

Screening Framework Guidance for Synthetic Double-Stranded DNA Providers

Jessica Tucker, Ph.D.

AAAS Science and Technology Policy Fellow

Office of the Assistant Secretary for Preparedness and Response U.S. Department of Health and Human Services

NSABB Meeting

December 3, 2009

Challenges and Concerns

- Synthetic biology and the underlying technologies together can provide significant scientific, health, and economic benefits.
- Nucleic acid synthesis technology is a potentially enabling technology for the de novo reconstruction of dangerous pathogens, either in part or in whole.
 - De novo synthesis of naturally-occurring pathogens
 - Access to sequences and organisms of concern
 - Evasion of current regulatory and physical access controls (e.g., U.S. Select Agents, Australia Group, pathogen security processes and procedures)
 - De novo synthesis of novel biological agents
 - Pathogens with unique properties
- Development of any oversight mechanism must...
 - balance the need to minimize the risk of misuse with the need to ensure that science and innovation are encouraged; and
 - involve engagement of the synthetic nucleic acid industry, the scientific community, and other stakeholders.

Genesis of the Synthetic DNA and Security Interagency Process

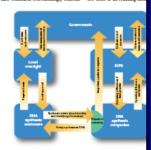

2007 COMMENTARY

DNA synthesis and biological security

Hans Būgi, John P Danner, Robert J Molinari, John T Mulligan, Han-Oh Park, Bas Reichert, David A Ro Ralf Wagner, Bruce Budowle, Robert M Scripp, Jenifer A L Smith, Scott J Steele, George Church & Drew A group of academics, industry executives and security experts propose an oversight framework to address over the security of research involving commercial DNA synthesis.

chemicals, from information processing to envi-ronmental monitoring, and from agricultural roomens i monitoring, and trost agricultura productivity to be after toggle in human health and medicine. Like any powerful technology. DNA synthesis has the potential to be purpose-fully misupplied. Misuse of DNA-synthesis technology could give rise to both known and unforeseable threats to our biological safety and security. Current government ovenight of the INA-synthesis industry falls short of addressing this unfortunate reality. Here, we outline a practical plan for devel-oping an effective oversight framework for

USG Development of a Screening Framework

Overarching goal:

 Minimize the risk that unauthorized individuals or individuals with malicious intent will gain access to toxins and organisms of concern through the use of nucleic acid synthesis technologies; simultaneously minimize any negative impacts on the conduct of research and business operations

• Key elements:

- 1. Appropriate sectors of the synthetic nucleic acid industry
 - dsDNA gene and genome synthesis sector
- 2. Mechanism(s) by which a screening framework should be pursued
 - Voluntary- Greater efficacy and reduced negative economic impact
- 3. Principles and objectives of screening
 - Providers should know customers and products they are selling
- 4. Process for enabling timely response to orders of concern
 - Protocols for contacting USG
- 5. Enabling development of tools to facilitate implementation
- 6. Evaluating implementation and impact(s)

Summary of Guidance Recommendations

- The U.S. Government recommends that all orders for synthetic double-stranded DNA 200 base pairs (bps) in length or greater be subject to a screening framework that incorporates both sequence screening and customer screening.
- Customer Screening
 - The U.S. Government recommends that, for every order, synthetic nucleic acid providers:
 - Verify the customer's identity.
 - Screen customers against several lists of proscribed entities.
 - Check for 'red flags.'
 - In any case where customer screening raises a concern, providers should conduct follow-up screening.

Summary of Recommendations, Continued

Sequence Screening

- The U.S. Government recommends that:
 - Nucleic acid sequences be screened against GenBank using a "Best Match" approach to identify nucleic acids that are unique to Select Agents and Toxins.
 - For foreign orders, nucleic acids be screened using a "Best Match" approach to identify nucleic acids that are unique to pathogens and toxins on the Commerce Control List.
 - Sequence screening be performed for both DNA strands and the resultant polypeptides derived from translations using the three alternative reading frames on each DNA strand (or six-frame translation).
 - Sequence alignment methods should permit the detection of hidden "sequences of concern" as small as 200 bps.
 - In any case where sequence screening raises a concern, providers should conduct follow-up screening.

Summary of Recommendations, Continued

Follow-up Screening

- When customer screening reveals any 'red flags' or sequence screening identifies a sequence of concern, the U.S. Government recommends that
 - Providers ask for information regarding the customer's proposed end-use of the order to assess their need and the scientific legitimacy of their work.
 - Providers take additional steps to verify the customer's identity and need.

Domestic and Foreign Orders

 The U.S. Government reminds providers to check against various lists of restricted entities before filling every order; these lists vary for domestic and foreign customers.

Contacting the U.S. Government

 In cases where follow-up screening cannot resolve concerns raised by customer screening or sequence screening, or when providers are otherwise unsure about whether to fill an order, the U.S. Government recommends that providers contact relevant agencies.

Summary of Recommendations, Continued

- Sequence Screening Software and Expertise
 - The U.S. Government recommends that:
 - Providers select a sequence screening software tool that utilizes both a global and local sequence alignment technique.
 - Providers have the necessary expertise in-house to perform the sequence screenings, analyze the results, and conduct the appropriate follow-up research to evaluate the significance of dubious sequence matches.
- Records Retention
 - The U.S. Government recommends that providers retain electronic copies of customer orders for at least eight years.

Next Steps

- Draft Guidance was posted for public comment in the Federal Register on November 27, 2009. It will be open for public comment for a period of 60 days until January 26, 2010.
- Please see http://edocket.access.gpo.gov/2009/E9-28328.htm for instructions on submitting comments.
- Comments can be submitted electronically to <u>asprfrcorrespondence@hhs.gov</u>.
- Public engagement regarding the Guidance will continue.
- At the conclusion of the public comment period, the U.S. Government will review and consider public comments for incorporation into the Guidance.
- The final Guidance will then be publicly released.
- An interagency group will be established to monitor the implementation and to evaluate the effectiveness of the Guidance.

Thank you.
