# What is VIVO?

VIVO is an open source semantic web application originally developed and implemented at Cornell University

When installed and populated with researcher descriptions, interests, activities, and accomplishments, VIVO enables the discovery of research and scholarship across organizations

VIVO allows browsing and searching, supported by facets

Adapted from VIVO Project Description, 2011 (<http://vivo.sourceforge.net>)

# Some VIVO Technical Requirements

VIVO Software: <http://vivoweb.org/download>

VIVO Tools: <http://sourceforge.net/p/vivo/tools/home/Home>

Java (SE) 1.6.x: <http://java.sun.com> (Not OpenJDK)

Apache Tomcat 6.x or 7.x: <http://tomcat.apache.org>

Apache Ant 1.7 or higher: <http://ant.apache.org>

MySQL 5.1 or higher: <http://www.mysql.com>)

# Challenges to USDA Implementation

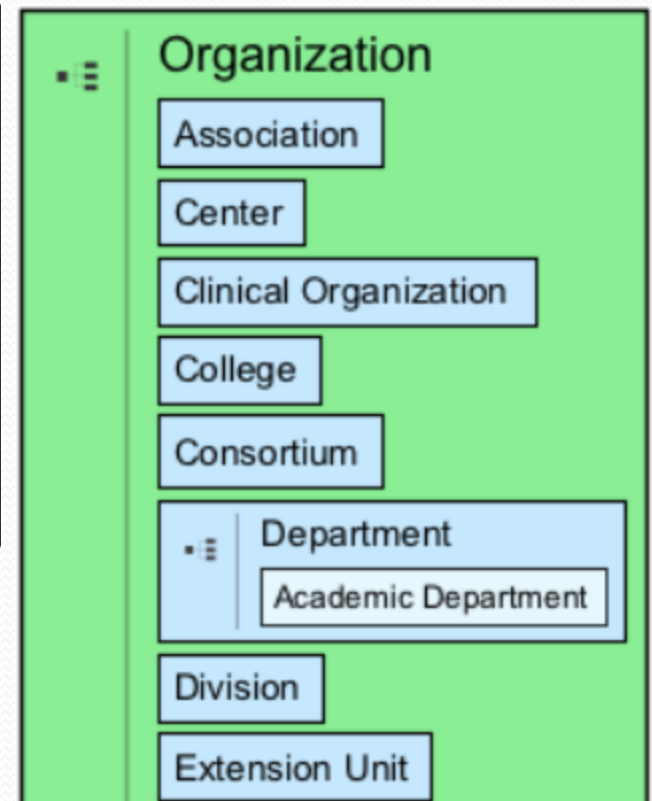

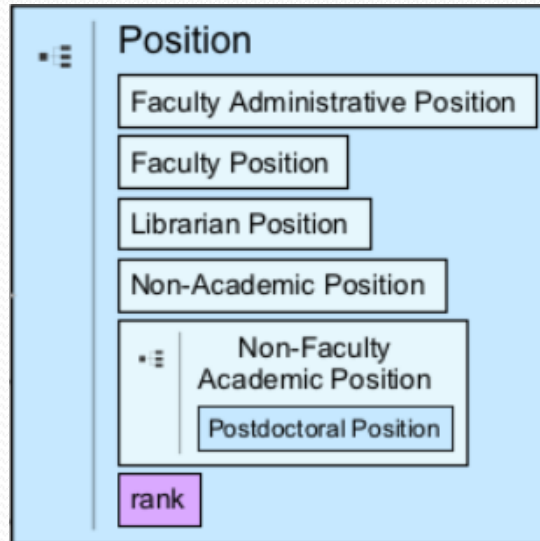

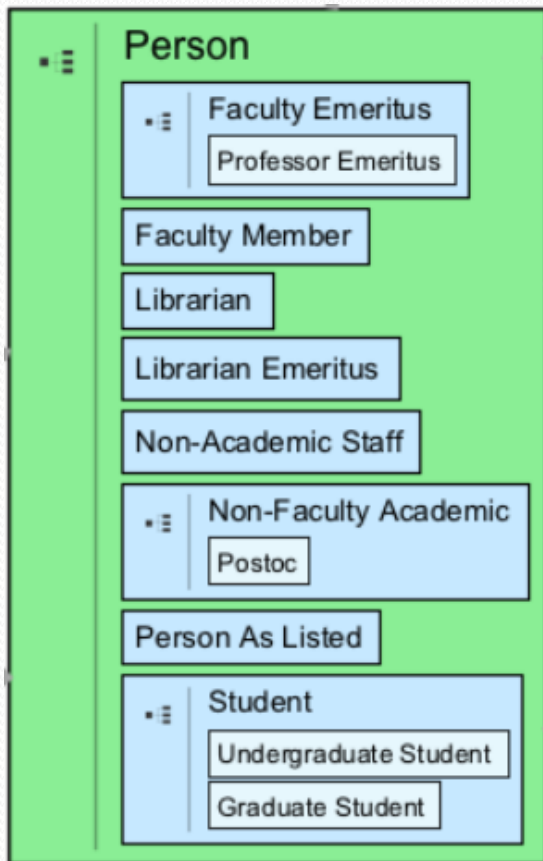

Approximately 50,000 researchers & scientists in USDA

VIVO ontology is based on an academic object model

No central HR system to supply current and consistent data

No consistent tracking of research, except ARS

# VIVO ontology classes do not correspond directly to USDA people or organization entities

# VIVO Data Ingest Process

Create a local ontology

Create workspace models for ingesting and constructing data

Pull external data file into RDF

Map tabular data into the ontology format

Construct the ingested entities using the map of properties

Load data to the current web model

# Search: Across all Entities

## Example: "bark beetle"

The screenshot shows the VIVO website interface. At the top, there is a navigation bar with the VIVO logo and the text "USDA Science & Collaboration". To the right of the logo, there are links for "Login", "About", "Contact Us", "Support", and "Index". Below the navigation bar is a search bar with a green "Search" button. The main content area has a secondary navigation bar with links for "Home", "People", "Projects", "Research", and "Organizations". Below this, there is a "Welcome to VIVO" section with a brief description of the tool and a "Search VIVO" section with a search bar containing the text "bark beetle" and a green "Search" button. At the bottom, there is a "Browse by" section with a list of categories and their counts, and a horizontal bar chart showing the distribution of results across these categories.

Zolubas, P., Negron, J. and Munson, A. S. 2009. Modelling Spruce Bark Beetle Infestation Probability. *Baltic Forestry*, 15 (1): 23–27.

#### Abstract

Spruce bark beetle (*Ips typographus* L.) risk model, based on pure Norway spruce (*Picea abies* Karst.) stand characteristics in experimental and control plots was developed using classification and regression tree statistical technique under endemic pest population density. The most significant variable in spruce bark beetle infestation risk model was spruce basal area. Model, good enough for forest management practices, rate spruce stands to: a) stands of low bark beetle risk (probability of infestation p=20%) – basal area of spruce less than 17.8 m<sup>2</sup>/ha; b) stands of moderate bark beetle risk (p=55%) – spruce basal area greater than 17.8 but less than 46.9 m<sup>2</sup>/ha; c) stands of high bark beetle risk (p=83%) – spruce basal area greater than 46.9 m<sup>2</sup>/ha. Further model clarification need research under epidemic spruce bark beetle condition levels.

**Key words:** spruce bark beetle, *Ips typographus*, Norway spruce, *Picea abies*, risk, classification and regression tree model
