the BUSINESS SITUATION

CHART 1

Real Product: Changes From Preceding Quarter

REAL GNP increased at an annual rate of 7½ percent in the first quarter, after having increased 5 percent in the fourth quarter of last year (table 1). The acceleration was due to an \$11 billion annual rate swing in real inventory investment, from fourth-quarter decumulation of \$1½ billion to first-quarter accumulation of \$9½ billion; from the third to the fourth quarter, there had been a small negative swing (chart 1). Final sales increased less than in the fourth quarter—3½ percent as compared with 5 percent. Fixed investment was up 9½ percent, a little less than in the fourth quarter, as a slowing of the rate of increase in residential investment was only partly offset by a strengthening in business fixed investment. The increase in personal consumption expenditures (PCE) was larger than in the fourth quarter—7½ percent as compared with 4 percent. Some of the deceleration in total final sales was due to government purchases, which showed little change in the first quarter. However, the bulk of it reflected a decrease in exports and a large increase in imports.

About two-thirds of the increase in final sales was in consumer and business purchases of motor vehicles, and the remainder was more than accounted for by consumer purchases of food and energy. The total of other final sales was essentially unchanged. These estimates are preliminary, and subject to revisions that might modify this picture. Furthermore, although some of the first-quarter increases in final sales seem unsustainable, it is quite possible that spending for other items will pick up as the unsustainable demands subside.

Inflation, as measured by the increase

in the GNP implicit price deflator, abated substantially, from 7 percent in the fourth quarter to 3½ percent in the first. The major factors were declines in the prices of the food and energy components of PCE. In addition, the rate of increase in prices of equipment and structures slowed. This slowing benefited not only business investors, but also government, which buys a considerable amount of these items. Prices paid by government had increased in the fourth quarter due to the Federal pay raise; that this factor was absent in the first quarter was the major reason for deceleration of prices paid by government.

Employment and unemployment.—Employment, as measured in the household survey, increased substantially in the first quarter, at a 5.6 percent annual rate, as compared with 0.5 percent in the fourth. Women accounted for more than a proportionate share of this increase, as they had over the past year. On a quarterly basis, unemployment showed the first sharp decline since its peak in the second quarter of 1975. The unemployment rate dropped from 8.5 percent in the fourth quarter to 7.6 percent in the first. (For a discussion of some of the problems involved in calculating the seasonally adjusted unemployment rate, see the March issue of the SURVEY OF CURRENT BUSINESS.)

On the basis of the establishment survey, the first-quarter increase in employment was smaller than shown by the household survey, but, at 3.6 percent, was about the same as the fourth-quarter increase. Among the goods-producing industries, which had been affected more by the recession than the service-producing industries, employ-

ment in durables manufacturing was up about 7 percent—more than in the fourth quarter. An increase in employment in the transportation equipment industry of about 14 percent accounted for almost one-third of the increase in employment in durables. Employment in nondurables manufacturing was up less than in the fourth quarter, was unchanged in mining, and was down in contract construction.

Although the quarterly gains in GNP final sales were concentrated in a very few categories—specifically, motor vehicles, food, and energy—the gains in employment were widespread industrially. Of the 172 private nonfarm industries, about 70 percent showed month-to-month employment increases, somewhat more than in the fourth quarter. To some extent, the contrast between the final sales and employment patterns may be due to statistical inconsistencies, although basically it was to be expected. For instance, the large increase in motor vehicle production that accompanied the sales increase affected employment not only in the transportation equipment industry, but also in the industries supplying raw material and semifinished goods to it and marketing its finished products. This kind of diffusion in employment facilitates the adjustments of the labor supply to changes in demand.

Costs and prices

Table 2 shows three measures that throw light on cost-output relationships

in the nonfarm business economy. In the first measure, output per hour, the numerator is derived by deducting from real GNP the production originating in the nonbusiness sectors—the rest of the world, households and institutions, and government—and in the farm sector. The denominator is derived by making the following major adjustments to the hours data that are based on the establishment survey: hours of nonfarm self-employed and unpaid family workers are added, and hours of employees of civilian government and nonprofit institutions are deducted. With output up 7.9 percent at an annual rate in the first quarter, and hours up 4.1 percent, the ratio of the two—often used as a measure of labor productivity—was up 3.6 percent, as compared with a decline in the fourth quarter.

In the second measure, compensation per hour, the numerator is derived from compensation of nonfarm business employees as measured in the national income and product accounts (NIPA's) by adding an allowance for the labor component of the income of the nonfarm self-employed. In the first quarter, compensation per hour increased 8.0 percent, as compared with 5.7 percent in the fourth.

The third measure, unit labor cost, is the quotient of the labor productivity and average compensation measures. In the first quarter, it increased 4.3 percent, somewhat less than in the fourth.

Developments in alternative measures of wage rates are summarized in table 3. The first of these, average

NOTE.—Output is calculated as business GNP less farm GNP.

hourly earnings, differs from the average compensation series, because it covers civilian government employees and employees of nonprofit institutions, but does not cover the self-employed and unpaid family workers. Also, the numerator of the ratio excludes supplements to wages and salaries (employer contributions for social insurance and other labor income). The average hourly earnings series can be adjusted to exclude the effects of overtime pay in manufacturing and of changes in the industrial mix of employment, and, accordingly, the adjusted series is a better measure of changes in hourly wage rates. The Hourly Earnings Index increased at a 6.1 percent annual rate in the first quarter, less than in any quarter in the last two years.

The last measure shown in table 3 relates to wage-rate changes taking place under major collective bargaining agreements. In the first quarter, the effective wage-rate change was 1.1 percent (not seasonally adjusted). That this change was the smallest shown in the table largely reflects the relatively

small number of workers receiving wage-rate changes, rather than the size of the increase per worker, which is the other major factor determining the change. The former factor tends to make this series erratic. In the first quarter, it held down the size of the wage-rate change stemming from current settlements. In that quarter, the change in current settlements was low—0.2 percent; it undoubtedly will be atypical of the remaining quarters of 1976, because, with a heavy bargaining calendar ahead, a large number of workers will receive changes in

current settlements. As of mid-April, a major collective bargaining agreement, that covering the International Brotherhood of Teamsters, was still in the process of being ratified. It appears that its wage-rate and fringe-benefit increases will average around 5 percent per year over the contract's 3-year life. The agreement also incorporates a "capless" escalator, which will provide substantial protection against increases in consumer prices.

Prices.—As noted earlier, the increase in the GNP implicit price deflator de-

celerated from an annual rate of about 7 percent in the fourth quarter to about 3½ percent in the first. The alternative measures of GNP prices—the fixed-weighted price index and the chain price index—showed about the same fourth-to-first-quarter changes as the deflator. The deflator for goods and services purchased by U.S. consumers, shown in table 4 as the deflator for GNP less exports plus imports, also decelerated; prices of both exports and imports, which had changed little in the fourth quarter, increased by about equal amounts.

1. Gasoline and oil, fuel and ice, electricity, and gas.

2. The change in business inventories has been excluded because the implicit price deflator for the change in business inventories is subject to large erratic movements that reflect shifts

in the composition among items that have shown large differences in their price rise as compared with the 1972 base period. The size of these erratic movements precludes the use of these deflators in price analysis.

Data: BLS & BEA

Among the other GNP components, improvements in price performance were widespread, although, as will be noted below, some of them were temporary. The deflator for PCE increased 3½ percent, as compared with 5½ percent in the fourth quarter. The improvement was due almost entirely to food prices, which declined about 1 percent after an increase of 3½ percent, and to energy prices, which declined 6½ percent after an increase of 7 percent (chart 2). The increase of other prices paid by consumers remained essentially unchanged, at about 6 percent.

Slower rates of increase were apparent in prices of equipment and structures. It should be noted that prices of these items are particularly difficult to measure. For instance, in the case of equipment, a complex procedure is necessary because the price information, which is believed to reflect new orders, must be synchronized with the GNP components, which are intended to be on a delivery basis. This synchronization procedure involves the application of distributed lags to the appropriate components of the Wholesale Price Index. This procedure has shortcomings; for instance, it does not take into account cyclical changes in the lags between new orders and deliveries. Because of the use of the distributed lag

procedure, it is possible to infer from the information taken from the Wholesale Price Index the near-term prospects for the deflator for equipment. Using this method, it appears that the second-quarter increase will not differ very much from the 6 percent increase in the first quarter.

The halving of inflation in the prices paid by government was largely due to the fact that fourth-quarter prices had been boosted by the Federal pay raise. The deceleration—from about 7 percent to 3 percent—in the prices paid by government for goods and services other than employee compensation was due to the movements of prices of food, energy, equipment, and structures.

The first-quarter decrease in food prices was due to larger supplies reaching the retail market as a result of last year's above-average harvest. In particular, meat prices reflected stepped-up production of grain fed cattle in response to lower feed prices combined with continued high marketing of grass fed cattle. The outlook for food prices is uncertain. Prices of meat—beef in particular—have turned around. Even setting aside seasonal changes, a decline in the marketing of grass fed cattle seems to be underway, and in the coming months will work in the same direction as the first-

quarter narrowing of the margin between feed costs and meat prices, that is, to reduce the supplies of beef and raise its price. As a result, month-to-month meat price increases are likely to occur during the second quarter. For the quarter as a whole, however, on a seasonally adjusted basis, consumer meat prices may not be any higher than in the first quarter. It is even more difficult to sort out the factors determining the prices of food other than meat, but it would appear that on average they also will show little change from the first to the second quarter. For the remainder of the year, price prospects are even more uncertain. However, the fragmentary information that is available points to a somewhat better performance of food prices than had generally been expected earlier in the year.

The major factor in the first-quarter decrease in energy prices was the Energy Policy and Conservation Act passed in December 1975. This act rolled back the average ceiling price of domestic crude oil from \$8.60 per barrel in the fourth quarter to \$7.66 in the first, and eliminated the \$2 per barrel fee on imported crude oil. The act also provided for decontrol of domestic crude oil prices over a forty-month period. As the first step in the imple-

2. Electricity and gas.

mentation of this provision, the Federal Energy Administration in April announced a 9.8 percent increase in the average ceiling price, to \$8.41 per barrel, to take effect over the next 10 months. This increase is designed to provide a specific incentive to domestic crude oil production in addition to offsetting the impact of general inflation. Crude oil prices will be subject to other factors as well, including the price decisions of the Organization of Petroleum Exporting Countries. Changes in crude oil prices will affect the prices consumers pay for gasoline, fuel oil, and related products. Although these prices, in turn, will be affected by other factors, it seems very likely that, on balance, a substantial increase in prices of these products will occur over the coming months. The prices of other kinds of energy purchased by consumers—for example, coal and natural gas—are also likely to rise. Cost increases, deregulation, increases in general demand, and shifts in relative demand tending to equalize price increases in competitive energy products, are all factors working in that direction.

Personal outlays, income, and saving

Real PCE increased 7½ percent (annual rate) in the first quarter, as compared with 4 percent in the fourth (table 5). The strength was in motor vehicles and parts, up 60 percent; food, up 10 percent; and energy goods and services, up 15 percent. The total of other goods was at a standstill, and

other services increased only moderately. The motor vehicles estimate is fairly firm, being based on 3 months of dealer sales. In interpreting the extreme behavior of food, energy, and the total of other goods, it should be noted that these estimates are less firmly based, and that they probably reflect in part statistical imperfections—Incomplete data, sampling errors, and deficiencies in seasonal adjustment procedures and in price information. Despite these qualifications, the estimates suggest that the recent increases in consumption were selective and irregular, rather than widespread and sustainable.

Personal income was up 9½ percent in the first quarter, only a little less than in the fourth. The first-quarter increases in the components of income were also similar to their increases in the fourth quarter. The exceptions were farm proprietors' income and transfer payments. Farm proprietors' income dropped sharply, reflecting a decline in farm prices, and transfer payments increased very rapidly due to accelerated payments of veterans' life insurance dividends and to disbursements of the earned income credit.

With the slowing of inflation, real disposable personal income increased more in the first quarter than in the fourth—6 percent as compared with 4½ percent. Given the increase in PCE, which accounts for almost all of personal outlays, the saving rate decreased from about 8 percent to about 7½ percent.

Fixed investment

Real residential investment increased about 14 percent (annual rate) in the first quarter, after very sharp increases in the second half of last year (table 6). Judging from the underlying information on housing starts, single-family construction continued to show greater strength than multifamily. Single-family starts were up 9.3 percent from the fourth quarter, to 1,130,000 units (annual rate). Multifamily starts fell back below both third- and fourth-quarter starts, although—at 284,000 units—they were 32 percent above the very depressed second quarter. Mobile home shipments improved in the first 2 months of the year, averaging nearly one-fifth above the fourth quarter.

In the months ahead, for single-family construction the most important factors are likely to be mortgage market conditions—availability and cost of credit—and the state of confidence of potential buyers. With continued economic recovery, the former may become a little less favorable, and the latter, more favorable. On balance, it seems probable that further increases in single-family construction will continue but at a reduced rate.

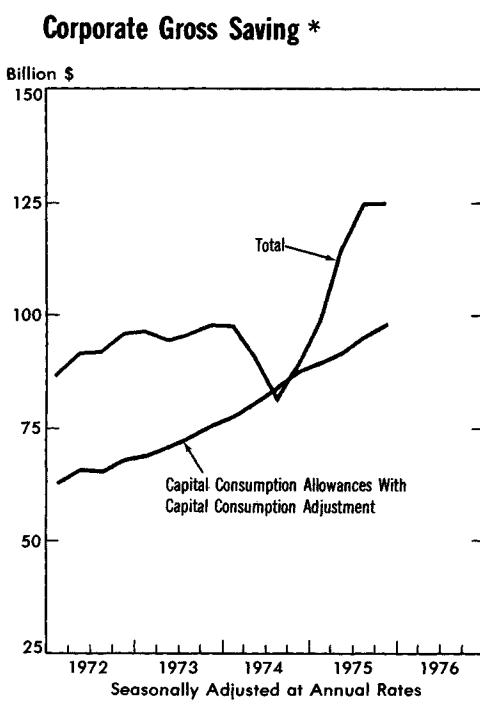

The outlook for multifamily construction is less favorable in the short run. Because costs of carrying and operating rental units have been rising more than rents, profitability has been impaired and is unlikely to improve rapidly. Also, difficulties of financing multi-family structures—the aftermath of the

overbuilding of condominiums and of poor profitability—are likely to be a limiting factor.

Mobile home shipments were severely depressed during the recent recession, after running at high levels for several years. They dropped to 213,000 units in 1975, from over 550,000 in 1972 and 1973. Several factors may have contributed to the severity of the contraction: a temporary saturation of the market, limitations on the availability of sites, a shift toward the production of expensive types of units that were above the price range of the typical buyer, and a high repossession rate for mobile homes, which was the result of the business recession. Consequently, a large overhang of used mobile homes competitive with shipments of new ones developed, and credit institutions became reluctant to finance purchases of mobile homes. Although the evidence is incomplete, the upturn in shipments in January and February may indicate that these difficulties are being resolved.

Business fixed investment.—Real investment in nonresidential structures increased further in the first quarter,

but at a slower rate than in the fourth—8 percent as compared with 14 percent (table 6). In contrast, nonresidential producers' durable equipment (PDE) accelerated sharply, from 2½ percent to 8 percent. The acceleration was entirely due to motor vehicles; other PDE was unchanged. Despite the increases in structures and PDE in the last two quarters, neither is higher than a year ago at the trough of the recent recession. This is so because—as is often the case—both continued to decline after the business recovery had begun.

Business fixed investment is a crucial factor in the economic outlook, and its prospective course is quite uncertain. According to the BEA plant and equipment (P & E) expenditures survey, the 1976 increase is expected to be 6½ percent in current dollars. According to a widely accepted hypothesis, there is a systematic tendency for actual capital expenditures to exceed planned expenditures in periods of business recovery (and to fall short in periods of business decline). It is difficult to verify this hypothesis, and even more difficult to quantify it. It is unlikely that the excess of actual expenditures over initial plans will be large for 1976 as a whole: even if—as seems entirely possible—expenditures turn out to be higher than plans in the second half of the year, this excess will tend to be offset by a shortfall in expenditures from plans in the first quarter, for which an improbably large increase in expenditures was planned. (A first-quarter shortfall has been allowed for in estimating the nonresidential fixed investment component of GNP shown in table 6.)

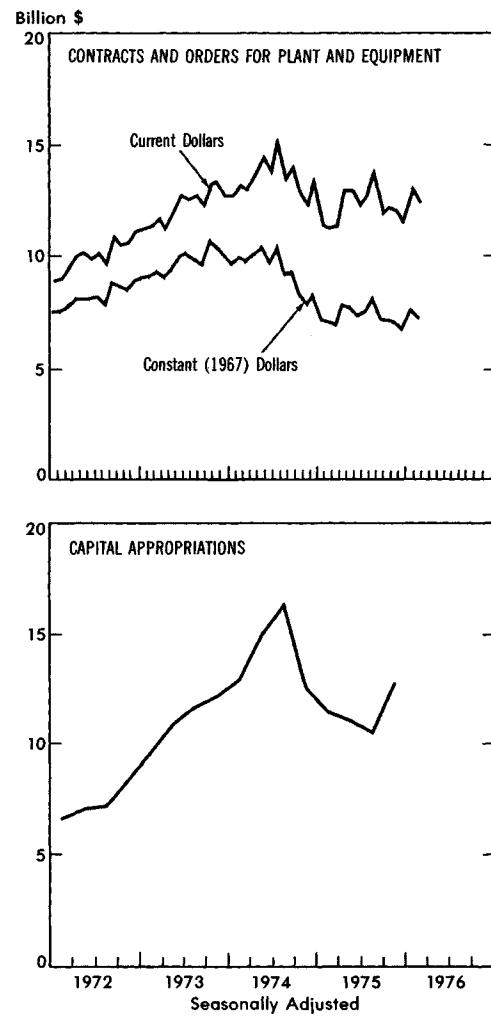

According to the survey taken last November and December, prices of plant and equipment were expected to rise about 10 percent in 1976. Mechanical application of this price rise to current-dollar investment plans results in a substantial drop in real investment in 1976. However, real investment will probably increase, because the actual price rise is likely to be significantly less than 10 percent, and because the bulk of investment plans seems to be formulated in dollar amounts that are not revised in the light of subsequent price developments.

Examination of some of the basic determinants of investment also makes a real increase in investment in 1976 credible. As shown in chart 3, there has been a very strong recovery in internal funds available to corporations; this recovery improved their financial situation and reduced financial constraints upon investment plans. The improvement in internal funds is likely to continue. The past and prospective increases are, of course, a reflection of similar developments in the profitability of corporate business, which is another—and perhaps even more important—determinant of business investment.

Evidence based on information on

7644

manufacturing capacity utilization is less clear. The rates of capacity utilization have improved since their recession lows, but remain well below their historical peaks—even in the major materials-producing industries where recovery appears to have been fairly strong. Manufacturers' evaluation of their capacity has barely turned around. Manufacturers accounting for 35 percent of gross capital assets reported that their capacity was inadequate in December 1975, up only 1 percentage point from the cyclical low in September. Of course, past experience shows that indicators of this type often change pace abruptly, and it is quite possible that they will suggest rapidly improving prospects for investment as the recovery proceeds.

Some evidence on the timing of increases in fixed investment is shown in chart 4. Contracts and orders for plant and equipment have not regis-

tered a clear upturn. Capital appropriations of the 1,000 largest manufacturers, which have an average lead-time over expenditures of about a year, place the recovery in expenditures late in 1976. Appropriations of investor-owned utilities suggest a similar timing.

Net exports and government purchases

After two quarters of relative stability, real net exports dropped sharply in the first quarter (table 7). The first-quarter estimate is based on 2 months' data on merchandise trade and fragmentary information on services, including net investment income. A decline in agricultural exports was largely due to reduced shipments to the Soviet Union. These shipments had been unusually high in the fourth quarter, when the bulk of the shipments of the 1975 grain crop provided for in the recent agreement with the Soviet Union occur-

red. The decline in nonagricultural exports was about the same in percentage terms, but much larger in absolute amount. Receipts for services seem to have increased from the fourth quarter. A large increase in imports was entirely due to merchandise; oil imports were up sharply, reflecting mainly the continued rise in economic activity and perhaps also the removal late in December 1975 of the \$2 per barrel fee on imported oil. A large part of the remaining increase was in industrial supplies and materials, and was widespread among the major components of this category.

Superficially, the first-quarter drop in real net exports accounts for the largest part of the deceleration of final sales. It is difficult, however, to give an explanation of this drop that brings out the underlying cause-effect relations between it and the deceleration of final sales. As regards exports, although the

bulk of the decline represented a drag on real GNP, there are exceptions. For instance, it is apparent that GNP in the fourth and first quarters would not have been very different in the absence of exports of grain to the Soviet Union. Agricultural production in the short run is quite insensitive to changes in demand, and the absence of these exports would have been offset by changes in inventory accumulation. Some of the first-quarter increase in imports can be viewed in a similar way. For instance, if the large increase in oil imports had not occurred, it is very likely that most of the compensating change would have been in inventories rather than in domestic production. Most of the remaining import increase is best interpreted as limiting the impact of the improvement in domestic demand on GNP. It is hard to think of any significant increase in imports that could be interpreted as an active drag on GNP.

Government purchases.—Real Federal and State and local government purchases of goods and services were unchanged in the first quarter (table 8). Among State and local purchases, a decline in structures was offset by increases in the other components.

In current dollars, Federal purchases were up about \$1 billion from the fourth quarter. Transfer payments were up \$5½ billion, due to the disbursements of veterans' life insurance dividends and the earned income credit. Subsidies less the current surplus of government

enterprises were down \$2 billion, reflecting the reduction of the Postal Service deficit that followed the December increase in postal rates. Total

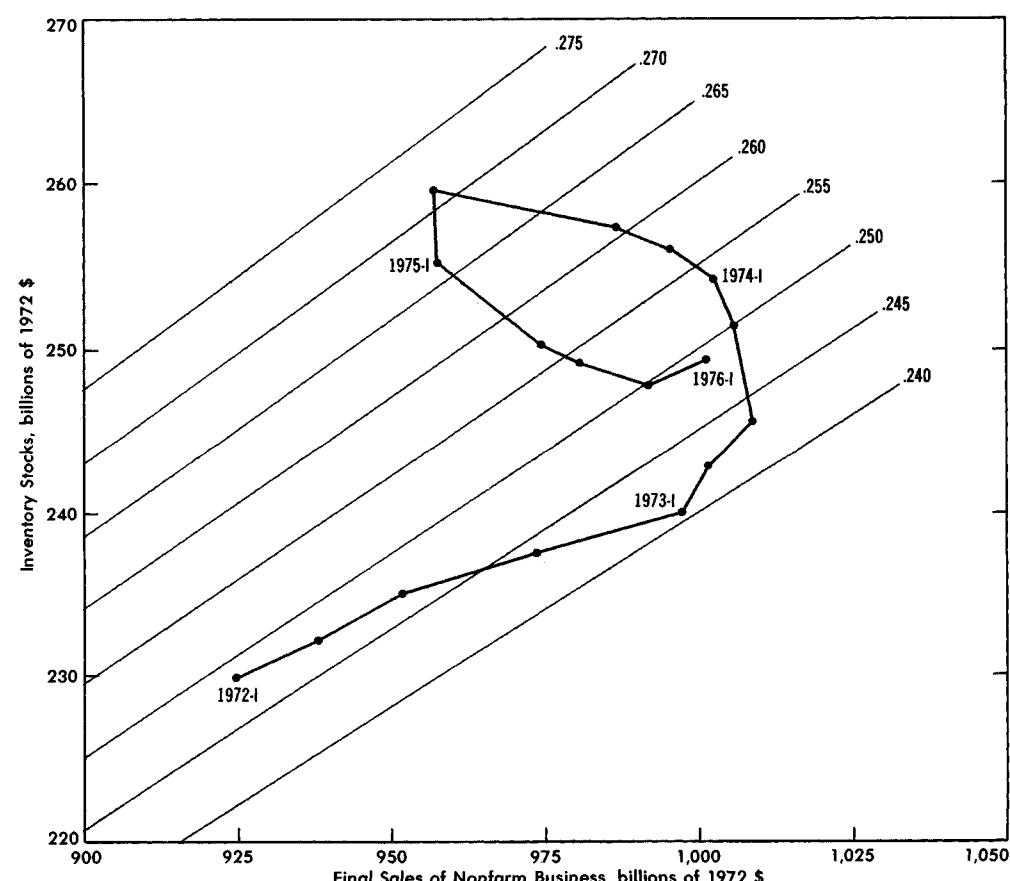

Federal expenditures increased \$6 billion, to about \$380 billion. Including an allowance for corporate profits tax accruals, which are not yet known, total Federal receipts increased by a comparable amount, and the Federal deficit on an NIPA basis held close to the \$72 billion registered in the fourth quarter.

Inventories

Real inventories accumulated in the first quarter after decumulation in the fourth. The swing was in nonfarm inventories; farm inventories increased by about equal amounts in both quarters. These estimates are based on preliminary data. For nonfarm inventories, the underlying book value information is available for only 2 months. A large accumulation of nondurable inventories appears to have been partly offset by a reduction in

CHART 5

Inventory Stocks, Final Sales of Nonfarm Business, and Stock-Sales Ratios

^p Preliminary.

1. Stocks are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from the current-dollar stocks shown in this table is not the current-dollar change in business inventories (CBI) component of GNP. The former is the difference between two inventory stocks, each valued at end-of-quarter prices. The latter is the change in the physical volume of inventories valued at average prices of the quarter. In addition, changes calculated from this table are at quarterly rates, whereas CBI is stated at annual rates.

2. Quarterly totals at annual rates.

3. Equals GNP in constant dollars measured as the sum of final products less GNP in constant dollars measured as the sum of gross product by industry.

NOTE.—Inventories are classified as durable or nondurable as follows: for manufacturing, by the type of product produced by the establishment holding the inventory; for trade by the type of product sold by the establishment holding the inventory; for construction, durable; and for other nonfarm industries, nondurable.

¹ Preliminary.

1. On February 18, 1974, the U.S. Government granted to India \$2,010 million (quarterly rate) in rupees under provisions of the Agricultural Trade Development and Adjustment Act. This transaction is being treated as capital grants paid to foreigners in the national income and product accounts but as current unilateral transfers in the balance of payments accounts. Accordingly, this transaction is excluded from Federal Government transfers to foreigners and related totals shown in tables 11, 15, and 16, and is included in the first quarter of 1974 as -\$8.0 billion (annual rate) in capital grants received by the U.S. shown in tables 11 and 16.

Earnings Increases, 1969-73

THE extent to which different demographic and earnings groups shared in the overall increase in earnings from 1969 to 1973 varied markedly, according to an analysis of data on workers with earnings in the first quarter of each year during that period. "Advancement"—defined as an increase in earnings from 1969 to 1973 that exceeded the 27 percent national average increase reported by the Bureau of Labor Statistics—was least common among those with average annual earnings during the period under \$3,000. With the exception of those earning under \$3,000, black men and black women were generally more likely to advance than were their white¹ counterparts in the same earnings ranges. Within given race-sex-earnings groups, young workers were more likely to advance than were older workers. With age held constant, the likelihood of advancement generally increased with increased earnings.

The Data

The data are from the Social Security Administration's Continuous Work History Sample (CWS), a longitudinal file containing information on a random, 1 percent selection of all persons having social security numbers.² These data refer only to earnings subject to social security taxation; earnings in uncovered employment and other types of income (such as interest and dividends) are excluded. The CWS

contains information on about 90 percent of the employed persons in the United States. The major excluded groups are civilian employees of the Federal Government, and those employees of State and local governments who are not covered by social security.

The earnings data are first-quarter earnings expressed at annual rates. Self-employed persons, who report their earnings to the Social Security Administration at the end of each year, are excluded from the analysis. To eliminate the effect of intermittent employment on the findings, the sample that was used includes only workers who had earnings in the first quarter of each year from 1969 to 1973. The 430,800 persons in this 1 percent sample represent 43,080,000 workers with earnings in the first quarter of each year during the period. These 43,080,000 workers include about one-half of the men and one-third of the women who had some work experience in 1969, and constitute a large group of workers with a very steady attachment to the work force.

The advancement standard of 27 percent is equal to the increase in average weekly earnings of production and nonsupervisory workers on private nonagricultural payrolls from the first quarter of 1969 to the first quarter of

1973. Because the Consumer Price Index increased 20 percent during the period, this standard represents an increase in real earnings of about 6 percent.

Findings

About 62 percent of all workers advanced from 1969 to 1973 (table 1). For each race-sex group, the proportion advancing was lower among those with average annual earnings under \$3,000 than it was for those at the higher earnings levels.³ Since the minimum hourly wage of \$1.60 which was in effect during the period implies minimum annual earnings of \$3,200 for persons working full time, full year (i.e., 40 hours per week, 50 weeks per year), very few of the workers with

3. The earnings groupings are based on average annual earnings (1969-73) rather than on initial-year (1969) earnings, because the use of 1969 earnings would make it more likely that low earners would advance than high earners. The reason is that in any single 3-month period (such as the first quarter of 1969), some workers are below their "permanent" earnings curve for reasons such as unemployment, part-time employment or sickness, while other workers are above their permanent earnings curve for reasons such as an unusually large amount of overtime. These workers are not randomly distributed among the various earnings levels. Rather, those with temporarily depressed earnings are more likely to fall into a low earnings level, while those with temporarily inflated earnings are more likely to fall into a high earnings level. Therefore, grouping workers on the basis of their earnings level in the initial year would make it easier for the low earners (including those with temporarily depressed earnings) to advance than the high earners (including those with inflated earnings in the initial period).

Table 1.—Proportions of Workers Who Advanced,¹ 1969-73

Average annual earnings, 1969-73	Total	White men*	Black men	White women*	Black women
Under \$3,000.....	52.3	56.2	51.2	51.2	47.0
\$3,000 to \$4,999.....	61.5	66.0	59.6	58.4	63.6
\$5,000 to \$6,999.....	63.9	62.6	65.9	64.5	71.8
\$7,000 to \$9,999.....	62.7	61.3	67.6	65.7	73.4
\$10,000 to \$14,999.....	64.4	63.8	69.6	69.0	77.0
\$15,000 and over.....	63.2	63.1	69.6	64.3	59.8
Total	62.1	62.6	63.9	60.4	61.9

*Includes all races other than black.

1. "Advancement" is defined as an earnings increase larger than the increase in average weekly earnings of production and nonsupervisory workers on private nonagricultural payrolls from the first quarter of 1969 to the first quarter of 1973.

NOTE.—Details may not add to 100 percent because of rounding.

Source: Continuous Work History Sample.

average annual earnings under \$3,000 could have worked full time steadily during the period.

Among white men earning over \$3,000 there was no systematic relationship between earnings level and the likelihood of advancement, and, because white men comprised 62 percent of the entire sample, the data for all race-sex groups combined also show no relationship between earnings level and the likelihood of advancement. In the three other race-sex groups, however, the likelihood of advancement generally increased with increased earnings, except for the groups earning \$15,000 and over, where the numbers of observations were small.⁴

Except for those earning under \$3,000, black men and black women were generally more likely to advance than their white counterparts at the same earnings levels. For example, 68 percent of the black men and 73 percent of the black women earning \$7,000-\$9,999 advanced, compared with 61 percent of the white men and 66 percent of the white women at that earnings level. For all earnings levels combined, however, the proportion who advanced was similar for each race-sex group. The explanation of this

4. A limitation of the CWHS is that earnings must be estimated for workers whose first-quarter earnings exceed the maximum annual amount subject to social security taxation. For example, for persons whose earnings in the first quarter of 1969 exceeded the taxable maximum of \$7,800, the CWHS estimates annual earnings as \$51,000 for men and \$45,000 for women. For those exceeding the taxable maximum of \$10,800 in the first quarter of 1973, the CWHS estimates annual earnings as \$73,500 for men and \$60,900 for women. Whatever error these estimates may introduce into the findings is very small, because in any year only a very small minority of the workers in the sample exceed the taxable maximum in the first quarter. Thus, even among those workers in the sample who earned over \$15,000 in 1969, only about 13 percent exceeded the taxable maximum in the first quarter of that year. Furthermore, the extent of the estimated earnings increase among those exceeding the taxable maximum in the first quarter was not very different from what it was among the remainder of those earning over \$15,000.

apparent anomaly lies in the larger proportions of blacks than whites at the lowest earnings level, where the likelihood of advancement was lowest; 10 percent of the black men and 28 percent of the black women had average annual earnings under \$3,000, compared with 5 percent of the white men and 18 percent of the white women (table 2).

The finding that blacks were generally more likely to advance than whites at the same earnings levels provides

perspective on Census Bureau figures that show that from 1969 to 1973 the ratio of black to white median earnings for all persons with earnings increased from 0.61 to 0.64 for men and from 0.75 to 0.92 for women.⁵ The longitudinal data presented here show that these increases are not merely the result of the withdrawal from the black labor force of low earners and their replacement by higher earners, but reflect, at least in part, the greater earnings gains of blacks than of whites at the same earnings levels.

The effect of age

As noted earlier, the proportion of white men who advanced was similar for all earnings levels above \$3,000. However, the low earnings levels contain larger proportions of young workers than the high earnings levels, and young workers are more likely to in-

Source: Continuous Work History Sample.

crease their earnings than older workers. A positive relationship appears between earnings level and the likelihood of advancement when the data are separated by age, that is, when the impact of the young workers on the low earnings levels is removed. The prevalence of young workers among the low earners is shown in table 3; 55 percent of the white men earning under \$3,000 and 54 percent of those earning \$3,000-\$4,999 were under 25 years of age in 1969, compared with far smaller proportions of the white men with higher earnings. The inverse relationship between age and the likelihood of advancement is shown in table 4. For example, among white men earning \$5,000-\$6,999, the proportion who advanced falls steadily from 84 percent of those under 25 years of age and 66 percent of those aged 25-34 to 39 percent of those aged 55

and over. Within given age groups, the data in table 4 show a positive relationship between earnings level and the likelihood of advancement. Among white men aged 25-34, for example, the proportion who advanced rises steadily from 45 percent of those earning under \$3,000 to 77 percent of those earning \$15,000 and over.

The inverse relationship between age and the likelihood of advancement and the positive relationship between earnings level and the likelihood of advancement are apparent for the three other race-sex groups as well. Among black men earning \$5,000-\$6,999, for example, the proportion who advanced falls from 81 percent of those under 25 to 50 percent of those 55 and over. Among black men aged 25-34, the proportion who advanced rises from 44 percent of

those earning under \$3,000 to 81 percent of those earning \$15,000 and over.

The age breakdowns in table 4 confirm the earlier finding that within given sex-earnings groups, blacks were generally more successful in advancing than whites. Also, within given race-age-earnings groups, women were generally more successful than men. Thus, among persons aged 45-54 and earning \$5,000-\$6,999, the proportions advancing were 69 percent for black women, 61 percent for white women, 58 percent for black men, and 48 percent for white men. A possible explanation for these findings is that assuming a history of previous discrimination, blacks and women at given earnings levels were superior workers to their white and men counterparts, and were therefore able to increase their earnings more rapidly as discrimination abated.

Tracking the BEA State Economic Projections

STATE projections to 1980 and 1990 of income and population, based on data covering the postwar years through 1971, were published in the April 1974 SURVEY OF CURRENT BUSINESS. This article reviews major changes in the economy since 1971 in order to determine the continuing usefulness of the projections. The assessment is made by measuring and evaluating the deviations between actual income and population and annual interpolations, for recent years, of the long-term full-employment projections.

The discussion focuses mainly on deviations for State economies which have departed substantially from their projected levels. The major causes of deviations fall into two categories: those that are likely to have long-term effects on State economies and those likely to have short-term effects. The first category includes changes in regional trends, such as the acceleration of growth in many industries in a number of small western and southern States, that were not apparent, or were overlooked, in the historical data when the projections were initially made, and unanticipated changes in particular industries nationally, such as the industrial effects of the energy situation. The second category includes temporary events, such as missile base construction in North Dakota; random events, such as floods, and their economic effects; and the national business cycle.

The following analysis emphasizes

NOTE.—The projection-monitoring system was developed and implemented by Eugene Janisch, assisted by Marian Sacks, both of whom contributed to this article. Howard Friedenberg and Robert Bretzfelder were primarily responsible for the preparation of the article, with Kenneth Johnson also contributing.

deviations for 1973, because it is the most recent year in which the national economy approximated the full-employment conditions projected for 1980 and 1990.

States With Significant Percent Deviations in 1973

In tables 1–3, the States are ranked in descending order of percent deviations [(projected less actual) ÷ actual] in labor and proprietors' income from all industries except agriculture, forestry, and fisheries—hereafter termed “nonfarm earnings”—in 1973.¹ States at the top of the tables had earnings overestimates, and States at the bottom had earnings underestimates. Table 1 shows projected and actual values and percent deviations for nonfarm and total earnings, total personal income, and population. Table 2 shows percent deviations for each of the 10 major industrial components of nonfarm earnings, and table 3 shows percent of total nonfarm earnings for each industry. (Nonfarm earnings are emphasized because of the unusually high level of farm earnings in 1973—63 percent more than projected—and the distorting effect this had on total earnings, particularly in States with substantial farming activity).

For the Nation as a whole in 1973, the difference between projected and actual nonfarm earnings was only 0.2 percent.² Percent deviations for the States and the District of Columbia ranged from 0 percent to 11 percent, with 35 of the observations falling below 5 percent.

1. The BEA State income estimates have not yet incorporated the revisions presented in “The National Income and Product Accounts of the United States: Revised Estimates, 1929–74,” SURVEY OF CURRENT BUSINESS, January 1976. These revisions are unlikely to substantially alter sub-national trends.

Underestimates exceeded overestimates by 2.4 to 1; States with overestimates accounted for more than one-half of U.S. nonfarm earnings. The following discussion centers on two groups of States—those with overestimates and those with large underestimates—because the pattern of deviation in each is associated with distinctive geographic and industrial characteristics (see chart 6).

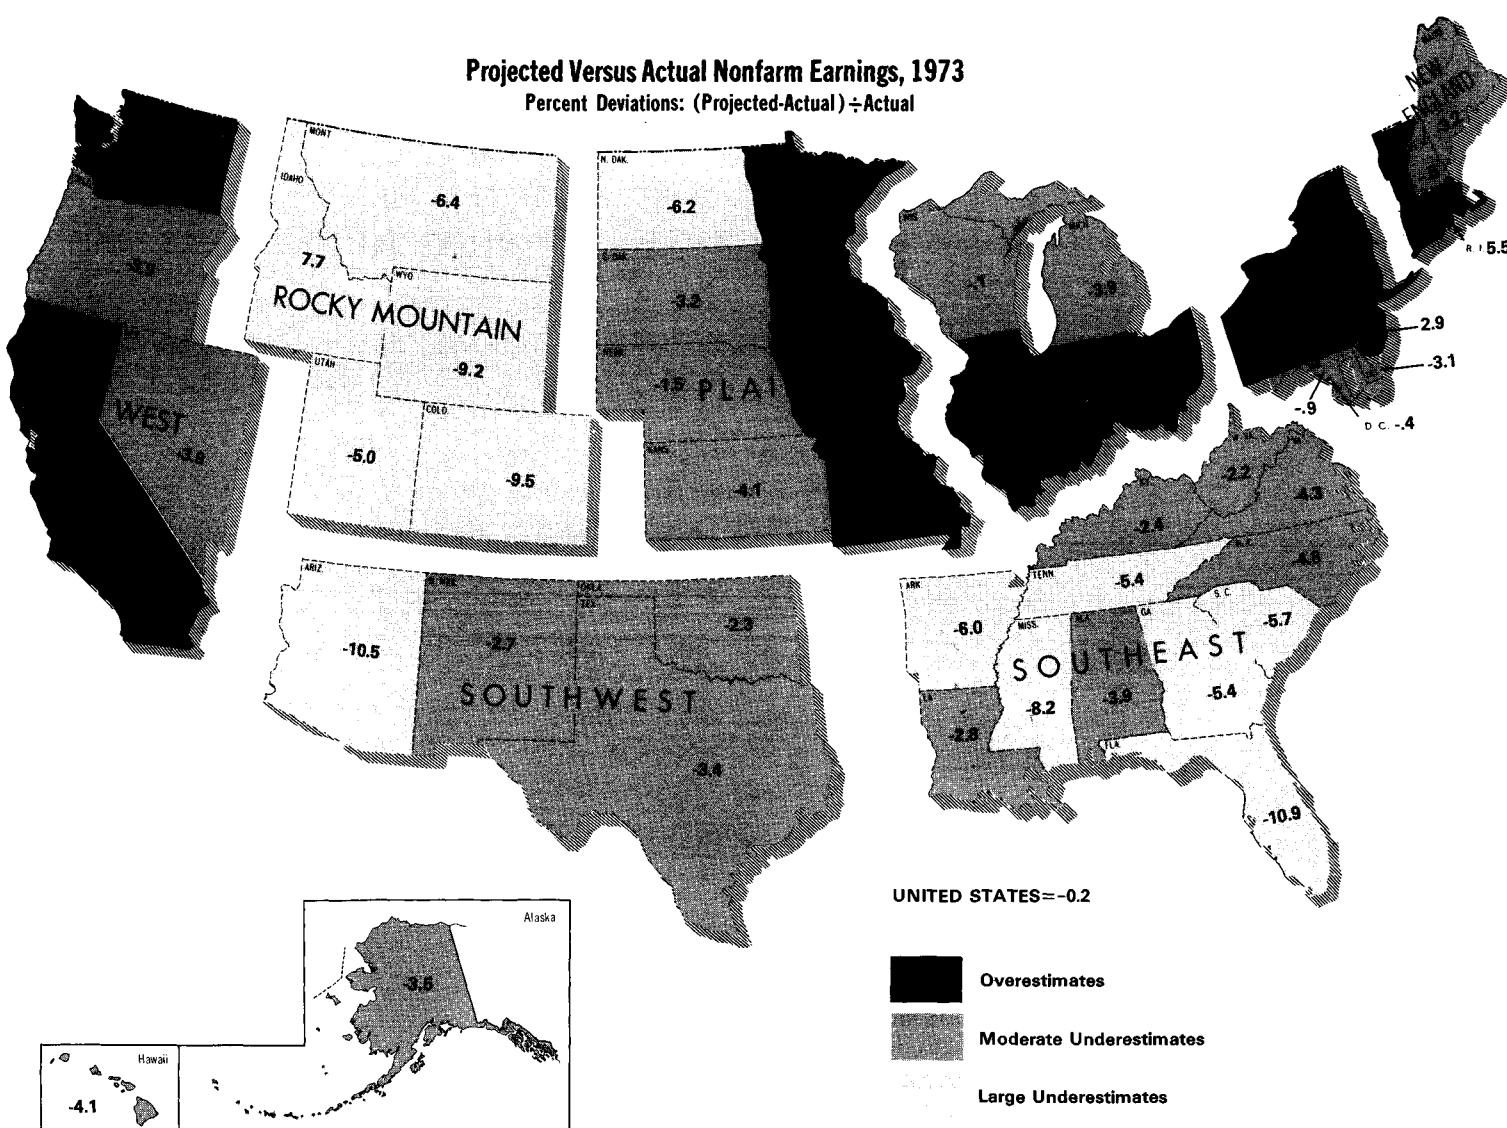

In the 15 States with overestimates, projected nonfarm earnings ranged from only slightly above actual levels (Indiana) to 6 percent above (New York); the average overestimate was 3 percent. This group included five of the largest States in the Nation: California and New York, each with more than 10 percent of U.S. nonfarm earnings, and Illinois, Pennsylvania, and Ohio, each with 5–6 percent. All 15 States except California and Washington are located in the manufacturing belt of the Northeast, Great Lakes, and eastern rim of the Plains.

In 13 States projected nonfarm earnings in 1973 ranged from 5 percent below the actual level (Utah) to 11 percent below (Florida); the average underestimate in these States was 7½ percent. This group accounted for only about 13 percent of U.S. nonfarm earnings, the largest States being Florida, with 3½ percent of the national total, and Georgia, with about 2 percent. All of these States are

2. This is the error in the aggregate that was projected independently of the State distribution; as such, this error is the weighted average of the State percent deviations—the sum of the State percent deviations, whether positive or negative, weighted by State nonfarm earnings.

The weighted average of the absolute percent deviations (that is, regardless of sign) was 2 percent. The unweighted average of the State percent deviations—the sum of the State percent deviations, whether positive or negative, divided by the number of States—was 1 percent. The unweighted average of the absolute percent deviations was 2.8 percent.

CHART 6

located in, or contiguous to, the Southeast and Rocky Mountain regions.

Sources of deviations

In general, the deviations noted above occurred because the projections (based on data through 1971) assumed a narrowing of growth rate differences among the States. Instead, recent data typically indicate that States projected to grow slowly (rapidly) grew even more slowly (more rapidly). From 1969 to 1973—both peak years in the national economy—the growth rate of nonfarm earnings in the 15 States with overestimates was only 10 percent, compared with a projected rate of 15 percent. Similarly, the growth rate

in the 13 States with large underestimates was 28 percent (nearly twice the U.S. rate), compared with a projected rate of 19 percent (only 25 percent above the U.S. rate).

In each group of States, most major industrial components of nonfarm earnings tended to deviate in the same direction. In the States with overestimates, projected earnings exceeded actual levels in 71 percent of the 150 observations (15 States times 10 industries). In this group, the exceptions were mainly in mining, State and local government, and transportation, communication, and public utilities (table 2). In the States with large underestimates, projected earnings fell short of

actual levels in 88 percent of the 130 cases (13 States times 10 industries).

In States with overestimates, manufacturing—an important industry in most—grew more slowly than expected, especially in New York, New Jersey, Connecticut, Massachusetts, Pennsylvania, and California. Ohio—a major producer in the motor vehicle industry, which operated at a high level in 1973—was the exception; its manufacturing performed as projected.

In States with large underestimates, growth in manufacturing, in some, and construction, more generally, was unexpectedly high. Manufacturing grew even more rapidly than projected in South Carolina, Tennessee, Arkansas,

and Colorado largely because the extent of the industry's increasing geographic dispersion away from the more industrialized States toward the southern and mountain States was underestimated in the projections. Underestimates of construction in Florida and Arizona in 1973 were due, in part, to a short-term building cycle: a temporary spurt in building in 1973 was followed by a sharp decline in 1975; these changes were properly "smoothed" in the projections. Construction in North Dakota, Montana, and Wyoming grew faster than expected because of missile base building in North Dakota—a short-term event—and more permanent gains in mining and related construction in Montana and Wyoming. Unusually good agricultural conditions contributed to greater-than-expected gains in related industries and in total nonfarm

earnings in most of the 13 States with large underestimates.

First Quarter 1975

Deviations for the first quarter of 1975 (the recession trough) necessarily show the effects of the 1974-75 recession; projected earnings exceeded actual levels in nearly all States (table 4). These data, however, also reveal the effects of changes in secular trends not evident in the 1973 data.

Despite the recession, nonfarm earnings were underestimated in 5 States (Alaska, Wyoming, North Dakota, Idaho, and Montana) and were only moderately overestimated in 11 States (in the Rocky Mountain, Plains, and Southern regions). These States benefited from the continuing geographic dispersion of manufacturing, from sharp

increases in the demand for domestically produced energy (dating from late 1973), and from three unusually good years of agricultural income—all of which supported increased levels of activity in major service-type industries and construction. Projections of manufacturing for these States held up well, even though projected earnings in this industry were overestimated by than 20 percent in the Northeast-Great Lakes industrial belt. Mining—the only major component of nonfarm earnings to be underestimated nationally (by 21 percent)—was unexpectedly strong in Alaska, Wyoming, Texas, West Virginia, Colorado, and Montana, and so, in nearly all of these States, were energy-related construction, transportation, and trade. In these States, projected mining earnings were about 30 percent below actual levels, due to

Table 2.—Percent Deviations¹ in Nonfarm Earnings,² 1973

2. Labor and proprietors' income, which consists of wage and salary disbursements, other labor income, and proprietors' income.

accelerated oil exploration and drilling and coal production.³

The largest overestimates in the first quarter of 1975 were in New York, Rhode Island, Vermont, and Massachusetts; long-term forces were at work in New York and Rhode Island. In Rhode Island large reductions in labor-intensive military base operations, beginning in 1974, resulted in overestimates of Federal military and civilian payrolls of more than 110 percent. These reductions subsequently affected service-type earnings, which were overestimated much more in the State than in the Nation as a whole.

The New York economy, which was

3. In a study, *The Economic Impact of Oil Resource Development on the Alaskan Economy, 1975-1985*, done for the Federal Energy Administration, BEA found that employment due to Alaskan oil development and exploitation, and construction of the pipeline and related facilities would reach a peak of over 40,000 in 1977, but would fall to around 30,000 jobs per year once the pipeline is in operation.

overestimated throughout the 1971-75 period, did not return to its long-term growth path following the 1970 recession as business establishments continued their exodus, particularly from New York City. Earnings from the important finance and trade industries, as well as from other service-type industries, have continued to be unexpectedly low. In addition, New York's manufacturing earnings which, prior to 1970, were somewhat cycle-resistant, have been consistently overestimated.⁴

State Percent Deviations in Population, 1973-75

Although long-term population changes (except for retirees) are as-

4. See "Sensitivity of State and Regional Income to National Business Cycles," SURVEY OF CURRENT BUSINESS, April 1973.

sociated with employment and earnings opportunities, population changes in short-term periods, particularly recessions, tend to be less volatile than earnings changes. Thus, deviations in the population projections during the recession of 1974-75 may be more indicative of changes in long-term trends than of cyclical changes.

Chart 7 indicates that, while projected population in nearly one-half of the States was within 3 percent of actual levels in 1975, population projections tended to diverge from actual levels cumulatively during the 1973-75 period. In 2 of the 3 years, for example, the largest overestimates were in Rhode Island, where projected population exceeded actual levels by 1 percent in 1973, 5 percent in 1974, and 7 percent in 1975. The largest underestimates, in contrast, were in Idaho, where

1. Total labor and proprietors' income, which consists of wage and salary disbursements, other labor income, and proprietors' income.

projected population fell short of actual levels by 8 percent, 11 percent, and 13 percent, respectively.

The States with large population underestimates were mainly in the South and West. An accelerated inflow of retirees has stimulated population growth in such Sun Belt States as Arizona, Florida, and Nevada. The growing energy industry, three unusually good farm income years in succession (1972-74), and reduced chances of finding jobs in the industrialized States of the Northeast and Great Lakes helped reverse the historical pattern of outmigration from some Rocky Mountain States and from other States in which agriculture is unusually important. Not only was immigration to the Northeast limited, but also outmigration from the Northeast—to the Sun Belt—may have accelerated due to

early retirements caused by the recession and fears of energy shortages and rising fuel costs.

Implications for 1980

In general, the post-1971 comparisons between projected and actual earnings and population reveal that about one-half of the State economies appear to have remained on their long-term growth paths. The other half have departed significantly from trend because of a larger-than-expected redistribution of economic activity and population between the Northeast-Great Lakes industrial States and a group of western and southern States.

If recent trends continue into the future, then the 1980 projections for the Northeast-Great Lakes industrial States would be too high; those for the

fast-growing southern and western States would be too low; and those for the remaining States would be approximately on trend. Supplemental data with which users can track the projections for particular States on a continuing basis are discussed in the following section.

Availability of Additional Data

Additional State data useful for measuring and explaining deviations between projected and actual population and income are available, including (1) data showing population, total personal income, and earnings in 37-industry detail, 1958-74, together with personal income and earnings in 10-industry detail through the four quarters of 1975; (2) estimates of population, personal income, and earnings in

Contrasting Developments in the States During Recession and Early Recovery

CHART 8

THE seven States hit hard during the recent recession (from the fourth quarter of 1973 to the first quarter of 1975) did well during the early part of the recovery (from the first to the fourth quarter of 1975). In contrast, of the six States that did exceptionally well during the recession, only half continued to do well during the recovery.

States that did poorly during the recession

States with the smallest gains in nonfarm income¹ during the recession turned around very sharply (Michigan, Georgia, New Hampshire, and South Carolina) or advanced somewhat faster than the national average (Indiana, North Carolina, and Ohio) during the recovery (chart 8). Manufacturing—especially autos and textiles—and construction held back income gains during the recession, but the former supported rapid gains during the recovery (table A). Changes in service-type industries paralleled those in manufacturing: gains were below the national average in the seven States during the recession, but above or near average in New Hampshire, Ohio, South Carolina, and Indiana during the recovery. In contrast, the lingering effects of the recession caused construction to continue to decline in five States and rise only moderately in New Hampshire and Indiana.

1. State nonfarm income is a more reliable indicator of the geographic impact of national economic changes than total personal income, because rapid and erratic changes in farm income tend to blur underlying economic developments.

In all seven States, rapid increases in government unemployment insurance benefits—at least 440 percent, compared with 266 percent nationally—helped cushion the declines in key industries during the recession. With recovery, these payments declined or changed only moderately.

Relative income changes in the District of Columbia, unlike those in the seven States, primarily resulted from changes in Federal Government payrolls.

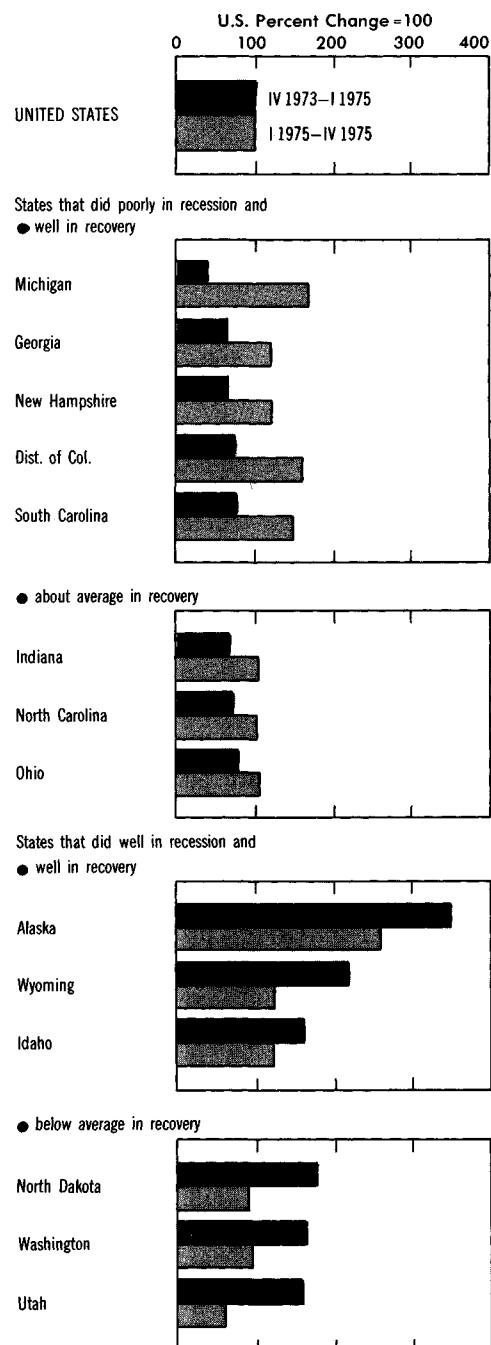

States that did well during the recession

Of the States with the fastest nonfarm income gains—at least 55 percent above the national average—during the recession, Alaska, Wyoming, and Idaho continued to gain rapidly during the recovery (though not as rapidly as previously), but North Dakota, Washington, and Utah did not (chart 8).

In all six States, mining, construction, and manufacturing stimulated gains in service-type industries during the recession. The large gains in Alaska and Wyoming mainly reflected increased mining and related construction activity, such as the Trans-Alaska oil pipeline. Missile base construction was important in North Dakota. Because of the economic strength of these six States, gains in government unemployment insurance benefits were well below average.

During the recovery, mining and related construction continued to support rapid gains in Alaska and Wyoming, and manufacturing con-

76-4-9

tinued to be strong in Idaho. In contrast, manufacturing weakened in Utah and Washington, and construction leveled off in North Dakota.

Five other States—New York, South

Dakota, Rhode Island, Hawaii, and Connecticut—had moderate gains in nonfarm income, ranging from 4½ percent to 5¼ percent, during the recovery.

Columbia, gains in current-dollar personal income were above the national rise in consumer prices. These States, with gains ranging from 33½ percent to 8 percent, were: Alaska, Nebraska, Wyoming, Iowa, Nevada, Montana, Washington, Utah, West Virginia, New Mexico, Texas, California, Rhode Island, Alabama, Oklahoma, Delaware, Vermont, Louisiana, Kansas, Maryland, Wisconsin, and Hawaii. In five States—Pennsylvania, Illinois, Virginia, Colorado, and Massachusetts—income gains approximated the rise in consumer prices. In the remaining 23 States, income gains ranged from 4 percent to 7½ percent, and real income apparently fell.

State Personal Income, 1974-75

From 1974 to 1975, both U.S. personal income and consumer prices (as measured by the implicit price deflator for personal consumption expenditures) rose about 8 percent; thus, real income was little changed. Current-dollar personal income gained in all 50 States and the District of Columbia.

Nationally and in most of the States, income gains were bolstered by sharp advances in transfer payments (up nearly 25 percent); excluding these payments, U.S. income gained 5½ percent, well below the rise in consumer prices.

In 22 States and the District of

Fixed Nonresidential Business and Residential Capital in the United States, 1925-75

THIS article presents revised and extended estimates of the Nation's stock of fixed nonresidential business capital, by major industry group, and of residential capital, by tenure group, for 1925-75. It also presents new estimates of both kinds of capital by legal form of organization. A brief explanation of the derivation of the estimates is provided.

The estimates are based on the gross fixed investment flows that are a part of the national income and product accounts (NIPA's) as reworked in the recently completed benchmark revision. BEA will publish the capital stock estimates in greater detail in a separate volume.

These estimates are part of a BEA

project to measure the Nation's tangible wealth. Estimates of the stock of business inventories were reworked in the course of the benchmark revision, and for certain quarters are shown in table 7 of the regular National Income and Product tables. Additional detail on inventories will be published in an article in the SURVEY OF CURRENT

Table 1.—Current-Dollar Gross Stocks of Fixed Nonresidential Business Capital, by Major Industry Group and Legal Form of Organization, 1925-75

[Billions of dollars]

End of year	Total			By major industry group									By legal form of organization

BUSINESS. Estimates of stocks of consumer durable goods are being prepared. Work on stocks of nonresidential government-owned capital has begun, and research on the land component of national wealth is planned.

Tables 1 and 2 show the estimates of gross and net stocks of fixed nonresidential business capital in current dollars; tables 3 and 4 show these stocks in constant (1972) dollars. Tables 5 through 8 provide the corresponding estimates of residential capital.

NOTE.—Gerald Silverstein assisted in preparing these estimates.

Derivation of the Estimates

Gross investment flows and capital stocks

The stock estimates are derived by the perpetual inventory method, which starts with investment flows and calculates gross capital stock for any given yearend by cumulating past investment flows and deducting discards. The investment flows used for the years since 1929 are: (1) the nonresidential and residential fixed investment that are included in the gross private domestic investment component of GNP, and (2) the government purchases of residential capital that are included in the

government purchases of goods and services component of GNP.¹ For the years before 1929, the flows are derived from data from various public and private sources.

The GNP investment flows are modified and supplemented. The modification relates to the valuation of purchases of used assets from another sector; these consist primarily of business purchases of government surplus assets. Intersector transfers of used assets other than government surplus assets are valued in gross stocks at

1. For definitions underlying these series, see "The National Income and Product Accounts of the United States: Revised Estimates, 1929-74," SURVEY OF CURRENT BUSINESS, Part I, January 1976.

SURVEY OF CURRENT BUSINESS

April 1976

their original acquisition prices. Except for items built for wartime use that were generally less suited to postwar than to war use, government surplus assets purchased by business are also valued in gross stocks at their original acquisition prices. The excepted items are valued in gross stocks at estimates of the prices that business would have been willing to pay for new assets of equal productivity designed specifically for the civilian uses to which these government surplus assets were put. These estimated prices are derived by raising the secondhand sales prices by a factor determined by the estimated age of the asset at the time of purchase by business.

The GNP flows are supplemented to provide appropriate investment series by industry for nonresidential capital or by tenure group for residential capital, and by legal form of organization. The investment series used to derive estimates by major industry group are: farm, U.S. Department of Agriculture (USDA) data, and manufacturing, Census Bureau data from the Census and Annual Survey of Manufacturers; nonfarm nonmanufacturing investment is the residual after the farm and manufacturing estimates are deducted from the NIPA totals. The investment series used to derive estimates by tenure group are: nonfarm, Census Bureau data from the Census of Housing, and

farm, USDA data. Investment series by legal form of organization are derived from a variety of sources: for fixed nonresidential business capital, these include the economic censuses, Internal Revenue Service (IRS), BEA plant and equipment expenditures survey, and trade associations; for residential capital, the Census Bureau's Survey of Residential Finance is used.

Service lives and retirement patterns

The service lives used to derive the estimates in tables 1 through 4 (nonresidential capital) are 85 percent of the lives specified in the 1942 edition of IRS Bulletin F.² The lives used to

SURVEY OF CURRENT BUSINESS

derive the estimates in tables 5 through 8 (residential capital) are 80 years for new 1- to 4-unit dwellings and 65 years for new 5- or more-unit dwellings; additions and alterations are assumed to have lives half as long as these.

These service lives are averages. The patterns of retirements used in this study are based on modifications of the Winfrey S-3 curve, which is a bell-shaped distribution centered on the average life.³ For nonresidential

2. Alternative estimates of stocks of fixed nonresidential business capital based on several different service life assumptions will be included in the volume on capital stock referred to earlier.

3. See Robley Winfrey, *Statistical Analyses of Industrial Property Retirement*, Iowa Engineering Experiment Station, Bulletin 125, December 11, 1935.

capital, retirements start at 45 percent and end at 155 percent of the average life. For residential capital, retirements start at 5 percent and end at 195 percent of the average.

Valuation

The capital stock measures are computed on three bases of valuation—historical cost, constant cost, and current cost. Historical cost measures are derived by valuing each item in the stock at the price at which it was purchased new. Historical cost stocks are not shown in this article, but they will be included in the volume on capital stock.

Constant cost measures are derived by valuing all assets at the prices of a given period. The prices of 1972 are used in this study. For these calculations, the gross investment flows must be expressed in constant prices. This is done by applying appropriate price indexes to the current-dollar investment flows. The constant cost stock is a measure of the physical volume of capital.

Current cost measures are derived by valuing all assets in the stock at any specified period at the prices of that period. This is done by applying price indexes to the constant cost stock estimates to convert them to current cost measures. In effect, the current cost

Table 4.—Constant-Dollar Net Stocks of Fixed Nonresidential Business Capital, by Major Industry Group and Legal Form of Organization, 1925-75

stock is a measure of the replacement value of capital.

The price indexes used in deriving the constant cost and current cost stocks are the same as those used in estimating the constant-dollar investment flows in the NIPA's. Improved indexes for both structures and producers' durable equipment were incorporated in the recent benchmark revision.

Depreciation and net capital stocks

Assets are carried in gross capital stocks at their undepreciated value

during the entire time they remain in the stock. The value of these assets is depreciated to obtain net stocks, which equal the difference between the cumulative value of gross investment and cumulative depreciation. The depreciation method used to derive the estimates of net stocks in tables 2, 4, 6, and 8 is the straight-line formula, which assumes equal dollar depreciation each year over the life of the asset.⁴

4. Another widely used method, the double-declining balance formula, assumes an annual percentage rate of depreciation that is twice the straight-line formula. Alternative estimates of stocks of fixed nonresidential business capital using this method will be included in the capital stock volume.

The "economic" capital consumption allowances in the NIPA's are based on straight-line depreciation and the same service lives used to derive the estimates of stocks in tables 1 through 8. However, these NIPA estimates differ slightly from the depreciation estimates in the capital stock calculations because of the treatment of accidental damage. The capital stock calculations are based on the assumption that accidental damage occurs at the same rate each year, whereas the NIPA estimates are adjusted to reflect year-to-year variations in the rate.

Table 5.—Current-Dollar Gross Stocks of Residential Capital, by Legal Form of Organization and Tenure Group, 1925–75

[Billions of dollars]

NOTE.—See table 5, Note.

CURRENT BUSINESS STATISTICS

THE STATISTICS here update series published in the 1973 edition of **BUSINESS STATISTICS**, biennial statistical supplement to the **SURVEY OF CURRENT BUSINESS**. That volume (available from the Superintendent of Documents for \$6.80) provides a description of each series, references to sources of earlier figures, and historical data as follows: For all series, monthly or quarterly, 1969 through 1972 (1962-72 for major quarterly series), annually, 1947-72; for selected series, monthly or quarterly, 1947-72 (where available). Series added or significantly revised after the 1973 **BUSINESS STATISTICS** went to press are indicated by an asterisk (*) and a dagger (†), respectively; certain revisions for 1972 issued too late for inclusion in the 1973 volume appear in the monthly **SURVEY** beginning with the August 1973 issue. Also, unless otherwise noted, revised monthly data for periods not shown herein corresponding to revised annual data are available upon request.

The sources of the data are given in the 1973 edition of **BUSINESS STATISTICS**; they appear in the main descriptive note for each series, and are also listed alphabetically on pages 189-90. Statistics originating in Government agencies are not copyrighted and may be reprinted freely. Data from private sources are provided through the courtesy of the compilers, and are subject to their copyrights.

^aSee corresponding note on p. S-8. ^bIncludes data for items not shown separately.
^cBeginning June 1974 SURVEY data are restated to reflect changes in pricing by BLS.
Because of delay in obtaining data the prices lag the current index as follows: industrial chemicals
and electric power, one month (i.e., July index reflects June prices); gas fuels, except
LPG, two months (July index reflects May prices); refined petroleum products (gasoline,
distillates, kerosene), one month (July index reflects June prices). The restated indexes are

comparable with those for earlier periods. § Effective with Jan. 1976 reporting, the textile products group has been extensively reclassified; no comparable data for earlier periods are available for the newly introduced indexes. ¶Beginning in the April 1976 SURVEY, data reflect new seasonal factors. All seasonally adjusted series have been revised back to January 1967. * Revised

Unless otherwise stated in footnotes below, data through 1972 and descriptive notes are as shown in the 1973 edition of BUSINESS STATISTICS	1974		1975		1975										1976

* Revised. ^ Preliminary. ^ Computed from cumulative valuation total. ^ Beginning with January 1976 State and local construction will be estimated from a new survey, creating break in the series owing to conceptual and procedural changes.

[†] Data for new construction have been revised back to 1958; those for housing starts and permits, back to 1959. The revised data are available from the Bureau of the Census, Washington, D.C. 20233.

Data for Aug. 1973 for nonresidential building and nonbuilding construction appearing in the Oct. 1974 SURVEY were transposed; they should have read (mil. \$) Nonresidential building, 3,167; non-building construction, 2,453.

② Includes data for items not shown separately.

⁸ Includes data for items not shown separately.

Unless otherwise stated in footnotes below, data through 1972 and descriptive notes are as shown in the 1973 edition of BUSINESS STATISTICS

* Revised. † Preliminary.

‡ Effective with the Oct. 1975 SURVEY, all establishment (payroll) employment, hours, earnings, and labor turnover reflect the periodic adjustment of these data to more recent benchmarks (Mar. 1974) and to revised seasonal factors. Data back to Jan. 1970 are subject to revision. The Oct. 1975 EMPLOYMENT AND EARNINGS (BLS) provides monthly data back to 1970 for many of the series published in the SURVEY.

NOTE FOR P. S-16: In accordance with the 1975 Tax Reduction Act (effective May 1, 1975), new formulas have been constructed for the period May-Dec. 1975 for calculating spendable earnings. Therefore, the entire reduction in 1975 taxes is accounted for in the period May-Dec. 1975. The 4.5% increase from Apr. to May 1975 in real spendable earnings reflects a .1% decrease in real weekly earnings plus a 4.6% decrease in the average tax effect (the change in average social security/federal income tax rates for worker with 3 dependents who earned the average weekly earnings).

Unless otherwise stated in footnotes below, data through 1972 and descriptive notes are as shown in the 1973 edition of BUSINESS STATISTICS

Others

¹ Revised. ² Preliminary.
¹ Average for year. ² Daily average. ³ Beginning Jan. 1973, data reflect changes in sampling and weighing. ⁴ Beginning June 30, 1974, data revised to include one large mutual savings bank that merged with a nonmember commercial bank. Total loans and investments were increased by about \$600 million of which \$500 million were in loans and \$100 million in "other securities." ⁵ Beginning Aug. 28, 1974, loans sold outright to banks' affiliates reflect a new definition of the group of affiliates included, and a somewhat different group of reporting banks; total loans were \$500 million less than they would have been on the old basis.

⑤ Adjusted to exclude interbank loans. § For bond yields, see p. S-21. ¶Beginning Jan. 1959, monthly data have been revised to reflect new seasonal factors and adjustment to benchmark marks for the latest call date (June 30, 1973). Revisions are in the Nov. 1973 Federal Reserve Bulletin. ⑨ Includes data for items not shown separately. □ Data have been revised back to 1971, noninstallment credit will no longer be available on a monthly basis. "Personal loans" and "other consumer goods paper" have been combined to form an "all other" category (not shown separately here). Earlier monthly data are available from the Federal Reserve Board, Washington, D.C. 20551. ° Corrected.

Unless otherwise stated in footnotes below, data through 1972 and descriptive notes are as shown in the 1973 edition of BUSINESS STATISTICS	1974	1975	1975											1976

FOREIGN TRADE OF THE UNITED STATES

⁷ Revised.
⁸Data may not equal the sum of the geographic regions, or commodity groups and principal commodities, because of revisions to the totals not reflected in the component items; these revisions will be shown later in biennial editions of BUSINESS STATISTICS. Also, beginning in 1973, the totals reflect relatively small amounts of trade with unidentified countries, not shown separately.

* Includes data not shown separately.

NOTE FOR PAGE S-25: *New series. Source: U.S. Dept. of Labor, BLS. The index measures changes in prices of shipping goods by rail in the U.S. (shipments priced were selected from ICC railroad waybill sample) and is not affected by changes in quantity, shipping terms, types of service, etc. Data back to 1939 (and detail for 11 commodity groups), concepts, methods, uses, and limitations appear in *MONTHLY LABOR REVIEW* (BLS), June 1975.

Unless otherwise stated in footnotes below, data through 1972 and descriptive notes are shown in the 1973 edition of BUSINESS STATISTICS	1974	1975	1975										1976

* Revised. † Preliminary. ‡ Annual data; monthly revisions are not available.
 ¶ Totals include data for types of lumber not shown separately. ^c Through March 1971 data are for flooring, B and better, F.G., 1" x 4", S.L., beginning April 1971, they are for flooring, C and better, F.G., 1" x 4", S.L.

¶ Effective Jan. 1975, data reflect expanded sample and exclusion of direct-reduced or preduced iron.

Unless otherwise stated in footnotes below, data through 1972 and descriptive notes are as shown in the 1973 edition of BUSINESS STATISTICS

INDEX TO CURRENT BUSINESS STATISTICS, Pages S1-S40

SECTIONS

General:

Business indicators.....	1-7
Commodity prices.....	8, 9
Construction and real estate.....	10, 11
Domestic trade.....	11-13
 Labor force, employment, and earnings.....	13-17
Finance.....	17-22
Foreign trade of the United States.....	22-24
Transportation and communication.....	24-25

Industry:

Chemical and allied products.....	25, 26
Electric power and gas.....	26
Food and kindred products; tobacco.....	27-30
Leather and products.....	30
Lumber and products.....	31
Metals and manufactures.....	31-34
Petroleum, coal, and products.....	34-36
Pulp, paper, and paper products.....	36, 37
Rubber and rubber products.....	37
Stone, clay, and glass products.....	38
Textile products.....	38-40
Transportation equipment.....	40

INDIVIDUAL SERIES

Advertising.....	11, 16
Aerospace vehicles.....	40
Agricultural loans.....	17
Air carrier operations.....	24
Air conditioners (room).....	34
Aircraft and parts.....	7, 40
Alcohol, denatured and ethyl.....	26
Alcoholic beverages.....	11, 27
Aluminum.....	33
Apparel.....	1, 4, 8, 9, 11-16, 40
Asphalt.....	35, 36
Automobiles, etc.....	1, 4, 6, 8, 9, 11, 12, 20, 23, 24, 40
 Balance of international payments.....	3
Banking.....	17, 18
Barley.....	27
Battery shipments.....	34
Beef and veal.....	28
Beverages.....	9, 11, 22, 23, 27
Blast furnaces, steel mills.....	5-7
Bonds, issued, prices, sales, yields.....	20, 21
Brass and bronze.....	33
Brick.....	38
Building and construction materials.....	4, 6, 7, 11, 31, 38
Building costs.....	10, 11
Building permits.....	10
Business incorporations (new), failures.....	7
Business sales and inventories.....	5
Butter.....	27
Cattle and calves.....	28
Cement and concrete products.....	9, 11, 38
Cereal and bakery products.....	9
Chain-store sales, firms with 11 or more stores.....	13
Cheese.....	27
Chemicals.....	5, 6, 9, 14-16, 20, 23, 25, 26
Cigarettes and cigars.....	30
Clay products.....	9, 38
Coal.....	5, 9, 23, 34, 35
Cocoa.....	23, 29
Coffee.....	23, 29
Coke.....	35
Combustion, atmosphere, heating equipment.....	34
Communication.....	2, 20, 25
Confectionery, sales.....	29
Construction:	
Contracts.....	10
Costs.....	10, 11
Employment, unemployment, hours, earnings.....	13-16
Fixed investment, structures.....	1
Highways and roads.....	10, 11
Housing starts.....	11
Materials output indexes.....	10
New construction put in place.....	18
Consumer credit.....	1
