

**Table 111. Age-Adjusted Death Rates by Sex, Race, and Hispanic Origin: 1970 to 2008**

[Age-adjusted rates per 100,000 population. Age-adjusted death rates are better indicators than crude death rates for showing changes in the risk of death over time when the age distribution of the population is changing, and for comparing the mortality of population subgroups that have different age compositions. Populations enumerated as of April 1 for census years and estimated as of July 1 for all other years. Excludes deaths of nonresidents of the United States. Data for Hispanic-origin and specified races other than White and Black should be interpreted with caution because of inconsistencies reporting race on death certificates and on censuses and surveys. See text this section and Appendix III]
