

U.S. Benchmark Input-Output Accounts, 2002

By Ricky L. Stewart, Jessica Brede Stone, and Mary L. Streitwieser

ON September 21, 2007, the Bureau of Economic Analysis (BEA) released its benchmark input-output (I-O) accounts for 2002.¹ Based on the highest quality source data available, these accounts provide an accurate and comprehensive picture of the inner workings of the economy, showing relationships among more than 400 industries and commodities.

For many economists, analysts, and policymakers, the benchmark I-O accounts are an essential research tool. (See the box “Uses of the Benchmark I-O Accounts.”) For BEA, the benchmark I-O accounts provide a foundation for other economic accounts. For example, the national income and product accounts (NIPAs) benchmark personal consumption expenditures and private equipment and software expenditures estimates to the benchmark I-O accounts.

Because benchmark I-O accounts are based largely on every 5-year data from the Census Bureau, the benchmark I-O accounts lag the reference year by about 5 years; this year, they were released on an accelerated schedule, 3 months earlier than the previous benchmark I-O release. The accounts incorporated several methodological and statistical improvements. These changes updated the accounts to more accurately reflect the structure of the economy and to improve estimates in areas where source data were previously sparse. In addition, the 2002 benchmark I-O estimates benefited from the first-time use of a balancing model to help determine the estimates of intermediate inputs and gross operating surplus.

1. Supplemental tables will be released in late October 2007.

Data Availability

The estimates from the 2002 benchmark input-output (I-O) accounts at the summary level (135 commodities and 133 industries) and at the detailed level (428 commodities and 426 industries) are available interactively on the BEA Web site. Go to <www.bea.gov>, and under “Industry,” select “Interactive Tables: Input-Output.” Online tools will enable you to create and store unique levels of aggregation of data for specific commodities and industries. To download publication tables, click on “2002” under “Benchmark I-O Data Tables.”

Highlights from the 2002 benchmark I-O accounts include the following:

- Private goods-producing industries accounted for about 18 percent of the economy, compared with about 21 percent in 1997.² Private services-producing industries accounted for about 69 percent of GDP in 2002, compared with about 66 percent in 1997.³ Government’s share of GDP was 13 percent in 2002, unchanged from 1997.⁴
- Health care-related services industries maintained their share of GDP at 6 percent in 2002. Hospitals value added increased about 44 percent; nursing and residential care facilities value added increased about 48 percent. At the same time, pharmaceutical and medicine manufacturing value added grew about 78 percent. The average increase across all industries was 28 percent.
- Electronic information-based industries accounted for less than 1 percent of total GDP and about 11 percent of the information sector’s value added. The 2002 accounts are the first to provide detailed information on electronic shopping, electronic auctions, Web search portals, Internet service providers, and Internet publishing and broadcasting as well as data on the interactions between the Internet industries and all other industries.
- Private goods-producing industries accounted for 28 percent of gross output, compared with 33 percent in 1997. Private services-producing industries accounted for 61 percent of the total, compared with 59 percent in 1997. Government gross output accounted for the remaining 11 percent in 2002, up from 8 percent in 1997.
- Intermediate purchases of materials and services were about \$9 trillion, with 39 percent purchased by private goods-producing industries, 51 percent purchased by private services-producing industries,

2. Private goods-producing industries consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.

3. Private services-producing industries consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance and insurance; real estate and rental and leasing; professional, scientific and technical services; management of companies and enterprises; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

4. Government includes government industries and other special I-O industries; for more information, see the table “Appendix A. Industries in the 2002 Benchmark Input-Output Accounts.”

Uses of the Benchmark I-O Accounts

The benchmark I-O accounts, produced every 5 years by the Bureau of Economic Analysis (BEA), are used by economists and policy makers in a variety of ways. Broadly speaking, they facilitate the study of economic activity by providing a highly detailed look at interindustry activity. Within BEA, benchmark I-O data are used as the starting point for other accounts, including the national income and product accounts (NIPAs).

General usage. The I-O tables, both benchmark and annual, allow researchers to analyze the economic effects of specific events. For example, they can be used in emergency planning and in estimating the economic effects of natural disasters and strikes. Supplemented with additional information, the I-O accounts can be used for broader analyses, such as estimating the effects of an increase in exports on employment or the impact of a petroleum price increase on production in specific industries and on commuting patterns and consumer spending. Recently, Nobel Laureate Lawrence Klein used I-O data to examine the role of information technology on productivity in the financial services industry.¹

In business, economists use data from the I-O accounts and other BEA accounts to develop forecasting models, which estimate future earnings among other things.

BEA usage. BEA uses the benchmark I-O accounts as the foundation for several other accounts (chart A). The benchmark I-O accounts are in fact the most important statistical source for the comprehensive revision of the NIPAs. They are

used to establish the benchmark year level for consumer spending, private equipment and software investment and to provide information on the composition of final demand. This in turn provides the basis for the estimates of GDP for the nonbenchmark years.

Also, the benchmark I-O accounts provide the framework and foundation for the capital flow table and the quantity index for the GDP-by-industry accounts, which are compiled by the Industry Accounts Directorate.² The benchmark I-O accounts also provide the foundation for the annual I-O accounts.

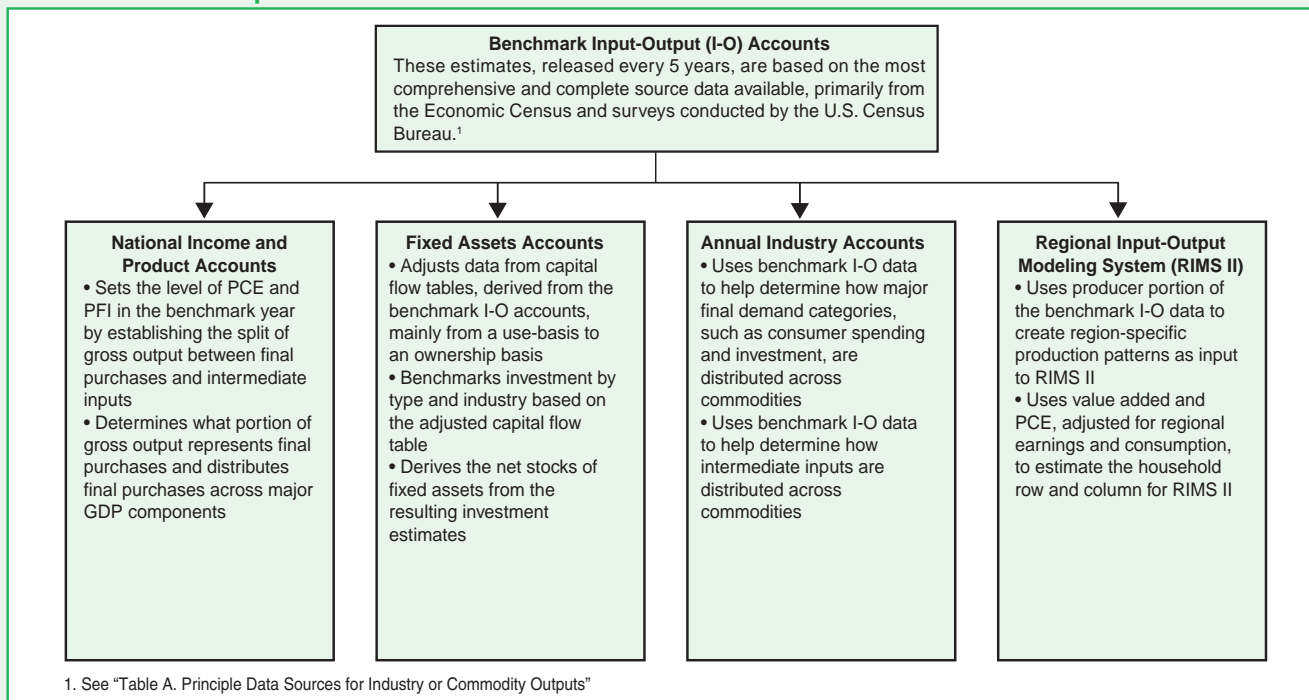

BEA's regional program uses data from the I-O accounts to generate its Regional Input-Output Modeling System (RIMS II), which can be used to analyze the impact of various projects or changes in economic programs on local economies. For example, state and local government planners can use the model to assess the impact of a military base closing or a new development project.

Other statistical agencies' usage. The benchmark I-O accounts also are used by other statistical agencies as a framework for preparing further economic statistics. The I-O accounts provide the detail that is essential in determining quantity weights for price indexes, such as the producer price index that is compiled by the Bureau of Labor Statistics (BLS). BLS also uses the benchmark I-O accounts in their projections of industry employment.

2. The capital flow table expands the gross private fixed investment component of the I-O use table in order to show the types of new equipment and structures purchased for use by each industry. The capital flow table is produced once every 5 years, generally in the year after the release of the benchmark I-O accounts.

1. See Lawrence R. Klein, Cynthia Saltzman, and Vijaya G. Duggal, "Information Technology and Productivity: The Case of the Financial Sector," *SURVEY OF CURRENT BUSINESS* 83 (August 2003): 32–37.

Chart A. Relationship Between the Benchmark I-O Accounts and Other BEA Accounts

and the remaining 10 percent purchased by government.

- On average, intermediate purchases of materials, energy, and services accounted for 44 cents of each dollar of gross output. Value added accounted for the remaining 56 cents (compensation accounted for 32 cents, taxes on production and imports less subsidies for 4 cents, and gross operating surplus for 20 cents). This distribution was virtually unchanged from 1987.

In addition to every 5-year benchmark I-O accounts, BEA also produces annual I-O accounts.⁵ Both of these complementary accounts provide information on the structure of the U.S. economy and an accounting of the production of goods and services by each industry. Both portray the goods and services purchased by each industry, the incomes earned in each industry, and the distribution of sales for each good and service to industries and final users.

However, the benchmark I-O and annual I-O accounts differ in several respects. The benchmark I-O accounts' rich source data—mainly the every 5-year Economic Census—allows them to paint a more detailed picture of the economy at a point in time. The 2002 benchmark I-O accounts detail the flows of 428 commodities to 426 industries and to 13 categories of final uses. In contrast, the annual I-O accounts, which are based primarily on annual survey data from the Census Bureau and the Bureau of Labor Statistics, provide an aggregate time series of information about the flow of goods and services of industries. The annual I-O accounts present information on 65 industries and commodities. Additionally, the annual I-O accounts rely on source data and statistical conventions that are more consistent with other BEA accounts, notably the NIPAs and the GDP-by-industry accounts.

The remainder of this article presents the key improvements in the 2002 benchmark I-O accounts. The first part summarizes the major changes in classification and definition. The second part describes statistical changes. The third part summarizes the methodology used to compile the accounts. A technical note describing the 2002 benchmark I-O tables is followed by several appendix tables that provide information on the classification of industries, value added, final uses, and bridge tables that link the 2002 benchmark I-O accounts to the NIPAs.

5. Benchmark I-O accounts are prepared at 5-year intervals and are based on detailed data from the Economic Census conducted by the U.S. Census Bureau. The 10 previous benchmark I-O accounts covered 1947, 1958, 1963, 1967, 1972, 1977, 1982, 1987, 1992, and 1997. The 1997 accounts were presented in the December 2002 SURVEY OF CURRENT BUSINESS.

Changes in Classification and Definition

The 2002 benchmark I-O accounts incorporated changes made by the 2003 comprehensive revision of the NIPAs. Some changes were the result of classification and definition changes designed to make the NIPAs more accurately reflect the structure of the U.S. economy. The changes also corrected various gaps in data and made the accounts more consistent with other economic accounts and international guidelines.

Specific changes include the following:

- The definition of government was changed to recognize government as a producing industry.
- The definitions of commercial banking and insurance were changed to include more services for which explicit fees are not charged.
- The presentation of Indian tribal governments was changed so that they now appear as autonomous governments.
- “Other value added” was replaced by “gross operating surplus” as a measure of proprietors' income, corporate profits, net interest, and business transfer payments.
- “Indirect business taxes” was replaced by “taxes on production and imports less subsidies” as a measure of tax and nontax liabilities that are chargeable to business expenses.

The 2002 benchmark I-O accounts also reflected changes in the North American Industry Classification System (NAICS), which are the I-O accounts' foundation for classifying industries.

Government as a producer

The 2002 benchmark I-O accounts treat general government as an intermediate industry that produces services available for final consumption. In previous benchmark I-O accounts, government was presented as a final user of capital and current account goods.

The new treatment created two new industries—a general Federal Government services industry and a general state and local government services industry—that appear in the intermediate use portion of the I-O accounts and represent government use of inputs of goods, services, labor, and capital to produce output (services). Intermediate government I-O industry output is equal to gross output of general government, which is the sum of compensation, consumption of fixed capital, and intermediate goods and services purchased less own-account construction, own-account software, and sales to other sectors.⁶

6. Own-account construction refers to new construction activities that are performed by businesses, governments, or persons rather than purchased from construction businesses. Own-account software refers to software production activities performed by businesses or governments, not purchased from software-producing businesses.

Capital account government investment appears in the final demand portion of the I-O table and is a measure of durable goods purchased, including structures and equipment and software. Services that are directly purchased by households, such as college education, are treated as secondary products of the government industry and flow into personal consumption expenditures. If sold to business, these services are treated as intermediate inputs of business. The remaining services are treated as consumption expenditures in government final use and valued at the expense of providing the services.

With this new treatment, the total value of government consumption expenditures and gross investment does not change, because the value of the newly recognized services produced by government equals the cost of inputs. Estimates of government output, purchases, and investment in the benchmark I-O tables equal the estimates made by BEA's Government Division and published in NIPA table 3.10.5, which presents government consumption expenditures and general government gross output.

Commercial banking

The 2002 benchmark I-O accounts changed the treatment of commercial banking output. Previously, the gross output of banks and other depository institutions was calculated as interest received from borrowers less interest paid to depositors. The new treatment recognizes that bank services may be fee-based services or they may be implicit charges resulting in a bank paying a lower interest rate rather than charging a fee for each service. Because banks and other financial intermediaries serve to reduce transactions costs for both depositors and borrowers, the value of the implicit services produced by banks should be allocated to both groups. Incorporating this change reduces GDP by re-allocating a portion of the implicit services from final expenditures to intermediate consumption and attributing the larger share of borrowed funds to business.

Insurance

The 2002 accounts incorporate a new definition of property and casualty insurance services. Previously, insurance services were measured as premiums received less actual incurred losses and less dividends payable by insurance companies to policyholders. The new treatment recognizes the implicit services that are funded by investment income on policyholders' reserves. Under this treatment, industry output is revised so that expected investment income earned on reserves is treated as a supplement to premiums received. In addition, normal losses (expected losses) are now used instead of actual losses to calculate the value of insur-

ance services output. This change reflects the fact that insurance companies base premiums on expected losses instead of actual losses, because actual losses are not known when premiums are set. This change also reduces the effect of catastrophic events on industry output.

Indian governments

The 2002 benchmark I-O accounts recognize tribal governments as autonomous governments and their activities as similar to state and local government enterprises. Previously, the activities of tribal governments—mainly gaming and hotels, fuel stations, and retail sales—were included within private industry output in the I-O accounts. As a result of this new treatment, a new industry was created, Indian gaming, in the I-O accounts. This industry captures the activities of tribal governments and now reports them as a part of state and local government enterprises. Because these activities were previously treated as part of private industry, the combined output for casinos, hotels, retail trade, and motor gasoline was reduced by the value of output of the industry Indian gaming.

Gross operating surplus

The 2002 benchmark I-O accounts recognize "gross operating surplus" as a profits-like measure that includes such items as proprietors' income, corporate profits, net interest, and business transfer payments. In practice, in the benchmark I-O accounts, gross operating surplus is a residual, calculated as gross output less intermediate inputs, employee compensation, and taxes on production and imports less subsidies. Gross operating surplus replaces "other value added" as the profits measure in the I-O accounts.

Taxes on production and imports less subsidies

The 2002 accounts modified the "indirect business tax" component of value added in order to remove tax payments that are not related to corporate profits-type income and to reclassify these payments primarily as transfer payments to government. The portion that remains includes Federal excise taxes and customs duties, state and local sales taxes, property taxes (including residential real estate taxes), motor vehicle licenses, severance taxes, other taxes, and special assessments. This new tax component was renamed "taxes on production and imports less subsidies" (TOPI). TOPI does not include the following: State and local fines and other nontaxes (now called business transfer payments to government), Federal outer continental shelf royalties, and state and local rents and royalties (now called income payments on assets). This

change provides more detail on the makeup of payments by corporations by separating special payments, such as tobacco settlements and payments not dependent on production, from taxes levied according to actual corporate production and imports.

NAICS changes

The 2002 benchmark I-O accounts reflect the 2002 NAICS, which included major changes from the 1997 NAICS to the classification of industries within NAICS sector 51, information. The sector was restructured, and new industries were created to account for new services and emerging technologies. Internet publishing and broadcasting was moved from 1997 NAICS 511 and 514 into its own industry, 2002 NAICS 5161. This new industry includes electronic publishing by newspapers, periodicals, books, databases, greeting cards, and atlases and maps. “Web search portals” was moved from “other information services” (NAICS 51419), and a new industry, “Internet service providers, Web search portals, and data processing” (NAICS 5180), was created. “On-line information services” was renamed “Internet service providers” to better reflect the activity of the industry.

Statistical Changes

In addition to classification and definition changes, the 2002 benchmark I-O accounts incorporated statistical changes in three areas: Inventories, royalties, and personal consumption expenditures. These statistical changes to I-O accounts reflect new and improved estimation methodologies and incorporate newly available or revised source data.

Inventory valuation adjustment

Inventories can be viewed as consumable physical assets that are produced in one period but stored for sale or use in a later period. In the I-O accounts and the NIPAs, change in private inventories includes an inventory valuation adjustment (IVA), which removes the effects of price changes while products are in inventory. Because of the IVA, change in private inventories is valued in current prices, that is, on a replacement-cost basis. In the NIPAs, estimates of IVA by holding industry are based on data from the previous benchmark I-O accounts, changes in product prices, and information on types of inventory accounting methods used (such as LIFO, FIFO, and average cost). The benchmark I-O accounts have traditionally shown the IVA as an aggregate balancing entry in the accounts. The previous benchmark I-O treatment included an IVA commodity and an IVA industry. In the IVA commodity row, the aggregate value for the IVA appeared in the final uses column for inventory

change. In the IVA industry column, it appeared as other value added (which included corporate and non-corporate IVA as two of its subcomponents).

The 2002 benchmark adopted a new treatment that explicitly accounts for the IVA by holding industry, commodity, and inventory type, which includes materials and supplies, work-in-process, finished goods, and merchandise trade inventories. The I-O accounts included IVA in output only where it was appropriate.

Royalties

BEA improved its measurement of royalties output with new source data and methodology changes. Income from royalties (except copyrighted works) is included in the gross output for the “lessors of nonfinancial intangible assets” industry. Because Economic Census source data for royalty and licensing income and payments are not comprehensive, BEA uses information from the Internal Revenue Service’s Statistics of Income (SOI) corporate income tax return data in measuring income from royalties.⁷ However, these data provide income from royalties and copyrights combined.

BEA’s international services data on royalties and licensing fees were used to develop a distribution of payments for the use of U.S. intellectual property by type.⁸ This distribution was applied to the SOI corporate royalty data in order to estimate and remove copyright receipts from royalty receipts. Additional adjustments were made to account for royalty income from individuals, partnerships, and fiduciaries.

Personal consumption expenditures

The 2002 benchmark I-O accounts improved the estimates of personal consumption expenditures (PCE) for telecommunications, air transportation, and “food away from home.” The changes reflect the results of extensive research into new source data and estimation methodologies so that estimates would better reflect changes to household purchasing patterns.

Telecommunications. A new methodology was adopted that estimates and redistributes reimbursed expenses of telecommunications services for those who use their personal telephone and/or Internet service for business use when working from home. In previous I-O accounts, consumer spending on telecommunications was based on historical expenditure levels that included within household expenditures, the business use of personal (household) telecommunications services; the business use was not treated as an intermediate expenditure.

7. For more information, go to <www.irs.gov>.

8. See “Table 4. Royalties and License Fees, 1986–2005” at <www.bea.gov/international/intlserv.htm>.

For the 2002 benchmark I-O accounts, information from the Current Population Survey's Work at Home Supplement and the Federal Communications Commission (FCC) on household expenditures on local, long distance, and cellular telephone services was used to estimate personal telephone service expenditures by workers at home. This estimate was then combined with information from the Consumer Expenditure Survey from the Bureau of Labor Statistics (BLS) to estimate the portion of telephone service expenditures attributable to work activities and reimbursed to the household.⁹

Estimates for reimbursed personal Internet service expenses were derived similarly. Both of these reimbursed expenses for business use were removed from personal consumption expenditures and redistributed as inputs or expenses of intermediate industries.

Air transportation. The 2002 benchmark I-O accounts updated the methodology and source data used to prepare PCE estimates for domestic passenger air transportation.

Previous benchmark I-O accounts estimates of PCE for domestic passenger air transportation included only domestic recreational or leisure air travel of U.S. residents. Nonresident travel and personal nonrecreational travel were not included.¹⁰ The 2002 benchmark I-O accounts incorporated nonresident travel data from the U.S. travel and tourism satellite accounts and personal and family business trip activity (non-recreational) data from the Bureau of Transportation Statistics' 2001 National Household Travel Survey. This resulted in qualitative and quantitative adjustments to include nonresident and nonrecreational domestic air travel within PCE.¹¹

As a result, the share of domestic passenger air transportation output that is attributed to households (PCE) increased significantly, which in turn increased GDP. Additionally, the estimates of intermediate consumption by business and government of air travel were reduced, and their value added was increased. The nonresident travel correction was included in the

9. The Current Population Survey is conducted by the Census Bureau for BLS. It provided estimates of the number of wage and salary workers and self-employed workers who worked at home and used a telephone or the Internet. The FCC's *Reference Book of Rates, Price Indices, and Household Expenditures for Telephone Service* provided the average annual household expenditures on local, long distance, and cellular telephone services. The 2002 Consumer Expenditure Survey provided percentages of consumers deducting telephone and Internet services as business expenses and the average annual Internet household expenditures.

10. Personal nonrecreational travel includes trips made for medical purposes, shopping, college visits, and funerals and other family-related emergencies.

11. See "Table 3. Demand for Commodities by Type of Visitor" in Peter D. Kuhbach, Mark A. Planting, and Erich H. Strassner, "U.S. Travel and Tourism Satellite Accounts for 1998–2003," SURVEY 84 (September 2004): 58.

I-O accounts as a rest-of-the-world adjustment.

Food away from home. In previous benchmark I-O accounts, the PCE estimates for food and beverages in purchased meals were based on historical household expenditures. The new methodology uses information from the BLS Telephone Point of Purchase Survey combined with the Census Bureau's Economic Census "class-of-customer" data to estimate household expenditures on food and nonalcoholic beverages in purchased meals. The Economic Census class-of-customer data were used to estimate the portion of overall food service industry sales that stem from households and individuals. Households and individuals purchase food and beverages in different ways, sometimes as part of a full service meal or a fast food meal, that reflect different pricing. The Telephone Point of Purchase Survey data were then used to measure the portion of food service industry sales that represent household expenditures at full service and limited service restaurants. The use of these two data sources updated PCE for food and beverages in purchased meals to reflect the differences in pricing and expenditure patterns for food away from home.

Compilation of the 2002 Benchmark I-O Accounts

The calculation of the benchmark I-O accounts is a complex process that involves the collection and integration of data from a variety of sources.¹² BEA prepared the 2002 benchmark I-O accounts in seven steps:

(1) A consistent classification framework that could be used for presenting the tables on a 2002 NAICS basis and for linking backwards with the aid of concordances was developed.

(2) Output for each industry and commodity, which formed the basis for the I-O make table, was estimated.

(3) Domestic supply of each commodity was estimated.

(4) Final uses of commodities were estimated, either directly or by using the commodity-flow method.

(5) Intermediate and value-added inputs required by each industry to produce its output were estimated.

(6) Wholesale and retail trade margins, transportation costs, and excise and sales taxes were estimated in order to convert all transactions by final and intermediate users from the prices received by producers to the prices paid by purchasers.

(7) The gross operating surplus from the 2002 benchmark I-O accounts was reconciled with the 2002 GDP-by-industry accounts, while simultaneously

12. For more information, see Karen J. Horowitz and Mark A. Planting, *Concepts and Methods of the Input-Output Accounts* on BEA's Web site at <www.bea.gov/papers/pdf/IOmanual_092906.pdf>.

balancing the benchmark I-O use table.

Step 1: Classification framework

The classification of industries in the 2002 benchmark I-O accounts was based on the 2002 NAICS. Over the past few years, many statistical agencies, including the Census Bureau, have completed the conversion from Standard Industrial Classification to NAICS, allowing for consistency and comparability between most Federal statistical data. The Harmonized System, the classification system for foreign trade, was used as the basis for foreign trade estimates in the I-O accounts; it was translated into a NAICS basis in order to create consistency across all estimates within the accounts.

Step 2: Industry and commodity outputs

BEA released a preliminary I-O make table showing industry and commodity output estimates in September 2005.¹³ These preliminary estimates were based on early 2002 Economic Census data and Department of Agriculture data on receipts and shipments. Data for all industries were not available at the time; the gross output estimates included some estimates based on extrapolation from annual survey data or estimated using other similar techniques. The industry estimates included in the September 2005 release were revised, based on final Economic Census data.

The output of most commodities and industries was based on receipts and shipments data from the 2002 Economic Census and for agriculture, data from the Department of Agriculture. Output was estimated using various approaches. For example, mining and manufacturing output was measured by shipments. Nonprofit and auxiliary industry output was measured using expenses. Commodities data formed the basis for agriculture output estimates. Receipts less cost of goods sold were used to estimate margin output of wholesale and retail trade. Most other industry output was estimated using receipts. Principal data sources used to estimate commodity and industry output are shown in table A.

While the Economic Census covered the majority of establishments, it did not cover businesses without employees, such as real estate agents and small, independent “mom and pop” businesses. For these entities, estimates were based on administrative records of the IRS, primarily from sole proprietorship businesses filing IRS Form 1040, and compiled as nonemployer data by the Census Bureau. The Census Bureau’s nonemployer data were added to BEA’s output estimates to

ensure complete coverage of all establishments.

The following industries were among those not covered by the Economic Census: Large certificated passenger air transportation and rail transportation, private elementary and secondary schools, and private colleges and universities. For these industries, BEA used data from other sources—such as the Department of Transportation and the Department of Education. These sources are identified in table A. BEA also made imputations for estimates for which data were not available, notably for owner-occupied housing, own-account construction, and own-account software.

Industry output includes all primary and secondary activities. For example, the output for an industry that primarily produced milk and a small amount of butter would be classified within the milk industry. However, at the commodity level, the shipments were separated so the milk commodity included only the production of milk and the butter production was part of the butter commodity.

Step 3: Domestic supply

The domestic supply of each commodity is the total value of goods and services available for consumption as intermediate inputs by industries or as final uses. Domestic supply represents the value of commodities produced by domestic firms, plus imports and government sales, less exports and changes in inventory. Changes in private inventories by commodity were based on Economic Census data and on information on corporate inventories by industry from the IRS Statistics of Income. Exports and imports were based on foreign trade statistics from the Census Bureau and on data from BEA’s international transactions accounts. Domestic supply was measured in producers’ prices; therefore, transportation costs and wholesale trade margins were removed from exports before the final calculation.

Step 4: Final uses

Many final demand estimates were created using the commodity-flow method. In many cases, a predominant user of a commodity can be identified and a portion of that commodity can be assigned to flow to a particular final use for purchase by consumers or by business for investment. Class-of-customer data from the Economic Census or information developed from alternative sources—such as trade associations, private businesses, and other government agencies—was used to identify who is purchasing a commodity. For example, using class-of-customer data from the Economic Census, purchases of tax return preparation services for PCE were estimated as 94.4 percent of domestic supply.

13. See Karla L. Stanley-Allen, Nicholas R. Empey, Douglas S. Meade, Stanislaw J. Rzezniak, Mary L. Streitwieser, and Monica S. Stropke, “Preview of the Benchmark Input-Output Accounts for 2002,” *SURVEY 85* (September 2005): 66–77.

The coverage of class-of-customer data may vary from previous benchmark I-O accounts and sometimes adjusted to reflect changes in purchasing patterns. If 2002 information was not available, commodity-flow estimates were carried forward.

If percentage distributions to final users were not precisely known, a modified commodity-flow method was used. In this method, government expenditures for, and intermediate purchases by businesses of, a commodity were subtracted from the commodity domestic supply in order to obtain a residual that reflects purchases by persons for consumption or by business for investment. For example, purchases of cereal for PCE were estimated using this method, with the entire residual value allocated to PCE.

The estimates of final uses of the Federal Government and of state and local governments were based on the estimates of total consumption and investment expenditures by type of purchase from the NIPAs. These estimates were then allocated to I-O commodities based on professional judgment and on information from the 2002 Census of Governments, Federal budget data, and government agency reports.

The estimates of residential and nonresidential structures in gross private fixed investment were generally based on information from Census Bureau data on the value of construction put in place. Estimates of oil and gas well drilling, new access structures for solid mineral development, and manufactured mobile structures were based on 2002 Economic Census data.

Step 5: Industry intermediate inputs and value added

As shown in table B, most of the detailed data available to estimate commodity inputs were from the 2002 Economic Census and the Business Expenses Survey, which included expanded information about industry expenses. In particular, BEA's input estimates were greatly improved because of the inclusion of a catch-all expense category on the Census Bureau reporting forms used by the manufacturing sector for "all other expenses." This expense category allowed for the reporting of all expenses, rather than the limited number of specific expenses available in the past. These data were available in previous benchmark I-O accounts for service industries, but for manufacturing industries, only select expenses data were available.

When only aggregate data for expenses were available, BEA combined that information (for example, purchases of fuel by manufacturing industries) with information on purchases of individual commodities (for example, purchases of petroleum products, natural gas, and coal in purchased fuels) to estimate the purchases of specific commodities by an industry (for example, purchases of natural gas by a manufacturing industry). If BEA did not have direct information for intermediate inputs, estimates were extrapolated from 1997 benchmark I-O accounts relative to the change in industry output from 1997 to 2002.

In the I-O accounts, value added consists of three components—compensation of employees, taxes on production and imports less subsidies, and gross operating surplus. The first two components were estimated from a variety of data sources (table B). Total compensation estimates were based on values reported in the 2002 Economic Census that were scaled to NIPA total compensation. Taxes on production and imports less subsidies data from the NIPAs were distributed to all appropriate industries either using a general distribution or by allocating industry specific taxes to the most correct industry. For general sales and excise taxes, the values were incorporated as part of each industry's output on the basis of information from census annual surveys for sales taxes and from the GDP-by-industry accounts for excise taxes. For other indirect business taxes, such as property taxes, estimates were allocated based on a variety of source data, including state government tax collections and highway statistics. Depreciation, a part of gross operating surplus, was estimated for auxiliaries and government industries.

Step 6: Transportation costs, trade margins, and excise and sales taxes

To estimate the cost of transporting commodities from producers to users, BEA first estimated all transportation services bought and sold in the economy by mode—that is, by rail, truck, water, air, and pipeline. Total transportation receipts for each mode were then separated into receipts from travel by persons, such as household consumers' purchases of airline services for vacation travel, and from receipts from the transport of goods, such as mining operators shipping coal by rail. The receipts for moving goods were allocated to commodities by mode: For rail, the allocation was based on information from the American Association of Railroads; for air, from the Department of Transportation; and for all other modes, from the Census Bureau's 2002 Commodity-Flow Survey. For transportation margins on pipeline transmissions, BEA used data directly from the 2002 Economic Census.

The estimates of wholesale and retail trade margins were based on sales data from the 2002 Economic Census supplemented by information from the 2002 Annual Trade Survey and the 2002 Annual Retail Trade Survey. Margin output was then allocated to commodities using information on sales for major commodity lines by type of business (for example, sales of kitchen appliances by household appliance stores) from the Economic Census. The estimates of sales and excise taxes were based on information from Census Bureau annual trade surveys and from the NIPAs.

Step 7: Reconciling gross operating surplus and final balancing

The final step was to balance the benchmark I-O use table. The output of each commodity (row) in the use table must equal the sum of the transactions for that commodity, and the output of each industry (column) in the table must equal the sum of input transactions, including value added, for that industry. In practice, the estimates often result in various discrepancies that require adjustments.

This balancing was achieved via a new process designed to reconcile the gross operating surplus esti-

mates in the 2002 benchmark I-O accounts with the gross operating surplus estimates in the 2002 GDP-by-industry accounts.¹⁴ The reconciliation produced a balanced benchmark I-O use table and improved the intermediate inputs and the gross operating surplus estimates.

The new reconciliation and balancing model is con-

14. The annual I-O accounts and the GDP-by-industry accounts were integrated in 2004; see Brian C. Moyer, Mark A. Planting, Paul V. Kern, and Abigail M. Kish, "Improved Annual Industry Accounts for 1998–2003: Integrated Annual Input-Output Accounts and Cross-Domestic-Product-by-Industry Accounts," SURVEY 84 (June 2004): 21–57.

Table B. Principal Data Sources and Methods for Estimating Intermediate Inputs and Value-Added, 2002 Benchmark I-O Accounts

Input component	Source data and methods used
Intermediate inputs	<p>Agriculture, forestry, fishing and hunting Inputs to the agriculture, forestry, fishing and hunting industries were estimated from U.S. Department of Agriculture's 2002 Census of Agriculture or by extrapolating 1997 benchmark I-O estimates. These estimates were adjusted during the process of balancing commodity purchases across industries with commodity output totals.</p> <p>Mining Inputs to the mining industries were estimated primarily from the 2002 Economic Census' mining sector reports. Detailed cost data on accounting, auditing, and bookkeeping services; advertising and promotional expenses; communication services; legal services; purchased electricity; purchased fuels consumed; rental payments for buildings and other structures; rental payments for machinery and equipment; supplies used and minerals received; and all other operating expenses were used to estimate intermediate inputs. Inputs were also extrapolated using the 1997 benchmark I-O estimates. Estimates were adjusted during the process of balancing commodity purchases across industries with commodity output totals.</p> <p>Construction Inputs to the construction industries were estimated primarily from 2002 Economic Census construction data.</p> <p>Manufacturing Inputs to the manufacturing industries were estimated primarily from the 2002 Economic Census' manufacturing sector reports. Detailed cost data on accounting, auditing, and bookkeeping services; advertising and promotional services; communication services; legal services; management consulting and administrative services; materials, parts, containers, packaging, etc., used; purchased computer services; purchased electricity; purchased fuels; refuse removal services; rental payments for buildings and other structures; rental payments for machinery and equipment; repair and maintenance services of buildings and/or machinery; and all other operating expenses were used to estimate intermediate inputs. Inputs were also extrapolated using the 1997 benchmark I-O estimates. Estimates were adjusted during the process of balancing commodity purchases across industries with commodity output totals.</p> <p>Services, trade, transportation and warehousing, and utilities For selected census-covered industries, information from the 2002 Business Expenses Survey (BES) on operating expenses was used, including accounting services; advertising services; communication services; contract labor costs; data processing and other computer related services; insurance costs; lease and rental payments; legal services; management consulting and other professional services; packaging and container costs; printing services; repair and maintenance services; transportation, shipping and warehousing services; cost of utilities; and other operating expenses. Estimates were adjusted during the process of balancing commodity purchases across industries with commodity output totals. For noncensus-covered industries, inputs were estimated from trade association data or by extrapolating 1997 benchmark I-O estimates by the change in industry output from 1997 to 2002. Estimates were adjusted during the process of balancing commodity purchases across industries with commodity output totals.</p>
Value-added:	<p>Compensation of employees For census-covered industries, payroll data from the 2002 Economic Censuses were used; data were adjusted for misreporting and I-O industry definitions. Benefits data for manufacturing and mining were from the 2002 Economic Census. Benefits data for industries covered by the BES were based on the relationship between the BES benefits and payroll data applied to the 2002 Economic Census payroll data. For the remaining industries, benefits were estimated using indirect techniques. For noncensus-covered industries, tabulations of wages and salaries covered by state unemployment insurance and estimates of benefits from the national income and product accounts were used; data were adjusted for misreporting and I-O industry definitions. All estimates were adjusted to balance to total compensation in the national income and product accounts.</p> <p>Taxes on production and imports less subsidies The estimates by industry were prepared in two parts: For excise and general sales taxes, the values were estimated as part of each industry's output; for other taxes, assessments and license fees, the estimates were distributed on the basis of a variety of source data, including state government tax collections statistics and the BES. For all other tax liabilities, estimates were distributed to industries using indirect techniques. All estimates were adjusted to balance to total taxes on production and imports, less subsidies in the national income and product accounts.</p> <p>Gross operating surplus For most industries, the residual method (total industry output less total intermediate inputs, compensation of employees, and taxes on production and imports, less subsidies) was used.</p>

sidered a milestone in the development of the BEA industry accounts; BEA has made integration of these accounts a priority. A full discussion of the new process will be published in an upcoming issue of the SURVEY OF CURRENT BUSINESS. In addition to enhanced transparency and flexibility, the new reconciliation and balancing framework has two notable advantages over past models. First, the model is built on a firm statistical foundation in which adjustments reflect the relative reliability of the initial estimates. Second, the least squares framework ensures that adjustments made to initial estimates are as small as possible and still satisfy the accounting constraints of the model.

Technical Note The 2002 Benchmark I-O Accounts Tables

The 2002 benchmark I-O accounts include standard make and use tables and several supplementary tables. The supplementary tables consist of make and use tables based on the standard tables, four requirements tables, and bridge tables.

Standard tables

The standard make and use tables are based on the 2002 NAICS. For the purpose of data collection, an establishment or a business unit is assigned to an industry according to its output and production process. However, most establishments produce more than one product, so the establishment is categorized by its primary source of revenue or its primary product. The other products that the establishment produces are identified as secondary products. For example, a hotel may also provide restaurant services, but these services are not part of the hotel industry's primary product of lodging, so they are treated as a secondary product of the hotel industry. The standard make and use tables are constructed before the redefinition of selected secondary products; all of the products—primary and secondary—that are produced by an industry are assigned to that industry. As a result, the data in these tables are consistent with GDP-by-industry accounts, the gross-domestic-product-by-state accounts, and with other industry data reported by other statistical agencies on a NAICS basis.

Table 1, standard make table. The standard make table is a matrix that shows the value in producers' prices of each commodity produced by each industry (see the schematic in the upper panel of chart 1 and estimates in table C). In the matrix, commodities are presented in the columns, and industries are presented in the rows. The entries in a row represent the dollar value of commodities produced by an industry. The entries in a column represent the value of the production by each industry of a commodity. The diagonal

cell in each row (a shaded cell in chart 1) shows the value of production of the commodity for which the industry has been designated the "primary" producer. Any entries in the other cells in the row show the value of production of commodities for which other industries are the primary producers (and for which the given industry is a "secondary" producer). The row total in the make table is total industry output, and the column total is total commodity output. As indicated by the shading in chart 1, the row totals of the make table equal the column totals of the use table, and the column totals of the make table equal the row totals of the use table.

Table 2, standard use table. The standard use table is a matrix that shows the commodities consumed, or used, by each industry and final consumer (see the schematic in the lower panel of chart 1 and estimates in table D). The entries in a row represent the dollar value of the use by each industry of a commodity and of the sales of the commodity to final uses. The industry uses add up to total intermediate use (the far right column of the industries' portion in chart 1). The final uses sum to GDP (the far right column of the final uses' portion in chart 1). The entries in a column represent the value of the commodities—that is, of raw materials, semi finished products, and services—used and the value added that is generated in production by an industry. The row total (total commodity output) is the production of the commodity (regardless of which industry contributed to that production), and the column total (total industry output) is the production of the industry (regardless of what commodity was produced).

Supplementary tables

The supplementary make and use tables are based on the standard make and use tables. In the supplementary make and use tables, some of the secondary products are reassigned to the industries in which these products are primary products. The estimates in the supplementary make and use tables are used to calculate four requirements tables—commodity-by-industry direct requirements, commodity-by-commodity total requirements, industry-by-commodity total requirements, and industry-by-industry total requirements—that quantify the direct and indirect effects of changes in final demand on the economy. The data in the supplementary make and use tables and in the total requirements tables that are derived from them are valuable for performing economic structural analysis, impact analysis, and other types of economic modeling because they show the interdependence among the producers and consumers in the economy. Using these tables, analysts can estimate the direct and indirect

 ■ PRIMARY PRODUCT OF THE INDUSTRY

1. The 2002 benchmark input-output (I-O) accounts use two classification systems, one for industries and another for commodities, but both generally use the same I-O numbers and titles based on NAICS.
 2. "Other inputs" includes noncomparable imports, and rest-of-the-world adjustments.
 3. "Gross operating surplus" consists of the following national income and product accounts components of gross domestic income: Consumption of fixed capital, net interest, proprietors' income, corporate profits, rental income of persons, business transfer payments, and subsidies less current surplus of government enterprises; in the I-O accounts, it is calculated as a residual after subtracting intermediate inputs, compensation of employees, and taxes on production and imports, less subsidies from industry output.
 U.S. Bureau of Economic Analysis

effects of changes in final uses on industries and commodities. For example, these tables can be used to determine the economic impact of a disaster or to compute the effect on output of a shift in demand from domestic to imported goods.

Tables 3 and 4, supplementary make and use tables (after redefinitions). In traditional I-O analysis, industries are required to have homogeneous production processes: Each industry produces only one commodity, and each commodity is produced by only one industry. Thus, secondary products present a special problem because they represent heterogeneity in an industry's output. In order to transform the make and use tables into the required format, assumptions about the technology of producing secondary products are needed. The two most commonly used technology assumptions are the industry-technology assumption and the commodity-technology assumption.

BEA developed a two-step process to reassign the secondary products from the industry in which they were produced to the industries in which these products are primary products.¹⁵ The first step is the "redefinition process." In this step, it is assumed (1) that the input structure of a secondary product differs from the

input structure of the primary product of the industry in which the secondary product was produced and (2) that the input structure of a secondary product is similar to that of the primary product of the industry to which it is reassigned.¹⁶ As a result of the redefinition process, the total value of secondary products is decreased, and the total value of primary products is increased, by the same amount. Redefinitions affect numerous industries within the I-O accounts, most notably wholesale trade, retail trade, and accommodations and food services.

The second step refers to "reclassifications and other secondary products."¹⁷ In this step, the remaining secondary products are reassigned so that each industry produces only its primary product. This step also assumes that the input structure of each secondary product is the same as, or similar to, that of the primary product that the industry produces.¹⁸ For example, newspapers are treated as the primary product of the newspaper industry, while advertising is treated as the primary product of the advertising industry. Newspaper advertising is treated as a secondary product of the newspaper industry, since the same input structure is

15. See Jiemin Guo, Ann M. Lawson, and Mark A. Planting, "From Make-Use to Symmetric I-O Tables: An Assessment of Alternative Technology Assumptions" (paper presented at the 14th International Conference on Input-Output Techniques, Montreal, Canada, October 10–15, 2002, sponsored by the International Input-Output Association) for the detailed procedures and technology assumptions used for secondary products in the preparation of benchmark I-O tables.

16. This step is based on the commodity-technology assumption, which assumes that each commodity has an input structure that is independent of the industry that produced it.

17. For more information, see *Concepts and Methods of the Input-Output Accounts* on BEA's Web site.

18. This step is based on the industry-technology assumption, which assumes that the input structure of all the commodities produced by an industry is the same.

1. Includes noncomparable imports and rest-of-the-world adjustments.

NOTE: Detail may not add to total due to rounding.

Table 6, commodity-by-commodity total requirements table. This table is derived from both the make and use tables. The values in the table, referred to as “commodity-by-commodity total requirements coefficients,” show the production required both directly and indirectly of the commodity at the beginning of each row per dollar of delivery to final use of the commodity at the top of the column.

Table 7, industry-by-commodity total requirements table. This table is derived from both the make and use tables. The values in the table, referred to as “industry-by-commodity total requirements coefficients,” show the production required directly and indirectly from the industry at the beginning of the row per dollar of delivery to final use of the commodity at the top of the column.

Table 8, the industry-by-industry total requirements table. This table is also derived from both the make and use tables. The values in the table, referred to as “industry-by-industry total requirements coefficients,” show the production required directly and indirectly from the industry at the beginning of the row per dollar of delivery to final use by the industry at the top of the column.

Bridge tables. Three additional supplementary tables serve as bridges between the I-O estimates and NIPA estimates. The first bridge table (appendix C) covers the I-O commodity composition of NIPA personal consumption expenditures. The second table (appendix D) covers the I-O commodity composition of NIPA private equipment and software expenditures. The third table (appendix E) reconciles the I-O estimates of exports and imports with those in the NIPAs.

The commodity composition tables are necessary because the valuations and definitions used in the I-O accounts differ from those used in the NIPAs. In the I-O accounts, the final use categories are expressed in producers’ prices; in the NIPAs, final demand categories are expressed in purchasers’ prices, except for merchandise imports where the value at the foreign port is used. Also, the definitions of the export and import components of I-O final use categories differ from

those of the NIPA final demand categories mainly because the I-O data are adjusted to account for goods that are returned to the country that originally exported it. Before the I-O total requirements tables can be used to analyze changes in commodity or industry output requirements that result from changes in the level or composition of NIPA final demand, the NIPA final demand categories must be converted to the I-O final use categories; that is, the analysis should be consistent with I-O final use commodities that are valued at producers’ prices for the I-O year and include separate entries for transportation costs and trade margins.

Some adjustments are necessary in order to reconcile the I-O estimates of exports and imports of goods and services with those in the NIPAs. In the NIPAs, unlike in the I-O accounts, imports include the U.S. merchandise that is returned to the United States from other countries, and exports include the foreign merchandise that is reexported from the United States to other countries. The same adjustments are made for both exports and imports, so total GDP is not affected.

New personal consumption expenditures classification system

The 2002 benchmark input-output accounts have incorporated a new classification structure for personal consumption final uses that classifies commodities according to function and type of product. The purpose of the new classification is to incorporate changes that reflect shifts in consumer buying patterns related to changing incomes, changing demographics, technological innovations, changing tastes and preferences, new government programs, and legislative changes.

This change was made in conjunction with the NIPAs and takes into consideration guidelines of the System of National Accounts (SNA). Under the new PCE classification system, there are numerous changes to commodities and commodity categories, and the aggregation structure is changed for each classification type. However, there is no change in the total level of PCE. For more information, see appendix C.

Acknowledgments

This article and the completion of the 2002 benchmark input-output (I-O) accounts represent the contributions of many members of the Industry Benchmark Division staff. Mary Streitwieser, Chief of the Industry Benchmark Division, assisted by Edward Morgan, supervised the preparation of the 2002 benchmark I-O accounts. Sumiye Okubo, Associate Director for Industry Accounts, provided overall guidance.

Mary Streitwieser, Ricky Stewart, and Jessica Brede Stone coordinated and wrote the article. Alvin Blake, Eric Bryda, Patricia W. Coles, Teresa Gilmore, William Jolliff, Holly Merwin, Edward Morgan, Kevin Muck, Simon Randrianarivelo, Darlene Robinson-Smith, and Mariam Tekle-Haimanot assisted in preparing text materials and in reviewing the tables and appendixes.

The following current and former staff members of the Industry Benchmark Division contributed to the 2002 benchmark I-O accounts:

- Agriculture, mining, manufacturing, construction, utilities, transportation, wholesale trade and retail trade industries: Alvin Blake, Belinda Bonds, Eric Bryda, Bethany Carrato (JPSM junior fellow), Thomas Dassel (U.S. Census Bureau exchange fellow), Nicholas Empey, Teresa L. Gilmore, Donald Kim, David McCarthy, Holly Merwin, Simon Randrianarivelo, Stanislaw Rzeznik, Ricky Stewart, and Steven Zemaneck.
- Personal and business services, information services, education, health care and social assistance, Federal and state and local government: Karla Stanley-Allen, Patricia W. Coles, Damon DuBord, William Jolliff, Yuen Lau, Kevin Muck, Elizabeth Ocalan, Darlene Robinson-Smith, Ricky Stewart, Jessica Brede Stone, and Mariam Tekle-Haimanot.
- Foreign transactions: Robert S. Robinowitz.
- Administrative and program assistance: Maxine Tiggle and Patricia Wilkinson.

Other Industry Accounts staff who contributed are Carol Robbins, who directed research to improve the estimates of royalties output and several PCE categories, and Robert E. Yuskavage, who provided guidance and review. Additional guidance and review were provided by Douglas Meade and Mark Planting, formerly with the Industry Benchmark Division.

Nicholas Empey, Thomas Howells, Edward Morgan, Dylan Rassier, and Conrad Roesch developed and executed the model to reconcile the benchmark I-O gross operating surplus with that from the GDP-by-industry accounts.

The following staff members of the Current Industry Analysis Division, under the direction of George Smith, Chief, contributed to the review and reconciliation of the 2002 benchmark accounts with the GDP-by-industry

accounts: Felicia Candela, Thomas Howells, Sherlene Lum, and Nicole Mayerhauser.

Erich Strassner, Chief of the Industry Research Group, also contributed to the review and reconciliation of the 2002 benchmark accounts with the GDP-by-industry accounts. Mahnaz Fahim-Nader organized and recorded the results of the final uses review and reconciliation between the Industry Benchmark Division estimates and the National Income and Wealth Division estimates.

The following staff members of the National Income and Wealth Division, under the direction of Carol Moylan, Chief, contributed to the review and reconciliation of the 2002 estimates of personal consumption expenditures (PCE) and private fixed investment with the national income and product accounts: Michael Armah, Kyle Brown, Robert Carlson, Jeffrey Crawford, Thomas Dassel (U.S. Census Bureau exchange fellow), Harvey Davis, April Downs, Yukun Fung, Velma Henry, Everette Johnson, Paul R. Lally, Brendan Leary, Nicole Mayerhauser, Denise McBride, Clinton McCully, Kristen Nespole, Jennifer Ribarsky, Charles Robinson, Todd Siebeneck, Tony Troy, Matt Tschetter, and David B. Wasshausen. Clinton McCully and Teresita Teensma were instrumental in incorporating the new PCE classification system into the structure of the 2002 benchmark I-O accounts.

The following staff members of the Government Division, under the direction of Brooks Robinson, former Chief, and Brian Moyer, Chief, contributed to the development of estimates: Bruce Baker, Pamela Kelly, and Benjamin Cowan.

Under the direction of Steve Holiday, staff members of the Office of the Chief Information Officer, particularly Brian Kajutti, Paul Kilday, Janice Townsend, and Ying Ni and Industry Benchmark Division staff members Edward Morgan, Damon DuBord, Nicholas Empey, Teresa Gilmore, William Jolliff, and Kevin Muck coordinated the computer programming and processing system that was used to compile, check, analyze, and report the final estimates.

Ruth A. Bramblett, Office of the Chief Statistician, and Stephen H. Andrews, National Income and Wealth Division, provided assistance in obtaining source data.

A special acknowledgment is made to the staff of the Census Bureau, particularly to those in the Economic Planning and Coordination Division under the direction of Shirin A. Ahmed, Chief; in the Manufacturing and Construction Division under the direction of Thomas Zabelsky, Chief; and in the Service Sector Statistics Division under the direction of Mike E. Wallace, Chief. Without their cooperation and assistance, the accelerated publication of the 2002 benchmark I-O accounts would have been impossible.

3260 Plastics and rubber products manufacturing		33329A Other industrial machinery manufacturing.....	33321, 333291-4, 333298
326110 Plastics packaging materials and un laminated film and sheet manufacturing.....	32611	333220 Plastics and rubber industry machinery manufacturing.....	33322
326121 Unlaminated plastics profile shape manufacturing.....	326121	333295 Semiconductor machinery manufacturing.....	333295
326122 Plastics pipe and pipe fitting manufacturing.....	326122	3333 Commercial and service industry machinery manufacturing	
326130 Laminated plastics plate, sheet (except packaging), and shape manufacturing.....	32613	33331A Vending, commercial, industrial, and office machinery manufacturing.....	333311-3
326140 Polystyrene foam product manufacturing.....	32614	333314 Optical instrument and lens manufacturing.....	333314
326150 Urethane and other foam product (except polystyrene) manufacturing.....	32615	333315 Photographic and photocopying equipment manufacturing.....	333315
326160 Plastics bottle manufacturing.....	32616	333319 Other commercial and service industry machinery manufacturing.....	333319
32619A Other plastics product manufacturing.....	32619	3334 HVAC and commercial refrigeration equipment manufacturing	
326210 Tire manufacturing.....	32621	33341A Air purification and ventilation equipment manufacturing.....	333411-2
326220 Rubber and plastics hoses and belting manufacturing.....	32622	333414 Heating equipment (except warm air furnaces) manufacturing.....	333414
326290 Other rubber product manufacturing.....	32629	333415 Air conditioning, refrigeration, and warm air heating equipment manufacturing.....	333415
3270 Nonmetallic mineral product manufacturing		3335 Metalworking machinery manufacturing	
32711A Pottery, ceramics, and plumbing fixture manufacturing.....	32711	333511 Industrial mold manufacturing.....	333511
32712A Brick, tile, and other structural clay product manufacturing	327121-3	33351A Metal cutting and forming machine tool manufacturing.....	333512-3
32712B Clay and nonclay refractory manufacturing.....	327124-5	333514 Special tool, die, jig, and fixture manufacturing.....	333514
327211 Flat glass manufacturing.....	327211	333515 Cutting tool and machine tool accessory manufacturing.....	333515
327212 Other pressed and blown glass and glassware manufacturing.....	327212	33351B Rolling mill and other metalworking machinery manufacturing	333516, 333518
327213 Glass container manufacturing.....	327213	3336 Engine, turbine, and power transmission equipment manufacturing	
327215 Glass product manufacturing made of purchased glass....	327215	333611 Turbine and turbine generator set units manufacturing.....	333611
327310 Cement manufacturing.....	32731	333612 Speed changer, industrial high-speed drive, and gear manufacturing.....	333612
327320 Ready-mix concrete manufacturing.....	32732	333613 Mechanical power transmission equipment manufacturing....	333613
327330 Concrete pipe, brick, and block manufacturing.....	32733	333618 Other engine equipment manufacturing.....	333618
327390 Other concrete product manufacturing.....	32739	3339 Other general purpose machinery manufacturing	
3274A0 Lime and gypsum product manufacturing.....	3274	333911 Pump and pumping equipment manufacturing.....	333911, 333913
327910 Abrasive product manufacturing.....	32791	333912 Air and gas compressor manufacturing.....	333912
327991 Cut stone and stone product manufacturing.....	327991	333920 Material handling equipment manufacturing.....	333921-4
327992 Ground or treated mineral and earth manufacturing.....	327992	333991 Power-driven handtool manufacturing.....	333991
327993 Mineral wool manufacturing.....	327993	33399A Other general purpose machinery manufacturing.....	333992, 333997, 333999
327999 Miscellaneous nonmetallic mineral products.....	327999	333993 Packaging machinery manufacturing.....	333993
331A Iron and steel mills and manufacturing from purchased steel		333994 Industrial process furnace and oven manufacturing.....	333994
331110 Iron and steel mills and ferroalloy manufacturing.....	3311	33399B Fluid power process machinery.....	333995-6
331200 Steel product manufacturing from purchased steel.....	33121, 33122	3341 Computer and peripheral equipment manufacturing	
331B Nonferrous metal production and processing		334111 Electronic computer manufacturing.....	334111
33131A Alumina refining and primary aluminum production.....	331311-2	334112 Computer storage device manufacturing.....	334112
331314 Secondary smelting and alloying of aluminum.....	331314	33411A Computer terminals and other computer peripheral equipment manufacturing.....	334113, 334119
33131B Aluminum product manufacturing from purchased aluminum.....	331315, 331316, 331319	334A Audio, video, and communications equipment manufacturing	
331411 Primary smelting and refining of copper.....	331411	334210 Telephone apparatus manufacturing.....	33421
331419 Primary smelting and refining of nonferrous metal (except copper and aluminum).....	331419	334220 Broadcast and wireless communications equipment.....	33422
331420 Copper rolling, drawing, extruding and alloying.....	33142	334290 Other communications equipment manufacturing.....	33429
331490 Nonferrous metal (except copper and aluminum) rolling, drawing, extruding and alloying.....	33149	334300 Audio and video equipment manufacturing.....	3343
3315 Foundries		3344 Semiconductor and other electronic component manufacturing	
331510 Ferrous metal foundries.....	33151	334411 Electron tube manufacturing.....	334411
331520 Nonferrous metal foundries.....	33152	334412 Bare printed circuit board manufacturing.....	334412
3321 Forging and stamping		334413 Semiconductor and related device manufacturing.....	334413
33211A All other forging, stamping, and sintering.....	332111-2, 332117	33441A Electronic capacitor, resistor, coil, transformer, and other inductor manufacturing.....	334414-6
332114 Custom roll forming.....	332114	334417 Electronic connector manufacturing.....	334417
33211B Crown and closure manufacturing and metal stamping.....	332115-6	334418 Printed circuit assembly (electronic assembly) manufacturing	334418
3322 Cutlery and handtool manufacturing		334419 Other electronic component manufacturing.....	334419
33221A Cutlery, utensil, pot, and pan manufacturing.....	332211, 332214	3345 Electronic instrument manufacturing	
33221B Handtool manufacturing.....	332212-3	334510 Electromedical and electrotherapeutic apparatus manufacturing.....	334510
3323 Architectural and structural metals manufacturing		334511 Search, detection, and navigation instruments manufacturing	334511
332310 Plate work and fabricated structural product manufacturing	33231	334512 Automatic environmental control manufacturing.....	334512
332320 Ornamental and architectural metal products manufacturing.....	33232	334513 Industrial process variable instruments manufacturing.....	334513
3324 Boiler, tank, and shipping container manufacturing		334514 Totalizing fluid meters and counting devices manufacturing....	334514
332410 Power boiler and heat exchanger manufacturing.....	33241	334515 Electricity and signal testing instruments manufacturing.....	334515
332420 Metal tank (heavy gauge) manufacturing.....	33242	334516 Analytical laboratory instrument manufacturing.....	334516
332430 Metal can, box, and other metal container (light gauge) manufacturing.....	33243	334517 Irradiation apparatus manufacturing.....	334517
332A Ordnance and accessories manufacturing		33451A Watch, clock, and other measuring and controlling device manufacturing.....	334518-9
33299A Ammunition manufacturing.....	332992-3		
33299B Arms, ordnance, and accessories manufacturing.....	332994-5		

Appendix A. Industries in the 2002 Benchmark Input-Output Accounts—Continues

I-O industry code and title	Related 2002 NAICS codes	I-O industry code and title	Related 2002 NAICS codes
3346 Manufacturing and reproducing magnetic and optical media		WHOLESALE TRADE	
33461A Software, audio, and video media reproducing.....	334611-2	4200 Wholesale trade	
334613 Magnetic and optical recording media manufacturing.....	334613	420000 Wholesale trade	42
3351 Electric lighting equipment manufacturing		RETAIL TRADE	
335110 Electric lamp bulb and part manufacturing.....	33511	4A00 Retail trade	
335120 Lighting fixture manufacturing.....	33512	4A0000 Retail trade.....	44, 45
3352 Household appliance manufacturing		TRANSPORTATION AND WAREHOUSING, EXCLUDING POSTAL SERVICE	
335210 Small electrical appliance manufacturing.....	33521	4810 Air transportation	
335221 Household cooking appliance manufacturing	335221	481000 Air transportation.....	481
335222 Household refrigerator and home freezer manufacturing	335222	4820 Rail transportation	
335224 Household laundry equipment manufacturing	335224	482000 Rail transportation.....	482
335228 Other major household appliance manufacturing	335228	4830 Water transportation	
3353 Electrical equipment manufacturing		483000 Water transportation.....	483
335311 Power, distribution, and specialty transformer manufacturing	335311	4840 Truck transportation	
335312 Motor and generator manufacturing.....	335312	484000 Truck transportation.....	484
335313 Switchgear and switchboard apparatus manufacturing.....	335313	4850 Transit and ground passenger transportation	
335314 Relay and industrial control manufacturing	335314	485000 Transit and ground passenger transportation.....	485
3359 Other electrical equipment and component manufacturing		4860 Pipeline transportation	
335911 Storage battery manufacturing.....	335911	486000 Pipeline transportation	486
335912 Primary battery manufacturing.....	335912	48A0 Scenic and sightseeing transportation and support activities	
335920 Communication and energy wire and cable manufacturing	33592	48A000 Scenic and sightseeing transportation and support activities for transportation	487, 488
335930 Wiring device manufacturing.....	33593	4920 Couriers and messengers	
335991 Carbon and graphite product manufacturing.....	335991	492000 Couriers and messengers	492
335999 All other miscellaneous electrical equipment and component manufacturing	335999	4930 Warehousing and storage	
3361 Motor vehicle manufacturing		493000 Warehousing and storage	493
336111 Automobile manufacturing	336111	INFORMATION	
336112 Light truck and utility vehicle manufacturing	336112	5111 Newspaper, periodical, book, and directory publishers	
336120 Heavy duty truck manufacturing.....	336120	511110 Newspaper publishers.....	51111
336A Motor vehicle body, trailer, and parts manufacturing		511120 Periodical publishers	51112
336211 Motor vehicle body manufacturing	336211	511130 Book publishers.....	51113
336212 Truck trailer manufacturing	336212	5111A0 Directory, mailing list, and other publishers.....	51114, 51119
336213 Motor home manufacturing	336213	5112 Software publishers	
336214 Travel trailer and camper manufacturing	336214	511200 Software publishers.....	51121
336300 Motor vehicle parts manufacturing	3363	5120 Motion picture and sound recording industries	
3364 Aerospace product and parts manufacturing		512100 Motion picture and video industries.....	5121
336411 Aircraft manufacturing.....	336411	512200 Sound recording industries.....	5122
336412 Aircraft engine and engine parts manufacturing	336412	5151 Radio and television broadcasting	
336413 Other aircraft parts and auxiliary equipment manufacturing	336413	515100 Radio and television broadcasting.....	5151
336414 Guided missile and space vehicle manufacturing	336414	5152 Cable networks and program distribution	
33641A Propulsion units and parts for space vehicles and guided missiles	336415, 336419	515200 Cable and other subscription programming.....	5152
336B Other transportation equipment manufacturing		5161 Internet publishing and broadcasting	
336500 Railroad rolling stock manufacturing.....	3365	516110 Internet publishing and broadcasting	516
336611 Ship building and repairing	336611	5170 Telecommunications	
336612 Boat building	336612	517000 Telecommunications.....	517
336991 Motorcycle, bicycle, and parts manufacturing	336991	5180 Internet service providers, web search portals, and data processing	
336992 Military armored vehicle, tank, and tank component manufacturing	336992	518100 Internet service providers and web search portals.....	5181
336999 All other transportation equipment manufacturing	336999	518200 Data processing, hosting, and related services.....	5182
3370 Furniture and related product manufacturing		5190 Other information services	
337110 Wood kitchen cabinet and countertop manufacturing.....	33711	519100 Other information services	519
337121 Upholstered household furniture manufacturing.....	337121	FINANCE AND INSURANCE	
337122 Nonupholstered wood household furniture manufacturing	337122	52A0 Monetary authorities, credit intermediation and related activities	
33712A Metal and other household furniture manufacturing	33712A-5	52A000 Monetary authorities and depository credit intermediation	521, 5221
337127 Institutional furniture manufacturing.....	337127	52A00 Nondepository credit intermediation and related activities	5222-3
33721A Wood TV, radio, and sewing machine cabinet manufacturing	337129	5230 Securities, commodity contracts, investments, and related activities	
337212 Office furniture manufacturing, including custom architectural woodwork and millwork	337211, 337212, 337214	523000 Securities, commodity contracts, investments, and related activities	523
337215 Showcase, partition, shelving, and locker manufacturing	337215	5240 Insurance carriers and related activities	
337910 Mattress manufacturing.....	33791	524100 Insurance carriers.....	5241
337920 Blind and shade manufacturing.....	33792	524200 Insurance agencies, brokerages, and related activities.....	5242
3391 Medical equipment and supplies manufacturing		5250 Funds, trusts, and other financial vehicles	
339111 Laboratory apparatus and furniture manufacturing.....	339111	525000 Funds, trusts, and other financial vehicles	525
339112 Surgical and medical instrument manufacturing	339112	REAL ESTATE AND RENTAL AND LEASING	
339113 Surgical appliance and supplies manufacturing	339113	5310 Real estate	
339114 Dental equipment and supplies manufacturing.....	339114	531000 Real estate	531
339115 Ophthalmic goods manufacturing	339115	5008 Owner-occupied dwellings	
339116 Dental laboratories	339116	S00800 Owner-occupied dwellings	n.a.
3399 Other miscellaneous manufacturing		5321 Automotive equipment rental and leasing	
339910 Jewelry and silverware manufacturing	33991	532100 Automotive equipment rental and leasing	5321
339920 Sporting and athletic goods manufacturing.....	33992		
339930 Doll, toy, and game manufacturing.....	33993		
339940 Office supplies (except paper) manufacturing.....	33994		
339950 Sign manufacturing	33995		
339991 Gasket, packing, and sealing device manufacturing.....	339991		
339992 Musical instrument manufacturing	339992		
33999A All other miscellaneous manufacturing	339993, 339995, 339999		
339994 Broom, brush, and mop manufacturing.....	339994		

Appendix A. Industries in the 2002 Benchmark Input-Output Accounts—Table Ends

I-O industry code and title	Related 2002 NAICS codes	I-O industry code and title	Related 2002 NAICS codes
532A Consumer goods and general rental centers		6230 Nursing and residential care facilities	
532A00 General and consumer goods rental except video tapes and discs.....	53221-2, 53229, 5323	623000 Nursing and residential care facilities.....	623
532230 Video tape and disc rental.....	53223	6240 Social assistance	
5324 Commercial and industrial machinery and equipment rental and leasing		624A00 Individual and family services.....	6241
532400 Commercial and industrial machinery and equipment rental and leasing.....	5324	624200 Community food, housing, and other relief services, including rehabilitation services.....	6242-3 6244
5330 Lessors of nonfinancial intangible assets		624400 Child day care services.....	6244
533000 Lessors of nonfinancial intangible assets.....	533	ARTS, ENTERTAINMENT, AND RECREATION	
PROFESSIONAL AND TECHNICAL SERVICES		71A0 Performing arts, spectator sports, museums, zoos, and parks	
5411 Legal services		711100 Performing arts companies.....	7111
541100 Legal services.....	5411	711200 Spectator sports.....	7112
5412 Accounting, tax preparation, bookkeeping, and payroll services		711A00 Promoters of performing arts and sports and agents for public figures.....	7113-4
541200 Accounting, tax preparation, bookkeeping, and payroll services.....	5412	711500 Independent artists, writers, and performers.....	7115
5413 Architectural, engineering, and related services		712000 Museums, historical sites, zoos, and parks.....	712
541300 Architectural, engineering, and related services.....	5413	7130 Amusements, gambling, and recreation	
5414 Specialized design services		713A00 Amusement parks, arcades, and gambling industries.....	7131-2
541400 Specialized design services.....	5414	713B00 Other amusement and recreation industries.....	71391-3, 71399
5415 Computer systems design and related services		713940 Fitness and recreational sports centers.....	71394
541511 Custom computer programming services.....	541511	713950 Bowling centers.....	71395
541512 Computer systems design services.....	541512	ACCOMMODATION AND FOOD SERVICES	
54151A Other computer related services, including facilities management.....	541513, 541519	7210 Accommodation	
5416 Management, scientific, and technical consulting services		7211A0 Hotels and motels, including casino hotels.....	72111-2
541610 Management, scientific, and technical consulting services.....	54161	721A00 Other accommodations.....	72119, 7212-3
5416A0 Environmental and other technical consulting services.....	54162, 54169	7220 Food services and drinking places	
5417 Scientific research and development services		722000 Food services and drinking places.....	722
541700 Scientific research and development services.....	5417	OTHER SERVICES EXCEPT PUBLIC ADMINISTRATION	
5418 Advertising and related services		8111 Automotive repair and maintenance	
541800 Advertising and related services.....	5418	8111A0 Automotive repair and maintenance, except car washes.....	81111-2, 811191, 811198, 811192
5419 Other professional, scientific, and technical services		811192 Car washes.....	811192
5419A0 All other miscellaneous professional, scientific, and technical services.....	54191, 54193, 54199	811A Electronic, commercial, and household goods repair	
541920 Photographic services.....	54192	811200 Electronic and precision equipment repair and maintenance.....	8112
541940 Veterinary services.....	54194	811300 Commercial and industrial machinery and equipment repair and maintenance.....	8113
MANAGEMENT OF COMPANIES AND ENTERPRISES		811400 Personal and household goods repair and maintenance.....	8114
5500 Management of companies and enterprises		8120 Personal and laundry services	
550000 Management of companies and enterprises.....	55	812100 Personal care services.....	8121
ADMINISTRATIVE AND WASTE SERVICES		812200 Death care services.....	8122
561A All other administrative and support services		812300 Dry-cleaning and laundry services.....	8123
561100 Office administrative services.....	5611	812900 Other personal services.....	8129
561200 Facilities support services.....	5612	813A Religious, grantmaking, giving, and social advocacy organizations	
561400 Business support services.....	5614	813100 Religious organizations.....	8131
561600 Investigation and security services.....	5616	813A00 Grantmaking, giving, and social advocacy organizations.....	8132, 8133
561700 Services to buildings and dwellings.....	5617	813B Civic, social, professional and similar organizations	
561900 Other support services.....	5619	813B00 Civic, social, professional, and similar organizations.....	8134, 8139
5613 Employment services		8140 Private households	
561300 Employment services.....	5613	814000 Private households.....	814
5615 Travel arrangement and reservation services		GOVERNMENT INDUSTRIES	
561500 Travel arrangement and reservation services.....	5615	S001 Federal Government enterprises	
5620 Waste management and remediation services		491000 Postal service.....	491
562000 Waste management and remediation services.....	562	S00101 Federal electric utilities.....	n.a.
EDUCATIONAL SERVICES		S00102 Other Federal Government enterprises.....	n.a.
6100 Educational services		S002 State and local government enterprises	
611100 Elementary and secondary schools.....	6111	S00201 State and local government passenger transit.....	n.a.
611A00 Junior colleges, colleges, universities, and professional schools.....	6112-3	S00202 State and local government electric utilities.....	n.a.
611B00 Other educational services.....	6114-7	S00203 Other state and local government enterprises.....	n.a.
HEALTH CARE AND SOCIAL ASSISTANCE		S005 General Federal defense government services	
6210 Ambulatory health care services		S00500 General Federal defense government services.....	n.a.
621A00 Offices of physicians, dentists, and other health practitioners.....	6211-3	S006 General Federal nondefense government services	
621B00 Medical and diagnostic labs and outpatient and other ambulatory care services.....	6214-5, 6219	S00600 General Federal nondefense government services.....	n.a.
621600 Home health care services.....	6216	S007 General state and local government services	
6220 Hospitals		S00700 General state and local government services.....	n.a.
622000 Hospitals.....	622	SPECIAL INDUSTRIES	
		S003 Noncomparable imports	
		S00300 Noncomparable imports.....	n.a.
		S004 Scrap, used and secondhand goods	
		S00401 Scrap.....	n.a.
		S00402 Used and secondhand goods.....	n.a.
		S009 Rest of the world adjustment	
		S00900 Rest of the world adjustment.....	n.a.

n.a. Not applicable.
NOTE: The titles in boldface represent the industries used for the summary version of the 2002 input-output (I-O) tables.

* An asterisk following a North American Industry Classification System (NAICS) code indicates that the NAICS industry is included in more than one I-O industry.

Appendix B. Classification of Value Added and Final Uses in the 2002 Benchmark Input-Output Accounts

I-O number and title		I-O number and title	
VALUE ADDED		F050	Imports of goods and services
V001	Compensation of employees		F05000 Imports of goods and services
	V00100 Compensation of employees	F06C	Federal Government consumption expenditures, national defense
V002	Taxes on production and imports, less subsidies		F06C00 Federal Government consumption expenditures, national defense
	V00200 Taxes on production and imports, less subsidies	F06I	Federal Government gross investment, national defense
V003	Gross operating surplus		F06I00 Federal Government gross investment, national defense
	V00300 Gross operating surplus	F07C	Federal Government consumption expenditures, nondefense
			F07C00 Federal Government consumption expenditures, nondefense
FINAL USES		F07I	Federal Government gross investment, nondefense
F010	Personal consumption expenditures		F07I00 Federal Government gross investment, nondefense
	F01000 Personal consumption expenditures	F08C	State and local government consumption expenditures, education
F020	Private fixed investment		F08C00 State and local government consumption expenditures, education
	F02000 Private fixed investment	F08I	State and local government gross investment, education
F030	Change in private inventories		F08I00 State and local government gross investment, education
	F03000 Change in private inventories	F09C	State and local consumption expenditures, other
F040	Exports of goods and services		F09C00 State and local consumption expenditures, other
	F04000 Exports of goods and services	F09I	State and local government gross investment, other
			F09I00 State and local government gross investment, other

NOTE. The titles in boldface represent the value added and final use components used for the summary version of the 2002 tables

Appendix E. Relationship of Exports and Imports in the Input-Output Accounts to the National Income and Product Accounts, 2002

[Millions of Dollars]

	Total	Goods	Services
Total exports, NIPAs	1,005,921	697,565	308,356
Less: U.S. merchandise returned	32,602	32,602	
Reexports	63,258	63,258	
Other transactions	309		309
Plus: Exports identified in Census documents ¹		7,393	-7,393
Equals: Exports, I-O	909,752	609,098	300,654
Total imports, NIPAs	1,431,554	1,190,591	240,963
Less: U.S. merchandise returned	32,602	32,602	
Reexports	63,258	63,258	
Other transactions	309		309
Plus: Imports identified in Census documents ¹		671	-671
Equals: Imports, I-O	1,335,385	1,095,402	239,983

1. NIPA Imports of goods include a revised estimate of NIPA gold over the estimate included in the starting point for foreign merchandise transactions in the 2002 benchmark I-O accounts—the NIPA imports of goods as

published in the August 2006 SURVEY OF CURRENT BUSINESS, Table 4.3B, "Relation of Foreign Transactions in the National Income and Product Accounts to the Corresponding Items in the International Transactions Accounts."
