

Debt Management

Technical Customer Workshop #3 July 8, 2010

Today's Agenda

| Торіс | Slide # | Presenter |
|--|----------------|------------------|
| Introduction IPR/Debt Management Processes Key Messages | 1-4 | Mertsching |
| Review/Summary of Scenarios Revenue Requirement Changes/Data Customer Feedback on Scenarios | 5-12 (8 -9) | Dull Homenick |
| Hedging: Products Available/Differentiation Interest Rate Hedging Strategies 2011/2012 Potential Transactions | 13-23 | Dull |
| Fuel: Background/Procurement Special Purchase Transaction Financing Fuel Policy | 24-26 | Dull Bentrup |
| Next Steps Timetable | 27-29 | Mertsching |

2

IPR/Debt Management Processes

- The 2010 Integrated Program Review (IPR) provides a way for discussing agency expense and capital program levels in a single forum. The IPR occurs every two years, or just prior to each rate case, and provides participants with an opportunity for customers and other interested parties to influence program levels before establishing the revenue requirement in the rate case.
- This year BPA created a separate sub-process for reviewing debt management activities, strategies, and items of interest, both past and present, because of the major policy issues confronting us in the debt management area.
- Debt management is a technical and highly complex subject. Decisions now will have impacts for many years to come.
- The coordinated debt management and IPR process will share some of the same forums, such as the July 13 general manager meeting.
- In addition to our regional conversation with BPA customers and interested parties, we have discussed some issues with the Energy Northwest Executive Board, and our intent is to also meet with the Energy Northwest Participants Review Board (PRB.)

Key Messages

- The primary advantages of debt restructuring include the elimination of the increase in non-Federal debt service for the FY 2012/13 rate period, and the matching of asset life with repayment of assets for Energy Northwest (EN) Columbia Generating Station debt.
- The main disadvantage of debt restructuring is that short-term needs can negatively impact long-term agency financial health.
- Although there is a large universe of callable EN bonds in 2011/12, the 2011 bonds are the only ones that can be refinanced with some certainty prior to the final WP-12 rate proposal.
- Hedging opportunities exist to lock in low interest rates for both the 2011 and 2012 callable EN bonds.
- BPA is evaluating strategies to address market access risk for the 2012 bond transaction and is willing to consider and implement such strategies in order to include the 2012 transaction in the Initial Rate Proposal.
- Through debt restructuring/extension, BPA may be able to reduce total debt service in FY 2012/13 by about \$100 M per year.
- BPA needs the support of public power in order to accomplish this effort. BPA must also have agreement from the EN Executive Board and the EN Participants Review Board by mid to late summer, prior to the release of the Initial Proposal in late fall 2010.

Scenario A: Extending and Restructuring 2011

2011 Debt Only - debt restructuring and extending CGS debt past 2018:

- By restructuring callable bonds in 2011 (Projects 1&3) and extending maturing and callable CGS debt in 2011, BPA achieves more levelized non-Federal debt service, which results in lowered total debt service requirements within the repayment study in FY2012-13, as well as FY14-18.
- Specifics: Extend \$155M of 2011 callable CGS principal; extend \$94M of 2011 maturing CGS principal. In 2011, redeem early \$94M of callable Project 1&3 debt that would otherwise mature in peak years.
- No rate case policy change and no hedging products are required as the deal would be completed before the final proposal, but may consider locking in interest rates.
- Average annual savings in FY2012-13 of \$37M.

Debt and Investment Management This information has been made publicly available by BPA on July 8, 2010 and estimates are subject to change.

Scenario B: Extending and Restructuring 2011 & 2012

2011 & 2012 Debt - debt restructuring and extending CGS debt past 2018:

- By restructuring callable bonds in 2011 & 2012 (Projects 1&3) and extending maturing and callable CGS principal in 2011 and 2012, BPA achieves even more levelized non-Federal debt service, which results in lowered total debt service requirements within the repayment study in FY2012-13, as well as FY14-18.
- Specifics 2011: Extend \$155M of 2011 callable CGS principal; extend \$94M of 2011 maturing CGS principal. In 2011, redeem early \$94M of callable Projects 1&3 debt that would otherwise mature in peak years.
- Specifics 2012: Extend \$260M of 2012 callable CGS principal; extend \$266M of 2012 maturing CGS principal; redeem early approximately \$180M of Projects 1& 3 debt that would otherwise mature in peak years.
- The 2012 debt management action cannot be completed prior to the final proposal, unless we hedge the transaction.
- Average annual savings in FY2012-13 of \$104M.

Debt and Investment Management This information has been made publicly available by BPA on July 8, 2010 and estimates are subject to change.

Sensitivity Analysis

- The majority of the benefits of the debt extension/restructuring scenario are attributable to extending principal so it is only somewhat interest rate sensitive; a 3% increase in interest rates would erode on average \$14M in ratepayer benefits per year for the period 2012-2013.
- With a 3% increase in interest rates, the average annual savings in FY2012-13 decreases to \$89M from \$104M.
- BPA is considering ways to hedge a rise in interest rates.

| | Base Case Debt | Sensitivity Debt | Delta from |

Customer Feedback on Debt Management

- We have heard three suggestions in addition to Scenarios A and B:
 - Complete the 2011 bond transaction on a tax-exempt basis, and the 2012 bond transaction on a taxable basis (during 2011) in order to lock in low rates, in an effort to simulate a hedge on the 2012 bonds.
 - Complete the 2011and 2012 bond transactions on a tax-exempt basis, and develop a special CRAC for FY 2012/13 rates in case the 2012 bond transaction does not take place.
 - Regarding Scenario B, revise the debt restructuring strategy in order to eliminate the \$26 M increase in total debt service costs over the 20 year period.

Hedging Interest Rates - Recap

- BPA has approximately \$875M of interest rate exposure on EN debt over the next few years, where it might be prudent to hedge:
 - \$775M CGS debt extension
 - \$100M of new money for CGS (FY12/13)
- Hedging interest rates can secure multiple benefits:
 - Mitigates future interest rate risk
 - Provides rate case benefits
- At the June 18th workshop, customers asked BPA to illustrate a specific transaction in order for them to understand the costs/benefits of hedging interest rates – we will do this today.
- BPA analyzed hedging \$350M of the 2011 and the 2012 transactions.

The more effective the hedge, the higher the cost.

Not all products are available to hedge right now.

- 1. Delayed Delivery: The underwriter agrees to sell and investors agree to buy bonds on a delivery date up to 9 months after pricing. This locks in the all-in-rate (rate and credit spread) as the investor takes the interest rate and credit spread risk. The underwriter risk is lower than an ABPA since the investor has already agreed to purchase the bonds and the underwriter is transferable.
 - Forward Period Availability: up to 9 months
 - Mandatory Settlement: N/A
- 2. ABPA: The underwriter agrees to purchase bonds at some point in the future and takes on all of the risks. This locks in the all-in-rate (rate and credit spread) as the underwriter takes the interest rate and credit spread risk and has a mandatory settlement.
 - Forward Period Availability: up to 2-3 months
 - Mandatory Settlement: N/A
- 3. MMD Rate Lock: Tax-exempt market is hedged, most expensive alternative (in terms of traditional hedges) but the smallest basis risk since it is based on the fixed rate muni market.
 - Forward Period Availability: up to 6 months
 - Mandatory Settlement: Yes
- 4. SIFMA Swap: High correlation between tax-exempt fixed rate market and tax-exempt variable rate market, but there is basis risk between bonds and swaps.
 - Forward Period Availability: 2+ years
 - Mandatory Settlement: No, but could be to decrease hedge cost
- 5. Libor Swap: Most liquid marketplace and the lowest hedge premium but considerable basis risk between tax exempt fixed rate and taxable variable rate.
 - Forward Period Availability: 2+years
 - Mandatory Settlement: No, but could be to decrease hedge cost

Note: Financial reform contemplated by Congress could significantly reduce or completely eliminate counterparties due to the restrictive provisions in the new legislation.

| Alternative | Delayed Delivery | MMD Rate Lock | SIFMA Swap / Rate Lock | 70% LIBOR Swap / Rate Lock | No Hedge |
|--------------------|--|--|---|---|--|
| Cost of Premium | 2011 Call: 0.50% 2012 Call: N/A | 2011 Call: 0.65% 2012 Call: N/A | 2011 Call: 0.29% 2012 Call: 0.55% | 2011 Call: 0.22% 2012 Call: 0.40% | N/A |
| Key Benefits | Lock in savings from the transaction at the commitment date. Documentation similar to traditional fixed rate issuance | Fixed rate bonds Qualified hedge Tax risk protection | Low long-term fixed rate Qualified hedge Tax risk protection | Lowest, long term fixed rate Qualified hedge | Fixed Rate Bonds No basis risk |
| Key Considerations | Limited risk to underwriter performance | Potential settlement payment Basis risk | Potential settlement payment Basis risk Credit risk | Potential settlement payment Basis risk Credit risk Tax risk | Subject to market rates on issuance date |
| Mechanics | Underwriter agrees to sell and investors agree to buy on the delivery date, bonds with maturities, coupons and prices set today to be delivered more than 90 days after closing. At the delivery date, bonds are delivered. | Execute a MMD Rate Lock agreement today. Upon settlement date, make settlement payment based upon prevailing market rate as compared to "locked-in" rate. Proceed with bond issuance process. | Execute a SIFMA Swap /Rate Lock agreement today. Upon settlement date, make settlement payment based upon prevailing market rates as compared to "locked-in" rate. Proceed with bond issuance process. | Execute a LIBOR Swap / Rate Lock agreement today. Upon settlement date, make settlement payment based upon prevailing market rates as compared to "locked-in" rate. Proceed with bond issuance process. | N/A |

Rates as of COB 06/01/2010. Subject to market conditions, documentation, and credit approval. 2011 Call Date Scenarios assume a 6-month forward period, 7-year final maturity from today. 2012 Call Date Scenarios assume an 18-month forward period, 7-year final maturity from today. For illustration purposes only; actual results will depend on future market conditions and may differ.

S R В F W Е R Т Α \cap Ν E D Μ N Т N **Delayed Delivery Analysis** (2011 Call Date)

- The Delayed Delivery Product is unique because it does not carry the same risks as the other products since it is a bond market product/transaction. It is essentially a forward bond purchase by investors.
- > The break-even analysis is based on the tax-exempt curve and not the taxable curve.
- MMD would have to move 0.50% for the cost of the hedge to be cost effective.

0.9-Year Forward, 7.0-Year Delayed Delivery Notional: \$350M Fixed Rate: 3.44% (Forward Premium 0.50%) Incremental Cost/Benefit Analysis Amounts in tables shown in \$Millions

Background: EN Fuel Procurement

- Nuclear fuel funding needs are increasing due to:
 - 1. the end of the Uranium Tails project and the need to replenish uranium and enrichment inventory used in previous years,
 - 2. the purchase of additional spent fuel storage casks, and
 - 3. enrichment costs deferred from EN FY 2011 to reduce rate pressure.
- Near term planned fuel purchases:

| BPA Fiscal Year | Amount (\$ in Millions) | |
|-----------------|-------------------------|---------------------|
| 2010 | 13* | |
| 2011 | 45* | FY10-11 Average: 29 |
| 2012 | $64^{\#}$ | |
| 2013 | 90 [#] | FY12-13 Average: 77 |

* From the WP-10 Rate Case [#]From the May 2010 IPR

CGS Nuclear Fuel BPA Fiscal Years – Dollars in Millions

EN Fuel Procurement

- Discussions with the customers and Energy Northwest on June 18^{th,} clarified how fuel costs are accounted for at BPA. EN employs standard fuel accounting treatment, holding the purchase in a CWIP type account while the fuel is enriched, fabricated, and moved into a capital asset until placed in the reactor and amortized as a fuel expense to match the burn period. This accounting treatment does not pass thru to BPA's obligation to meet EN's cash requirements.
- There are two separate proposals on the table:
 - <u>Planned Fuel Purchases:</u> In an April letter to Energy Northwest and its Executive Board, the Public Power Council and Northwest Requirements Utilities made observations about the increase in fuel expense in FY12-13 when compared to FY10-11. They requested that EN and BPA work together to look at recovering the cost over the burn period (amortization period) rather than expensing the nuclear fuel in the purchase year.
 - <u>FY 2011 Extraordinary Purchases:</u> In a June letter to BPA, Energy Northwest described a revision to their earlier plans to take advantage of current low uranium prices and pre-purchase fuel in EN FY 2011 that is currently scheduled to be purchased in EN FY 2016 -2020, defer some contract deliveries to later years, and reduce uncommitted purchases in EN FY 2016 -2020.

EN Fuel Procurement Next Steps

- BPA is not inclined to transition to entirely debt financing nuclear fuel purchases. However, some amount of debt financing may be appropriate.
 - <u>Planned Fuel Purchases:</u> Work with EN to discuss the best way to purchase future fuel
 - Engage with EN in a discussion about fuel purchasing strategy and the cost impacts those strategies can have on BPA's finances and rates.
 - Explore mechanisms to provide feedback to EN such that CGS's fuel requirements are met and BPA's financial needs are recognized.
 - Complete the development of principles that delineate when it is appropriate to expense fuel related costs and when it is appropriate to finance them.
 - <u>FY 2011 Extraordinary Purchases</u>: BPA is supportive of Energy Northwest's described desire to take advantage of current uranium prices and pre-purchase fuel that is currently scheduled to be purchased in EN FY 2016-2020.
 - BPA is considering the methods to pay for fuel and also is evaluating the rate impacts each method creates.
 - BPA is looking at reducing any impact that could potentially double up fuel costs, particularly when principal
 payments are made on this special purchase, and these payments are coupled with routine planned fuel purchases
 which are currently scheduled to be expensed in future years.

Next Steps

- Debt Management actions will be discussed at the July 13th General Manager meeting.
- The comment period runs through July 29th we strongly encourage you to give us your feedback.
- Debt management decisions will be communicated to the region during the IPR closeout process in September, in combination with the IPR close-out letter.
- If we determine that debt restructuring/extension is the right way to proceed, BPA anticipates that EN would need to approve a two-year Refunding Plan that authorizes the debt restructuring/extension plan in order for the 2011 and 2012 bond transactions to be included in the Initial Proposal.
- BPA may be willing to include the 2012 bond transaction in the Initial Proposal assuming appropriate risk strategies are developed and evaluated.

Timeline/Schedule

Comments

Submitting Comments:

- The Debt Management process includes a public comment period which began June 8th and lasts until July 29th.
- Comments can be submitted at any of the scheduled workshops or submitted in writing to:
 - Bonneville Power Administration, P.O. Box 14428, Portland, OR 97293-4428,
 - Email to comment@bpa.gov,
 - Faxed to (503) 230-3285
