

# **Cost and Quality of Fuels for Electric Plants**

## **2009**

**November 2010**

**U.S. Energy Information Administration**  
Assistant Administrator for Energy Statistics  
Office of Electricity, Renewables, and Uranium Statistics  
U.S. Department of Energy  
Washington DC 20585

**This report is only available online at:**  
**[http://www.eia.gov/cneaf/electricity/cq/cq\\_sum.html](http://www.eia.gov/cneaf/electricity/cq/cq_sum.html)**

This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the Department of Energy or other Federal agencies.

## **Preface**

## **Background**

The *Cost and Quality of Fuels for Electric Plants* reports have been prepared in the past by the Electric Power Division (EPD) within the Office of Coal, Nuclear, Electric and Alternate Fuels (CNEAF), U.S. Energy Information Administration (EIA), U.S. Department of Energy (DOE). Due to a reorganization within EIA, the 2010 edition (which includes 2009 data) and subsequent reports are being prepared by the Electric Power Operations Team within the Office of Electricity, Renewables, and Uranium Statistics (ERUS) under the Assistant Administrator for Energy Statistics, EIA. This publication provides information concerning the quality, quantity, and cost of fossil fuels used by U.S. electric power generating plants for both electric power generation and, in the case of a combined heat and power plant, useful thermal output. These plants are comprised of regulated utility power plants and independent power producers, including combined heat and power producers in the commercial and industrial sectors. This publication continues the coverage of fuel cost and quality data presented in previous annual *Cost and Quality of Fuels for Electric Plants* reports.

## **Data Sources and Coverage**

The information contained in previous reports was compiled from three separate surveys: the Federal Energy Regulatory Commission (FERC) Form 423, "Monthly Report of Cost and Quality of Fuels for Electric Plants," the EIA Form EIA-423, "Monthly Cost and Quality of Fuels for Electric Plants Report," and Schedule 2 of Form EIA-923, "Power Plant Operations Report." In 2008, EIA made significant changes to its data collection vehicles and the 423 forms were subsumed under the then new Form EIA-923. In this publication, 2009 data are provided solely by Schedule 2 of Form EIA-923. The geographic coverage of all three surveys includes the contiguous United States, Alaska, Hawaii, and the District of Columbia.

In prior *Cost and Quality of Fuels for Electric Plants* reports, two sets of tables were presented for most of the detailed data, i.e. Table A and Table B. Table A covered the latest year of final data while Table B covered the previous year. Beginning with this report, the B Tables will no longer be presented. All prior year reports are available at the following website:

[http://www.eia.gov/cneaf/electricity/cq/cq\\_sum.html](http://www.eia.gov/cneaf/electricity/cq/cq_sum.html).

For a discussion on the Instrument and Design History for the data contained in this report, please see Appendix A, "Technical Notes."

Please note that the cost data from unregulated plants are protected and not disclosed to the public. This may result in the appearance of a 'W' (for withheld) in a State-level table where suppression rules apply. (See suppression rules methodology: "Policy on the Disclosure of Individually Identifiable Energy Information in the Possession of the EIA" [45 Federal Register 59812, 1980].)

## **Data Download**

The data used to produce this report, other than withheld cost information, are available as Excel files at the following url: <http://www.eia.gov/cneaf/electricity/page/eia423.html>.

## **Display of Average Fuel Cost Information**

Due to the detailed nature of some of the information presented in the *Cost and Quality of Fuels for Electric Plants 2009* tables (i.e., where fuel rank, mine type, or purchase type are presented), the sensitivity of the cost information dictates that a significant amount of information be withheld. In order to provide as much meaningful cost information as possible, the average costs presented for these levels of detail include only the costs submitted by the regulated (utility) plants. Notes have been provided for each table to assist with the interpretation of the information presented. Wherever possible, State- and national-level aggregations are published if sufficient data are available to avoid disclosure of individual company plant-level costs.

## **Publication Contacts:**

Questions of a general nature concerning this report should be directed to:

Channele Wirman, Project Leader  
(202) 586-5356  
email: channele.wirman@eia.gov

Specific questions about the data should be directed to:

Rebecca Peterson  
(202) 586-4509  
email: rebecca.peterson@eia.gov

## **Quality**

The U.S. Energy Information Administration is committed to quality products and service. To ensure that this report meets the highest standards for quality, please forward your comments or suggestions about this publication to Rebecca Peterson at (202) 586-4509, or email: [rebecca.peterson@eia.gov](mailto:rebecca.peterson@eia.gov). For general inquiries about energy data, please contact the National Energy Information Center at (202) 586-8800, or email: [infoctr@eia.gov](mailto:infoctr@eia.gov).

## **Summary Tables**

**Table ES1. Receipts of Fossil Fuels by Type of Fuel, 2009**

Type of Fuel	Total All Sectors	Electric Power Sector		Commercial Sector <sup>1</sup>	Industrial Sector <sup>2</sup>
		Electric Utilities	Independent Power Producers		
<b>Total Coal (thousand tons)<sup>3</sup></b> .....	<b>981,477</b>	<b>719,253</b>	<b>240,687</b>	<b>1,876</b>	<b>19,661</b>
Bituminous <sup>4</sup> .....	418,688	322,426	81,473	1,394	13,395
Subbituminous .....	484,007	362,141	115,339	482	6,045
Lignite .....	64,966	34,030	30,933	--	3
<b>Total Petroleum (thousand barrels)</b> .....	<b>88,951</b>	<b>52,122</b>	<b>20,066</b>	<b>628</b>	<b>16,135</b>
Petroleum Liquids .....	54,181	32,959	11,408	583	9,232
Residual .....	35,497	22,441	7,285	228	5,543
Distillate <sup>5</sup> .....	14,980	9,322	2,813	355	2,489
Other Fuel Oil <sup>6</sup> .....	3,705	1,195	1,309	*	1,200
Petroleum Coke <sup>7</sup> .....	34,769	19,163	8,659	45	6,903
<b>Total Natural Gas (Thousand Mcf)<sup>8</sup></b> .....	<b>8,118,550</b>	<b>2,962,640</b>	<b>3,987,721</b>	<b>79,308</b>	<b>1,088,880</b>

<sup>1</sup> Commercial combined-heat-and-power (CHP) and commercial electricity-only plants.

<sup>2</sup> Industrial combined-heat-and-power (CHP) and industrial electricity-only plants.

<sup>3</sup> Includes anthracite, bituminous coal, subbituminous coal, lignite and waste coal; includes imported coal as well as domestic production.

<sup>4</sup> Includes anthracite.

<sup>5</sup> Distillate fuel oil (all diesel and No. 1, No. 2, and No. 4 fuel oils).

<sup>6</sup> Other Fuel Oil includes jet fuel, kerosene, and waste oil data.

<sup>7</sup> Petroleum coke (converted to liquid petroleum equivalent). As stated in the EIA Glossary (<http://www.eia.doe.gov/cneaf/electricity/page/glossary.html>), in order to convert petroleum coke to the liquid petroleum equivalent, the quantity conversion is 5 barrels (42 U.S. gallons per barrel) per short ton (2,000 pounds). Coke from petroleum has an average heating value of 6,024 million Btu per barrel.

<sup>8</sup> Natural gas, including a small amount of supplemental gaseous fuels that cannot be identified separately. Natural gas values do not include blast furnace gas or other manufactured gases.

\* = Value is less than half of the smallest unit of measure (e.g., for values with no decimals, the smallest unit is "1" and values under 0.5 are shown as "\*".)

Notes: • Totals may not equal sum of components because of independent rounding. • Monetary values are expressed in nominal terms.

W = Withheld to avoid disclosure of individual company data.

Notes: • Includes anthracite, bituminous coal, subbituminous coal, lignite, and waste coal. • Totals may not equal sum of components because of independent rounding. • The cost of coal receipts displayed for the States of Virginia, Florida, Ohio, Kentucky, Tennessee, Michigan, and Alabama may not represent the total average delivered cost of coal for these States and their respective Census Divisions. In some instances, coal is delivered to a transfer facility prior to being delivered to the power plant. The costs presented in this table is the initial delivery costs, not any additional costs incurred to deliver the coal from the transfer facility to the power plant site. • Monetary values are expressed in nominal terms.

<sup>1</sup> Represents imputed data. Beginning in 2008, the receipts and cost data are imputed for plants between 1 and 50 megawatts.

NM = Not meaningful due to large relative standard error or excessive percentage change.

Notes: • Includes anthracite, bituminous coal, subbituminous coal, lignite, and waste coal. • Includes imported coal as well as domestic production. • Receipts include data supplied by both regulated and unregulated plants.

Average delivered cost of fuel includes data supplied by regulated plants only. • Totals may not equal sum of components because of independent rounding. • The cost of coal receipts displayed for the States of Virginia, Florida, Ohio, Kentucky, Tennessee, Michigan, and Alabama may not represent the total average delivered cost of coal for these States and their respective Census Divisions. In some instances, coal is delivered to a transfer facility prior to being delivered to the power plant. The costs presented in this table include the initial delivery costs, not any additional costs incurred to deliver the coal from the transfer facility to the power plant site. • Monetary values are expressed in nominal terms.

<sup>1</sup> Represents coal purchased directly from preparation plants where originating mine cannot be identified.

<sup>2</sup> Represents imputed data. Beginning in 2008, the receipts and cost data are imputed for plants between 1 and 50 megawatts.

NM = Not meaningful due to large relative standard error or excessive percentage change.

Notes: • Includes anthracite, bituminous coal, subbituminous coal, lignite, and waste coal. • Includes imported coal as well as domestic production. • Receipts include data supplied by both regulated and unregulated plants.

Average delivered cost of fuel includes data supplied by regulated plants only. • Totals may not equal sum of components because of independent rounding. • The cost of coal receipts displayed for the States of Virginia, Florida, Ohio, Kentucky, Tennessee, Michigan, and Alabama may not represent the total average delivered cost of coal for these States and their respective Census Divisions. In some instances, coal is delivered to a transfer facility prior to being delivered to the power plant. The costs presented in this table include the initial delivery costs, not any additional costs incurred to deliver the coal from the transfer facility to the power plant site. • Monetary values are expressed in nominal terms.

<sup>1</sup> Includes anthracite.

<sup>2</sup> Includes waste coal not included elsewhere in this table; includes imported coal as well as domestic production.

NM = Not meaningful due to large relative standard error or excessive percentage change.

W = Withheld to avoid disclosure of individual company data.

Notes: • Receipts, heat value, and total average delivered cost include data supplied by both regulated and unregulated plants. Average delivered cost for Bituminous, Subbituminous, and Lignite include data supplied by regulated plants only. • Totals may not equal sum of components because of independent rounding. • The cost of coal receipts displayed for the States of Virginia, Florida, Ohio, Kentucky, Tennessee, Michigan, and Alabama may not represent the total average delivered cost of coal for these States and their respective Census Divisions. In some instances, coal is delivered to a transfer facility prior to being delivered to the power plant. The costs presented in this table include the initial delivery costs, not any additional costs incurred to deliver the coal from the transfer facility to the power plant site. • Monetary values are expressed in nominal terms.

NM = Not meaningful due to large relative standard error or excessive percentage change.

W = Withheld to avoid disclosure of individual company data.

Notes: • Includes distillate fuel oil (all diesel and No. 1, No. 2, and No. 4 fuel oils), residual fuel oil (No. 5 and No. 6 fuel oils and bunker C fuel oil), jet fuel, kerosene, and waste oil. • Totals may not equal sum of components because of independent rounding. • Monetary values are expressed in nominal terms.

<sup>1</sup> Represents imputed data which includes plants below 50 megawatts and missing data. Beginning in 2008, the receipts and cost data are imputed for plants between 1 and 50 megawatts.

NM = Not meaningful due to large relative standard error or excessive percentage change.

Notes: • Distillate fuel oil includes all diesel, No. 1, No. 2, and No. 4 fuel oils. • Receipts include data supplied by both regulated and unregulated plants. Average delivered cost of fuel includes data supplied by regulated plants only. • Totals may not equal sum of components because of independent rounding. • Monetary values are expressed in nominal terms.

<b>U.S. Total.....</b>	<b>6,954</b>	<b>34,769</b>	<b>7,040</b>	<b>35,202</b>

Notes: • As stated in the EIA Glossary (<http://www.eia.doe.gov/cneaf/electricity/page/glossary.html>), in order to convert petroleum coke to the liquid petroleum equivalent, the quantity conversion is 5 barrels (42 U.S. gallons per barrel) per short ton (2,000 pounds). Coke from petroleum has an average heating value of 6,024 million Btu per barrel. • Totals may not equal sum of components because of independent rounding.

<sup>1</sup> Represents imputed data. Beginning in 2008, the receipts and cost data are imputed for plants between 1 and 50 megawatts.

\* = Value is less than half of the smallest unit of measure (e.g., for values with no decimals, the smallest unit is "1" and values under 0.5 are shown as ".")

NM = Not meaningful due to large relative standard error or excessive percentage change.

Notes: • Totals may not equal sum of components because of independent rounding. • Monetary values are expressed in nominal terms.

<sup>1</sup> Distillate fuel oil includes all diesel, No. 1, No. 2, and No. 4 fuel oils.

<sup>2</sup> Residual fuel oil includes No. 5 and No. 6 fuel oils and bunker C fuel oil.

<sup>3</sup> Also includes jet fuel, kerosene, and waste oil.

NM = Not meaningful due to large relative standard error or excessive percentage change.

W = Withheld to avoid disclosure of individual company data.

Notes: • Receipts, heat value, and total average delivered cost include data supplied by both regulated and unregulated plants. Average delivered cost for distillate and residual fuel oil include data supplied by regulated plants only. • Totals may not equal sum of components because of independent rounding. • Monetary values are expressed in nominal terms.

<sup>1</sup> Represents imputed data which includes plants below 50 megawatts and missing data. Beginning in 2008, the receipts and cost data are imputed for plants between 1 and 50 megawatts. NM = Not meaningful due to large relative standard error or excessive percentage change.

Notes: • Natural gas, including a small amount of supplemental gaseous fuels that cannot be identified separately. Natural gas values do not include blast furnace gas or other manufactured gases. • Receipts and total average delivered cost include data supplied by both regulated and unregulated plants. Average delivered cost for firm, interruptible, and unclassified delivery types include data supplied by regulated plants only. • Totals may not equal sum of components because of independent rounding. • Monetary values are expressed in nominal terms.

<sup>1</sup> Represents imputed data which includes plants below 50 megawatts and missing data. Beginning in 2008, the receipts and cost data are imputed for plants between 1 and 50 megawatts. NM = Not meaningful due to large relative standard error or excessive percentage change.

Notes: • Natural gas, including a small amount of supplemental gaseous fuels that cannot be identified separately. Natural gas values do not include blast furnace gas or other manufactured gases. • Receipts and total average delivered cost include data supplied by both regulated and unregulated plants. Average delivered cost for firm, interruptible, and unclassified delivery types include data supplied by regulated plants only. • Totals may not equal sum of components because of independent rounding. • Monetary values are expressed in nominal terms.

Source: U.S. Energy Information Administration, Form EIA-923, "Power Plant Operations Report."

## **Origin and Destination of Coal**

<sup>1</sup> Represents imputed data. Beginning in 2008, the receipts and cost data are imputed for plants between 1 and 50 megawatts.

NM = Not meaningful due to large relative standard error or excessive percentage change.

W = Withheld to avoid disclosure of individual company data.

Notes: • Includes anthracite, bituminous coal, subbituminous coal, lignite, and waste coal. • Receipts, heat value, sulfur, ash, and average delivered cost of fuel at the destination include data supplied by both regulated and unregulated plants. Average delivered cost of fuel at the origin includes data supplied by regulated plants only. • Totals may not equal sum of components because of independent rounding. • The cost of coal receipts displayed for the States of Virginia, Florida, Ohio, Kentucky, Tennessee, Michigan, and Alabama may not represent the total average delivered cost of coal for these States and their respective Census Divisions. In some instances, coal is delivered to a transfer facility prior to being delivered to the power plant. The costs presented in this table include the initial delivery costs, not any additional costs incurred to deliver the coal from the transfer facility to the power plant site. • Monetary values are expressed in nominal terms

Source: U.S. Energy Information Administration, Form EIA-923, "Power Plant Operations Report."

**Table 16. Origin and Destination of Coal to Electric Plants By State: Total (All Sectors), 2009**

<sup>1</sup> Represents imputed data. Beginning in 2008, the receipts and cost data are imputed for plants between 1 and 50 megawatts.

NM = Not meaningful due to large relative standard error or excessive percentage change.

Notes: • Includes anthracite, bituminous coal, subbituminous coal, lignite, and waste coal. • Receipts, heat value, sulfur, ash, and average delivered cost of fuel at the origin include data supplied by both regulated and unregulated plants. Average delivered cost of fuel at the destination includes data supplied by regulated plants only. • Totals may not equal sum of components because of independent rounding. • The cost of coal receipts displayed for the States of Virginia, Florida, Ohio, Kentucky, Tennessee, Michigan, and Alabama may not represent the total average delivered cost of coal for these States and their respective Census Divisions. In some instances, coal is delivered to a transfer facility prior to being delivered to the power plant. The costs presented in this table include the initial delivery costs, not any additional costs incurred to deliver the coal from the transfer facility to the power plant site. • Monetary values are expressed in nominal terms.

<b>U.S. Total.....</b>	*	*	2	1	1	1	1	1	2	2	*	*

\* = Value is less than half of the smallest unit of measure (e.g., for values with no decimals, the smallest unit is "1" and values under 0.5 are shown as "\*".)

Notes: • Relative Standard Error is designed to indicate error due to sampling. However, nonsampling error is important for all surveys, census or sample. See Technical Notes for further information. • Beginning in 2008, receipts and average delivered costs are imputed for plants under 50 MW. Purchase type, mine type, and coal origin state are unavailable for these data.

Note:

## **B. Technical Notes**

This appendix describes how the U.S. Energy Information Administration (EIA) collects, estimates, and reports electric power data in the *Cost and Quality of Fossil Fuels for Electric Plants* reports. Following is a description of the ongoing data quality efforts and sources of data.

## **Data Quality**

The *Cost and Quality of Fuels for Electric Plants* reports have been prepared in the past by the Electric Power Division (EPD) within the Office of Coal, Nuclear, Electric and Alternate Fuels (CNEAF), U.S. Energy Information Administration (EIA), U.S. Department of Energy (DOE). Due to reorganization within EIA, the 2010 edition (which includes 2009 data) and subsequent reports are being prepared by the Electric Power Operations Team within the Office of Electricity, Renewables, and Uranium Statistics (ERUS) under the Assistant Administrator for Energy Statistics, EIA. The ERUS office performs routine reviews of the data collected and the forms on which they are collected. Additionally, to assure that the data are collected from the complete set of respondents, ERUS routinely reviews the frames for each data collection.

## **Unified Data Submission Process**

Data submitted to EIA are either received on paper forms or entered directly by respondents into CNEAF's Internet Data Collection (IDC) System. Hard copy forms are keyed by EIA into the IDC. All data are subject to review via edits built into the IDC, additional quality assurance reports, and review by subject matter experts. Questionable data values are verified through contacts with respondents. Also, survey non-respondents are identified and contacted.

Initial edit checks of the data are performed through the IDC by the respondent. Other program edits include both deterministic checks, in which records are checked for the presence of data in required fields, and statistical checks, in which the data are checked against a range of values based on historical data values and for logical or mathematical consistency with data elements reported in the survey. Discrepancies found in the data, as a result of these checks, are resolved either by the processing staff or by further information obtained from a telephone call to the respondent.

Those respondents unable to use the electronic reporting method provide the data in hard copy, typically via fax and email. These data are manually entered into the computerized database and are subjected to the same data edits as those that are electronically submitted. Resolution of questionable data is accomplished via telephone or email contact with the respondents.

## **Reliability of Data**

Survey data have non-sampling errors. Non-sampling errors can be attributed to many sources: (1) inability to obtain complete information about all cases in the sample (i.e., nonresponse); (2) response errors; (3) definitional difficulties; (4) differences in the interpretation of questions; (5) mistakes in recording or coding the data; and (6) other errors of collection, response, coverage, and estimation for missing data. Although no direct measurement of the biases due to non-sampling errors can be obtained, precautionary steps are taken in all phases of the frame development and data collection, processing, and tabulation processes, in an effort to minimize their influence.

## **Data Revision Procedure**

ERUS has adopted the following procedures with respect to the revision of data disseminated in energy data products:

- Annual survey data are disseminated either as preliminary or final when first appearing in a data product. Data initially released as preliminary will be so noted in the data product. These data are typically released as final by the next dissemination of the same product; however, if final data are available at an earlier interval they may be released in another product.
- After data are disseminated as final, further revisions will be considered if they make a difference of 1 percent or greater at the national level. Revisions for differences that do not meet the 1 percent or greater threshold will be determined by the Office Director. In either case, the proposed revision will be subject to the EIA revision policy concerning how it affects other EIA products.
- The magnitudes of changes due to revisions experienced in the past will be included periodically in the data products, so that the reader can assess the accuracy of the data.

The *Cost and Quality of Fossil Fuels for Electric Plants 2009* presents the most current annual data available to the EIA, and will be consistent with the *Electric Power Annual 2009*. Previous reports have included 2 years of data, i.e. the most current year and the preceding year. Data comparisons to prior years can be made by accessing back issue of the *Cost and Quality of Fossil Fuels for Electric Plants* reports.

## **Rounding and Percent Change Calculations**

**Rounding Rules for Data.** To round a number to n digits (decimal places), add one unit to the nth digit if the (n+1) digit is 5 or larger and keep the nth digit unchanged if the (n+1) digit is less than 5. The symbol for a number rounded to zero is (\*).

**Percent Change.** The following formula is used to calculate percent differences:

$$\text{Percent Change} = \left( \frac{x(t_2) - x(t_1)}{x(t_1)} \right) \times 100,$$

where  $x(t_1)$  and  $x(t_2)$  denote the quantity at year  $t_1$  and subsequent year  $t_2$ .

## **Data Sources for the Cost and Quality of Fossil Fuels for Electric Plants**

Data published in the report are compiled from forms filed monthly and annually by electric utilities and electricity generators. The current applicable EIA form is Form EIA-923, "Power Plant Operations Report", which began collection in 2008. Previously, cost and quality of fuels data at nonutility plants were collected on Form EIA-423, "Monthly Cost and Quality of Fuels for Electric Plants Report."

Cost and quality of fuel data at utility plants were collected by the Federal Energy Regulatory Commission (FERC) on FERC Form 423, "Monthly Report of Cost and Quality of Fuels for Electric Plants."

Understanding the effect of the restructuring of the electricity industry is important when reviewing data presented in previous *Cost and Quality of Fossil Fuels for Electric Plants* reports. FERC's predecessor agency, the Federal Power Commission, began collecting these data in July of 1972 from each electric power producer for each of its electric generating plants whose total steam turbine electric generating capacity and/or combined-cycle (gas turbine with associated steam turbine) generating capacity was 25 or more megawatts. (In 1983 the threshold was changed to 50 or more megawatts.) Only fuel delivered for use in steam-turbine and combined-cycle units was to be reported. Fuel received for use in gas turbine or internal combustion units that were not associated with a combined-cycle operation were not reported.

In the mid- to late-1990s, many electric utilities sold their plants to nonutility entities or created subsidiaries whose assets were not regulated by State public utility commissions. Once a plant became the property of such an entity, it was no longer required to file on the FERC Form 423. In 2002, EIA initiated the Form EIA-423 to capture the data from these plants. The respondents from both the FERC Form 423 and the Form EIA-423 now

submit their cost and quality of fuels data on Schedule 2 of the Form EIA-923.

## **Form EIA-923**

Form EIA-923, "Power Plant Operations Report," is used to collect information on receipts and cost of fossil fuels, fuel stocks, electric power generation, fuel consumption, and environmental data (e.g., emission controls and cooling systems). Data are collected from a monthly sample of approximately 1,800 plants, which includes a census of nuclear and pumped storage hydroelectric plants. The plants in the monthly sample report their receipts, cost and stocks of fossil fuels, electric power generation, and the total consumption of fuels for both electric power generation and, if a combined heat and power plant, useful thermal output. At the end of the year, the monthly respondents report their annual source and disposition of electric power (nonutilities only), and if applicable, the environmental data on the Form EIA-923 Supplemental Form (Schedules 6, 7, and 8A to 8F). Approximately 3,400 plants, representing all generators not included in the monthly sample and with a nameplate capacity of 1 MW or more, report data on the entire form (Schedules 1 to 8F, as applicable) annually. In addition to electric power generating plants, respondents include fuel storage terminals without generating capacity that receive shipments of fossil fuels for eventual use in electric power generation. The monthly data are due by the last day of the month following the reporting period.

Receipts of fossil fuels, fuel cost and quality information, and fuel stocks at the end of the reporting period are all reported at the plant level. Fuel receipts and costs are collected from plants with a nameplate capacity of 50 MW or more and burn fossil fuels. Plants that burn organic fuels and have a steam-turbine capacity of at least 10 megawatts report consumption at the boiler level and generation at the generator level for each month, regardless of whether the plant reports in the monthly sample or reports once a year (annually). For all other plants, consumption is reported at the prime-mover level. For these plants, generation is reported either at the prime-mover level or, for noncombustible sources (e.g., wind, nuclear), at the prime-move and energy source level (including generating unit for nuclear only). The source and disposition of electricity is reported annually for nonutilities at the plant level, as is revenue from sales for resale. Additional operational data, including environmental data, are collected annually from facilities that have a steam-turbine capacity of at least 10 megawatts.

**Instrument and Design History:** On July 7, 1972, the Federal Power Commission (FPC) issued Order Number 453 enacting the New Code of Federal Regulations, Section 141.61, legally creating the FPC Form 423. Originally, the form was used to collect data only on

fossil-steam plants, but was amended in 1974 to include data on internal-combustion and combustion-turbine units. The FERC Form 423 replaced the FPC Form 423 in January 1983. The FERC Form 423 eliminated peaking units, for which data were previously collected on the FPC Form 423. In addition, the generator nameplate capacity threshold was changed from 25 megawatts to 50 megawatts. This reduction in coverage eliminated approximately 50 utilities and 250 plants. All historical FPC Form 423 data in this publication were revised to reflect the new generator-nameplate-capacity threshold of 50 or more megawatts reported on the FERC Form 423. In January 1991, the collection of data on the FERC Form 423 was extended to include combined-cycle units. Historical data have not been revised to include these units. Starting with the January 1993 data, the FERC began to collect the data directly from the respondents.

The Form EIA-423 was originally implemented in January 2002 to collect monthly cost and quality data for fossil fuel receipts from owners or operators of nonutility electricity generating plants. Due to the restructuring of the electric power industry, many plants which had historically submitted this information for utility plants on the FERC Form 423 (see above) were being transferred to the nonutility sector. As a result, a large percentage of fossil fuel receipts were no longer being reported. The Form EIA-423 was implemented to fill this void and to capture the data associated with existing non-regulated power producers. Its design closely followed that of the FERC Form 423. Understanding the effect of the restructuring of the electricity industry is important when reviewing data presented in previous *Cost and Quality of Fossil Fuels for Electric Plants* reports.

Both the Form EIA-423 and FERC-423 were superseded by Form EIA-923 (Schedule 2) in January of 2008. The EIA-923 maintains the same 50 megawatt threshold for these data. However, not all data are collected monthly on the new form. Beginning with 2008 data, a sample of the respondents reported monthly, with the remainder reporting annually (monthly values are imputed via regression). For 2007, Schedule 2 annual data were not be collected or imputed, as most of the plants required to report on Schedule 2 already submitted their 2007 receipts data on a monthly basis via the FERC Form 423 or the Form EIA-423.

**Data Processing and Data System Editing:** Respondents are encouraged to enter data directly into a computerized database via the e-filing system. A variety of automated quality control mechanisms are run during this process, such as range checks and comparisons with historical data. These edit checks are performed as the data are provided, and many problems that are encountered are resolved during the reporting process. Those plants that are unable to use the electronic reporting medium provide the data in hard copy, typically via fax. These data are manually entered into the computerized database, and are subjected to the same edits as those that were electronically submitted.

If the reported data appeared to be in error and the data issue could not be resolved by follow up contact with the respondent, or if a facility was a nonrespondent, a regression methodology was used to impute for the facility.

**Issues within Historical Data Series:** Beginning with 2008 data, tables for total receipts will include imputed quantities for plants with capacity one megawatt or more, to be consistent with other electric power data. Previously published receipts data were from plants over a 50-megawatt threshold, which was a legacy of their original collection as information for a regulatory agency (FERC), not as a survey to provide more meaningful estimates of totals for statistical purposes. Totals appeared to become smaller as more electric production came from unregulated plants, until the Form EIA-423 was created to help fill that gap. As a further improvement, the Form EIA-923 collects data from the universe of power plants depicted in the Electric Power Annual (*i.e.*, one megawatt and above), provides estimates for plants not required to report fuel cost and quality data (*i.e.*, plants under 50 MW) and provides associated relative standard errors, thus portraying a more complete assessment of the market.

**Imputation:** Estimation by regression prediction, or imputation, is done for all missing data including non-sampled plants, nonrespondents, and plants not required to report Schedule 2 (under 50 MW). Fossil fuel receipts at electric generating plants not required to report this data element are imputed using a weighted least squares regression model stratified by fuel, plant type, and geographic region. The model uses the current annual consumption as the sole regressor. The amount of imputed receipts data for 2009 is summarized in the table at the end of this appendix.

**Receipts of Fossil Fuels:** Receipts data, including cost and quality of fuels, are collected at the plant level from selected electric generating plants and fossil-fuel storage terminals in the United States. These plants include independent power producers, electric utilities, and commercial and industrial combined heat and power producers whose total fossil-fueled nameplate capacity is 50 megawatts or more (excluding storage terminals, which do not produce electricity). The data on receipts include imported coal as well as domestic production. The data on cost and quality of fuel shipments are used in the following formulas to produce aggregates and averages for each fuel type at the State, Census Division, and U.S. levels. For these formulas, receipts and average heat content are at the plant level. For each geographic region, the summation sign,  $\Sigma$ , represents the sum of all facilities in that geographic region.

For coal, units for receipts are in tons and units for average heat contents (A) are in million Btu per ton.

For petroleum, units for receipts are in barrels and units for average heat contents (A) are in million Btu per barrel.

For gas, units for receipts are in thousand cubic feet (Mcf) and units for average heat contents (A) are in million Btu per thousand cubic foot.

For each of the above fossil fuels:

$$\text{Total Btu} = \sum_i (R_i \times A_i),$$

where  $i$  denotes a facility;  $R_i$  = receipts for facility  $i$ ;  $A_i$  = average heat content for receipts at facility  $i$ ;

$$\text{Weighted Average Btu} = \frac{\sum_i (R_i \times A_i)}{\sum_i R_i},$$

where  $i$  denotes a facility;  $R_i$  = receipts for facility  $i$ ; and,  $A_i$  = average heat content for receipts at facility  $i$ .

The weighted average cost in cents per million Btu is calculated using the following formula:

$$\text{Weighted Average Cost} = \frac{\sum_i (R_i \times A_i \times C_i)}{\sum_i (R_i \times A_i)},$$

where  $i$  denotes a facility;  $R_i$  = receipts for facility  $i$ ;  $A_i$  = average heat content for receipts at facility  $i$ ; and  $C_i$  = cost in cents per million Btu for facility  $i$ .

The weighted average cost in dollars per physical unit (i.e., tons, barrels, or Mcf) is calculated using the following formula:

$$\text{Weighted Average Cost} = \frac{\sum_i (R_i \times A_i \times C_i)}{10^2 \sum_i R_i},$$

where  $i$  denotes a facility;  $R_i$  = receipts for facility  $i$ ;  $A_i$  = average heat content for receipts at facility  $i$ ; and,  $C_i$  = cost in cents per million Btu for facility  $i$ .

## Relative Standard Error

The relative standard error (RSE) statistic, usually given as a percent, describes the magnitude of sampling error that might reasonably be incurred. The estimated RSEs here are the square root of the estimated variance, divided by a statistic for the variable(s) of interest, expressed as a percent. This statistic may be the estimated ratio of two variables, say a price, or an estimated total for a single variable.

The sampling error may be less than the nonsampling error. In fact, large RSE estimates found in preliminary work with these data have often indicated nonsampling errors, which were then identified and corrected. Nonsampling errors may be attributed to many sources, including the response errors, definitional difficulties, differences in the interpretation of questions, mistakes in recording or coding data obtained, and other errors of collection, response, or coverage. These nonsampling errors also occur in complete censuses. In a complete census, this problem may become unmanageable.

Using the Central Limit Theorem, which applies to sums and means such as are applicable here, there is approximately a 68-percent chance that the true total or mean is within one RSE of the estimated total. Note that reported RSEs are always estimates, themselves, and are usually, as here, reported as percents. As an example, suppose that a net generation from coal value is estimated to be 1,507 total million kilowatthours with an estimated RSE of 4.9 percent. This means that, ignoring any nonsampling error, there is approximately a 68-percent chance that the true million kilowatthour value is within approximately 4.9 percent of 1,507 million kilowatthours (that is, between 1,433 and 1,581 million kilowatthours). Also under the Central Limit Theorem, there is approximately a 95-percent chance that the true mean or total is within 2 RSEs of the estimated mean or total.

Note that there are times when a model may not apply, such as in the case of a substantial reclassification of sales, when the relationship between the variable of interest and the regressor data does not hold. In such a case, the new information represents only itself, and such numbers are added to model results when estimating totals. Further, there are times when sample data may be known to be in error, or are not reported. Such cases are treated as if they were never part of the model-based sample, and values are imputed.

**Imputed Receipts Quantities, 2009**

	Coal (thousand tons)	Natural Gas (thousand mcf)	Petroleum Liquids (thousand barrels)
<b>Total Receipts</b>	973,140	8,123,487	55,088
<b>All Imputed Receipts</b>	12,459	412,399	10,942
<b>Under 50 MW</b>	12,459	411,723	10,938
<b>Over 50 MW</b>	0	676	4
