Genomic Medicine and Breast Cancer

Genomic Medicine Definition

The use of molecular Genotype (DNA) and Phenotype (mRNA) to predict disease incidence, outcome, and/or to dictate treatment

Genomic Medicine and Breast Cancer

Genomic Medicine Definition

The use of molecular Genotype (DNA) and Phenotype (mRNA) to predict disease incidence, outcome, and/or to dictate treatment

In cancer biology there are two genomes

Tumor (somatic)

Patient (germline)

Genomic Medicine and Breast Cancer Past

Treatment based on:

**Clinical features of the tumor
(size, pathologic grade, nodal metastasis)**

**Expression and/or genetic abnormalities of one
or a few genes in the tumor**

The First Therapy Based on Tumor Phenotype

Estrogen Receptor

104 THE LANCET,] DR. BEATSON: INOPERABLE CASES OF CARCINOMA OF THE MAMMA [JULY 11, 1896.

another thirty years it would then have entirely disappeared. The first great drop in its rate took place in the decade 1840-50, about the time that serious attention began to be given to sanitary reforms and especially to land drainage. It then remained scarcely reduced for about seventeen years; but from 1867 to 1894 it has been steadily on the decline. It is in this period that most of the great sanitary works have been carried out in this country. Can we doubt that it is to them that we owe so substantial a diminution of the disease? And need we despair of carrying it on to its fitting close? Let it be remembered that this improvement has taken place in spite of the increasing aggregation of the population in towns and without any special measures of repression having been attempted. It is indeed only recently that

ON THE TREATMENT OF INOPERABLE
CASES OF CARCINOMA OF THE MAMMA:
SUGGESTIONS FOR A NEW METHOD
OF TREATMENT, WITH ILLUSTRATIVE
CASES.¹

BY GEORGE THOMAS BEATSON, M.D. EDIN.,
SURGEON TO THE GLASGOW CANCER HOSPITAL; ASSISTANT SURGEON,
GLASGOW WESTERN INFIRMARY; AND EXAMINER IN SURGERY
TO THE UNIVERSITY OF EDINBURGH.

The First Therapy Based on Tumor Phenotype

Estrogen Receptor

Case History

33 year old premenopausal woman presented with a 11 X 8 cm left breast tumor with skin involvement

Patient underwent radical mastectomy

3 months later presented with diffuse chest wall and skin involvement with tumor and apparent metastatic disease in her thyroid

Patient underwent oophorectomy 1 month later and had a complete remission of her tumor and survived for 4 years

The First Therapy Based on Tumor Phenotype

Estrogen Receptor

HER2/Neu amplification

Genomic Medicine and Breast Cancer Present

Treatment based on:

**Clinical features of the tumor
(size, pathologic grade, nodal metastasis)**

**Expression and/or genetic abnormalities of multiple
genes in the tumor**

**Estrogen Receptor and Progesterone Receptor
HER2/Neu Amplification
Recurrence Score
Gene Expression Microarrays**

Recurrence Score

Developed to stratify the risk of relapse and/or need for chemotherapy

Early stage

Hormone receptor positive tumors

Node negative

Tamoxifen treated

21 Gene set developed from literature and array experiments

Designed to use Quantitative Reverse Transcription PCR (qRT-PCR) of RNA from formalin fixed paraffin-embedded tumor tissue

Recurrence Score

Quantitative Reverse Transcription PCR

Recurrence Score

mRNA Targets

ESTROGEN

(size, pathologic grade, nodal metastasis)**

**Expression and/or genetic abnormalities of multiple
genes in the tumor**

Estrogen Receptor and Progesterone Receptor

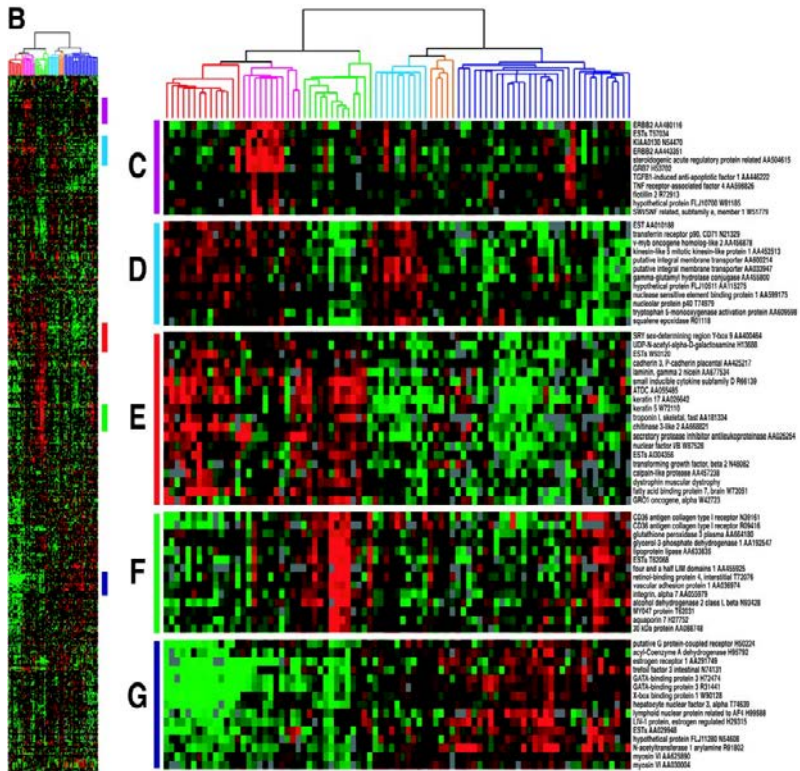

HER2/Neu Amplification

Measures of multiple gene expression

Pharmacogenomics

Whole genome sequencing

Expression Profiling of Breast Cancer Intrinsic subtypes

C 6 tumor subtypes (based upon Fig 1)

X Censored, Lum A, Lum C, NorB-like, Basal, ERBB2+, Lum B

Molecular Profiling of Breast Cancer

Triple Negative Breast Cancer

Pharmacogenomics

Using genetic information (genotype or phenotype) to predict drug efficacy or toxicity

Pharmacogenomics

Using genetic information (genotype or phenotype) to predict drug efficacy or toxicity

In Cancer Biology there are two genomes

Tumor (somatic)

Patient (germline)

Pharmacogenomics

Tumor Pharmacogenomics:

Presence of the therapeutic target predicts treatment benefit

Estrogen Receptor

HER2/Neu amplification

Pharmacogenomics

Tumor Pharmacogenomics:

Presence of the therapeutic target predicts treatment benefit

Estrogen Receptor → Anti-hormonal agents

HER2/Neu amplification → Anti-HER2/Neu agents

Pharmacogenomics

Tumor Pharmacogenomics:

Genetic abnormality that predicts a treatment benefit

BRCA1 and BRCA2 mutations

Pharmacogenomics

Pharmacogenomics

Pharmacogenomics

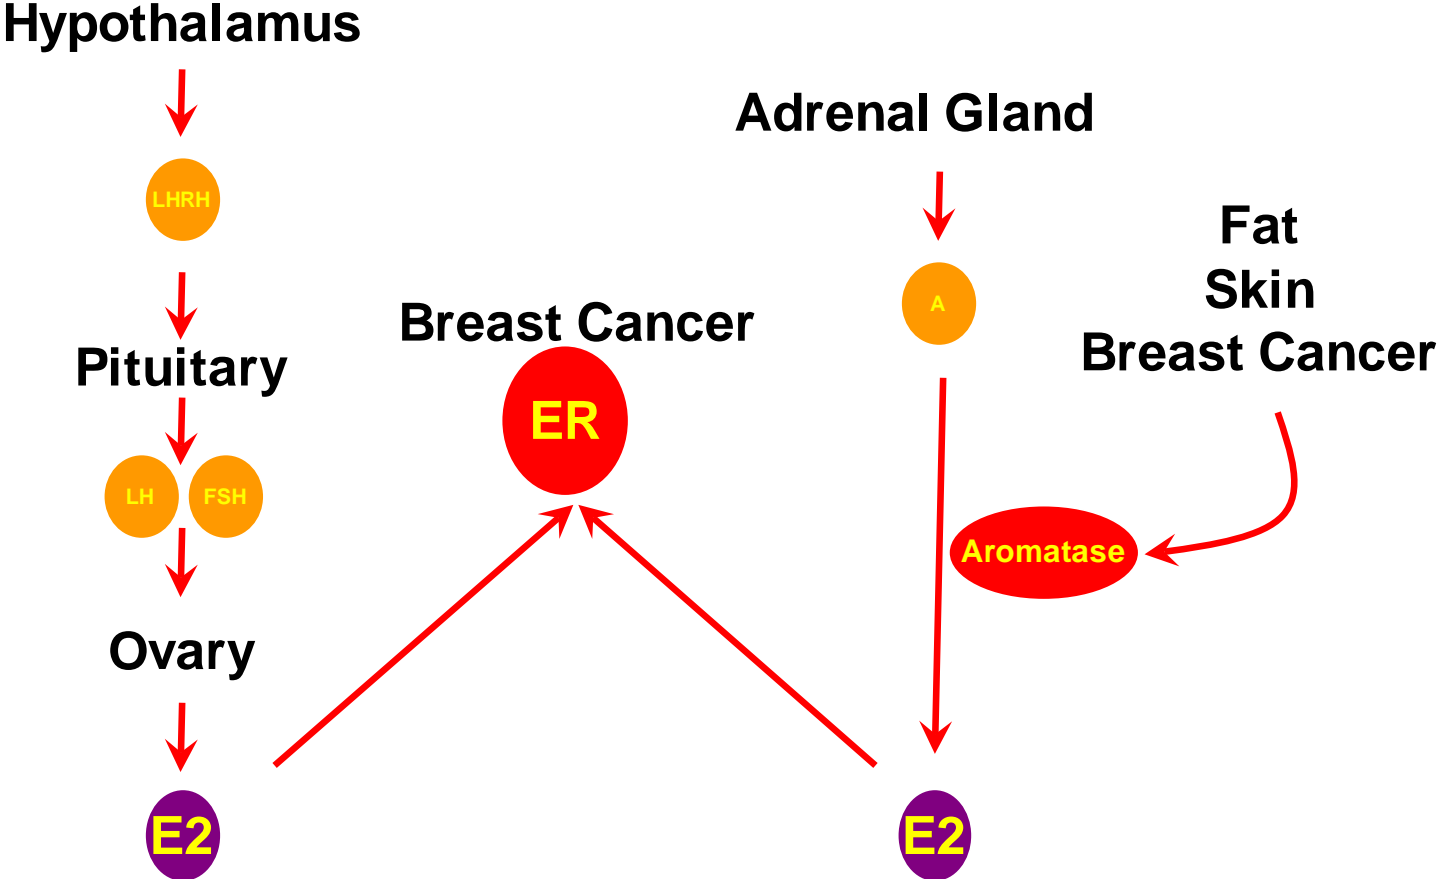

Pharmacogenomics

Patient Pharmacogenomics:

Presence of genotypic or phenotypic markers in the patient that predict a drugs efficacy or toxicity

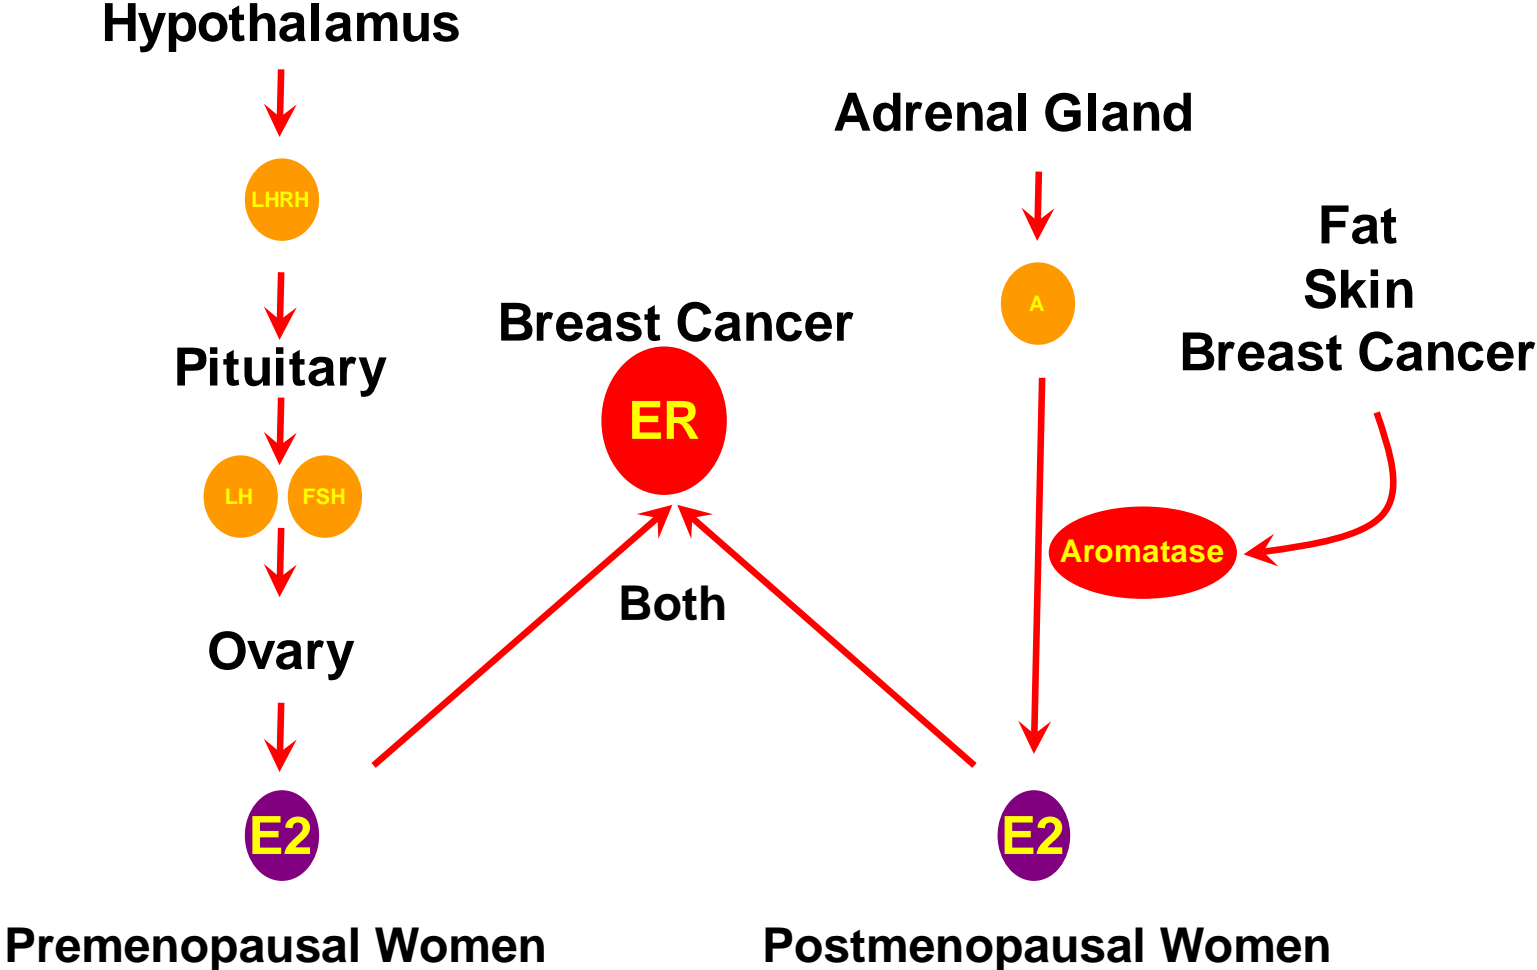

Patient Pharmacogenomics

Phenotype and Hormonal Treatment

Patient Pharmacogenomics

Phenotype and Hormonal Treatment

Pharmacogenomics

Patient Pharmacogenomics:

Presence of genotypic or phenotypic markers in the patient that predict a drug's efficacy

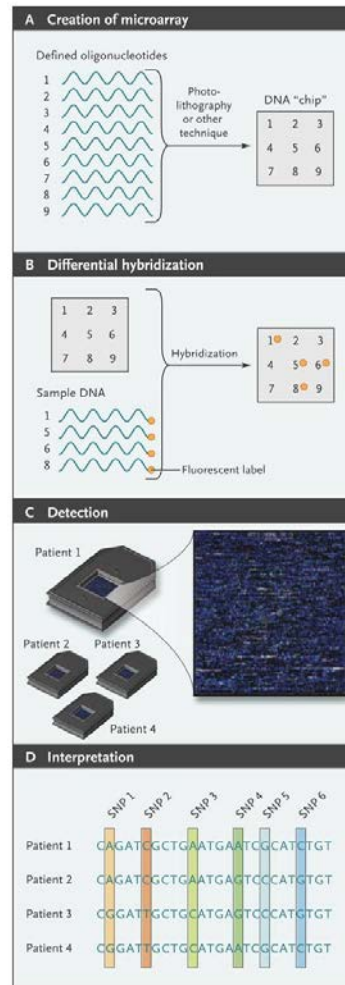

Metabolic enzyme isotypes may affect metabolism of drugs

e.g., cytochrome p450 enzymes

Most commonly single nucleotide polymorphisms (SNPs)

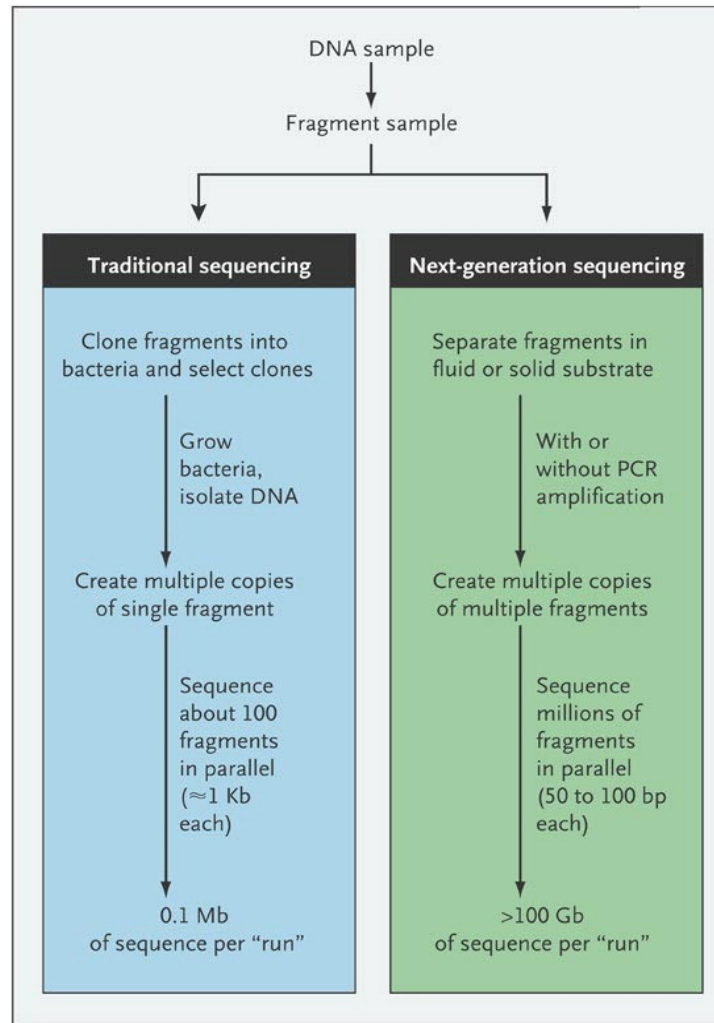

Genomic Sequence Variation

Single Nucleotide Polymorphism (SNP) Arrays

Genomic Sequence Variation

Whole Genome Sequencing

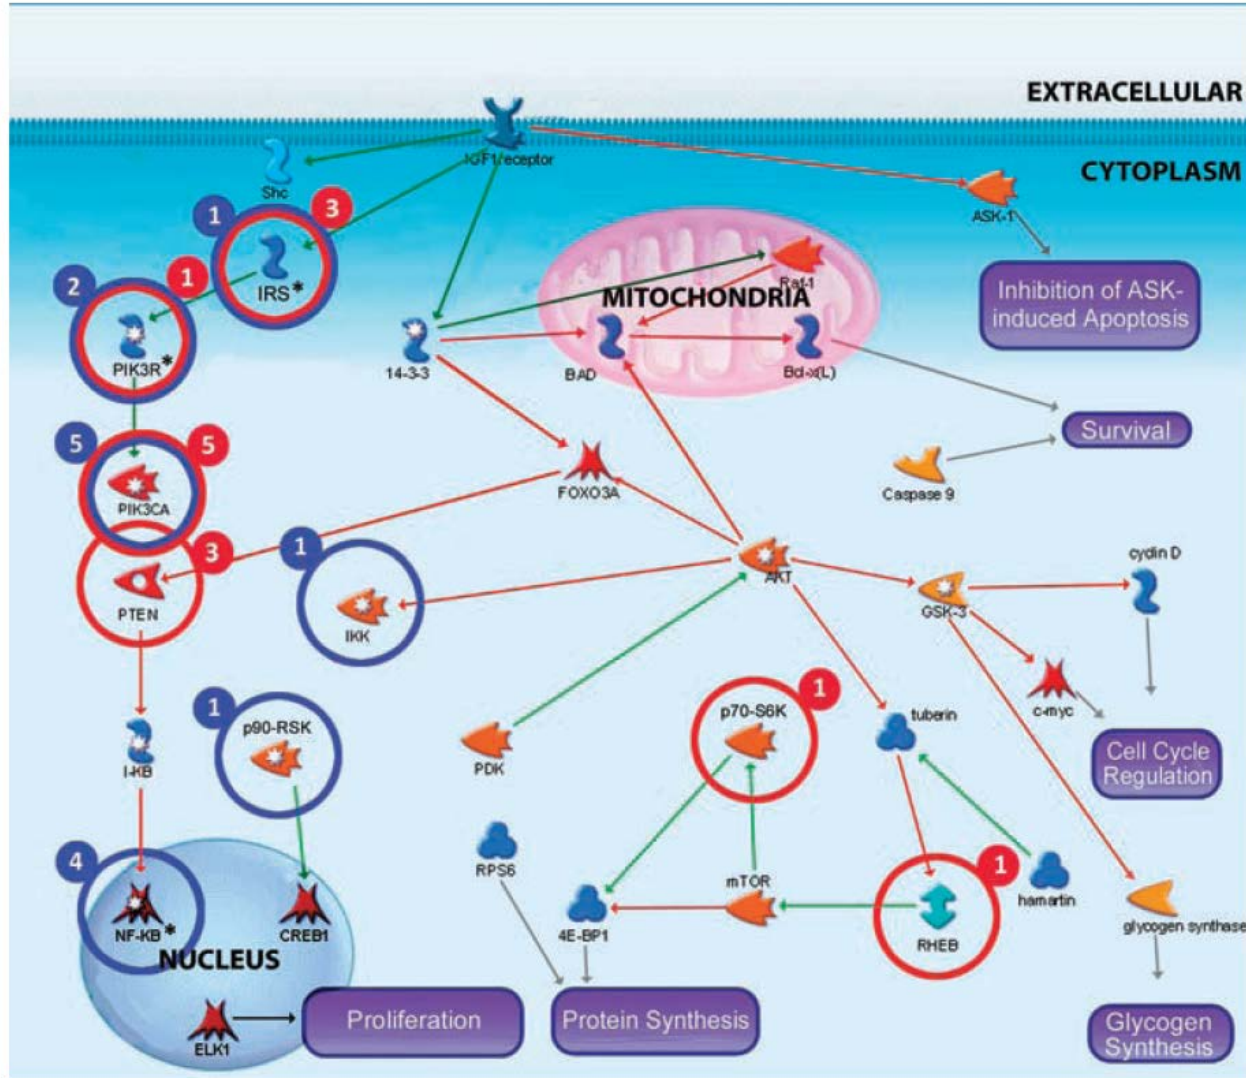

Genomic Sequence Variation

Whole Genome Sequencing

Genomic Sequence Variation

Whole Genome Sequencing PI3K Pathway Mutations

Genomic Medicine and Breast Cancer Past, Present, and Future

Prognostic determination and treatment decisions

Past: Tumor characteristics (size, grade, nodal metastasis)
Expression or mutation of a few genes
e.g., ER, PR, HER2/Neu

Present: Tumor characteristics (size, grade, nodal metastasis)
Expression or mutation of a multiple genes primarily in the tumor
e.g., Recurrence Score, Microarrays

Future: Tumor characteristics (size, grade, nodal metastasis)
Expression or mutation of many (perhaps hundreds) of genes in the tumor and the patient
e.g., Whole genome sequencing, SNP arrays
