

Acknowledgments

Carmen DeNavas-Walt prepared the income section of this report under the direction of **Edward J. Welniak Jr.**, Chief of the Income Surveys Branch. **Bernadette D. Proctor** prepared the poverty section and **Jessica C. Smith** prepared the health insurance coverage section, both under the direction of **Sharon Stern**, Chief of the Poverty and Health Statistics Branch. **Charles T. Nelson**, Assistant Division Chief for Income, Poverty, and Health Statistics, Housing and Household Economic Statistics Division, provided overall direction.

Adelle D. Berlinger, **George M. Mitcham**, **Tim J. Marshall**, and **Gregory D. Weyland**, Demographic Surveys Division, processed the Current Population Survey 2008 Annual Social and Economic Supplement file. **Caroline S. Carbaugh**, Chief of the Survey Processing Branch, **Donna K. Benton**, **Kirk E. Davis**, **Vlad Etlin**, **Stephen Heacock**, **Hung Pham**, and **Chandararith R. Phe** programmed and produced the detailed and publication tables.

Rebecca A. Hoop, **Jana S. Hatch**, and **Michael E. White**, under the supervision of **David V. Hornick** and **John M. Finamore**, all of the Demographic Statistical Methods Division, conducted sample review.

Shannon M. Burnett, **Lisa Clement**, **Tim J. Marshall**, and **Catherine M. Walker**, Demographic Surveys Division, and **Leslie Fleet** and **Yogeeta R. Purohit**, Technologies Management Office, prepared and programmed the computer-assisted interviewing instrument used to conduct the Annual Social and Economic Supplement.

Additional people within the U.S. Census Bureau also made significant contributions to the preparation of this report. **Victoria Ellison**, **Krista L. Gray**, **Marjorie Hanson**, **John Hisnanick**, **Cheryl H. Lee**, **Len Norry**, **Ashley Provencher**, **Tracy Roberts**, and **Amy Steinweg** reviewed the contents.

Census Bureau field representatives and telephone interviewers collected the data. Without their dedication, the preparation of this report or any report from the Current Population Survey would be impossible.

Janet S. Sweeney, **Jamie A. Stark**, **Theodora S. Forgione**, and **Diane Oliff-Michael**, of the Administrative and Customer Services Division, **Francis Grailand Hall**, Chief, provided publications and printing management, graphics design and composition, and editorial review for print and electronic media. General direction and production management were provided by **Claudette E. Bennett**, Assistant Division Chief, and **Wanda Cevis**, Chief, Publications Services Branch.

Income, Poverty, and Health Insurance Coverage in the United States: 2007

Introduction

This report presents data on income, poverty, and health insurance coverage in the United States based on information collected in the 2008 and earlier Annual Social and Economic Supplements (ASEC) to the Current Population Survey (CPS) conducted by the U.S. Census Bureau.

Data presented in this report indicate the following:

- Real median household income increased between 2006 and 2007—the third annual increase.¹
- The poverty rate was not statistically different between 2006 and 2007.
- Both the number and the percentage of people without health

¹ All income values are adjusted to reflect 2007 dollars. “Real” refers to income after adjusting for inflation. The adjustment is based on percentage changes in prices between earlier years and 2007 and is computed by dividing the annual average Consumer Price Index Research Series (CPI-U-RS) for 2007 by the annual average for earlier years. The CPI-U-RS values for 1947 to 2007 are available in Appendix A and on the Internet at <www.census.gov/hhes/www/income/income07/AA-CPI-U-RS.pdf>. Inflation between 2006 and 2007 was 2.8 percent.

insurance coverage decreased between 2006 and 2007.

These results were not uniform across groups. For example, between 2006 and 2007, real median household income rose for non-Hispanic Whites and Blacks but remained statistically

unchanged for Asians and Hispanics; the poverty rate increased for children under 18 years old but remained statistically unchanged for people 18 to 64 years old and people 65 and over; and the percentage of people without health insurance decreased for the native-born population, while the

Source of Estimates and Statistical Accuracy

The data in this report are from the Annual Social and Economic Supplement (ASEC) to the 2008 Current Population Survey (CPS). The population represented (the population universe) is the civilian noninstitutionalized population living in the United States. Members of the Armed Forces living off post or with their families on post are included if at least one civilian adult lives in the household. Most of the data from the CPS ASEC were collected in March (with some data collected in February and April), and the data were controlled to independent population estimates for March 2008. The estimates in this report (which may be shown in text, figures, and tables) are based on responses from a sample of the population and may differ from actual values because of sampling variability or other factors. As a result, apparent differences between the estimates for two or more groups may not be statistically significant. All comparative statements have undergone statistical testing and are significant at the 90-percent confidence level unless otherwise noted. Further information about the source and accuracy of the estimates is available at <www.census.gov/hhes/www/p60_235sa.pdf>.

State and Local Estimates of Income, Poverty, and Health Insurance

With the full implementation of the American Community Survey (ACS) to approximately 3 million addresses in 2005 and the lower standard errors that resulted from that sample size and design, the Census Bureau presents annual state estimates of median household income and poverty from the ACS, including comparisons of change from 2006 to 2007, in the report *Income, Earnings, and Poverty Data From the 2007 American Community Survey*. For trend analysis over a longer time period, state-level estimates of median household income and poverty rates from the CPS ASEC are available on the Internet.

While the ACS produces annual single-year estimates of income and poverty for counties and places with population of 65,000 or more, the Census Bureau's Small Area Income and Poverty Estimates (SAIPE) program also produces single-year estimates of median household income and poverty for states and all counties, as well as population and poverty estimates for school districts. These estimates are based on models using data from a variety of sources, including current surveys, administrative records, and personal income data published by the Bureau of Economic Analysis. In general, SAIPE estimates have lower variance than ACS estimates but are

released later because they incorporate ACS data in the models. Estimates for 2005 are available on the Internet at <www.census.gov/hhes/www/saiepe/index.html>. Estimates for 2006 and 2007 will be available later this year.

In 2008, the ACS added a question on health insurance coverage to the survey. Data from the new health insurance item will be available in fall 2009. Since health insurance estimates are not currently available from the ACS, this report includes the state uninsured rates using 2- and 3-year averages from the CPS ASEC. The Census Bureau's Small Area Health Insurance Estimates (SAHIE) program produces estimates of health insurance coverage rates for states and all counties. In July 2005, the SAHIE program released the first nationwide set of county-level estimates on the number of people without health insurance coverage for all ages and those under 18 years old. Estimates for 2000 are available on the Internet at <www.census.gov/hhes/www/sahie/index.html>. Later this year, the SAHIE program will release 2005 estimates of health insurance coverage by age, sex, race, Hispanic origin, and income categories at the state level and by age, sex, and income categories at the county level.

foreign-born population remained statistically unchanged.^{2,3}

These results are discussed in more detail in the three main sections of this report—income, poverty, and health

insurance coverage. Each section presents estimates by characteristics such as race, Hispanic origin, nativity, and region. Other topics include earnings of year-round, full-time workers; families in poverty; and health

insurance coverage of children. This report concludes with a section discussing health insurance coverage by state using 2- and 3-year averages.

² Federal surveys now give respondents the option of reporting more than one race. Therefore, two basic ways of defining a race group are possible. A group such as Asian may be defined as those who reported Asian and no other race (the race-alone or single-race concept) or as those who reported Asian regardless of whether they also reported another race (the race-alone-or-in-combination concept). The body of this report (text, figures, and text tables) shows data using the first approach (race alone). The appendix tables show data using both approaches. Use of the single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches.

In this report, the term "non-Hispanic White" refers to people who are not Hispanic and who reported White and no other race. The Census Bureau uses non-Hispanic Whites as the comparison group for other race groups and Hispanics.

Because Hispanics may be any race, data in this report for Hispanics overlap with data for racial groups. Being Hispanic was reported by 13.0 percent of White householders who reported only one race, 3.0 percent of Black householders who reported only one race, and 1.9 percent of Asian householders who reported only one race.

Data users should exercise caution when interpreting aggregate results for the Hispanic population or for race groups because these populations consist of many distinct groups that differ in socioeconomic characteristics, culture, and recency of immigration. In addition, the CPS does

not use separate population controls for weighting the Asian sample to national totals. Data were first collected for Hispanics in 1972 and for Asians and Pacific Islanders in 1987. For further information, see <www.bls.census.gov/cps/ads/adsmain.htm>.

³ The householder is the person (or one of the people) in whose name the home is owned or rented and the person to whom the relationship of other household members is recorded. If a married couple owns the home jointly, either the husband or the wife may be listed as the householder. Since only one person in each household is designated as the householder, the number of householders is equal to the number of households. This report uses the characteristics of the householder to describe the household.

The Census Bureau recognizes that measuring money income may not completely capture the economic well-being of individuals and families.⁴ Families and individuals also derive economic well-being from noncash benefits, such as food stamps and housing subsidies, and they have reductions in disposable income due to taxes. While the income and poverty estimates shown in this report are based solely on money income before taxes and do not include the value of noncash benefits, the Census

⁴ For the purpose of the official poverty calculations in this report, families are defined as including all people residing together and related by birth, marriage, or adoption. As a result, families in which two unmarried parents reside with their child (or children) are treated as two units—a single-parent family and an unrelated individual. The 2007 ASEC included a new direct question to capture the relationship of couples that do not include the householder, in addition to those who are already identified as the unmarried partner of the householder. The addition of a second-parent pointer to children's records adds accuracy to the measurement of coresidence of children and their parents and increases the number of children living with two parents by 2.2 million. As part of research into alternative measurements of poverty, one research project examined the effect of including the second parent as part of the family. The official rate for 2006 was 12.3 percent, or 36.5 million people. Preliminary estimates taking account of new relationships yield a 2006 poverty rate of approximately 11.2 percent. This result suggests that about 3.4 million individuals classified as poor under the official measure may be sharing resources with others that allow them to adequately meet their basic needs. For more details, see Short, Kathleen and Jason Fields, *Poverty Measures That Take Account of New Data on Relationship Within Households in the ASEC 2007*, Poverty Measurement Working Paper, forthcoming and Kreider, Rose, *Improvements to Demographic Household Data in the Current Population Survey: 2007*, Housing and Household Economic Statistics Division Working Paper.

Bureau computes a number of alternative measures of income and poverty that do attempt to account for those factors. These alternatives fall into two categories: poverty measures based on the recommendations of the National Academy of Sciences (called NAS-based measures on the Census Bureau's Web site) and income and poverty estimates that use various formulas to add or subtract from resources and examine the incremental impact of these changes (called "Effects of Taxes and Transfers" on the Census Bureau's Web site).

Alternative measures for 2006 are available in detailed tables and in microdata form. The tables based on NAS recommendations are available on the Internet at <www.census.gov/hhes/www/povmeas/tables.html>, and the "Effects of Taxes and Transfers" tables are available on the Internet at <pubdb3.census.gov/macro/032007/alttoc/toc.htm>. The Census Bureau also has a Web-based tool for researchers to explore alternative income and poverty measures. The tool is available in a link from the "Microdata Access" page on the poverty Web site <www.census.gov/hhes/www/poverty/microdata.html>. The Census Bureau will release the 2007 data on alternative measures of income and poverty later this year.

The CPS is the longest-running survey conducted by the Census Bureau. The CPS ASEC asks detailed questions categorizing income into over 50 sources. The key purpose of the CPS

ASEC is to provide timely and detailed estimates of income, poverty, and health insurance coverage and to measure change in those estimates at the national level. The CPS ASEC is the official source of the national poverty estimates calculated in accordance with the Office of Management and Budget's (OMB) Statistical Policy Directive 14 (Appendix B).

The Census Bureau also reports income and poverty estimates based on data from the American Community Survey (ACS). The ACS is part of the 2010 Decennial Census Program and has eliminated the need for a long-form sample questionnaire. The ACS offers broad, comprehensive information on social, economic, and housing data and is designed to provide this information at many levels of geography, particularly for local communities.

Since the CPS ASEC produces more complete and thorough estimates of income and poverty, the Census Bureau recommends that people use it as the data source for national estimates. Estimates for income and poverty at the state level and for smaller geographic entities can be found in the ACS report *Income, Earnings, and Poverty Data From the 2007 American Community Survey*. This CPS ASEC report includes state-level estimates for health insurance coverage. For more information on state and local estimates, see the text box "State and Local Estimates of Income, Poverty, and Health Insurance."

The CPS ASEC provides reliable estimates of the net change, from one year to the next, in the overall distribution of economic characteristics of the population, such as income and earnings, but it does not show how those characteristics change for the same person, family, or household. Longitudinal measures of income, poverty, and health insurance coverage that are based on following the same people over time are available from the Survey of Income and Program Participation (SIPP). Estimates derived from SIPP data answer questions such as:

- What percentage of households move up or down the income distribution over time?
- How many people remain in poverty over time?
- How long do people without health insurance tend to remain uninsured?

The text box “Dynamics of Economic Well-Being” provides more information.

Dynamics of Economic Well-Being

The Survey of Income and Program Participation (SIPP) provides monthly data about the labor force participation, income sources and amounts, and health insurance coverage of individuals, families, and households during the time span covered by each of its panels. The data yield insights into the dynamic nature of these experiences and the economic mobility of U.S. residents.* For example, the data demonstrate that using a longer time frame to measure poverty (e.g., 2 years) yields, on average, a lower poverty rate than the annual measures presented in this report, while using a shorter time frame (e.g., 1 month) yields higher poverty rates. Some specific findings from the 2001 Panel include:

- Of households in the lowest income quintile in 2001, 28.6 percent were in a higher quintile in 2003; of those originally in the highest income quintile, 32.1 percent were in a lower quintile 2 years later.
- Households with householders who had lower levels of education were more likely to remain in or move into a lower quintile than households whose householders had higher levels of education.
- Nearly one-third of the population had at least one spell of poverty lasting 2 or more months during the 3-year period from 2001 to 2003.
- Chronic poverty was relatively uncommon, with 2.4 percent of the population living in poverty all 36 months of the period.

More information based on these data is available in a series of reports titled the *Dynamics of Economic Well-Being*, as well as in table packages and working papers.

The Census Bureau is in the process of reengineering the SIPP for 2013. The reconstructed survey is expected to reduce respondent burden and attrition and deliver data on a timely basis, while addressing the same topic areas of the earlier SIPP panels. For more information, see <www.sipp.census.gov/sipp>.

* The 2001 SIPP Panel collected data from February 2001 through January 2004; the microdata are currently available to download. The 2004 SIPP Panel collected data from February 2004 through January 2008. The data are being released on a flow basis, with a complete dataset scheduled to be released in 2009. See the SIPP Web site for details <www.sipp.census.gov/sipp>.

INCOME IN THE UNITED STATES

Highlights

- Real median household income increased 1.3 percent between 2006 and 2007, from \$49,568 to \$50,233 (Figure 1 and Table 1)—the third annual increase in real median household income.
- Real median incomes of Black and non-Hispanic White households rose between 2006 and 2007 (Table 1)—the first real increases in annual household income since 1999. The apparent changes in median household income for

Asians and Hispanics were not statistically significant. (Hispanic householders may be any race.)⁵

- Between 2006 and 2007, real median income of native-born households increased 1.0 percent, from \$50,466 to \$50,946.⁶ In contrast, income declined for foreign-born households maintained by a

⁵ While the overall changes in per capita income and mean income are proportionate to changes in and relative sizes of component subgroups, changes in overall median income do not necessarily follow changes experienced by component subgroups because medians do not have the same mathematical properties as per capita and means.

⁶ Native-born householders are those in which the householder was born in the United States, Puerto Rico, or the U.S. island areas of Guam, the

householder who was not a U.S. citizen. The 2006–2007 changes in income for all foreign-born households and those maintained by a naturalized citizen were not statistically significant.

- Income inequality decreased between 2006 and 2007, as measured by the shares of aggregate

Northern Mariana Islands, or the Virgin Islands of the United States or was born in a foreign country but had at least one parent who was a U.S. citizen. All other households are considered foreign born regardless of the date of entry into the United States or citizenship status. The CPS does not interview households in Puerto Rico. Of all households, 86.6 percent were native-born households, 6.4 percent were households with foreign-born householders who were naturalized citizens, and 7.0 percent were noncitizen households.

Figure 1.
Real Median Household Income: 1967 to 2007

Note: Median household income data are not available before 1967. For information on recessions, see Appendix A.
Source: U.S. Census Bureau, Current Population Survey, 1968 to 2008 Annual Social and Economic Supplements.

household income by quintiles and the Gini index (Table 1).⁷

- Real median earnings of both men and women who worked full-time, year-round rose between 2006 and 2007, following 3 years of annual declines. Men's earnings increased by 3.8 percent to \$45,113, women's by 5.0 percent to \$35,102. The 2007 female-to-male earnings ratio, 0.78, is an all-time high (Table 1 and Figure 2).
- Real per capita income declined by 1.1 percent between 2006 and 2007. Per capita income also declined in 2007 for Whites (-1.0 percent) and Asians (-4.6 percent) (Table 1).⁸ The apparent changes for non-Hispanic Whites, Blacks, and Hispanics were not statistically significant.

Household Income

Between 2006 and 2007, real median household income rose 1.3 percent, from \$49,568 to \$50,233 (Figure 1 and Table 1)—a level not statistically different from the 1999 prerecession income peak. This was the third annual increase in real median household income. Compared with 1967, the first year for which household income statistics are available, real median household income has increased 29.6 percent.⁹

⁷ See "What Are Shares of Aggregate Household Income and a Gini Index?" *Income, Earnings, and Poverty Data From the 2007 American Community Survey*, American Community Survey Reports, ACS-09, August 2008, <www.census.gov/prod/2008pubs/acs-09.pdf>.

⁸ The apparent differences among the percent changes for the overall, White, and Asian populations were not statistically significant.

⁹ Using the CPI-U, instead of the CPI-U-RS, real median household income increased 13.3 percent since 1967. For a further discussion about the Census Bureau's use of the Consumer Price Index, see Appendixes C and D, *Money Income in the United States: 1998*, U.S. Census Bureau, Current Population Reports, P60-206, September 1999, <www.census.gov/prod/99pubs/p60-206.pdf>.

Race and Hispanic Origin

The real median incomes of Black households and non-Hispanic White households rose between 2006 and 2007 (Table 1)—the first real increases in annual income for these households since 1999. The apparent increase between 2006 and 2007 in median household income for Asians and the apparent decline for Hispanics were not statistically significant. Annual increases in real household income last occurred in 2000 for these households.

Among the race groups and Hispanics, Black households had the lowest median income in 2007, \$33,916, which was 62 percent of the median for non-Hispanic White households, \$54,920.¹⁰ Asian households had the highest median income, \$66,103, about 120 percent of the median for non-Hispanic White households. The median income for Hispanic households was \$38,679 in 2007, which was 70 percent of the median for non-Hispanic White households.

Nativity

Between 2006 and 2007, the real median income of native-born households rose by 1.0 percent to \$50,946. This was the second annual increase in real median household income for native-born households. The income of foreign-born households whose householder was not a U.S. citizen dropped by 7.3 percent to \$37,637 after increasing 4.1 percent in 2006 (Table 1). The apparent declines for all foreign-born households and those maintained by a naturalized citizen were not statistically significant. The median income of foreign-born households in 2007 was \$44,230. For households maintained by a naturalized citizen, the median income was

¹⁰ The distribution of household income is influenced by many factors, such as the number of earners and household size.

\$52,092, higher than the income of native-born households.

Region

Real median household incomes rose in the Midwest (by 2.2 percent) and the South (by 2.3 percent), declined in the Northeast (by 2.4 percent), and remained statistically unchanged in the West between 2006 and 2007.^{11,12} Before 2007, the Midwest and South regions had not experienced annual increases in income since 1999; the Northeast and West regions last experienced annual increases in 2005. In 2007, households in the West had the highest median household income (\$54,138), followed by households in the Northeast (\$52,274), the Midwest (\$50,277), and the South (\$46,186).

Metropolitan Status

The real median income for households outside metropolitan statistical areas rose by 3.1 percent to \$40,615 between 2006 and 2007 and continued to have a lower income than households inside metropolitan statistical areas (\$51,831, not statistically different from their 2006 level). Within metropolitan statistical areas, households outside principal cities had the highest 2007 median income, \$57,444, compared with \$44,205 for households inside principal cities—neither was statistically different from its 2006 level.

¹¹ The Northeast region includes the states of Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont. The Midwest region includes the states of Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin. The South region includes the states of Alabama, Arkansas, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia, and the District of Columbia, a state equivalent. The West region includes the states of Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

¹² The apparent difference between the increases in median household income in the Midwest and the South was not statistically significant.

Table 1.

* Statistically different from zero at the 90-percent confidence level.
 - Represents or rounds to zero.

¹ A 90-percent confidence interval is a measure of an estimate's variability. The larger the confidence interval in relation to the size of the estimate, the less reliable the estimate. For more information, see "Standard Errors and Their Use" at <www.census.gov/hhes/www/p60_235sa.pdf>.

² Federal surveys now give respondents the option of reporting more than one race. Therefore, two basic ways of defining a race group are possible. A group such as Asian may be defined as those who reported Asian and no other race (the race-alone or single-race concept) or as those who reported Asian regardless of whether they also reported another race (the race-alone-or-in-combination concept). This table shows data using the first approach (race alone). The use of the single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Information on people who reported more than one race, such as White **and** American Indian and Alaska Native or Asian **and** Black or African American, is available from Census 2000 through American FactFinder. About 2.6 percent of people reported more than one race in Census 2000. Data for American Indians and Alaska Natives, Native Hawaiians and Other Pacific Islanders, and those reporting two or more races are not shown separately in this table.

³ The "Outside metropolitan statistical areas" category includes both micropolitan statistical areas and territory outside of metropolitan and micropolitan statistical areas. For more information, see "About Metropolitan and Micropolitan Statistical Areas" at <www.census.gov/population/www/estimates/aboutmetro.html>.

⁴ The data shown in this section are shares of aggregate household income, the Gini index, and their respective confidence intervals. See the article by Paul Alison, "Measures of Inequality," *American Sociological Review*, 43, December 1977, pp. 865-880, for an explanation of inequality measures.

⁵ The data shown in this section are per capita incomes and their respective confidence intervals. Per capita income is the mean income computed for every man, woman, and child in a particular group. It is derived by dividing the total income of a particular group by the total population in that group (excluding patients or inmates in institutional quarters).

Source: U.S. Census Bureau, Current Population Survey, 2007 and 2008 Annual Social and Economic Supplements.

Income Inequality

The Census Bureau has traditionally used two methods to measure income inequality—the shares of aggregate household income received by quintiles and the Gini index. The shares method ranks households from lowest to highest on the basis of income and then divides them into groups of equal population size, typically quintiles. The aggregate income of each group is then divided by the overall aggregate income to derive shares. The Gini index incorporates detailed shares data into a single measure, which summarizes the dispersion of income across the entire income distribution. The Gini index ranges from 0,

indicating perfect equality (where everyone receives an equal share), to 1, perfect inequality (where all the income is received by only one person or group of people).

The changes in the shares of aggregate household income received by quintiles indicated a decrease in income inequality between 2006 and 2007 (Table 1 and Appendix Table A-3). Specifically, the share of the highest quintile dropped from 50.5 percent to 49.7 percent, and the shares of aggregate income of the third and fourth quintiles increased from 14.5 percent to 14.8 percent and from 22.9 percent to 23.4 percent, respectively. For the lowest and the second

quintiles, the shares remained statistically unchanged (3.4 percent and 8.7 percent, respectively). Along with the changes in the shares of aggregate income were changes in the mean incomes of quintiles between 2006 and 2007. Declines were evident for the lowest, second, and highest quintiles (-1.1 percent, -0.5 percent, and -2.9 percent, respectively), while the mean incomes of the third and fourth quintiles each experienced increases of 0.8 percent.¹³

¹³ The apparent difference between the percent changes in the mean incomes of the lowest and second quintiles was not statistically significant.

Table 2.

Income Distribution Measures Using Money Income and Equivalence-Adjusted Income: 2006 and 2007

Measure	2006				2007			
	Money income		Equivalence-adjusted income		Money income		Equivalence-adjusted income

¹ A 90-percent confidence interval is a measure of an estimate's variability. The larger the confidence interval in relation to the size of the estimate, the less reliable the estimate. For more information, see "Standard Errors and Their Use" at <www.census.gov/hhes/www/p60_235sa.pdf>.

Source: U.S. Census Bureau, Current Population Survey, 2007 and 2008 Annual Social and Economic Supplements.

The Gini index also indicated a decrease in income inequality in 2007. The Gini index decreased by 1.5 percent between 2006 and 2007, from 0.470 to 0.463; however, the 2007 index was not statistically different from any of the annual Gini indexes over the 1997 to 2005 period. The earliest year available for comparable measures of income inequality is 1993.¹⁴ Since that time, the Gini index has increased by 2.0 percent; however, there were no other statistically significant annual changes. (Appendix Table A-3 lists historical inequality measures.)¹⁵

¹⁴ Direct comparisons with years earlier than 1993 are not recommended because of substantial methodological changes in the 1994 ASEC. In that year, the Census Bureau introduced computer-assisted interviewing, increased income reporting limits, and implemented 1990 decennial-census-based population controls.

¹⁵ Other measures of income inequality also show declines in income inequality between 2006 and 2007; see Appendix A, Table A-3.

Equivalence-Adjusted Income Inequality

Another way to measure income inequality is using equivalence-adjusted income. Equivalence-adjusted income may be a better income measure because it takes into consideration the number of people living in the household and how these people share resources and take advantage of economies of scale. For example, the household-income-based distribution treats income of \$30,000 for a single-person household and a family household similarly, while the equivalence-adjusted income of \$30,000 for a single-person household would be more than twice the equivalence-adjusted income of \$30,000 for a family household with two adults and two children. The equivalence adjustment used here is based on a three-parameter scale that reflects the fact that:

1. On average, children consume less than adults.

2. As family size increases, expenses do not increase at the same rate.
3. The increase in expenses is larger for a first child of a single-parent family than the first child of a two-adult family.¹⁶

Table 2 shows several income inequality measures, including shares of aggregate income and the Gini index, using both money income (as shown in Table 1) and equivalence-adjusted income for income years

¹⁶ The three-parameter scale used here is the same as the one used in the report *The Effect of Taxes and Transfers on Income and Poverty in the United States: 2005*, U.S. Census Bureau, Current Population Reports, P60-232, March 2007, <www.census.gov/prod/2007pubs/p60-232.pdf>. The three-parameter scale was applied to incomes of families and unrelated individuals and assigned to each family member or unrelated individual living within the household. For details on the derivation of the three-parameter scale, see Short, Kathleen, *Experimental Poverty Measures: 1999*, U.S. Census Bureau, Current Population Reports, P60-216, October 2001, <www.census.gov/prod/2001pubs/p60-216.pdf>.

2006 and 2007. For both 2006 and 2007, the Gini index is lower under the equivalence-adjusted income concept than under the traditional money income concept, indicating a more equal distribution of income.

Comparing the shares of aggregate household income received by quintile, higher shares of income appear in the lower quintiles, and lower shares appear in the higher quintiles for equivalence-adjusted income than for money income. This redistribution would be expected given that:

1. The lower end of the income distribution is made up of a higher concentration of single-person households.
2. The lower end of the income distribution is made up of smaller families than the upper end.

Equivalence adjusting increases the relative incomes of people living in lower-income groups.

As with money income, there was a decline between 2006 and 2007 in the Gini index and a redistribution of shares of aggregate household income within quintiles for equivalence-adjusted income.

Work Experience and Earnings

The number of working men aged 15 and older increased by 0.6 million between 2006 and 2007 to 84.5 million. An estimated 74.5 percent worked full-time, year-round, a lower percentage than in 2006 (75.1 percent).¹⁷ The number of working women aged 15 and older was 74.4 million, an increase of 0.6 million from 2006. About 61.4 percent of these women worked full-time, year-round in 2007, an all-time high—up from 60.6 percent in 2006. Over the past 10 years, the proportion of working women who reported being year-round, full-time workers increased 5.8 percentage points (from 55.6 percent to 61.4 percent), compared with a 2.9 percentage-point increase for men (from 71.6 percent to 74.5 percent).

While earnings represent the largest component of income, earnings

¹⁷ A full-time, year-round worker is a person who worked 35 or more hours per week (full-time) and 50 or more weeks during the previous calendar year (year-round). For school personnel, the summer vacation is counted as weeks worked if they are scheduled to return to their job in the fall. For detailed information on work experience, see Table PINC-05, "Work Experience in 2007—People 15 Years Old and Over by Total Money Earnings in 2007, Age, Race, Hispanic Origin, and Sex" at <www.census.gov/hhes/www/income/dinctabs.html>.

trends and household income trends are not perfectly correlated. The inclusion of nonearned income along with earned income in combination with the labor force characteristics of household members affects household income. While overall median household income in 2007 rose by 1.3 percent, the real median income of households with a householder that worked full-time, year-round rose 1.7 percent, and the income of households with no earners declined 4.8 percent.¹⁸ This occurred while the earnings of men and women who worked full-time, year-round rose by 3.8 percent and 5.0 percent, respectively (Table 1 and Figure 2). The median earnings of men rose from \$43,460 to \$45,113 and those of women rose from \$33,437 to \$35,102. Prior to 2007, both men and women experienced 3 years of annual declines in real earnings. In 2007, the female-to-male earnings ratio was 0.78—higher than the previous all-time-high of 0.76, first recorded in 2001.

¹⁸ The apparent difference between the increases in median household income of all households and that of households with householders who worked full-time, year-round was not statistically significant.

Figure 2.
Female-to-Male Earnings Ratio and Median Earnings of Full-Time, Year-Round Workers 15 Years and Older by Sex: 1960 to 2007

Note: Data on earnings of full-time, year-round workers are not readily available before 1960. For information on recessions, see Appendix A.
 Source: U.S. Census Bureau, Current Population Survey, 1961 to 2008 Annual Social and Economic Supplements.

Per Capita Income¹⁹

Real per capita income declined by 1.1 percent between 2006 and 2007.

¹⁹ The per capita income data presented in this report are not directly comparable with estimates of personal per capita income prepared by the Bureau of Economic Analysis, U.S. Department of Commerce. The lack of correspondence stems from the differences in income definition and coverage. For further details, see <www.census.gov/hhes/www/income/compare1.html>.

Per capita income declined in 2007 for Whites (-1.0 percent) and Asians (-4.6 percent) (Table 1).^{20,21} The apparent changes for non-Hispanic

²⁰ Unlike medians, per capita and means are affected by extremely high and low incomes.

²¹ The apparent differences among the declines for the overall, White, and Asian populations were not statistically significant.

Whites, Blacks, and Hispanics were not statistically significant. The per capita income for the overall population in 2007 was \$26,804; for Whites, \$28,325; for non-Hispanic Whites, \$31,051; for Blacks, \$18,428; for Asians, \$29,901; and for Hispanics, \$15,603.

POVERTY IN THE UNITED STATES²²

Highlights

- The official poverty rate in 2007 was 12.5 percent, not statistically different from 2006 (Table 3).
- In 2007, 37.3 million people were in poverty, up from 36.5 million in 2006.
- Poverty rates in 2007 were statistically unchanged for non-Hispanic Whites (8.2 percent), Blacks (24.5 percent), and Asians (10.2 percent) from 2006. The poverty rate increased for Hispanics (21.5 percent in 2007, up from 20.6 percent in 2006).
- The poverty rate in 2007 was lower than in 1959, the first year for which poverty estimates are

available (Figure 3), while statistically higher than the most recent trough in 2000 (11.3 percent).

- The poverty rate increased for children under 18 years old (18.0 percent in 2007, up from 17.4 percent in 2006), while it remained statistically unchanged for people 18 to 64 years old (10.9 percent) and people 65 and over (9.7 percent).²³

Race and Hispanic Origin

At 8.2 percent, the 2007 poverty rate for non-Hispanic Whites was lower than the rate for Blacks and Asians—24.5 percent and 10.2 percent, respectively (Table 3). For all three of these groups, the number and the percentage in poverty were statistically unchanged between 2006 and 2007. In 2007, non-Hispanic Whites accounted for 43.0 percent of people

in poverty while representing 65.8 percent of the total population. Among Hispanics, 21.5 percent (9.9 million) were in poverty in 2007, higher than the 20.6 percent (9.2 million) in 2006.

Age

Both the poverty rate and the number in poverty for people aged 18 to 64 were not statistically different in 2007 than in 2006, at 10.9 percent and 20.4 million in 2007. The poverty rate for people 65 and older remained statistically unchanged at 9.7 percent, while the number in poverty increased to 3.6 million in 2007 from 3.4 million in 2006 (Table 3 and Figure 4).

In 2007, both the poverty rate and the number in poverty increased for children under 18 years old (18.0 percent and 13.3 million in 2007, up from 17.4 percent and 12.8 million in 2006). The poverty rate for children was higher than the rates for people

²² OMB determined the official definition of poverty in Statistical Policy Directive 14. Appendix B describes how the Census Bureau calculates poverty.

²³ Unrelated individuals under 15 are excluded from the poverty universe; therefore, 407,000 fewer children are in the poverty universe than in the total population.

Figure 3.
Number in Poverty and Poverty Rate: 1959 to 2007

* Statistically different from zero at the 90-percent confidence level.

- Represents or rounds to zero.

¹ A 90-percent confidence interval is a measure of an estimate's variability. The larger the confidence interval in relation to the size of the estimate, the less reliable the estimate. For more information, see "Standard Errors and Their Use" at <www.census.gov/hhes/www/p60_235sa.pdf>.

² Details may not sum to totals because of rounding.

³ Federal surveys now give respondents the option of reporting more than one race. Therefore, two basic ways of defining a race group are possible. A group such as Asian may be defined as those who reported Asian and no other race (the race-alone or single-race concept) or as those who reported Asian regardless of whether they also reported another race (the race-alone-or-in-combination concept). This table shows data using the first approach (race alone). The use of the single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Information on people who reported more than one race, such as White and American Indian and Alaska Native or Asian and Black or African American, is available from Census 2000 through American FactFinder. About 2.6 percent of people reported more than one race in Census 2000. Data for American Indians and Alaska Natives, Native Hawaiians and Other Pacific Islanders, and those reporting two or more races are not shown separately.

⁴ The "Outside metropolitan statistical areas" category includes both micropolitan statistical areas and territory outside of metropolitan and micropolitan statistical areas. For more information, see "About Metropolitan and Micropolitan Statistical Areas" at <www.census.gov/population/www/estimates/aboutmetro.html>.

Figure 4.
Poverty Rates by Age: 1959 to 2007

Note: Data for people aged 18 to 64 and 65 and older are not available from 1960 to 1965. For information on recessions, see Appendix A.
 Source: U.S. Census Bureau, Current Population Survey, 1960 to 2008 Annual Social and Economic Supplements.

18 to 64 years old and those 65 and older (Table 3). Children represented 35.7 percent of the people in poverty and 24.8 percent of the total population.

Estimates for related children under 18 include children related to the householder (or the reference person of an unrelated subfamily) who are not themselves a householder or spouse of the householder (or the family reference person). Both the poverty rate and the number in poverty increased for related children under 18 living in families (17.6 percent and 12.8 million in 2007, up from 16.9 percent and 12.3 million in 2006). For related children under 18 living in families with a female householder with no husband present, 43.0 percent were in poverty, compared with 8.5 percent for children in married-couple families.

The poverty rate for related children under 6 was 20.8 percent in 2007,

statistically unchanged from 2006, while the number in poverty increased to 5.1 million in 2007, up from 4.8 million in 2006. Of related children under 6 with female householders with no husband present, 54.0 percent were in poverty, over five times the rate of their counterparts in married-couple families (9.5 percent).

Nativity

Of all people, 87.5 percent were native born and 12.5 percent were foreign born. The poverty rate and the number in poverty for the native-born population, 11.9 percent and 31.1 million in 2007, were not statistically different from any of the three previous years—2004 to 2006. The poverty rate and the number in poverty for the foreign-born population increased to 16.5 percent and 6.2 million in 2007 from 15.2 percent and 5.7 million in 2006 (Table 3).

Of the foreign-born population, 40.4 percent were naturalized citizens; the remaining were noncitizens. The poverty rate in 2007 was 9.5 percent for foreign-born naturalized citizens, statistically unchanged from 2006. The poverty rate in 2007 was 21.3 percent for those who were not U.S. citizens, up from 19.0 percent in 2006.

Region

The number in poverty in the South increased to 15.5 million in 2007, up from 14.9 million in 2006, while the poverty rate remained statistically unchanged at 14.2 percent in 2007. In 2007, the poverty rate for the Northeast (11.4 percent), the Midwest (11.1 percent), and the West (12.0 percent) were all statistically unchanged from 2006.²⁴

²⁴ The poverty rate for the Northeast was not statistically different from that of the Midwest or the West.

Metropolitan Status

Inside metropolitan statistical areas, the poverty rate and the number of people in poverty were 11.9 percent and 29.9 million in 2007, both statistically unchanged from 2006. Of all people in metropolitan statistical areas in 2007, 38.5 percent lived in principal cities, and 53.4 percent of people in poverty in those metropolitan areas lived in principal cities.

The number in poverty increased for people in principal cities to 16.0 million in 2007, from 15.3 million in 2006, while their poverty rate remained statistically unchanged at 16.5 percent in 2007. The poverty rate and the number in poverty for those not in principal cities were 9.0 percent and 13.9 million in 2007, statistically unchanged from 2006.

Among those living outside metropolitan statistical areas, the poverty rate and the number in poverty were 15.4 percent and 7.4 million in 2007, statistically unchanged from 2006.

Work Experience

People 16 and older who worked some or all of 2007 had a lower poverty rate than those who did not work at any time, 5.7 percent compared with 21.5 percent (Table 3). The poverty rate among full-time, year-round workers (2.5 percent) was lower than the rate for those who worked part-time or part-year (12.7 percent) in 2007. In addition, among people 16 and older, those who did not work in 2007 represented 43.5 percent of people in poverty and 25.2 percent of all people.

Families

In 2007, the poverty rate and the number of families in poverty were 9.8 percent and 7.6 million, both statistically unchanged from 2006 (Table 3).

Furthermore, the poverty rate and the number in poverty showed no statistical change between 2006 and 2007 for the different types of families. In 2007, the poverty rates for married-couple families (4.9 percent and 2.8 million), female-householder-with-no-husband-present families (28.3 percent and 4.1 million), and male-householder-with-no-wife-present families (13.6 percent and 696,000) were all statistically unchanged from 2006.

Depth of Poverty

Categorizing people as “in poverty” or “not in poverty” is one way to describe their economic situation. The income-to-poverty ratio and the income deficit (surplus) describe other aspects of economic well-being. Where the poverty rate provides a measure of the proportion of people with a family income that is below the established poverty thresholds, the income-to-poverty ratio provides a measure to gauge the depth of poverty and to calculate the size of the population who may be eligible for government-sponsored assistance programs, such as Temporary Assistance for Needy Families (TANF), Medicare, food stamps, and the Low-Income Home Energy Assistance Program (LIHEAP). The income-to-poverty ratio is reported as a percentage that compares a family’s or an unrelated individual’s (people who do not live with relatives) income with

their poverty threshold. For example, a family or individual with an income-to-poverty ratio of 110 percent has income that is 10 percent above their poverty threshold.

The income deficit (surplus) tells how many dollars a family’s or an unrelated individual’s income is below (above) their poverty threshold. These measures illustrate how the low-income population varies in relation to the poverty thresholds.

Ratio of Income to Poverty

Table 4 presents the number and the percentage of people within three ranges of income-to-poverty ratios—those below 50 percent of poverty (“Under 0.50”), those below 100 percent of poverty (“Under 1.00,” also called “in poverty”), and those below 125 percent of poverty (“Under 1.25”).

Figure 5 illustrates the distribution of people according to their income-to-poverty ratios. The curve (based on a density function) graphically depicts the proportion of people with given income-to-poverty ratios.²⁵ Hence, this chart presents the number of people in poverty as the area under the curve to the left of the vertical line at 1.0, approximately 37.3 million people in 2007.

²⁵ To plot the distribution on the income-to-poverty ratio using all people in the poverty universe, a smoothing function in SAS is employed to determine the probability that a particular ratio value occurs. To display all probabilities, the density of each ratio value is plotted, forming the distribution. The vertical axis is labeled “Density” since this continuous distribution is determined by a statistical function.

Table 4.
People With Income Below Specified Ratios of Their Poverty Thresholds by Selected Characteristics: 2007

¹ A 90-percent confidence interval is a measure of an estimate's variability. The larger the confidence interval in relation to the size of the estimate, the less reliable the estimate. For more information, see "Standard Errors and Their Use" at <www.census.gov/hhes/www/p60_235sa.pdf>.

² Federal surveys now give respondents the option of reporting more than one race. Therefore, two basic ways of defining a race group are possible. A group such as Asian may be defined as those who reported Asian and no other race (the race-alone or single-race concept) or as those who reported Asian regardless of whether they also reported another race (the race-alone-or-in-combination concept). This table shows data using the first approach (race alone). The use of the single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Information on people who reported more than one race, such as White *and* American Indian and Alaska Native or Asian *and* Black or African American, is available from Census 2000 through American FactFinder. About 2.6 percent of people reported more than one race in Census 2000. Data for American Indians and Alaska Natives, Native Hawaiians and Other Pacific Islanders, and those reporting two or more races are not shown separately.

Note: Details may not sum to totals because of rounding.

Source: U.S. Census Bureau, Current Population Survey, 2008 Annual Social and Economic Supplement.

In 2007, 5.2 percent, or 15.6 million people, had an income below one-half of their poverty threshold. This group represented 41.8 percent of the poverty population in 2007 (Table 4).

The percentage and number of people with income below 125 percent of their threshold was 17.0 percent and 50.9 million. For children under 18 years old, 7.8 percent (5.8 million)

were below 50 percent of their poverty thresholds and 23.8 percent (17.6 million) were below 125 percent of their thresholds.

Figure 5.
Distribution of Income-to-Poverty Ratios: 2007

Source: U.S. Census Bureau, Current Population Survey, 2008 Annual Social and Economic Supplement.

The demographic makeup of the population differs at varying degrees of poverty. In 2007 among all people, 5.2 percent were below 50 percent of their threshold, 7.3 percent were above 50 percent and below 100 percent of their threshold, and 4.6 percent were between 100 percent and 125 percent of their threshold. The 65-and-older population was more highly concentrated between 100 percent and 125 percent of their poverty thresholds (6.4 percent) than below 50 percent of their thresholds (2.5 percent). Among people 65 and older, 9.7 percent were below 100 percent of poverty and 16.1 percent were below 125 percent of poverty—a 66.0 percent difference. The distribution was different for all people—12.5 percent were below 100 percent of poverty and 17.0 percent

were below 125 percent of poverty, a 36.0 percent difference.

Income Deficit

The income deficit for families in poverty (the difference in dollars between a family's income and its poverty threshold) averaged \$8,523 in 2007, higher in real terms than the 2006 figure (\$8,032) (Table 5). The average income deficit was larger for families with a female householder with no husband present (\$9,059) than for married-couple families (\$7,937) and families with a male householder with no wife present (\$7,780).²⁶

²⁶ The average income deficit for married-couple families was not statistically different from that of male-householder-with-no-wife-present families.

The income deficit per capita for families with a female householder with no husband present, (\$2,741) was higher than for married-couple families (\$2,073). The income deficit per capita is computed by dividing the average deficit by the average number of people in that type of family. Because families with a female householder with no husband present were smaller, on average, than married-couple families, the larger per capita deficit for female-householder families with no husband present reflects their smaller family size as well as their lower income. For unrelated individuals in poverty, the average income deficit was \$5,609 in 2007. The \$5,377 deficit for women was lower than the \$5,920 deficit for men.

Table 5.
Income Deficit or Surplus of Families and Unrelated Individuals by Poverty Status: 2007

¹ A 90-percent confidence interval is a measure of an estimate's variability. The larger the confidence interval in relation to the size of the estimate, the less reliable the estimate. For more information, see "Standard Errors and Their Use" at <www.census.gov/hhes/www/p60_235sa.pdf>.

Note: Details may not sum to totals because of rounding.

HEALTH INSURANCE COVERAGE IN THE UNITED STATES

Highlights

- Both the percentage and number of people without health insurance decreased in 2007. The percentage without health insurance was 15.3 percent in 2007, down from 15.8 percent in 2006, and the number of uninsured was 45.7 million, down from 47.0 million (Table 6).²⁷
- The number of people with health insurance increased to 253.4 million in 2007 (up from 249.8 million in 2006). The number of people covered by private health insurance (202.0 million) in 2007 was not statistically different from 2006, while the number of people covered by government health insurance increased to 83.0 million, up from 80.3 million in 2006.
- The percentage of people covered by private health insurance was 67.5 percent, down from 67.9 percent in 2006 (Figure 7). The percentage of people covered by employment-based health insurance decreased to 59.3 in 2007 from 59.7 percent in 2006. The number of people covered by employment-based health insurance, 177.4 million, was not statistically different from 2006.

²⁷ For a brief description of how the Census Bureau collects and reports on health insurance, see the text box "What Is Health Insurance Coverage?" For a discussion of the quality of ASEC health insurance coverage estimates, see Appendix C.

What Is Health Insurance Coverage?

The Annual Social and Economic Supplement (ASEC) to the Current Population Survey (CPS) asks about health insurance coverage in the previous calendar year. The survey asks separate questions about the major types of health insurance, and people who answer "no" to each of the coverage questions are then asked to verify that they were, in fact, not covered by any type of health insurance. For reporting purposes, the Census Bureau broadly classifies health insurance coverage as private coverage or government coverage. Private health insurance is a plan provided through an employer or a union or purchased by an individual from a private company. Government health insurance includes the federal programs Medicare, Medicaid, and military health care; the State Children's Health Insurance Program (SCHIP); and individual state health plans.* People were considered "insured" if they were covered by any type of health insurance for part or all of the previous calendar year. They were considered "uninsured" if they were not covered by any type of health insurance at any time in that year.

Research shows health insurance coverage is underreported in the CPS ASEC for a variety of reasons. Annual retrospective questions appear to cause few problems when collecting income data (possibly because the interview period is close to when people pay their taxes). However, because health insurance coverage status can change over the course of a year, answering questions about this long reference period may lead to response errors. For example, some people may report their insurance coverage status at the time of their interview rather than their coverage status during the previous calendar year. Compared with other national surveys, the CPS ASEC's estimate of the number of people without health insurance more closely approximates the number of people who were uninsured at a specific point in time during the year than the number of people uninsured for the entire year.

For more information on the quality of CPS ASEC health insurance estimates, see Appendix C, "Estimates of Health Insurance Coverage." For a comparison of health insurance coverage rates from the major federal surveys, see *How Many People Lack Health Insurance and for How Long?* (Congressional Budget Office, May 2003) and *People With Health Insurance: A Comparison of Estimates From Two Surveys* (Survey of Income and Program Participation Working Paper 243, June 2004).

* Types of insurance are not mutually exclusive; people may be covered by more than one during the year.

Figure 6.
Number Uninsured and Uninsured Rate: 1987 to 2007

¹ Implementation of Census 2000-based population controls occurred for the 2000 ASEC, which collected data for 1999. These estimates also reflect the results of follow-up verification questions that were asked of people who responded “no” to all questions about specific types of health insurance coverage in order to verify whether they were actually uninsured. This change increased the number and percentage of people covered by health insurance, bringing the CPS more in line with estimates from other national surveys.

Note: Respondents were not asked detailed health insurance questions before the 1988 CPS. For information on recessions, see Appendix A.

Source: U.S. Census Bureau, Current Population Survey, 1988 to 2008 Annual Social and Economic Supplements.

- The percentage of people covered by government health insurance programs increased to 27.8 percent in 2007, from 27.0 percent in 2006. The percentage and number of people covered by Medicaid increased to 13.2 percent and 39.6 million in 2007, up from 12.9 percent and 38.3 million in 2006.
- In 2007, the percentage and number of children under 18 years old without health insurance were 11.0 percent and 8.1 million, lower than they were in 2006—11.7 percent and 8.7 million (Table 6). Although the uninsured rate for children in poverty decreased to 17.6 percent in 2007, from 19.3 percent in

2006, children in poverty were more likely to be uninsured than all children.²⁸

- The uninsured rate and number of uninsured for non-Hispanic Whites decreased in 2007 to 10.4 percent and 20.5 million (from 10.8 percent and 21.2 million in 2006). The uninsured rate for Blacks decreased to 19.5 percent in 2007 from 20.5 percent in 2006. The number of uninsured Blacks in 2007 was not statistically different from 2006, at 7.4 million. (Table 6).

²⁸ The number of uninsured children in poverty in 2007 was not statistically different from the number in 2006.

- The percentage and number of uninsured Hispanics were 32.1 percent and 14.8 million in 2007, lower than 34.1 percent and 15.3 million in 2006 (Table 6).

Type of Coverage

Most people (59.3 percent) were covered by a health insurance plan related to employment for some or all of 2007, a proportion that was lower than that in 2006. The rate of private coverage decreased in 2007 to 67.5 percent, from 67.9 percent in 2006, while the number of people covered by private insurance was statistically unchanged at 202.0 million in 2007 (Figure 7).

Figure 7.
**Coverage by Type of Health Insurance:
 2006 and 2007**
 (Percent)

* Statistically different at the 90-percent confidence level.

¹ Military health care includes CHAMPUS (Comprehensive Health and Medical Plan for Uniformed Services)/Tricare and CHAMPVA (Civilian Health and Medical Program of the Department of Veterans Affairs), as well as care provided by the Department of Veterans Affairs and the military.

Note: The estimates by type of coverage are not mutually exclusive; people can be covered by more than one type of health insurance during the year.

Source: U.S. Census Bureau, Current Population Survey, 2007 and 2008 Annual Social and Economic Supplements.

The percentage of those covered by government health programs increased to 27.8 percent in 2007 from 27.0 percent in 2006. The number of those covered also increased to 83.0 million in 2007 from 80.3 million in 2006. The percentage of people with Medicaid coverage (13.2 percent) and the percentage of people covered by Medicare (13.8 percent) were higher in 2007 than in 2006—12.9 percent and 13.6 percent,

respectively. The number of people insured by Medicaid and Medicare also increased—to 39.6 million by Medicaid and 41.4 million by Medicare.

Race and Hispanic Origin

In 2007, the uninsured rate for non-Hispanic Whites decreased to 10.4 percent from 10.8 percent (Table 6). The uninsured rate for Blacks was also lower in 2007 (19.5 percent)

than in 2006 (20.5 percent). The uninsured rate for Asians was 16.8 percent in 2007, higher than the 15.5 percent in 2006 but not statistically different from 2005.²⁹ Among Hispanics, the uninsured number and rate decreased in 2007 to 14.8 million and 32.1 percent from 15.3 million and 34.1 percent in 2006.

Table 7 displays the 3-year average (2005–2007) number and percentage of uninsured by race and Hispanic origin.³⁰ Because of the relatively small populations of these groups, the sampling variability of their health insurance data is larger than for the other racial groups and may cause single-year estimates to fluctuate more widely. American Indians and Alaska Natives had a 3-year-average (2005–2007) uninsured rate (32.1 percent) that was higher than the rate for Native Hawaiians and Other Pacific Islanders (20.5 percent). The 3-year average also shows that the uninsured rate for American Indians and Alaska Natives was not statistically different from the rate for Hispanics (32.8 percent). Using 2-year averages, neither American Indians and Alaska Natives nor Native Hawaiians and Other Pacific Islanders had a statistical change in their uninsured rates between 2004–2005 and 2006–2007.

²⁹ The data allow the change in the percentage of uninsured Asians to be seen in a long-term context. For example, the uninsured rate for Asians increased between 2004 and 2005, decreased between 2005 and 2006, and increased between 2006 and 2007.

³⁰ Data users should exercise caution when interpreting aggregate results for the American Indian and Alaska Native and the Native Hawaiian and Other Pacific Islander populations because these populations consist of groups that differ in economic characteristics. In addition, the CPS does not use separate population controls for weighting the American Indian and Alaska Native and the Native Hawaiian and Other Pacific Islander samples to national totals.

- Represents or rounds to zero.

* Statistically different from zero at the 90-percent confidence level.

¹ Details may not sum to totals because of rounding.

² A 90-percent confidence interval is a measure of an estimate's variability. The larger the confidence interval in relation to the size of the estimate, the less reliable the estimate. For more information, see "Standard Errors and Their Use" at <www.census.gov/hhes/www/p60_235sa.pdf>.

³ Federal surveys now give respondents the option of reporting more than one race. Therefore, two basic ways of defining a race group are possible. A group such as Asian may be defined as those who reported Asian and no other race (the race-alone or single-race concept) or as those who reported Asian regardless of whether they also reported another race (the race-alone-or-in-combination concept). This table shows data using the first approach (race alone). The use of the single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Information on people who reported more than one race, such as White and American Indian and Alaska Native or Asian and Black or African American, is available from Census 2000 through American FactFinder. About 2.6 percent of people reported more than one race in Census 2000. Data for American Indians and Alaska Natives, Native Hawaiians and Other Pacific Islanders, and those reporting two or more races are not shown separately.

⁴ The "Outside metropolitan statistical areas" category includes both micropolitan statistical areas and territory outside of metropolitan and micropolitan statistical areas. For more information, see "About Metropolitan and Micropolitan Statistical Areas" at <www.census.gov/population/www/estimates/aboutmetro.html>.

Nativity

The uninsured rate for the native-born population declined to 12.7 percent in 2007, from 13.2 percent in 2006, while the uninsured rate for the foreign-born population was statistically unchanged at 33.2 percent in 2007 (Table 6). Among the foreign-born population, the uninsured rate for naturalized citizens increased to 17.6 percent in 2007 (from 16.4 percent in 2006), while the uninsured rate for noncitizens declined to 43.8 percent in 2007 (from 45.0 percent in

2006).³¹ The proportion of the foreign-born population without health insurance in 2007 was about two and one-half times that of the native-born population in 2007.

Economic Status

The proportion of people not covered by health insurance is lower among people with higher income. In 2007, 24.5 percent of people in households

³¹ The number of uninsured foreign-born citizens in 2007 was not statistically different from the number in 2006.

with annual incomes of less than \$25,000 had no health insurance coverage. Uninsured rates decreased for each consecutive household income group to 21.1 percent for households with incomes of \$25,000 to \$49,999, 14.5 percent for households with incomes of \$50,000 to \$74,999, and 7.8 percent for households with incomes of \$75,000 or more. Among the four household income groups in Table 6, the uninsured rate was not statistically different in 2007 from 2006 in the lower three groups. The

uninsured rate fell for people in households in the highest income group to 7.8 percent in 2007, from 8.5 percent in 2006.

Among 18- to 64-year-olds in 2007, the percentage of workers (people who worked at some time during the year) with no health insurance coverage was 18.1 percent, lower than the 18.7 percent in 2006. The number of workers who were uninsured decreased to 26.8 million in 2007 from 27.6 million in 2006. In 2007, full-time workers were more likely to be covered by health insurance (83.0 percent) than part-time workers (76.6 percent) or nonworkers (74.6 percent).³² The number and percentage of uninsured among full-time workers decreased to 21.1 million and 17.0 percent in 2007 from 22.0 million and 17.9 percent in 2006. The number and percentage uninsured among part-time workers (5.8 million and 23.4 percent) were not statistically different from 2006.³³

Children's Health Insurance Coverage

In 2007, the percentage and number of children under 18 years old without health insurance (11.0 percent and 8.1 million) were lower than in 2006 (11.7 percent and 8.7 million) (Table 6).

The proportion of children not covered by health insurance varied by poverty status, age, race, and Hispanic origin. Figure 8 shows that children in poverty were more likely to be uninsured than the population of all children in 2007—17.6 percent compared with 11.0 percent. Children 12 to 17 years old had a higher uninsured rate than those under 12 years

³² Workers are classified as part-time if they worked fewer than 35 hours per week in the majority of the weeks they worked in 2007.

³³ The number and percentage of uninsured nonworkers were statistically unchanged between 2006 and 2007 at 10.0 million and 25.4 percent.

Figure 8.
Uninsured Children by Poverty Status, Age, and Race and Hispanic Origin: 2007

(Percent)

¹ Federal surveys now give respondents the option of reporting more than one race. This figure shows data using the race-alone concept. For example, "Asian" refers to people who reported Asian and no other race.

Source: U.S. Census Bureau, Current Population Survey, 2008 Annual Social and Economic Supplement.

old—12.0 percent compared with 10.4 percent.

In 2007, the uninsured rates were 7.3 percent for non-Hispanic White children, 12.2 percent for Black children, 11.7 percent for Asian children, and 20.0 percent for Hispanic children.³⁴ The uninsured rates for non-Hispanic White children and Asian children in 2007 were not statistically different from their respective rates in 2006. The uninsured rates for Black children and Hispanic children in 2007 decreased from their respective rates in 2006.

Region

At 11.4 percent, the Northeast and the Midwest had lower uninsured rates in 2007 than the West (16.9 percent) and the South (18.4 percent)

³⁴ In 2007, the uninsured rate for Black children was not statistically different from the uninsured rate for Asian children.

(Table 6). These rates represented decreases from the 2006 uninsured rates in the Northeast (12.3 percent), the West (17.9 percent), and the South (19.0 percent). The uninsured rate for the Midwest in 2007 was not statistically different from 2006.

Metropolitan Status

The uninsured rate for people living inside metropolitan statistical areas decreased to 15.3 percent in 2007 from 15.8 percent in 2006 (Table 6). In 2007, the uninsured rate was higher among people in principal cities (18.5 percent) than among people not in principal cities (13.3 percent). The uninsured rate for people living outside metropolitan statistical areas decreased from 16.0 percent to 15.0 percent between 2006 and 2007.³⁵

³⁵ In 2006 and 2007, the percentage of uninsured living within metropolitan statistical areas was not statistically different from the percentage of uninsured living outside metropolitan statistical areas.

* Statistically different from zero at the 90-percent confidence level.

– Represents or rounds to zero.

¹ The 2004 and 2005 data were revised in March 2007. See <www.census.gov/hhes/www/hlthins/usernote/schedule.html>.² A 90-percent confidence interval is a measure of an estimate's variability. The larger the confidence interval in relation to the size of the estimate, the less reliable the estimate. For more information, see "Standard Errors and Their Use" at <www.census.gov/hhes/www/p60_235sa.pdf>.³ Details may not sum to totals because of rounding.

Figure 9.
**Differences in 2-Year-Average Uninsured Rates by State:
 2006–2007 Less 2004–2005¹**

¹ The 2004 and 2005 data were revised in March 2007. See <www.census.gov/hhes/www/hlthins/usernote/schedule.html>. Source: U.S. Census Bureau, Current Population Survey, 2005 to 2008 Annual Social and Economic Supplements.

State-Level Data

The Census Bureau recommends using 3-year averages to compare estimates across states. Appendix D displays 3-year averages and the associated 90-percent confidence intervals for the United States, each of the 50 states, and the District of Columbia. This ordered list should not be regarded as a ranking.³⁶

³⁶ The CPS ASEC is designed to collect statistically reliable estimates primarily at the national level and secondarily at the regional level. State estimates are considerably less reliable—that is, the sampling variability for state estimates is higher, and state estimates fluctuate more widely year-to-year than national estimates.

Comparing 3-year-average uninsured rates for 2005–2007 across states shows that Texas (24.4 percent) had the highest percentage of uninsured. No one state had the “lowest” uninsured rate. At 8.3 percent, Massachusetts and Hawaii had the lowest point estimates for uninsured rates, but they were not statistically different from Minnesota (8.5 percent), Wisconsin (8.8 percent), and Iowa (9.4 percent). In addition, Hawaii was not statistically different from Maine (9.5 percent) (Table 8).³⁷

³⁷ The uninsured rates for Minnesota, Wisconsin, Iowa, and Maine are not statistically different from each other.

Figure 9 is a map highlighting whether the 2-year-average uninsured rate for 2006–2007 for each state and the District of Columbia is statistically higher, lower, or not different from the 2-year-average uninsured rate for 2004–2005. Five states (Connecticut, Indiana, Massachusetts, West Virginia, and Wisconsin) and the District of Columbia had lower 2-year-average uninsured rates for 2006–2007 than their 2-year-average uninsured rates for 2004–2005. Ten states (Kansas, Kentucky, Louisiana, Mississippi, Nebraska, New Jersey, New Mexico, New York, North Carolina, and Texas) had higher 2-year-average uninsured

Additional Data and Contacts

Detailed tables, historical tables, press releases and briefings, and unpublished data are available electronically on the Census Bureau's income, poverty, and health insurance Web sites. The Web sites may be accessed through the Census Bureau's home page at <www.census.gov> or directly at <www.census.gov/hhes/www/income/income.html> for income data, <www.census.gov/hhes/www/poverty/poverty.html> for poverty data, and <www.census.gov/hhes/www/hlthins/hlthins.html> for health insurance data.

Microdata are available for download by clicking on "Data Tools" on the Census Bureau's home page and then clicking the "DataFerrett" link. Technical methods have been applied to CPS microdata to avoid disclosing the identities of individuals from whom data were collected.

For assistance with income, poverty, or health insurance data or questions about them, contact the Data Integration Division's Information Resources and Dissemination Branch at 301-763-3242, or search your topic of interest using the Census Bureau's "Question and Answer Center" found at <ask.census.gov>.

rates for 2006–2007 than their 2-year-average uninsured rates for 2004–2005.

CPS DATA COLLECTION

The information in this report was collected in the 50 states and the District of Columbia and does not represent residents of Puerto Rico and U.S. island areas.³⁸ It is based on a

³⁸ U.S. island areas include American Samoa, Guam, the Northern Mariana Islands, and the Virgin Islands of the United States.

sample of about 100,000 addresses. The estimates in this report are controlled to national population estimates by age, sex, race, and Hispanic origin. The population controls used to prepare estimates for 1999 to 2007 were based on the results from Census 2000 and are updated annually using administrative records for such things as births, deaths, emigration, and immigration.

The CPS is a household survey primarily used to collect employment data. The sample universe for the basic CPS

consists of the resident civilian noninstitutionalized population of the United States. People in institutions, such as prisons, long-term care hospitals, and nursing homes, are not eligible to be interviewed in the CPS. Students living in dormitories are only included in the estimates if information about them is reported in an interview at their parents' homes. The sample universe for the CPS ASEC is slightly larger than that of the basic CPS since it includes military personnel who live in a household with at least one other civilian adult, regardless of whether they live off post or on post. All other Armed Forces are excluded. For further documentation about the CPS ASEC, see <www.census.gov/apspd/techdoc/cps/cpsmar08.pdf>.

COMMENTS

The Census Bureau welcomes the comments and advice of data and report users. If you have suggestions or comments, please write to:

APPENDIX A. ESTIMATES OF INCOME

How Income Is Measured

For each person 15 years and older in the sample, the Annual Social and Economic Supplement (ASEC) asks questions on the amount of money income received in the preceding calendar year from each of the following sources:

1. Earnings
2. Unemployment compensation
3. Workers' compensation
4. Social security
5. Supplemental security income
6. Public assistance
7. Veterans' payments
8. Survivor benefits
9. Disability benefits
10. Pension or retirement income
11. Interest
12. Dividends
13. Rents, royalties, and estates and trusts
14. Educational assistance
15. Alimony
16. Child support
17. Financial assistance from outside of the household
18. Other income

It should be noted that although the income statistics refer to receipts during the preceding calendar year, the demographic characteristics, such as age, labor force status, and household composition, are as of the survey date. The income of the household does not include amounts received by people who were members during all or part of the previous year if these people no longer resided in the household at the time of interview. The Current Population Survey (CPS) collects income data for people

Recessions

who are current residents but did not reside in the household during the previous year.

Data on income collected in the ASEC by the U.S. Census Bureau cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes, social security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some families receive noncash benefits, such as food stamps, health benefits, subsidized housing, and goods produced and consumed on the farm. In addition, money income does not reflect the fact that noncash benefits are also received by some nonfarm residents, which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. Data users should consider these elements

when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. Based on an analysis of independently derived income estimates, the Census Bureau determined that respondents report income earned from wages or salaries more accurately than other sources of income, and that the reported wage and salary income is nearly equal to independent estimates of aggregate income.

Recessions

Recessions are defined by the National Bureau of Economic Research, Inc. Peak and trough months of recent recessions are shown in the text box above. The data points in the time series charts in this report use July as a reference for recessions.

1977	97.7		

¹ The 1977 and earlier indexes shown in this table have changed from those previously published. Earlier CPI-U-RS series issued by the Census Bureau erroneously indexed 1977 = 100.0 when, in fact, the Bureau of Labor Statistics series has December 1977 = 100.0. The Census Bureau uses the Bureau of Labor Statistics' experimental CPI-U-RS for 1977 through 2007. The Census Bureau derived the CPI-U-RS for years before 1977 by applying the 1977 CPI-U-RS-to-CPI-U ratio to the 1947 to 1976 CPI-U.

Note: Data users can compute the percentage changes in prices between earlier years' data and 2007 data by dividing the annual average CPI-U-RS for 2007 by the annual average for the earlier year(s).

For more information on the CPI-U-RS, see <www.bls.gov/cpi/cpirsdc.htm>.

Cost of Living Adjustment

In order to accurately assess changes in income and earnings over time, an adjustment for changes in the cost of living is required. The Census Bureau uses the research series of the Consumer Price Index (CPI-U-RS), provided by the Bureau of Labor Statistics for 1977 through 2007, to adjust for changes in the cost of living. The indexes used to make the constant dollar conversions are shown in the text box "Annual Average Consumer Price Index Research Series Using Current Methods (CPI-U-RS) All Items: 1947 to 2007." The 1977 and earlier indexes have changed from those previously published. Earlier CPI-U-RS series issued by the Census Bureau erroneously indexed 1977=100.0 when, in fact, the Bureau of Labor Statistics series has December 1977=100.0.

Table A-1.

Households by Total Money Income, Race, and Hispanic Origin of Householder: 1967 to 2007(Income in 2007 CPI-U-RS adjusted dollars. Households as of March of the following year. (NA) Not available.

¹ Data have been revised to reflect a correction to the weights in the 2005 ASEC.

² Implementation of a 28,000 household sample expansion.

³ Implementation of Census 2000-based population controls.

⁴ Full implementation of 1990 census-based sample design and metropolitan definitions, 7,000 household sample reduction, and revised editing of responses on race.

⁵ Introduction of 1990 census sample design.

⁶ Data collection method changed from paper and pencil to computer-assisted interviewing. In addition, the 1994 ASEC was revised to allow for the coding of different income amounts on selected questionnaire items. Limits either increased or decreased in the following categories: earnings limits increased to \$999,999; social security limits increased to \$49,999; supplemental security income and public assistance limits increased to \$24,999; veterans' benefits limits increased to \$99,999; child support and alimony limits decreased to \$49,999.

⁷ Implementation of 1990 census population controls.

⁸ Implementation of a new CPS ASEC processing system.

⁹ Recording of amounts for earnings from longest job increased to \$299,999. Full implementation of 1980 census-based sample design.

¹⁰ Implementation of Hispanic population weighting controls and introduction of 1980 census-based sample design.

¹¹ Implementation of 1980 census population controls. Questionnaire expanded to show 27 possible values from 51 possible sources of income.

¹² First year medians were derived using both Pareto and linear interpolation. Before this year, all medians were derived using linear interpolation.

¹³ Some of these estimates were derived using Pareto interpolation and may differ from published data, which were derived using linear interpolation.

¹⁴ Implementation of a new CPS ASEC processing system. Questionnaire expanded to ask 11 income questions.

¹⁵ Full implementation of 1970 census-based sample design.

¹⁶ Introduction of 1970 census sample design and population controls.

¹⁷ Implementation of new CPS ASEC processing system.

¹⁸ Beginning with the 2003 CPS, respondents were allowed to choose one or more races. White alone refers to people who reported White and did not report any other race category. The use of this single-race population does not imply that it is the preferred method of presenting or analyzing the data. The Census Bureau uses a variety of approaches. Information on people who reported more than one race, such as White **and** American Indian and Alaska Native or Asian **and** Black or African American, is available from Census 2000 through American FactFinder. About 2.6 percent of people reported more than one race in Census 2000.

¹⁹ For the years 2001 and earlier, the CPS allowed respondents to report only one race group.

²⁰ Black alone refers to people who reported Black and did not report any other race category.

²¹ Asian alone refers to people who reported Asian and did not report any other race category.

²² Because Hispanics may be any race, data in this report for Hispanics overlap with data for racial groups. Being Hispanic was reported by 13.0 percent of White householders who reported only one race, 3.0 percent of Black householders who reported only one race, and 1.9 percent of Asian householders who reported only one race. Data users should exercise caution when interpreting aggregate results for the Hispanic population and for race groups because these populations consist of many distinct groups that differ in socioeconomic characteristics, culture, and recency of immigration. Data were first collected for Hispanics in 1972.

¹ The 2004 data have been revised to reflect a correction to the weights in the 2005 ASEC.

² Implementation of a 28,000 household sample expansion.

³ Implementation of Census 2000-based population controls.

⁴ Full implementation of 1990 census-based sample design and metropolitan definitions, 7,000 household sample reduction, and revised editing of responses on race.

⁵ Introduction of 1990 census sample design.

⁶ Data collection method changed from paper and pencil to computer-assisted interviewing. In addition, the 1994 ASEC was revised to allow for the coding of different income amounts on selected questionnaire items. Limits either increased or decreased in the following categories: earnings limits increased to \$999,999; social security limits increased to \$49,999; supplemental security income and public assistance limits increased to \$24,999; veterans' benefits limits increased to \$99,999; child support and alimony limits decreased to \$49,999.

⁷ Implementation of 1990 census population controls.

⁸ Implementation of a new CPS ASEC processing system.

⁹ Recording of amounts for earnings from longest job increased to \$299,999. Full implementation of 1980 census-based sample design.

¹⁰ Implementation of Hispanic population weighting controls and introduction of 1980 census-based sample design.

¹¹ Implementation of 1980 census population controls. Questionnaire expanded to allow the recording of up to 27 possible values from a list of 51 possible sources of income.

¹² First year medians were derived using both Pareto and linear interpolation. Before this year, all medians were derived using linear interpolation.

¹³ Some of these estimates were derived using Pareto interpolation and may differ from published data, which were derived using linear interpolation.

¹⁴ Implementation of a new CPS ASEC processing system. Questionnaire expanded to ask 11 income questions.

¹⁵ Full implementation of 1970 census-based sample design.

¹⁶ Introduction of 1970 census sample design and population controls.

¹⁷ Implementation of a new CPS ASEC processing system.

¹⁸ Questionnaire expanded to ask eight income questions.

¹⁹ Implementation of new procedures to impute missing data only.

²⁰ Full implementation of 1960 census-based sample design and population controls.

²¹ Introduction of 1960 census-based sample design. Implementation of first hotdeck procedure to impute missing income entries.

See footnotes on next page.

¹ Data have been revised to reflect a correction to the weights in the 2005 ASEC.

² Implementation of a 28,000 household sample expansion.

³ Implementation of Census 2000-based population controls.

⁴ Full implementation of 1990 census-based sample design and metropolitan definitions, 7,000 household sample reduction, and revised editing of responses on race.

⁵ Introduction of 1990 census sample design.

⁶ Data collection method changed from paper and pencil to computer-assisted interviewing. In addition, the 1994 ASEC was revised to allow for the coding of different income amounts on selected questionnaire items. Limits either increased or decreased in the following categories: earnings limits increased to \$999,999; social security limits increased to \$49,999; supplemental security income and public assistance limits increased to \$24,999; veterans benefits limits increased to \$99,999; child support and alimony limits decreased to \$49,999.

⁷ Implementation of 1990 census population controls.

⁸ Implementation of a new CPS ASEC processing system.

⁹ Recording of amounts for earnings from longest job increased to \$299,999. Full implementation of 1980 census-based sample design.

¹⁰ Implementation of Hispanic population weighting controls and introduction of 1980 census-based sample design.

¹¹ Implementation of 1980 census population controls. Questionnaire expanded to allow the recording of up to 27 possible values from a list of 51 possible sources of income.

¹² First year medians were derived using both Pareto and linear interpolation. Before this year, all medians were derived using linear interpolation.

¹³ Some of these estimates were derived using Pareto interpolation and may differ from published data, which were derived using linear interpolation.

¹⁴ Implementation of a new CPS ASEC processing system. Questionnaire expanded to ask 11 income questions.

¹⁵ Full implementation of 1970 census-based sample design.

¹⁶ Introduction of 1970 census sample design and population controls.

¹⁷ Implementation of a new CPS ASEC processing system.

APPENDIX B. ESTIMATES OF POVERTY

How Poverty Is Calculated

Following the Office of Management and Budget's (OMB) Statistical Policy Directive 14, the U.S. Census Bureau uses a set of dollar value thresholds that vary by family size and composition to determine who is in poverty (see the matrix below).

Poverty Thresholds in 2007 by Size of Family and Number of Related Children Under 18 Years

(Dollars)

Size of family unit	Related children under 18 years								
	None	One	Two	Three	Four	Five	Six	Seven	Eight or more
One person (unrelated individual):									
Under 65 years	10,787								
65 years and older	9,944								
Two people:									
Householder under 65 years	13,884	14,291							
Householder 65 years and older	12,533	14,237							
Three people	16,218	16,689	16,705						
Four people	21,386	21,736	21,027	21,100					
Five people	25,791	26,166	25,364	24,744	24,366				
Six people	29,664	29,782	29,168	28,579	27,705	27,187			
Seven people	34,132	34,345	33,610	33,098	32,144	31,031	29,810		
Eight people	38,174	38,511	37,818	37,210	36,348	35,255	34,116	33,827	
Nine people or more	45,921	46,143	45,529	45,014	44,168	43,004	41,952	41,691	40,085

If a family's total income is less than that family's threshold, then that family and every individual in it is considered in poverty. The official poverty thresholds do not vary geographically, but they are updated annually for inflation using the Consumer Price Index (CPI-U). The official poverty definition uses money income before taxes and does not include capital gains or noncash benefits (such as public housing, Medicaid, and food stamps).

Example: Suppose Family A consists of five people: two children, their mother, their father, and their great-aunt. Family A's poverty threshold in 2007 was \$25,364. Suppose also that each member had the following income in 2007:

Mother	\$10,000
Father	7,000
Great-aunt	10,000
First child	0
Second child	0
Total:	\$27,000

Since their total family income, \$27,000, was higher than their threshold (\$25,364), the family would not be considered "in poverty" according to the official poverty measure.

While the thresholds in some sense represent families' needs, they should be interpreted as a statistical yardstick rather than as a complete description of what people and families need to live. Many of the government's aid programs use different dollar amounts as eligibility criteria.

Poverty rates and the number in poverty are important ways of examining people's well-being. Other more detailed measures of poverty are considered in the section "Depth of Poverty Measures," and in the Census Bureau report *Supplemental Measures of Material Well-Being: Expenditures, Consumption, and Poverty* (P23-201).

For a history of the official poverty measure, see "The Development of the Orshansky Poverty Thresholds and Their Subsequent History as the Official

U.S. Poverty Measure" by Gordon M. Fisher, available at <www.census.gov/hhes/www/poverty/histofpovmeas.html>.

Weighted average thresholds: Some data users want a summary of the 48 thresholds to get a general sense of the "poverty line." The average thresholds shown below provide that summary, but they are not used to compute poverty data. The averages are based on the relative number of families by size and composition.

Weighted Average Poverty Thresholds in 2007 by Size of Family

(Dollars)

One person	10,590
Two people	13,540
Three people	16,530
Four people	21,203
Five people	25,080
Six people	28,323
Seven people	32,233
Eight people	35,816
Nine people or more	42,739

(NA) Not available.

¹ For 2004, figures are revised to reflect a correction to the weights in the 2005 ASEC.

² Consistent with 2001 data through implementation of Census 2000-based population controls and a 28,000 household sample expansion.

³ For 1999, figures are based on Census 2000 population controls.

⁴ For 1992, figures are based on 1990 census population controls.

⁵ For 1991, figures are revised to correct for nine omitted weights from the original March 1992 CPS file.

⁶ For 1988 and 1987, figures are based on new processing procedures and are also revised to reflect corrections to the files after publication of the 1988 advance report *Money Income and Poverty Status in the United States: 1988*, P-60, No. 166.

⁷ The 2003 CPS allowed respondents to choose more than one race. White alone refers to people who reported White and did not report any other race category. The use of this single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Information on people who reported more than one race, such as White and American Indian or Alaska Native or Asian and Black or African American, is available from Census 2000 through American FactFinder. About 2.6 percent of people reported more than one race in Census 2000.

⁸ For 2001 and earlier years, the CPS allowed respondents to report only one race group. The reference race groups for 2001 and earlier poverty data are White, non-Hispanic White, Black, and Asian and Pacific Islander.

⁹ Black alone refers to people who reported Black and did not report any other race.

¹⁰ Asian alone refers to people who reported Asian and did not report any other race.

Note: Prior to 1979, people in unrelated subfamilies were included in people in families. Beginning in 1979, people in unrelated subfamilies are included in all people but are excluded from people in families.

¹ For 2004, figures are revised to reflect a correction to the weights in the 2005 ASEC.

² Consistent with 2001 data through implementation of Census 2000-based population controls and a 28,000 household sample expansion.

³ For 1999, figures are based on Census 2000 population controls.

⁴ For 1992, figures are based on 1990 census population controls.

⁵ For 1991, figures are revised to correct for nine omitted weights from the original March 1992 CPS file.

⁶ For 1988 and 1987, figures are based on new processing procedures and are also revised to reflect corrections to the files after publication of the 1988 advance report *Money Income and Poverty Status in the United States: 1988*, P-60, No. 166.

⁷ The 2003 CPS allowed respondents to choose more than one race. White alone refers to people who reported White and did not report any other race category. The use of this single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Information on people who reported more than one race, such as White **and** American Indian and Alaska Native or Asian **and** Black or African American, is available from Census 2000 through American FactFinder. About 2.6 percent of people reported more than one race in Census 2000.

⁸ For 2001 and earlier years, the CPS allowed respondents to report only one race group. The reference race groups for 2001 and earlier poverty data are White, non-Hispanic White, Black, and Asian and Pacific Islander.

⁹ Black alone refers to people who reported Black and did not report any other race.

¹⁰ Asian alone refers to people who reported Asian and did not report any other race.

Note: Prior to 1979, people in unrelated subfamilies were included in people in families. Beginning in 1979, people in unrelated subfamilies are included in all people but are excluded from people in families.

APPENDIX C. ESTIMATES OF HEALTH INSURANCE COVERAGE

Quality of Health Insurance Coverage Estimates

National surveys and health insurance coverage. Health insurance coverage is likely to be underreported on the Current Population Survey (CPS). While underreporting affects most, if not all, surveys, underreporting of health insurance coverage in the Annual Social and Economic Supplement (ASEC) appears to be a larger problem than in other national surveys that ask about insurance. Some reasons for the disparity may include the fact that income, not health insurance, is the main focus of the ASEC questionnaire. In addition, the ASEC collects health insurance information by asking in February through April about the previous year's coverage. Asking annual retrospective questions appears to cause few problems when collecting income data (possibly because the interview period is close to when people pay their taxes), but it may be less than ideal when asking about health insurance coverage. Compared with other national surveys, the CPS estimate of the number of people without health insurance more closely approximates the number of people who are uninsured at a specific point in time during the year than the number of people uninsured for the entire year. For a comparison of health insurance coverage rates from the major federal surveys, see *How Many People Lack Insurance and for How Long?* (Congressional Budget Office, May 2003).

Reporting of coverage through major federal health insurance programs.

The CPS ASEC data underreport Medicare and Medicaid coverage compared with enrollment and participation data from the Centers for Medicare and Medicaid Services

(CMS).³⁹ Because the CPS is largely a labor force survey, interviewers receive less training on health insurance concepts than labor concepts. Additionally, many people may not be aware that a health insurance program covers them or their children if they have not used covered services recently. CMS data, on the other hand, represent the actual number of people who have enrolled or participated in these programs.

The State Health Access Data Assistance Center (SHADAC) of the University of Minnesota has worked with the U.S. Census Bureau, CMS, and the Office of the Assistant Secretary for Planning and Evaluation (ASPE) on a research project to evaluate why CPS ASEC estimates of the number of people with Medicaid are lower than counts of the number of people enrolled in the program from CMS. Reports from Phases 1 and 2 of the research project are available from the Census Bureau's Web site at <www.census.gov/did/www/shadac/shadac.html>.

During Phase 2, files from the Medicaid Statistical Information System (MSIS) were linked with the CPS ASEC files and individual records compared. A key finding indicating survey response error in the CPS ASEC was that 16.9 percent of people with an MSIS record indicating Medicaid coverage reported in the CPS ASEC that they were uninsured.⁴⁰ The report found that those with longer and more recent Medicaid

enrollment were more likely to report coverage. Respondents for enrolled children were more apt to report coverage for those children than for adults enrolled. Families with lower incomes tended to report coverage more frequently. Individuals who received Medicaid services during the reporting cycle tended to report coverage more often than individuals who had not received services. Reporting differences were also apparent from state to state.

Last year, SHADAC released an imputation adjustment for the 2007 public-use CPS ASEC microdata that are available to the public through the Minnesota Population Center's IPUMS-CPS Web site to help researchers interested in partially adjusting the CPS ASEC data.⁴¹ This is an experimental imputation, and it is being produced for interested parties to use in their research. The Census Bureau has not evaluated the methodology, and users should be aware that this is not an official data product.

There are several ongoing projects aimed at improving the quality of health coverage data from the CPS ASEC. This research includes: 1) cognitive research to improve the wording of the CPS ASEC health coverage questions; 2) editing and imputation research, including additional research on the use of models that attempt to account for Medicaid underreporting; and 3) expanding the number of studies that match administrative Medicaid data to current survey data to include other surveys, such as the National Health Interview Survey (NHIS) and the American Community Survey (ACS). Through this research, it will be possible to compare and contrast CPS ASEC

³⁹ CMS is the federal agency primarily responsible for administering the Medicare and Medicaid programs at the national level.

⁴⁰ For consistency purposes across the MSIS and the CPS, SHADAC removed all MSIS enrollees who received only partial coverage, those who had died before the CPS reporting cycle, and all duplicate person records. Also, all State Children's Health Insurance Program (SCHIP) enrollees were removed from the MSIS count.

⁴¹ The IPUMS-CPS Web site is available at <cps.ipums.org/cps/>.

underreporting rates with other surveys, which will, in turn, allow Census Bureau analysts to better understand the nature and impact of CPS ASEC health coverage underreporting.

Changes in Medicaid coverage estimates from one year to the next should be viewed with caution. Because many people who are covered by Medicaid do not report that coverage, the Census Bureau assigns coverage to those who are generally regarded as “categorically eligible”

(those who received some other benefits, usually public assistance payments, that make them eligible for Medicaid). Since the number of people receiving public assistance has been dropping, the relationship between Medicaid coverage and public assistance has changed, causing the imputation process to introduce a downward bias in the most recent Medicaid estimates.

After consulting with health insurance experts, the Census Bureau modified

the definition of the population without health insurance in the supplement to the March 1998 CPS, which collected data about coverage in 1997. Previously, people with no coverage other than access to the Indian Health Service were counted as part of the insured population. Subsequently, the Census Bureau has counted these people as uninsured. The effect of this change on the overall estimates of health insurance coverage was negligible.

(NA) Not available. Respondents were not asked detailed health insurance questions about direct-purchase coverage before the 1995 Current Population Survey (CPS) Annual Social and Economic Supplement (ASEC).

¹ Military health care includes CHAMPUS (Comprehensive Health and Medical Plan for Uniformed Services)/Tricare and CHAMPVA (Civilian Health and Medical Program of the Department of Veterans Affairs), as well as care provided by the Health and Medical Program of the Department of Veterans Affairs and care provided by the Department of Veterans Affairs and the military.

² The 2004 and 2005 data were revised in March 2007. See <www.census.gov/hhes/www/hlthins/usernote/schedule.html>.

³ Implementation of a 28,000 household sample expansion.

⁴ Estimates reflect the results of follow-up verification questions and implementation of Census 2000-based population controls.

⁵ Beginning with the 1998 CPS ASEC, people with no coverage other than access to Indian Health Service are no longer considered covered by health insurance; instead, they are considered to be uninsured. The effect of this change on the overall estimates of health insurance coverage is negligible; however, the decrease in the number of people covered by Medicaid may be partially due to this change.

⁶ The data for 1996 through 2003 were constructed for consistency with the revision to the 2004 and 2005 estimates. As a result, they do not match the previously published estimates. To see the original series, see Table C-1 in *Income, Poverty, and Health Insurance Coverage in the United States: 2005* at <www.census.gov/prod/2006pubs/p60-231.pdf>.

⁷ Health insurance questions were redesigned. Increases in estimates of employment-based and military health care coverage may be partially due to questionnaire changes.

Overall coverage estimates were not affected.

⁸ Data collection method changed from paper and pencil to computer-assisted interviewing.

⁹ Implementation of 1990 census population controls.

¹⁰ Implementation of a new CPS ASEC processing system.

¹ Military health care includes CHAMPUS (Comprehensive Health and Medical Plan for Uniformed Services)/Tricare and CHAMPVA (Civilian Health and Medical Program of the Department of Veterans Affairs), as well as care provided by the Health and Medical Program of the Department of Veterans Affairs and care provided by the Department of Veterans Affairs and the military.

² The 2004 and 2005 data were revised in March 2007. See <www.census.gov/hhes/www/hlthins/usernote/schedule.html>.

³ Implementation of a 28,000 household sample expansion.

⁴ The 2003 CPS asked respondents to choose one or more races. White alone refers to people who reported White and did not report any other race category. The use of this single-race population does not imply that it is the preferred method of presenting or analyzing data. The Census Bureau uses a variety of approaches. Information on people who reported more than one race, such as White **and** American Indian and Alaska Native or Asian **and** Black or African American, is available from Census 2000 through American FactFinder. About 2.6 percent of people reported more than one race in Census 2000.

⁵ The 2001 CPS and earlier years asked respondents to report only one race. The reference groups for these years are White, White not Hispanic, Black, and Asian and Pacific Islander.

⁶ Black alone refers to people who reported Black or African American and did not report any other race.

⁷ Asian alone refers to people who reported Asian and did not report any other race.

Note: All years reflect the implementation of the verification question. The data for 1999 through 2003 were revised using an approximation method for consistency with the revision to the 2004 and 2005 estimates. To see the original series, see Table C-1 in *Income, Poverty, and Health Insurance Coverage in the United States: 2005* at <www.census.gov/prod/2006pubs/p60-231.pdf>.

Source: U.S. Census Bureau, Current Population Survey, 2000 to 2008 Annual Social and Economic Supplements.

¹ Military health care includes CHAMPUS (Comprehensive Health and Medical Plan for Uniformed Services)/Tricare and CHAMPVA (Civilian Health and Medical Program of the Department of Veterans Affairs), as well as care provided by the Health and Medical Program of the Department of Veterans Affairs and care provided by the Department of Veterans Affairs and the military.

² The 2004 and 2005 data were revised in March 2007. See <www.census.gov/hhes/www/hlthins/usernote/schedule.html>.

³ Implementation of a 28,000 household sample expansion.

⁴ Estimates reflect the results of follow-up verification questions and implementation of Census 2000-based population controls.

Note: All years reflect the implementation of the verification question. The data for 1999 through 2003 were revised using an approximation method for consistency with the revision to the 2004 and 2005 estimates. To see the original series, see Table C-1 in *Income, Poverty, and Health Insurance Coverage in the United States: 2005* at <www.census.gov/prod/2006pubs/p60-231.pdf>.
