CIRCULAR

UMTA C 2710.4A

Subject: REVENUE BASED SAMPLING PROCEDURES FOR
OBTAINING FIXED ROUTE BUS OPERATING DATA
REQUIRED UNDER THE SECTION 15 REPORTING SYSTEM

July 22, 1988

1. PURPOSE. This circular describes a suggested alternative revenue based procedure for use in collecting fixed route operating data required under the Section 15 Uniform System of Accounts and Records and Reporting System. The procedure is suited to any fixed route mode with on-board data collection.
2. CANCELLATION. This circular cancels UMTA Circular 2710.4, "Revenue Based Sampling Procedures for Obtaining Fixed Route Bus Operating Data Required Under the Section 15 Reporting System," dated 5-10-85.

4. BACKGROUND. UMTA Circular 2710.1A, "Sampling Procedures for obtaining Fixed Route Bus Operating Data Required Under the Section 15 Reporting System," suggests one sampling procedure for obtaining fixed route bus operating data required under the Section 15 Reporting System. Its procedures require sample sizes between 549 and 915 vehicle trips per year.

DISTRIBUTION: UMTA Headquarters Offices (U-W-2)
UMTA Regional Offices (U-X-2)

OPI: Office of Grants
Management

The sampling procedures described in this circular require a significantly smaller sample size to obtain estimates of annual passenger trips and passenger miles by mode at the required levels of precision and confidence.

The total required sample size has been reduced to 208 bus trips a year. This represents a reduction of between 62 and 77 percent from the number of trips that need to be sampled using the procedures described in UMTA Circular 2710.1A.

The sampling procedures contained in the circular meet the statistical standards of 95 percent confidence and 10 percent precision for each transit service mode. Transit agencies can use these procedures to estimate bus "service consumed" (passenger miles) to be reported to UMTA for use in allocating Section 9 funds authorized by the Surface Transportation Assistance Act of 1982. (See Section 9(a)(3) of the UMTA Act.)

A transit agency may use a technique other than the UMTA recommended techniques as long as it meets the prescribed precision and confidence levels. If a different technique is used, it is recommended that the technique be submitted to UMTA for approval. Implementation of a sampling procedure that has not been confirmed in writing by UMTA as meeting the prescribed statistical requirements may result in adjustments to future Section 9 formula apportionments if the data are found not to be reliable.

CHAPTER I

INTRODUCTION

1. PURPOSE. This circular suggests an approach for the collection of the following operating data required for the Section 15 Reporting System:

- a. Total annual unlinked passenger trips (passengers).
- b. Total annual passenger miles.

The "revenue based" sampling approach developed for this circular satisfies the specified confidence and precision levels (95% and + 10%, respectively).

Due to the manner in which the estimates of annual unlinked passenger trips and annual passenger miles are estimated, the approach described in this circular is suitable only to fixed route modes with on-board fare collection. This limitation primarily affects rail modes for which fare collection is not on-board.

Because the sample size required for the sampling procedures described in this circular is much smaller than that required for the procedures described in Circular 2710.1A, use of these revenue-based procedures significantly reduces the burden on transit operators of meeting the Section 15 Data Reporting System requirements. However, for acceptable accuracy of estimates derived from revenue-based procedures to be maintained, it is vital that the revenue collection on individual bus trips be accurately measured. Registering fareboxes offer the easiest way to meet this requirement. One feasible alternative is to empty the farebox at the beginning and end of each sample trip and count the revenue collected on that trip. (This might be done by providing an assigned checker with a portable farebox that is used only to collect the fares on the randomly selected trips.) The procedures and supporting forms contained in this circular require an accurate count of the farebox revenue received on each sampled trip.

The revenue-based sampling method is offered as one of many possible approaches that meet the statistical precision and confidence standards established for Section 15 reporting.

It may be used to estimate passenger miles for use in allocating Section 9 funds authorized by the Surface Transportation Act of 1982. No operator is required to follow either the procedures described herein or any other specific set of procedures. An operator may elect to use any other

procedures so long as the ones chosen satisfy the minimum statistical requirements. If a different technique is used, it should be submitted to UMTA for approval. Implementation of a sampling procedure that has not been confirmed in writing by UMTA as meeting the prescribed statistical requirements may result in adjustments to future Section 9 formula apportionments if the data are found not to be reliable.

2. OVERVIEW OF PROCEDURE. The procedure described in this circular enables any transit agency to estimate annual unlinked passenger trips and annual passenger miles based on data from a small sample of randomly selected bus trips. In summary, the method consists of counting boarding and alighting passengers, measuring distances between stops, and counting farebox revenue on four randomly selected bus trips each week throughout the fiscal year. Consequently, 208 bus trips are sampled, enabling estimates to be made of two ratios:
- a. Farebox revenue per unlinked passenger trip
 - b. Farebox revenue per passenger mile.

The sample size is sufficient to meet the 95% confidence and $\pm 10\%$ precision limits on estimates of total annual passenger miles as required for the Section 15 Reporting System.

Total annual system-wide passenger trips and passenger miles are estimated by dividing each of these ratios separately into the total annual system (mode) farebox revenues for all routes. For example, total annual unlinked passenger trips are estimated as follows:

$$\text{TOTAL ANNUAL UNLINKED PASSENGER TRIPS} = \frac{\text{System-wide Annual Farebox Revenue}}{\text{Estimated Farebox Revenue Per Unlinked Passenger Trip}}$$

where the "farebox revenue per unlinked passenger trip" is estimated from the sample of trips.

Farebox revenue includes all passenger revenue actually collected on board. However, it is important that it include only revenue collected on board. It excludes revenue from sales of passes, tokens, and other prepayment instruments. It also excludes all non-transportation revenue. Finally, it excludes all revenue collected on trips not eligible to be sampled.

Since all bus trips sampled are randomly selected, all types of services, day of the week, levels of fare, types of fare payment, periods of the day, etc., are represented on the average, in proportion to their occurrence in the pool of total annual trips. Likewise, since all riders are counted on

7-22-88

the selected trips (including cash fares, passholders, elderly, handicapped, and students), the ratios of "farebox revenue per passenger" and "farebox revenue per passenger mile" based on the sampled trips yield total passenger and passenger mile estimates when applied to system-wide farebox revenues for the fiscal year.

The sampling procedure is based on relationships between farebox revenue and unlinked passenger trips and between farebox revenue and passenger miles. Consequently, the procedure requires an unchanged fare structure. If changes are made in fare structure or policy during the course of the fiscal year, passengers and passenger miles must be estimated independently for each separate period of fare structure. This means that the year may have to be divided into two or more periods that are defined by when fare changes are introduced. Revenues collected during each period and cumulative passengers and passenger miles for each period's sampled trips should be kept and tallied separately. Once system-wide passengers and passenger miles are estimated separately for each period, they can be assumed to arrive at estimates of total annual passengers and passenger miles. A change in fare structure would necessitate a slight increase in the total sample size.

CHAPTER II

DEFINITIONS, SAMPLE SIZE AND COMPOSITION

1. DEFINITIONS. The following are definitions of key terms used in this circular:
 - a. Bus Trip. A bus trip is defined as a one-way trip by a bus while in revenue service, starting at one end of a route and ending at another end of a route. A round trip, therefore, is counted as two separate bus trips. In the case where a route is a pure loop involving entirely different streets and pickup points, and where there is no logical way to identify route end points, then the traversing of the loop can be regarded as a single bus trip. If a bus is interlined (i.e., if a bus changes routes during revenue service) then the point of interlining (or route change) is considered to represent the end of one one-way trip and the beginning of another.
 - b. Farebox Revenue. Farebox revenue is the cash collected in fares on bus trips. Transfers, tokens, passes, and other non-currency forms of payment should not be counted as farebox revenue. It is critical to the method's validity that the counting of cash fares be done in the same way for all sampled trips. In addition, it is imperative that accurate system-wide farebox revenue totals be available for the entire year and any separate sampling periods within the year (as defined below in this chapter).
 - c. Weekly Bus Trip Lists. These are lists of weekly trips from which the sample of trips will be drawn. The lists are simply tallies of bus trips scheduled during each week, including trippers. In some cases, a "day-of-week" digit may be included in the numbering scheme of the tally. The lists of each week must include all revenue bus trips, except school bus, charter, and demand response trips.
 - d. Sampling Period. If, during the fiscal year, there is a change in fare policy, then annual passengers and passenger miles must be computed separately for the periods before and after the fare change(s). The year is thus divided into sampling periods for which separate tabulations of revenues, passengers and passenger miles from sampled trips are kept, and separate ratios of "revenue per unlinked passenger trip" and "revenue per passenger mile" are calculated. If there are no fare changes during a fiscal year, then the year is considered to be a single sampling period.

- e. Time Period. Each weekday is divided into time periods as defined in Appendix A. The periods include: A.M. Peak, Midday, P.M. Peak, and Night. Saturdays, Sundays, and Holidays do not have designated time periods. The time at which a sampled trip begins determines the time period in which it is classified.
- f. Random Sample. For a sample to be random, each element in the population of all elements must have a known chance of appearing in the sample. The odds of drawing each element must either be the same, or, in the cases where the odds differ, elements must be grouped so that those within each group have an equal chance of being drawn.
2. SAMPLE SIZE AND COMPOSITION. Table II-1 outlines the annual sample from which estimates of "farebox revenue per passenger trip" and "farebox revenue per passenger mile" are to be made. The sample of trips is obtained by randomly selecting four trips from each week's trip list. (For twelve weeks following a fare change, the weekly sample is increased from four to five trips.) Over a full year, the number of trips on which revenue and ridership data are collected is 208.

Different weekly trip lists should be developed corresponding to changes in the scheduled services made during the course of the year. Typically, a separate weekly trip list would be required for each timetable. Each week's four-trip sample should be separately selected at a time close to the sample week, but still allowing adequate lead time for scheduling of survey/data collection personnel and any supporting equipment.

There is, however, one exception to this general sample size rule of four bus trips per week. Transit agencies introducing a fare policy change should increase the weekly sample size to five bus trips for twelve weeks following the change in fare policy. The purpose of this sample size increase is to compensate statistically for the greater variability and instability in riding habits that typically follow fare changes. If the designated twelve-week period extends into a new fiscal year, five trips a week should be sampled in the final weeks of the ending fiscal year, and five per week should be sampled in the initial weeks of the beginning fiscal year so that a total of twelve consecutive weeks are sampled at a rate of five trips a week. Thereafter, the sampling reverts to a rate of four trips per week.

Table II-1
SAMPLE CHARACTERISTICS

Number of Weeks per Year	X	Number of Sampled Trips per Week*	=	Number of Sampled Trips per Year
(52)	X	(4)	=	(208)

*As noted above, the sample size should be increased to 5 trips per week for 12 weeks after a fare policy change is implemented.

CHAPTER III

SELECTION OF THE SAMPLE

1. OUTLINE OF THE APPROACH. Success of the procedure described in this circular requires that the four (or five) weekly bus trips are selected randomly from all trips operated during the respective week. This chapter provides two approaches to randomly selecting bus trips.

For each of these approaches, the first step is to identify the population of weekly trips from which the sampled trips will be chosen and to assign a serial number to each trip. This step is referred to as the construction of a weekly bus trip list. The second step is to randomly choose the serial numbers of the trips to be surveyed. The third step is to determine which trips correspond to the selected serial numbers. To allow subsequent determination of which trips have been chosen by the random sampling process, the list must be constructed in a way which allows unique identification of each trip operated during the week.

In addition to the two random selection approaches explained in this circular, there are many other methods that are both feasible and valid. It is essential only that the list be developed in a way that each and every trip operated during a week is included and that each trip has the same chance of being selected.

Each of the methods described has both advantages and disadvantages relating to its ease of use. Preference of one method over another will vary among transit agencies, depending on such factors as uniformity of schedules across days of the week, the total number of daily bus trips, the number of routes in the system, and the frequency of changes in fare policy or in the number of scheduled trips.

In general, the following two-step sequence assures that the four trips in each week's sample are selected randomly:

- a. Construct a list of all scheduled one-way revenue bus trips, including trippers, for the week to be sampled, including trips made on all weekdays, weekend days and holidays, and assign a unique number to each trip on the list. Charter, school bus (bus used exclusively for carrying school children), and demand response (dial-a-ride) operations should be excluded.

- b. Randomly select the trips for which data are to be collected.

The remainder of this chapter describes in detail both of these steps for the two techniques. Copies of the worksheets to aid in constructing weekly bus trip lists for each method are provided in Appendix B.

The same weekly list is used week after week as long as the schedule is unchanged. A separate selection of trips is made for each week. The listing and selection process for the trips of a given week need to be accomplished only far enough in advance to allow scheduling of surveyors. It is possible to do the selection on a weekly basis, each week only drawing the four trips necessary for the following week. Alternatively, it is also possible to do a full year's worth of selections all at one time. In general, the selection should be done far enough ahead to schedule surveyors, but not so far ahead that the week's final schedule of trips has not been determined. Thus, for example, if schedules are adjusted quarterly, not more than one quarter's worth of selection would be accomplished at one time.

2. LISTING OF WEEKLY TRIPS. The two methods explained below can be described as follows:
 - a. Method 1. Continuous numbering across all days of the week.
 - b. Method 2. Separate numbering according to day of the week.

While the two methods have much in common, each is relatively better suited to some situations than to others. Before presenting the methods themselves, some of their differences will be considered.

The first of these methods has the advantage that a single range of valid identification numbers is developed. This means that when using a random number table to select trips from the list, any number within the single range is known to correspond to an actual bus trip. The disadvantage is that even a minor schedule adjustment can require changes to the entire list. The approach is probably more attractive to agencies with stable schedules.

The second method sets a separate range of valid identification numbers for each day of the week. It thus leaves gaps of invalid numbers between the valid range for one day and the valid range for the following day. This makes it somewhat more complicated to know whether a number from a random number table corresponds to an actual bus trip or to one of the gaps

between the valid ranges for individual days. On the other hand, a minor schedule adjustment affects the identification number of trips only on the days for which schedule has been changed. To an agency making frequent, minor schedule changes, this method might be more attractive than the first.

3. METHOD 1: CONTINUOUS NUMBERING WEEKLY TRIP LIST. Assume for the purpose of illustration that a transit system has three routes and that the same bus schedules are followed on Monday through Friday, with fewer trips on Saturday and Sunday. Using bus schedules, timetables, or daily driver run sheets, the operator can then select any day (say, Monday) and number one-way bus trips to be made on that day, beginning with one route and proceeding to the next route until all scheduled trips for the day on all routes have been numbered consecutively (no numbers skipped). The numbering would then be picked up, in sequence, for the following days until all trips scheduled over the seven days of the week have been numbered and recorded. A simplified example of a listing of trips using this method is shown in Table III-1. An important point to remember is that every revenue trip is considered to be a scheduled one-way trip, and that all trips should be included except those that are specifically excluded (e.g., school bus).

It is not necessary to write down each trip number to derive the trip number range for each day. Rather, the trips for any given day can simply be counted on the schedules in some logical, reproducible sequence. The number ranges for the days enable the user to determine on which day a randomly selected numbered trip, generated by the procedure described subsequently, will fall.

Following the sample in Table III-1, selection of random four-digit number, 2047, indicates that a bus trip would be sampled on Friday of the week in question, a day that has a bus trip number range of 1661-2075. Further, it can be determined from the data that the trip to be sampled will be on Route 3, if, as is shown, the numbering of daily trips is done so that each route's bus trips have identifiable Trip Serial Number ranges. Then, the trips can be counted, in order, from the beginning of the appropriate route's printed schedule for the appropriate day until the randomly selected trip number is reached. Once the selected trip is determined by counting through the schedule, its time, location of departure, and direction can be determined.

Any schedule change that alters the number of trips on any given day means that the weekly trip list must be changed accordingly, and new ranges of numbers by day or route must be established. Consequently, the continuous numbering approach for trip lists may not be as practical as some other

Table III-1

EXAMPLE OF CONTINUOUS NUMBERING METHOD FOR WEEKLY ONE-WAY TRIPS

Day of Week	Trip Serial Numbers by Route Number			Trip Serial Number Range
	1	2	3	
Monday	0001- 0124	0125- 0304	0305- 0415	0001-0415
Tuesday	0416- 0539	0540- 0719	0720- 0830	0416-0830
Wednesday	0831- 0954	0955- 1134	1135- 1245	0831-1245
Thursday	1245- 1369	1370- 1549	1550- 1660	1246-1660
Friday	1661- 1781	1785- 1964	1965- 2075	1661-2075
Saturday	2076- 2136	2137- 2171	2172- 2212	2076-2212
Sunday	2213- 2233	2234- 2249	2250- 2261	2213-2261
Total Range of Weekly Trips				0001-2261 (Valid Number Range).

approaches for large transit agencies with frequent schedule changes since re-numbering of trips would be an often repeated process. An example worksheet for listing weekly trips by day of the week and by route is given in Appendix B. Note that each Trip Serial Number must have the same number of digits, that number being the number of digits in the total number of trips counted a week. Thus, for example, a trip occurring 215th in a list of 2261 weekly trips would be designated by the four-digit number "0215".

4. METHOD 2: NUMBERING TRIPS BY DAY OF THE WEEK. An alternative method to developing a weekly one-way bus trip list of sample selection is to code trips according to the day of the week on which they are scheduled. This coding consists of a day-of-the-week digit (ranging from 1 to 7) at the beginning of the trip numbers for each day, followed by the number of a trip for that day's schedules for all routes.

Table III-2 contains a listing of weekly trips for a three-route system using this numbering method. According to the table, Route 2 accounts for trips 116 through 290 on Monday through Friday. So, when a four-digit random number 2277 is selected, it tells the user that the sample trip is to be the 277th trip on Tuesday (the 2nd day of the week, based on the first digit). Further, it is known that "277" falls in the range of valid numbered trips for Route 2.

Using this method of deriving a weekly trip list, changes in schedules for particular days can be accommodated without the necessity of changing all subsequent trip numbers on other days of the week. In addition, the first digit of the selected random number immediately indicates the day of the week on which the trip would be sampled. However, all randomly selected trip serial numbers from the Table of Random Numbers beginning with the numbers 0, 8, or 9 are invalid because there are no days of the week with which they are associated. Four-digit numbers beginning with 0, 8, and 9 are thus disregarded.

5. SELECTING THE SAMPLE. The sample of four trips for a given week is selected from the weekly list of one-way bus trips using a random selection process. The concept of random numbers is very important to the statistical theory on which confidence and precision standards are based. Replacement of a proper random selection process by an informal arbitrary process or by a formal attempt to achieve a representative sample will invalidate the results and thus prevent the data from meeting the statistical standards.

Table III-2

EXAMPLE OF DAY-OF-WEEK NUMBERING METHOD FOR WEEKLY ONE-DAY TRIPS

Day of Week	Trip Serial Numbers by Route Number			Number of Scheduled One-Way Trips	Trip Serial Number Range
	1	2	3		
Monday	001- 115	116- 290	291- 415	415	1001-1415
Tuesday	001- 115	116- 290	291- 415	415	2001-2415
Wednesday	001- 115	116- 290	291- 415	415	3001-3415
Thursday	001- 115	116- 290	291- 415	415	4001-4415
Friday	001- 115	116- 290	291- 415	415	5001-5415
Saturday	001- 085	086- 154	155- 250	250	6001-6250
Sunday	001- 080	081- 141	142- 208	208	7001-7208
Total Range of Weekly Trips					1001-7208 (Valid Number Range)

Random numbers tables are developed through use of specialized computer programs which guarantee that the sequence with which individual digits appear is random. This ensures that blocks of sequential 2, 3, 4, or more digit numbers are also random. In reading the table, leading blanks in the four digit groupings of the table should be read as zeros. Thus a number appearing as (56) should be read as (0056).

The first step in using a random numbers table is to decide on the appropriate number of digits in the random numbers drawn. To illustrate, the third line of Table III-3 can be used to generate a series of two-digit random numbers. In order to make the most of the table, it is best to read numbers in an overlapping fashion. To do this for two-digit numbers, a two-digit long "window" is moved along the line in one-digit steps. The resulting series of two-digit numbers on line three is:

33 34 40 06 63 38 81 15 52 29 93 33 34 42 23 31.

Similarly, the set of three-digit numbers from the same line is:

834 340 406 063 638 381 815 152 529 293 933 334 342.

The same process can be used to produce a series of numbers with any required number of digits.

The technique for selecting four "valid" random numbers (i.e., numbers of trips appearing in the ranges established by the weekly trip list) is virtually the same for both of the trip listing methods described above. However, because the trip numbering methods differ for the two lists, the valid numbers selected from the random numbers tables will also be different.

The number of digits in the trip numbers to be randomly selected will vary among transit agencies. If trips are listed continuously across all days of the week (Method 1), then the number of digits in the random number may range up to five (or even six) digits (e.g., if there are a total of 80,000 (or 100,000) weekly one-way bus trips).

The number of random number digits needed if trips are listed by day (Method 2) will be governed by the maximum number of one-way trips on any day of the week. Thus, if a system operates a maximum of 5,600 daily one-way trips on five days (Monday through Friday), then the number of digits in all random numbers will be five, since an extra "day of the week" digit is added at the beginning of a four-digit trip number.

6. METHOD 1: SELECTING THE SAMPLE FROM CONTINUOUS NUMBERED WEEKLY TRIPS.

Using the data presented in Table III-1 for continuous numbering of a 3-route system, the procedure for selecting the sample of four trips from the weekly list of Trip Serial Numbers is as follows:

- a. Choose any line of digits in the random number table (Table III-3); line 1, for example.
- b. Since the Trip Serial Numbers in the listing of weekly trips (Table III-1) contain four digits, only use sets of four consecutive digits in the random numbers table. (If serial numbers from the trip list had five digits, then sets of five consecutive digits would be selected from Table III-3).

Table III-3

EXAMPLE RANDOM NUMBERS TABLE

3554	4224	3880	8191	7393	9150	6665	1894	2309	5730
9567	2421	5037	9828	2348	7773	9018	5836	2898	3081
8340	6381	5293	3423	1843	2848	8400	2794	7928	9437
6149	5561	1879	9745	469	1045	8725	1111	2984	2056
5960	8196	2942	4521	1658	2548	4026	1544	4773	9130
1977	1512	5685	9033	8195	6118	6283	9884	1748	383
124	1657	3451	3076	4480	7893	6947	2099	7302	552
2955	5730	3423	969	4106	6817	5513	4687	9047	3281
6614	4108	5726	4546	2288	9223	5033	9751	1669	2894
7222	9855	7982	3433	4782	1986	310	1444	6677	660

- c. Read along line 1, from left to right, in "overlapping" sets of four digits until four valid four-digit numbers have been obtained; i.e., each of the four numbers should be within their range of numbers in the list of weekly trips shown in Table III-1. (Each four-digit number overlaps the preceding one, in that the second digit in the initial four-digit number set becomes the first digit in the second four-digit number set, and so forth.)

- d. Reading from Table III-3 (the random numbers table), the first set of four digits is 3554. The second set is 5544 (the first number, 3, is dropped and the number 4 in the next "unused" column is added). Continuing along line 1 the series becomes:

3554 5544 5442 4422 4224 2243 2433 . . .

Referring to the Trip Serial Number listing in Table III-1, the first valid random number (i.e., a number lying in the range of 001-2261) is 2243. The next three valid numbers encountered, in order, are:

- (1) 0819
- (2) 1917
- (3) 1739.

Each of these four-digit numbers is circled in line 1 of Table III-3.

NOTE: Leading zeros in the fields of a random number table are often left as blanks. These blanks should be read as zeros.

- e. The four trips to be surveyed during the week in the example occur on the following days and routes:

- (1) 2243 : Sunday, Route 2
- (2) 0819 : Tuesday, Route 3
- (3) 1917 : Friday, Route 2
- (4) 1739 : Friday, Route 1

By numbering trips in a sequence of days and route numbers, the burden of having to count to determine the specific trip to be surveyed is reduced.

- f. Keep track of the lines and the columns that are used and the first digit of the last valid number identified for the week's sample just selected. For the next week's four-trip sample, begin listing four-digit numbers as described above, but this time, beginning with the next four-digit number following ("overlapping") the four-digit number of the last trip selected for the previous week. Thus, the next week's sample would be drawn from a series of numbers that begins with the following:

7393 3939 9391 3915 9150 1506 5066 . . .

When all of the random number pages in Appendix G have been used, reverse the process starting from the right side of the lines, or use some other technique (e.g., going from the top down by column) that does not retrace the set of numbers previously selected. Under no circumstances should the trip numbers selected for one week, or year, be automatically transferred to the next. If necessary, additional random number tables should be procured to ensure no duplication among weeks and among years.

7. ADDITIONAL COMMENTS.

a. The Daily List.

- (1) Normally, a new summary table of Trip Serial Numbers will not have to be developed every week. As long as the schedules remain the same, the scheduled Trip Serial Numbers will remain the same.
- (2) In general, any process that assigns a unique number to a bus trip is acceptable. If the serial numbers have a large number of digits, it becomes more difficult to find them in the table of random numbers.

b. Sample Selection Process.

- (1) A sample selection process that appears to provide "more representative" trips must not be substituted. Doing so may inadvertently introduce biases that cannot be evaluated by standard statistical methods. If another trip selection process is used, be sure that it can be demonstrated to be a random process and that it yields estimates within the prescribed limits specified in Chapter I of this circular.
- (2) The random selection process automatically distributes trips according to time period, so that there is adequate representation in peak periods. This is another reason for strict adherence to the random sampling process.
- (3) If for some reason a trip selected for the sample is eliminated from the schedule or terminated due to breakdown, an additional trip should be sampled during the next week. (Sometimes the scheduling of surveyors may require a lapse of two or three weeks before the missed trip can be replaced.)

- (4) For surveyor scheduling purposes, the samples may need to be chosen well in advance of the days on which the surveys are to be taken. This is acceptable if the scheduled daily trips are reasonably constant. If major scheduling changes occur, however, the sample should be redrawn.
- (5) When constructing the week's trip list, replace "normal" day's trips with the holiday trip schedule when appropriate. For example, if Christmas were to fall on a Sunday, and workers have Monday off, then two consecutive weeks' samples should have revised (holiday) schedules on one of their days:

In one week, the Sunday (day 7) would run on a holiday trip schedule; and in the new week, Monday (day 1) would have a holiday schedule.

- (6) Sampling theory assures that the sampling procedures apply to any size agency.
- (7) The random selection of the trips assures equal likelihood of inclusion of any trip operating on the same route (e.g., zonal, express or short-turns).

8. METHOD 2: SELECTING THE SAMPLE FROM WEEKLY TRIPS NUMBERED BY DAY. The same procedures and guidelines set forth for sample selecting using continuous numbering of weekly trips apply to weekly trips lists derived based on days of the week. For example, using another random number listing (Table III-4) and the trip list in Table III-2 to demonstrate, we begin on line 1, listing four-digit numbers in sequence.

2078 0784 7845 8459 4596 5964 . . .

Only those four-digit numbers are valid whose remaining three digits are less than or equal to the maximum numbers of trips on the day indicated by the first digit. Thus, the first number derived from line 1 in Table III-4, 2078, is valid since it lies in the valid range of numbers (2001-2415) for Tuesday, as indicated in Table III-2. The next three valid numbers on line 1 of Table III-4 are:

- a. 4008
- b. 5161
- c. 6114

The four valid numbers are circled on Table III-4.

According to the trip list in Table III-2, the four trips to be surveyed are:

- a. 2078 Tuesday, Route 1
- b. 4003 Thursday, Route 1
- c. 5161 Friday, Route 2
- d. 6114 Saturday, Route 1.

To determine which trips (i.e., routes, times of departure and directions) are to be surveyed each week, the trips from the schedules have to be counted in the same order as when the original ranges of trip serial numbers were established for the weekly trips lists. As the randomly selected trip numbers are each reached on the schedules for the appropriate routes and days, they are noted and scheduled for survey. Thus, using the above example, the 78th trip on Route 1 on Tuesday would be sampled; the 8th trip on Route 1 on Thursday would be sampled; the 161st trip on Route 2 on Friday would be sampled; and the 114th trip on Route 1 on Saturday would be sampled.

Table III-4

CHAPTER IV

COLLECTING THE DATA

1. DATA ITEMS TO BE COLLECTED. The data collected from sampled trips are sufficient to enable a transit agency to derive annual estimates of the following required Section 15 report items:
 - a. Unlinked Passenger Trips
 - b. Passenger Miles
 - c. Passengers Boarded
 - d. Trips in Sample
 - e. Total Number of Bus Trips
 - f. Unlinked Passengers per Trip
 - g. Passenger Miles per Trip.

2. GENERAL PROCEDURE. The procedure for collecting unlinked passenger trip and passenger mile data requires that surveyors ride the buses on the four trips selected in the weekly sample, and that they record the number of passengers that board and alight the bus at each bus stop. Note that in the survey process, the passengers are not contacted in any way. The surveyor is positioned on the bus so that all boarding and alighting passengers can be observed and accurately counted. During peak hours and on crowded runs, two surveyors may be needed. Distances between consecutive stops are determined either directly from the bus odometer readings, by retracing the trip by automobile and recording the odometer readings, or by any other means that gives accurate measurements. To ensure that the total passenger mile estimate is valid, it is absolutely necessary that the distance between stops be accurately known. The sampling of on-off counts, farebox revenue and distances between stops provides the survey information needed to estimate annual passenger trips and passenger miles for the whole system.

3. THE SURVEY TRIP SHEET. A form, the "Survey Trip Sheet," that may be used to collect the data is contained in Appendix C. It is suggested that this form be studied carefully before reading the following instructions. A completed example Survey Trip Sheet is also provided in Appendix C to demonstrate the steps described below.

4. PRE-SURVEY PROCEDURES. A separate Survey Trip Sheet should be used for each bus trip sampled. If the trip involves more stops than can be recorded on a single page, additional pages should be used, and the

page numbers should be written in the upper right-hand corner (Page of). Each surveyor should carry several extra sheets in the event that additional pages are required. Before the survey trip begins, the surveyor should fill in the following items on the Survey Trip Sheet:

- a. Date - The date the survey is taken.
- b. Day of Week - The day of the week that the survey is taken. If the day is a holiday, place a check (X) in the "holiday" blank, in addition to noting the day of the week.
- c. Trip Serial Number - The number given to each trip on the weekly trip list (see Chapter III).
- d. Direction of Travel - Inbound, outbound, westbound, or other such designation.
- e. Time Period - The period during which the sampled trip begins:
 - (1) A.M. Peak
 - (2) Midday
 - (3) P.M. Peak
 - (4) Night
 - (5) Saturday
 - (6) Sunday
- f. Route Number - The officially designated route number.
- g. Farebox Reading - The reading on the farebox before the first passenger boards at the start of the trip. (This is written down only if registering fareboxes are used.)
- h. Number of Passengers - The number of passengers who boarded the vehicle at the originating stop should be recorded in column (11). Include any passengers who might have stayed on board from the previous trip.
- i. At subsequent points where the bus stops to let passengers on or off during the trip, record the following information:
 - (1) The stop number in column (8).
 - (2) The stop name or description in column (9).

- (3) The odometer reading in column (10). If the bus has no odometer, or if the driver is too busy to call out the readings, then column (10) should be left blank and filled in later based on a field check or a review of detailed schedule sheets.
 - (4) The number of passengers boarded in column (11).
 - (5) The number of passengers alighting in column (12).
- j. Between stops, count the number of passengers onboard and enter it in column (13). This recording should agree with the following calculation:
- (1) passengers on-board between previous two stops
 - (2) plus passengers who boarded at last stop
 - (3) minus passengers who alighted at last stop.

For example, in the Survey Trip Sheet in Appendix C, there were 25 passengers on-board between stops #3 and #4. At stop #4, 14 boarded and 2 alighted; therefore, the number on-board between stops #4 and #5 should be:

$$25 + 14 - 2 = 37$$

This number should check with an actual head count after stop #4. It is important to check the number on board whenever possible, because this is the key number in estimating passenger miles.

- k. At the last stop, indicate on the worksheet that this is where the survey trip ended (as shown in the Survey Trip Sheet example) and record the ending farebox reading (if a registering farebox is used) in item (16). Record the total revenue collected on the trip in item (17). This amount is calculated by subtracting the beginning farebox reading from the ending farebox reading if a recording farebox is used on the trip. Otherwise, another method must be used to determine the revenues collected on the trip (e.g., issuing the checker's portable substitute farebox that would be emptied and counted after each sampled trip).

5. POST-SURVEY PROCEDURES. The remaining columns and totals should be completed back at the office.
- a. If two surveyors are used, combine the results of the two Survey Trip Sheets into a single one. Usually, the only additional data that the rear-door surveyor will have is the rear-door alighting count, column (12). However, that surveyor should also be recording items (8), (9), and (13) so that these can be checked with the front-door surveyor.
 - b. Determine the distance between stops, column (14), from the bus odometer readings. If the bus odometer readings cannot be obtained, determine the distance from system records, a map, or by retracing the route by automobile, or by a combination of all three. Map distances alone may not be accurate if the route involves a large proportion of curved streets typical of some suburban areas.
 - c. For each between-stop distance, multiply the number of passengers on board, column (13), by the distance between stops, column (14), to get the passenger miles between two stops. Record the results in column (15) for each between-stop distance.
 - d. Add the columns specified by the numbers in parentheses at the bottom of the trip sheet.

(18) = column (11) sum = total passengers boarded.

(19) = column (15) sum = total passenger miles for the trip.

Items (18) and (19) are next recorded on the Weekly Record Sheet, as described in Chapter 6 and shown in Appendix D.
 - e. If a selected trip is not operated or if an assigned surveyor misses a trip which does operate, a replacement trip should be added to the following week's four scheduled trips. The replacement must be randomly selected.

CHAPTER V

RECORDING AND ACCUMULATING SURVEY RESULTS

1. THE PURPOSE OF WEEKLY ACCUMULATION. The following procedures may be used to record and accumulate the survey results on a weekly basis. The procedures are designed so that, at the end of each year, the annual Section 15 passenger trips and passenger miles data can be prepared directly from the final (52nd) Weekly Record Sheet.
2. THE WEEKLY RECORD SHEET. The form for recording the survey results from a weekly sample of trips is called the "Weekly Record Sheet." A blank form and a partially completed form are provided in Appendix D.
3. RECORDING THE SURVEY RESULTS. The following discussion references the completed Survey Trip Sheet and Weekly Record Sheet in Appendix C and Appendix D, respectively.

The Weekly Record Sheet records the totals on the Survey Trip Sheets--i.e., items (18) and (19)--for each of the four sampled weekly trips. On the Weekly Record Sheet shown, note that the circled number 49 under column (5) "Passengers Boarded" corresponds to 49 passengers boarded--item (18)--on the Survey Trip Sheet. Similarly, the circled number 304.4 under column (6) "Passenger Miles" on the Weekly Record Sheet corresponds to the total passenger miles--item (19)--on the Survey Trip Sheet, and so on. Note that the day Trip Serial Number for each of the sample trips are recorded. In addition, the Serial Number may indicate the day of week on which the sample was taken. Direction of travel may also be indicated if the trip numbering method is designed to do so by the operator (e.g., odd numbers inbound, even westbound).

A notation for "Holiday" is recorded (checked) only for a trip sampled on a holiday. This item is not required, but it may be useful for internal agency purposes.

The procedure requires the recording of the revenue, boarding and passenger mile totals from each of the four Survey Trip Sheets for a week on the Weekly Record Sheet. Data for the example Trip Sheet in Appendix C appear in the first row of the example Weekly Record Sheet. (A fifth line is provided in the Weekly Record Sheet for weeks when an additional sample trip is required because of a change in fare structure, policy, and/or missed runs.)

The other data in the example Weekly Record Sheet represent three other hypothetical surveys taken during one week. Note that one trip sampled in the example is shown to be on a holiday, but its data are treated just like data from all other sampled trips.

4. ACCUMULATING THE RESULTS. A week's sampling should be totaled and averaged on the Weekly Record Sheet. (Note that "totals" are appropriate for "passengers boarded," "passenger miles," "revenue collected," and "number of trips sampled," while "averages" are appropriate for "revenues per passenger" and "revenues per passenger mile.")

The process of weekly accumulation can save time at the end of the year when the UMTA Section 15 report is due. Keep a running total of the results. The estimates of annual passenger trips (boarding) and passenger miles are derived from UMTA Annual Reporting requirements from the last three columns on the final Weekly Record Sheet for the fiscal year. The steps in the derivations are given in the following chapter of this circular.

Finally, it is noted that data are accumulated from one week to the next only up to the point of a change in fare policy. The cumulative process should be started anew at the time that any fare change is introduced. In that way, passengers and passenger miles are calculated separately for each so-defined period during the year and then summed for all periods to arrive at annual totals and cumulative averages at the end of the fiscal year.

7-22-88

CHAPTER VI

COMPUTING ANNUAL PASSENGER TRIPS, PASSENGER MILES

1. USING WEEKLY RECORD SHEETS TO PRODUCE ANNUAL ESTIMATES. Cumulative information from the Weekly Record Sheets is used to estimate the number of passengers boarded and passenger miles for the year. If the fiscal year has more than one sampling period (i.e., if there is a fare change), then the estimates of total passenger trips and passenger miles must be done separately by sampling periods and then added to arrive at fiscal year totals.
2. ESTIMATING ANNUAL UNLINKED PASSENGER TRIPS. Passenger trips for each fiscal year are estimated by dividing the "total annual system-wide farebox revenues" derived from all trips eligible to be sampled (including trips actually sampled) by the final cumulative average "revenue per passenger" derived from the last Weekly Record Sheet of the fiscal year:

$$\begin{array}{l} \text{ESTIMATED UNLINKED} \\ \text{PASSENGER TRIPS} \end{array} = \frac{\text{Total Annual System Farebox Revenue}}{\text{Cumulative Average Farebox Revenue Per Unlinked Passenger Trip}}$$

It should be emphasized that passenger revenue collected through passes, tokens, or other payment mechanisms for which there is no on-board fare collection are to be excluded from the annual total of system-wide farebox revenue. Revenue collected aboard trips which are not eligible to be sampled must likewise be excluded.

Note that the form shown in Figure VI-1 and Appendix E is designed to accommodate five separate sampling periods plus the annual totals and averages. Each of the data items appearing on the form should be filled out for all sampling periods as might exist in any given year (as determined by the occurrence of fare changes). Any extra periods on the form should be crossed out (X), and the spaces for data below them not used. If the number of periods in the year exceeds five, then additional forms should be added as required and numbered accordingly.

3. ESTIMATING ANNUAL PASSENGER MILES. An estimate of passenger miles for the fiscal year is obtained by dividing the total annual system farebox revenue by the final cumulative average "revenue per passenger mile" derived from the last Weekly Record Sheet of the fiscal year:

$$\text{ESTIMATED UNLINKED PASSENGER MILES} = \frac{\text{Total Annual System Farebox Revenue}}{\text{Cumulative Average Farebox Revenue Per Passenger Mile}}$$

If separate sampling periods are necessary, passenger miles should be calculated in the same way as was described above for passenger trips, i.e., by summing individual estimates across periods for the fiscal year.

4. ALLOCATION OF ANNUAL TOTALS TO TIME PERIODS. Once these annual totals for passenger trips and passenger miles are calculated, the allocation of each among time periods and/or days (according to the definitions of time periods in Appendix A and the UMTA Section 15 reporting forms 406 and 406A) can be done.

The allocation approach is to assign the year's total unlinked trips and passenger miles to the six time periods according to the proportions of sampled unlinked trips and passenger miles in each of the time periods. To distribute passenger boardings by time period (Y), for example, the following procedure is used:

$$\begin{array}{l} \text{NUMBER OF} \\ \text{PASSENGER TRIPS} \\ \text{IN TIME} \\ \text{PERIOD "Y"} \end{array} = \begin{array}{l} \text{Estimated} \\ \text{Total Annual} \\ \text{Passenger Trips} \end{array} \times \frac{\begin{array}{l} \text{Annual Sampled} \\ \text{Boardings in} \\ \text{Time Period "Y"} \end{array}}{\begin{array}{l} \text{Total Annual} \\ \text{Sampled Boardings} \end{array}}$$

where "Estimated Total Annual Passenger Trips" is derived from the procedure described above, and the "Annual Sampled Boardings" and "Annual Sampled Boardings by Time Period 'Y'" can be determined from the Weekly Record Sheets.

Similarly, for estimating passenger miles by time period, the following relationship is used:

$$\begin{array}{l} \text{NUMBER OF} \\ \text{PASSENGER MILES} \\ \text{IN TIME PERIOD "Y"} \end{array} = \begin{array}{l} \text{Estimated} \\ \text{Total Annual} \\ \text{Passenger Miles} \end{array} \times \frac{\begin{array}{l} \text{Annual Sampled} \\ \text{Passenger Miles} \\ \text{in Time Period "Y"} \end{array}}{\begin{array}{l} \text{Total Annual Sampled} \\ \text{Passenger Miles} \end{array}}$$

Note that passenger mile data are not required for Section 15 reporting by average weekday time periods but by average weekday, Saturday, and Sunday totals only.

APPENDIX A
DETERMINATION OF TIME PERIODS

A form for indicating your service periods appears on the next page. The following definitions apply to that form.

SERVICE TIMES

Time A.M. Service Begins - The earliest time in the morning when a bus begins its first trip after the break between night service and morning service. For 24-hour service, assume that service begins at 2400.

Time A.M. Peak Begins - The time in the morning when additional service is provided to handle higher passenger volumes.

Time Midday Begins - The time in the morning when normal scheduled (base) headways are resumed.

Time P.M. Peak Begins - The time in the afternoon or evening when service is again increased to handle higher passenger volumes.

Time Night Service Begins - The time in the evening when the P.M. peak ends and normal scheduled night headways are begun.

Time Night Service Ends - The time that the last bus ends its last trip. This may be in the early morning (e.g., 2:00 A.M.). For 24-hour service, assume that night service ends at 2400.

SERVICE PERIODS

A.M. Peak - The period between the time when A.M. Peak service begins and the time when Midday service begins.

Midday - The period between the time when Midday service begins and P.M. Peak service begins.

P.M. Peak - The period between the time when P.M. Peak service begins and Night service begins.

Night - The period between the time Night service begins and A.M. Peak service begins. Note that this includes part of the early morning service just before the A.M. peak.

CLASSIFICATION OF BUS TRIPS

A bus trip is classified into one of the four time periods listed above according to the time when the trip begins. All trips are classified into the time period when the trips begin even though they may be regarded as being in the "base schedule."

APPENDIX E

WORKSHEET FOR CALCULATING ANNUAL PASSENGER TRIPS AND PASSENGER MILES

YEAR: 19 _____ SAMPLING PERIOD: Start Date: _____ End Date: _____	_____	_____	_____	ANNUAL TOTAL (SUM OF PERIODS)
(A) Farebox Revenue (\$)	_____	_____	_____	_____
(B) Cumulative Revenue per Passenger Trip (\$/pass) for Period	_____	_____	_____	_____
(C) Cumulative Revenue per Passenger-Mile (\$/pass-mi) for Period	_____	_____	_____	_____
(D) Estimated System Passenger Trips ((A) divided by (B))	_____	_____	_____	_____
(E) Estimated System Passenger-Miles ((A) divided by (C))	_____	_____	_____	_____

* Separate sampling periods should be used only if a change in fare level or fare structure, or a major service change has occurred during the year. Otherwise the year should be treated as a single period and only the first column should be used.
