December 8, 2011

Mr. Edward DeMarco Acting Director Federal Housing Finance Agency 1700 G Street, NW, 4th Floor Washington, DC 20552

Thank you for the opportunity to comment on its "Alternative Mortgage Servicing Discussion Paper," released on September 27, 2011. The world of servicing has undergone unprecedented stress over the course of the economic downturn. I appreciate the interest of FHFA and other regulators in ensuring that we collectively work to improve service to borrowers, reduce financial risk to servicers, ensure flexibility for guarantors to better manage non-performing loans, promote market liquidity and enhance opportunities for competition in the origination as well as servicing markets.

However, I believe that any change to the current servicing compensation model is unnecessary to accomplish these goals. The current system has served the market well for decades and still remains a viable option, even in these tumultuous times. Furthermore, any consideration of changing mortgage servicing compensation is premature in light of the ongoing process of developing national servicing standards, in addition to the constantly changing regulatory environment due to the implementation of the Dodd-Frank Wall Street Reform and Consumer Protection Act (Dodd-Frank).

While I do not endorse any change to the current servicing compensation model, if FHFA feels strongly that making changes to the servicing fee structure is necessary, of the options presented in the September 27th discussion paper, I strongly urge FHFA to adopt the 'cash reserve' model. Of the two proposals presented, it is the only one which truly meets FHFA's stated objective while ensuring minimal disruptions to the market, which is tenuous at best.

The Cash Reserve Proposal, originally introduced by MBA and the Clearinghouse, establishes a minimum "normal servicing fee" and proposes the creation of a reserve account which servicers can use to conduct catastrophic nonperforming loan servicing. The reserve would be built up over time by placing a small portion of the mortgage cash flow (e.g., 3 bps) into a custodial reserve account, tied to a particular vintage of loans. Any unused portions would eventually be refunded to the mortgage servicer if they are not required to cover unanticipated operating costs of the servicer. Under this structure, use of the reserves should be the exception, not the rule, and would not be expected to occur under normal market conditions.

I feel this approach is the best of the options presented, though I reiterate: the fact remains that despite the issues in the mortgage servicing market and the need for

investment and training in servicing, the current mortgage servicing compensation structure is <u>appropriate</u> and <u>suitable</u> to meet the needs of the market.

Thank you for your consideration of our comments. If you have any questions, please contact me at Lshina@acceptancecapital.com

Sincerely yours,

Lydia Shina
