governing Board approved its budget. FHFB's FY 2008 budget was $38.7 million.

FHFA: New Agency, New Financial Operations

On July 30, 2008, when the President signed HERA into law, FHFA was created as an independent, non-appropriated regulatory agency responsible for regulating both the Enterprises and the Federal Home Loan Banks. The agency is headed by a Director appointed by the President and confirmed by the Senate. FHFA has an Oversight Board that meets quarterly and testifies before Congress. The Director of FHFA serves as the chairman. The Secretary of Treasury, the Secretary of HUD and the SEC Chairman are the other three members. The Oversight Board is an advisory Board and does not have any management responsibilities.

All of the resources of OFHEO and FHFB were transferred to FHFA on July 30, 2008. As a practical matter, FHFA's FY 2008 budget (August and September 2008) was simply the combined remaining budgets of OFHEO and FHFB. Beginning October 1, 2008, the Director approved a FY 2009 budget for FHFA of $120.8 million. This budget comprised the costs of regulating the Enterprises and the 12 Federal Home Loan Banks, start-up costs for FHFA infrastructure, and the initial phase of funding for a working capital account for the agency.

FHFA immediately began work to transition and unify the administrative functions for the new agency. FHFA contracted with the United States Treasury's Bureau of Public Debt (BPD) to provide the agency with accounting, travel, and charge card services. The transition to BPD is expected to be completed by July 2009. In the interim, FHFA is using the existing accounting systems and infrastructures of both OFHEO and FHFB to operate during the first half of FY 2009.

Unqualified Audit Opinions in FY 2008

Both OFHEO and FHFB received unqualified audit opinions on their FY 2008 financial statements. OFHEO contracted with Dembo, Jones, Healy, Pennington & Marshall, PC, to conduct its audit. FHFB's Office of Inspector General (OIG) audited that agency. No material weaknesses in internal controls or instances of noncompliance with laws or regulations were identified by either the audit firm or OIG. Under HERA, the Government Accountability Office will be responsible for the FY 2009 audit.

N/M = not meaningful

[1] Interest income net of interest expense. Beginning November 2006, fees received from the interest earned on cash flows between the date of remittance of mortgage and other payments to Fannie Mae by servicers and the date of distribution of these payments to MBS investors are excluded from net interest income.

[2] Credit-related expenses include provision for credit losses and foreclosed property expense (income).

[3] Net income (loss) available to common stockholders divided by average outstanding common equity.

Source: Fannie Mae

1 Beginning in 1998, the guaranty liability for Fannie Mae MBS held as investments is classified as a liability.

2 Gross mortgage assets net of unamortized purchase premiums, discounts, and cost basis adjustments and, beginning in 2002, fair value adjustments on available-for-sale and trading securities, as well as impairments on available-for-sale securities. Excludes the allowance for loan losses on loans held for investment. The amounts for 1999 through 2001 include certain loans held for investment that were previously classified as nonmortgage investments.

3 Data reflect unpaid principal balance net of unamortized purchase premiums, discounts, and cost basis adjustments, as well as fair-value adjustments and impairments on available-for-sale and trading securities. Since 2005, advances to lenders are not included. Amounts for periods prior to 2005 may include or consist of advances to lenders. Prior to 1982, the majority of nonmortgage investments consisted of U.S. government securities and agency securities.

4 The sum of (a) the stated value of outstanding common stock (common stock less Treasury stock); (b) the stated value of outstanding noncumulative perpetual preferred stock; (c) paid-in capital; and (d) retained earnings (accumulative deficit), less Treasury stock. Core capital excludes accumulated other comprehensive income (loss).

5 Unpaid principal balance of Fannie Mae MBS held by third-party investors. The principal balance of resecuritized Fannie Mae MBS is included only once.

6 Beginning in 2005, consists of securities guaranteed by Fannie Mae that are backed by Ginnie Mae collateral, grantor trusts, and REMICs, as well as stripped MBS backed by Fannie Mae certificates.

1 Unpaid principal balance.

2 Beginning with 2002, includes mortgage-related securities that were consolidated as loans as of period-end. For 1999, 2000, and 2001, includes certain loans held for investment that were classified as nonmortgage investments.

3 Beginning with 2002, excludes mortgage-related securities that were consolidated as loans as of period-end.

4 Includes mortgage revenue bonds.

5 Includes unamortized premiums, discounts, deferred adjustments, and fair value adjustments on securities and loans. Beginning in 2002, amounts include fair value adjustments and impairments on mortgage-related securities and securities commitments classified as trading and available-for-sale. Excludes the allowance for loan losses on loans held for investment.

1 Data reflect unpaid principal balance net of unamortized purchase premium, discounts and cost basis adjustments, and fair value adjustments, and impairments on available-for-sale and trading securities. Prior to 1982, the majority of nonmortgage investments consisted of U.S. government and agency securities.

2 Since 2005, advances to lenders are not included in the data. Amounts for periods prior to 2005 may include or consist of advances to lenders. Includes tri-party repurchase agreements.

3 Includes commercial paper, floating-rate notes, taxable auction notes, corporate bonds and auction-rate preferred stock. Starting with 2006, medium-term notes previously reported in other are included in commercial paper.

4 Includes Yankee and domestic CDs.

Source: Fannie Mae

[1] Single-family loans are seriously delinquent when the borrower has missed three or more consecutive monthly payments and the loan has not been brought current. Rate is calculated using the number of conventional single-family loans owned and backing Fannie Mae MBS. Includes loans referred to foreclosure proceedings but not yet foreclosed. Prior to 1988, all data included all seriously delinquent loans for which Fannie Mae had primary risk of loss. Beginning with 1998, data include all seriously delinquent conventional loans owned and backing Fannie Mae MBS with and without primary mortgage insurance and/or credit enhancement. Data prior to 1992 include loans and securities in relief or bankruptcy even if the loans were less than 90-days delinquent, calculated based on number of loans.

[2] Prior to 1998, data include multifamily loans for which Fannie Mae had primary risk of loss. For years 1998–2002, data include all multifamily loans and securities 60 days or more past due. Rate is calculated using the mortgage credit book of business as the denominator. Beginning in 2002, data include all multifamily loans and securities 60 days or more past due. Rate is calculated using unpaid principal balance of delinquent multifamily loans owned by Fannie Mae or underlying Fannie Mae-guaranteed securities as the denominator.

[3] Credit losses are charge-offs, net of recoveries and foreclosed property expense (income); average balances used to calculate ratios subsequent to 1994; quarterly data are annualized. Beginning in 2005, credit losses exclude the impact of SOP-03-3 fair value losses. Beginning in 2008, credit losses exclude the impact of HomeSaver Advance fair value losses.

[4] Guarantee book of business refers to the sum of the unpaid principal balance of (1) mortgage loans held as investments; (2) Fannie Mae MBS held as investments; (3) Fannie Mae MBS held by third parties; and (4) credit enhancements that Fannie Mae provides on mortgage assets. It excludes non-Fannie Mae mortgage-related securities held as investments that Fannie Mae does not guarantee. Prior to 2005, ratio was based on the mortgage credit book of business, which includes non-Fannie Mae mortgage-related securities held as investments that are not guaranteed.

[5] Beginning in 2000, credit-enhanced is expanded to include primary mortgage insurance. Amounts for periods prior to 2000 reflect proportion of the mortgage assets portfolio with additional recourse from a third party to accept some or all of the expected losses on defaulted mortgages.

Sources: Fannie Mae and FHFA

N/A = not applicable

N/M = not meaningful

1 On October 9, 2008, FHFA suspended capital classifications of Fannie Mae. As of the fourth quarter of 2008, neither the existing statutory nor the FHFA-directed regulatory capital requirements are binding and will not be binding during the conservatorship.

2 Beginning in the third quarter of 2005, Fannie Mae was required to maintain an additional 30 percent capital in excess of the statutory minimum capital requirement. That requirement was reduced to 20 percent as of the first quarter of 2008 and further, to 15 percent as of the second quarter of 2008. The minimum capital requirement and minimum capital surplus numbers stated in this table do not reflect the additional capital requirements. Minimum capital surplus is the difference between core capital and minimum capital requirement.

3 Total capital is core capital plus the total allowance for loan losses and guaranty liability for MBS, less any specific loss allowances. Information after 2001 reflects restated or most recently reported amounts, rather than amounts originally reported and used by FHFA to make capital classifications.

4 Risk-based capital requirement is the amount of total capital that an Enterprise must hold to absorb projected losses flowing from future adverse interest rate and credit risk conditions and is specified by the Federal Housing Enterprise Financial Safety and Soundness Act of 1992. For 2004 through 2006, the requirements were calculated based on originally reported, not restated or revised, financial results.

5 The difference between total capital and the risk-based capital requirement. For 2004 through 2006, the difference reflects restated and revised total capital, rather than total capital originally reported by Fannie Mae and used by FHFA to make capital classifications.

6 Stock price at the end of the period multiplied by the number of outstanding common shares.

7 Common dividends declared during the period divided by net income available to common stockholders for the period.

Source: Freddie Mac

1 Based on unpaid principal balances and excludes mortgage loans and mortgage-related securities traded but not yet settled.

2 Consists of loans purchased from lenders. Excludes purchases of non-Freddie Mac MBS as well as Freddie Mac MBS repurchased and held as investments.

3 Not included in total mortgages. For 2002 through the current period, amounts include non-Freddie Mac mortgage-related securities as well as Freddie Mac MBS repurchased and held as investments. For years prior to 2002, amounts exclude structured securities backed by Ginnie Mae MBS. Activity does not include dollar roll transactions.

N/M = not meaningful

1 For years 2002 through 2005, defined as provision for credit losses and real estate-owned operations income/expense. For years 2000 and 2001, include only the provision for credit losses.

2 Ratio computed as annualized net income (loss) available to common stockholders, divided by the simple average of beginning and ending stockholders' equity, net of preferred stock (at redemption value).

1 Based on the number of mortgages 90 days or more delinquent or in foreclosure and excludes modified loans if the borrower is less than 90 days past due under the modifed terms. Rates for years 2000 through 2004 are based on the single-family loans held as Investments and total MBS and structured securities issued, excluding that portion of structured securities backed by Ginnie Mae MBS. Rates for 2005 through the current period are based on single-family loans held as investments and total MBS and structured securities issued, excluding structured transactions and that portion of issued structured securities backed by Ginnie Mae MBS.

2 Prior to 2008, these rates were based on net carrying value of mortgages 60 days or more delinquent or in foreclosure. Beginning in 2008, these rates are based on the net carrying value of loans 90 days or more delinquent or in foreclosure and exclude structured transactions.

3 Credit losses equal to REO operations expense (income) plus charge-offs, net. Calculated as credit losses divided by total mortgage portfolio, excluding non-Freddie Mac mortgage-related securities and that portion of structured securities backed by Ginnie Mae MBS.

4 Based on the total mortgage portfolio excluding non-Freddie Mac mortgage-related securities and that portion of issued structured securities backed by Ginnie Mae MBS.

5 Credit enhanced includes loans for which the lender or a third party has retained a portion of the primary default risk by pledging collateral or agreeing to accept losses on loans that default. In many cases, the lender's or third party's risk is limited to a specific level of losses at the time the credit enhancement becomes effective.

Sources: Freddie Mac and FHFA

N/A = not applicable

N/M = not meaningful

1 On October 9, 2008, FHFA suspended capital classifications of Freddie Mac. As of the fourth quarter, neither the existing statutory nor the FHFA-directed regulatory capital requirements are binding and will not be binding during the conservatorship.

2 Beginning in the fourth quarter of 2003, FHFA directed Freddie Mac to maintain an additional 30 percent capital in excess of the statutory minimum capital requirement. On March 19, 2008, FHFA announced a reduction in the mandatory target capital surplus from 30 percent to 20 percent above the statutory minimum capital requirements. The minimum capital requirement and minimum capital surplus numbers stated in this table do not reflect the inclusion of the additional capital requirement. Minimum capital surplus is the difference between core capital and the minimum capital requirement.

3 Total capital includes core capital and general reserves for mortgage and foreclosure losses.

4 The risk-based capital requirement is the amount of total capital that an Enterprise must hold to absorb projected losses flowing from future adverse interest rate and credit risk conditions and is specified by the Federal Housing Enterprise Financial Safety and Soundness Act of 1992.

5 The difference between total capital and risk-based capital requirement.

6 Stock price at the end of the period multiplied by the number of outstanding common shares.

7 Common dividends paid as a percentage of net income available to common stockholders.

1 For the Federal Home Loan Bank of Chicago and for all other Banks before 2005, amounts for regulatory capital are from call reports filed by each Federal Home Loan Bank. Except for the Federal Home Loan Bank of Chicago, amounts in 2005, 2006, 2007, and the first three quarters of 2008 are as reported by the Office of Finance. For the fourth quarter of 2008, amounts are from Form 10-Ks filed by individual Federal Home Loan Banks.

2 Combining adjustment for Federal Home Loan Bank System retained earnings reported by the Office of Finance.

[1] Conforming loan limits are 50 percent higher in Alaska, Hawaii, Guam, and the U.S. Virgin Islands.

[2] Loan limits for mortgages originated in 2009 were initially set under provisions of the Housing and Economic Recovery Act of 2008, which allowed for high-cost area limits of up to $625,500. In February 2009, however, the American Recovery and Reconciliation Act of 2009 restored the $729,750 maximum loan limit for mortgages originated in 2009.

[3] The Economic Stimulus Act of 2008 allowed Fannie Mae and Freddie Mac to raise the conforming loan limits in certain high-cost areas to a maximum of $729,750 for one-unit homes in the continental United States. Higher limits applied to two-, three- and four-unit homes. Alaska, Hawaii, Guam and the Virgin Islands have higher maximum limits. The limits applied to loans originated between July 1, 2007, and December 31, 2008.
