F = forecast Numbers may not add due to rounding.

1/ Final sector output is the gross value of the commodities and services produced within a year. Net value-added is the sector's contribution to the National economy and is the sum of the income from production earned by all factors-of- production.

Net farm income is the farm operators' share of income from the sector's production activities. The concepts presented are consistent with those employed by the Organization for Economic Cooperation and Development (OECD).

2/ A positive value of inventory change represents current-year production not sold by December 1.

A negative value is an offset to production from prior years included in current-year sales.

3/ Government payments reflect payments made directly to all recipients in the farm sector, including landlords.

The nonoperator landlords' share is offset by its inclusion in rental expenses paid to these landlords and thus is not reflected in net farm income or net cash income.
