the BUSINESS SITUATION

REAL GNP increased at an annual rate of 1 percent in the third quarter, after a second-quarter decline of 9½ percent (table 1 and chart 1).¹ An increase in final sales more than offset a swing to liquidation of business inventories. Among final sales, personal consumption expenditures (PCE) and net exports increased, residential investment steadied, and nonresidential investment and government purchases declined.

In the second quarter, declines in three elements—motor vehicle output, PCE on other than motor vehicles, and residential investment—about accounted for the decline in GNP. In the third quarter, motor vehicle output and PCE on other than motor vehicles increased, and residential investment steadied (table 2). These elements combined increased \$12½ billion in real terms.² An \$8 billion swing to liquidation in business inventories other than motor vehicles almost offset these increases; real GNP increased only \$3½ billion.

1. The third-quarter GNP estimates are based on the following major source data: For *personal consumption expenditures* (PCE), retail sales, and unit auto and truck sales through September; for *nonresidential fixed investment*, the same information for autos and trucks as for PCE, manufacturers' shipments of machinery and equipment for July and August, July and August construction put in place, and investment plans for the quarter; for *residential investment*, July and August construction put in place, and housing starts for July and August; for *change in business inventories*, July and August book values for manufacturing and trade, and unit auto inventories through September; for *net exports of goods and services*, July and August merchandise trade, and fragmentary information on investment income for the quarter; for *government purchases of goods and services*, Federal unified budget outlays for July and August, State and local construction put in place for July and August, and State and local employment through September; and for *GNP prices*, the Consumer Price Index for July and August, the Producer Price Index through September, and unit value indexes for exports and imports for July and August. Some of these source data are subject to revision.

2. Quarterly estimates of the national income and product accounts are expressed at seasonally adjusted annual rates, and quarterly changes in them are differences between these rates.

Prices.—GNP prices as measured by the fixed-weighted price index increased 9½ percent at an annual rate, as they had in the second quarter. Prices of two products had a substantial effect on the GNP price index in the 2 quarters. Price increases for food accelerated sharply; in contrast, price increases for energy decelerated sharply. As can be seen from the accompanying tabulation, the prices of GNP less food and energy increased a little less in the third quarter than in the second—9½ percent, compared with 10½ percent.

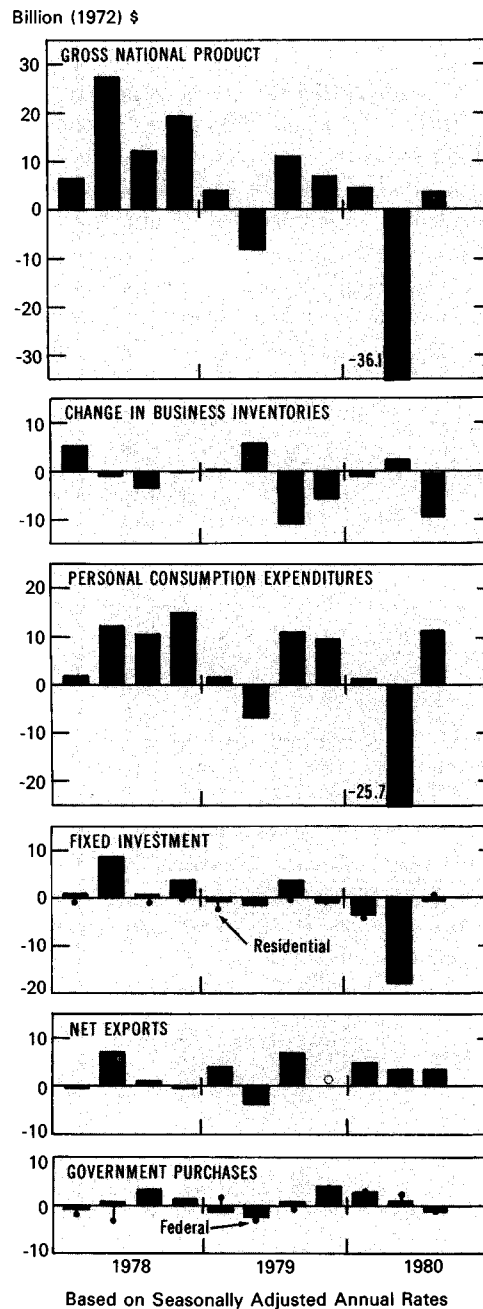

The pattern of sharp changes in food and energy prices is quantified in table 3 in terms of prices of PCE on food and of PCE on energy. The rate of increase of PCE food prices doubled, from 6½ percent at an annual rate to 13½ percent. The major factor in the acceleration was prices of red meat and poultry. These prices, and also prices of some other foods, were affected in the third quarter by heat and drought in farm regions. In addition, meat prices had been held down earlier in the year by record marketings. The rate of increase of PCE energy prices was cut from 24½ percent in the second quarter to 4 percent in the third. The major factor in the deceleration was gasoline prices, which declined in the third quarter after a substantial increase in the second. Prices of PCE on energy are discussed in an article later in this SURVEY. Other

PCE prices decelerated, from 10½ percent to 9½ percent. The prices of "other" items—fixed investment goods, and goods and services purchased by government—increased at about the same rate in both quarters.

Employment and unemployment.—Labor market conditions stabilized in the third quarter. The household measure of employment, which had declined 911,000 in the second quarter, in-

creased 177,000 in the third (table 4). Although unemployment was up 209,000 for the quarter, it declined 380,000 from July to September. The unemployment rate—at 7.6 percent—was virtually unchanged from the second quarter, but drifted down during the third quarter.

The establishment measure of employment, which had declined 631,000 in the second quarter, declined another

398,000 in the third. Both quarterly declines were concentrated in durable goods manufacturing. On a monthly basis, however, total employment increased 429,000 from July to September, with durables manufacturing up 95,000. The average workweek in durables manufacturing, as well as in manufacturing as a whole, had fallen sharply in the second quarter, fell another 0.1 hours in the third, but rose 0.5 from July to September. In the nonfarm economy, the pattern in hours was similar but the changes were less pronounced.

Costs and productivity.—Changes in real gross product per hour and unit labor costs in the business economy other than farm and housing were particularly sharp in the second and third quarters (table 5). It is always difficult to prepare accurate estimates of these measures on a timely basis, and it is particularly difficult to do so when, as was the case this year, real gross product and hours change rapidly. It is probable that the second- and third-quarter changes in real gross product per hour and in unit labor costs were smoother than those shown in the table.

Personal income and its disposition

Personal income increased \$60½ billion in the third quarter, compared with \$23 billion in the second (table 6). Changes in both quarters reflected the special factors that are listed in the addenda to the table. In the third quarter, by far the largest was the cost-of-living increases in Federal transfer payments, mainly social security benefit payments. They added \$17½ billion to the increase in personal income and accounted for about one-half of the step-up.

The remainder of the step-up was accounted for by wage and salary disbursements and by proprietors' income. Wages and salaries increased \$17 billion, compared with \$6½ billion in the second quarter. Although average hourly earnings increased a little less than in the second quarter, declines in hours and employment, which in their effect on wages and salaries are an offset

1. Gasoline and oil, fuel oil and coal, electricity and gas.

to increases in average hourly earnings, were substantially less than in the second quarter. The acceleration in wages and salaries was in manufacturing and retail trade, and—to a much smaller extent—in construction. Manufacturing payrolls had declined substantially in the second quarter and registered a small increase in the third.

Most of the swing was in durables manufacturing. Payrolls in retail trade increased after changing little in the second quarter, and construction payrolls steadied after declining.

A swing in farm proprietors' income—from a \$4½ billion decline to a \$1 billion increase—largely reflected the course of farm prices. Prices, especially of live-

stock, increased sharply in the third quarter after having declined in the second. In nonfarm proprietors' income, there was a swing from a \$5 billion decline to a \$2½ billion increase. A large part of the swing was due to construction and retail trade, where fluctuations in activity strongly affect proprietors' income. Another factor was a turnaround in commissions on the sale of securities, commodities, and residences.

In contrast, personal interest income increased less in the third quarter than in the second—\$6½ billion, compared with \$11½ billion. (Personal interest income is included in "other" income in table 6.) The deceleration was largely due to reductions in interest rates paid on short-term instruments held by persons. Short-term rates peaked in March-April and fell during the second quarter; they affect personal interest income

with a lag that reflects the turnover in these instruments.

Disposable personal income increased \$51½ billion, or 12½ percent at an annual rate, compared with \$18½ billion, or 4½ percent, in the second quarter. In real terms, the improvement was more pronounced, because prices paid by consumers increased less than in the second quarter. Real disposable income increased 3½ percent at an annual rate, after a 6-percent decline in the second quarter.

Personal outlays—of which PCE is the preponderant part—increased even more than disposable income, and personal saving declined. In contrast, outlays had declined in the second quarter, and saving had increased substantially. In that quarter, the saving rate had

jumped 1.2 percentage points to 4.9 percent; in the third quarter, it fell back to 4.6 percent (chart 2).

Real PCE increased about 5 percent at an annual rate, after a 10½-percent drop in the second quarter that was shared by all but one of the components shown in table 7. In the third quarter, durable goods registered the sharpest increase—about 21 percent. Their strength was due to motor vehicles, which are discussed in an article later in this SURVEY, and, to a lesser extent, to furniture and household equipment. Nondurables were flat. Continued declines in food and energy were about offset by a strong increase in clothing and shoes. A swing in services from a decline in the second quarter to an increase in the third was largely due to commissions of security and commodity brokers. These commissions had fallen in the second quarter from an unusually high level in the first, and recovered in the third.

Table 8, which presents month-to-month changes in real PCE, shows that most of the third-quarter increase occurred in July and was concentrated in durable goods. The increase that occurred in August was much more moderate. In September, a decline in PCE on goods was only partly offset by a continued increase in services.

Investment

Real nonresidential fixed investment declined 3½ percent at an annual rate, compared with 14½ percent in the second quarter (table 9). The slowing of the decline was due to motor vehicles, which turned up after a long slide. Both structures and producers' durable equipment other than motor vehicles declined more than in the second quarter. The declines in structures—9½ percent in the second quarter and 18 percent in the third—were widespread. The declines were concentrated in commercial and industrial buildings and in public utilities; the only substantial increase was in petroleum exploration and drilling. In producers' durable equipment other than motor vehicles, which declined 1½ percent and then 8½ percent, the weakening also was widespread. Sharp declines were registered in construction machinery, metalworking machinery, and aircraft.

Real residential investment steadied in the third quarter after 2 years of decline climaxed by drops of 26 and 62 percent in the first 2 quarters of 1980. Residential investment as measured in the national income and product accounts includes the value of new construction and brokers' commissions on the sale of new and existing residences (as well as additions and alterations, and mobile home purchases). The value of new construction continued to decline; construction of single-family units stabilized but that of multifamily units fell further. Brokers' commissions in-

creased sharply in the third quarter, as sales of residences increased.

Housing starts have increased each month beginning in June (chart 3). In the third quarter, at a seasonally adjusted annual rate of 1.4 million, they were 34 percent above the second quarter. The upturn was concentrated in single-family starts, and was evident in every region of the country. Prospects for a strong recovery in residential investment are dimmed by a third-quarter turnaround in interest rates, and by softness that may be emerging in housing sales.

The prime rate, to which construction loans are tied, fell from its peak of 20 percent in April to 11 percent in August, but rose to 13 percent by the end of September. The commitment interest rate on 25-year mortgages with a loan-to-price ratio of 75 percent fell from over 16 percent in April to about 12 percent in July and August, but rose 67 basis points to 12.86 percent in September. The increase through the end of September in yields at the Federal National Mortgage Association auctions portends a continued uptrend in mortgage rates.

CHART 3

U.S. Department of Commerce, Bureau of Economic Analysis

Data: Census

80-10-3

Sales of new one-family houses almost doubled from April to July, increasing from a seasonally adjusted annual rate of 345,000 to 655,000, but then declined to 623,000 in August. Sales of existing homes have increased beginning in June through August—from 2,310,000 to 3,030,000, or nearly one-third—but the August increase was the smallest. Sales of new homes must keep pace with construction to prevent an overhang of unsold homes, and, because many buyers of new homes are trading up, the sale of an existing home is often a precondition of the purchase of a new one.

Inventory investment.—As can be seen from chart 4, which presents an overview of inventory developments, the real stock of business inventories declined moderately in the third quarter. Since the first quarter of 1980, when the inventory-sales ratio reached a low, the stock of inventories has changed little, and the changes in the ratio were almost entirely due to changes in final sales. If the increase in final sales that started in the third quarter continues, a balance between inventories and final sales will not be difficult to achieve.

This assessment of inventories is confirmed by information on constant-dollar inventories, sales, and inventory-sales ratios for manufacturing and trade, which, for January and August, is assembled in table 10. In manufacturing and trade as a whole, as well as in the durable and nondurable goods categories of manufacturing, wholesale trade, and retail trade, sales were lower in August than in January. For total manufacturing and trade, inventories were unchanged; some categories showed lower inventories and some higher. The largest increase was in durable goods wholesalers, reflecting an August level that appears erratically high. In durable goods manufacturing, the increase in inventories over this period can be traced to primary metals, nonelectrical machinery, and to "other" transportation equipment, where the increase was particularly large. Because the inventory buildups in these industries were associated with sales declines, their inventories may be out of line.

CHART 4

Constant-Dollar Business Inventories, Final Sales and Final Sales of Goods and Structures, and Inventory-Sales Ratios

Note.—End-of-quarter inventories, seasonally adjusted; final sales seasonally adjusted at annual rates. Blue lines represent ratios of inventory stocks to final sales.

Net exports

Real net exports increased \$3½ billion in the third quarter, about as much as they had in the second (table 11). In both quarters, the increase was due to merchandise trade. Agricultural and nonagricultural exports increased in the third quarter, after declining in the second. The second-quarter decline in agricultural exports had been due to a cessation of grain shipments to the Soviet Union. In nonagricultural exports, a third-quarter decline in industrial supplies and materials, which may have reflected a weakening in economic activity abroad, was more than offset by small increases spread across most other categories. Petroleum and non-petroleum imports declined, as they had in the second quarter. The weakness in U.S. economic activity contributed to the declines. In nonpetroleum imports, in the third quarter as in the second, by far the largest decline was in industrial supplies and materials. Petroleum imports continued to decline sharply, from 8.4 million barrels per day in the first quarter to 7.4 million in the second and 6.1 million in the third.

Government purchases

Real government purchases declined 2 percent at an annual rate, after an increase of 1½ percent in the second quarter (table 12). State and local purchases continued to slip, largely due to declines in highway and building construction. Federal purchases were down despite continued strengthening

in defense purchases. The decline was due to purchases of the Commodity Credit Corporation (CCC). Following the cessation of sales of grain to the Soviet Union, the CCC attempted to remove from the market the amount of grain that would otherwise have been exported. The purchases were almost all

in the second quarter. In addition, as crop prices strengthened in the third quarter, farmers redeemed crops previously placed under loan to the CCC. The redemptions are treated as negative purchases in the national income and product accounts.

NIPA Federal sector.—Table 13 rounds out information on Federal receipts and expenditures. Expenditures increased \$32 billion in the third quarter, compared with \$18 billion in the second. The step-up was entirely due to transfer payments. Purchases of goods and services increased less than in the second quarter—\$1½ billion, compared with \$7 billion—and net interest paid declined fractionally after a \$4½ billion increase in the second quarter, as the average interest rate paid on Federal debt dropped.

Receipts increased substantially in the third quarter, after a decline in the second. The major factor in the swing was corporate profits tax accruals. Accruals had dropped \$21 billion in the second quarter, and—on the basis of a residual calculation of corporate

profits—increased substantially in the third. This residual calculation of corporate profits, from which tax accruals are estimated, assumes that the statistical discrepancy in the national income and product account is the same as in the preceding quarter. Indirect business tax accruals were the only major category of Federal receipts that

increased less in the third quarter than in the second. The second-quarter increase in these taxes had been unusually large because it included \$7 billion due to the windfall profits tax. This tax, which became effective March 1, yielded about \$3 billion in the first quarter and \$10 billion in the second, when it was in effect for the entire quarter.

HISTORICAL STATISTICS

The national income and product series for 1929-72 are in *The National Income and Product Accounts of the United States, 1929-74: Statistical Tables* (available for \$4.95, SN 003-010-00052-9, from Commerce Department District Offices or the Superintendent of Documents; see address inside front cover). Data for 1973, 1974,

1975, and 1975-78 are in the July 1976, 1977, 1978, and 1979 issues of the SURVEY, respectively. Summary national income and product series in current and constant dollars and implicit price deflators for 1947-79 are shown in the January 1980 issue of the SURVEY.

¹ Preliminary.

1. Equals GNP in constant dollars measured as the sum of final products less GNP in constant dollars measured as the sum of gross product by industry. The quarterly estimates are obtained by interpolating the annual estimates with the statistical discrepancy deflated by the implicit price deflator for gross domestic business product.

NOTE.—Table 6: The industry classification within the business sector is on an establishment basis and is based on the 1972 Standard Industrial Classification.

Footnotes for tables 2 and 3.

1. Equals GNP in constant dollars measured as the sum of final products less GNP in constant dollars measured as the sum of gross product by industry. The quarterly estimates are obtained by interpolating the annual estimates with the statistical discrepancy deflated by the implicit price deflator for gross domestic business product.

2. Held constant at level of previous quarter.

NOTE.—Table 2: "Final sales" is classified as durable or nondurable by type of product. "Change in business inventories" is classified as follows: For manufacturing, by the type of product produced by the establishment holding the inventory; for trade, by the type of product sold by the establishment holding the inventory; for construction, durable; and for other industries, nondurable.

Table 3: The industry classification within the business sector is on an establishment basis and is based on the 1972 Standard Industrial Classification.

^p Preliminary.

1. Inventories are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from current-dollar inventories shown in this table is not the current-dollar change in business inventories (CBI) components of GNP. The former is the difference between two inventory stocks, each valued at end-of-quarter prices. The latter is the change in the physical volume of inventories valued at average prices of the quarter. In addition, changes calculated from this table are at quarterly rates, whereas CBI is stated at annual rates.

2. Quarterly totals at annual rates.

3. Equals ratio of nonfarm inventories to final sales of business. These sales include a small amount of final sales by farms.

NOTE.—Table 16: Inventories are classified as durable or nondurable as follows: For manufacturing, by the type of product produced by the establishment holding the inventory; for trade, by the type of product sold by the establishment holding the inventory; for construction, durable; and for other nonfarm industries, nondurable. The industry classification is based on the 1972 Standard Industrial Classification.

Table 17: The industry classification of compensation of employees, proprietors' income, and rental income is on an establishment basis; the industry classification of corporate profits and net interest is on a company basis. The industry classification of these items is based on the 1972 Standard Industrial Classification.

Table 23.—Implicit Price Deflators for the Relation of Gross National Product, Net National Product, and National Income (7.6)

Gross national product	152.05	165.46	163.81	167.20	170.58	174.48	178.99	182.92
Less: Capital consumption allowances with capital consumption adjustment.....	163.6	177.7	175.4	180.1	184.1	187.7	191.8	197.0
Equals: Net national product	150.8	164.2	162.6	165.8	169.1	173.1	177.6	181.3
Less: Indirect business tax and nontax liability plus business transfer payments less subsidies plus current surplus of government enterprises.....	131.8	138.6	137.7	139.2	142.1	146.7	154.7	157.5
Residual.....								
Equals: National income	153.4	167.3	165.6	169.1	172.5	176.3	180.5	

^a Preliminary.

1. Consists of final sales and change in business inventories of new autos produced in the United States.
2. Consists of personal consumption expenditures, producers' durable equipment, and government purchases.

NOTE.—Table 21: "Final sales" is classified as durable or nondurable by type of product. "Change in business inventories" is classified as follows: For manufacturing, by the type of product produced by the establishment holding the inventory; for trade, by the type of product sold by the establishment holding the inventory; for construction, durable: and for other industries, nondurable.

Tables 22 and 24: The industry classification within the business sector is on an establishment basis and is based on the 1972 Standard Industrial Classification.

* Preliminary.

NOTE.—Table 27: The implicit price deflator for GNP is a weighted average of the detailed price indexes used in the deflation or GNP. In each period, the weights are based on the composition of constant-dollar output in that period. In other words, the price index for each item is weighted by the ratio of the quantity of the item valued in 1972 prices to the total output in 1972 prices. Changes in the implicit price deflator reflect both changes in prices and changes in the composition of output. The chain price index uses as weights the composition of output in the prior period, and, therefore, reflects only the change in prices between the two periods. However, comparisons of percent changes in the chain index also reflect changes in the composition of output. The fixed-weighted price index uses as weights the composition of output in 1972. Accordingly, comparisons over any timespan reflect only changes in prices.

State Personal Income, Second Quarter 1980

PERSONAL income in the United States increased only 1.1 percent in the second quarter of 1980, as the cyclical expansion that began in 1975 ended. Real personal income declined, as consumer prices, measured by the implicit price deflator for personal consumption expenditures, increased 2.6 percent. In each State, the percent change in current-dollar personal income was less than the national increase in consumer prices.

Because farm income is subject to erratic changes, it is often preferable to use nonfarm income to track current economic developments in States. Nonfarm income in the United States increased only 1.4 percent, after an increase of 2.9 percent in the first quarter; nonfarm income decelerated in each State except Oklahoma, where the first- and second-quarter increases were equal.

Nonfarm income in the second quarter either declined or increased at a rate well (50 percent or more) below the

national average in 19 States. Seven of these were in the Northeast-Great Lakes manufacturing belt, and eight were in the Southeast; the others were Alaska, Idaho, Oregon, and Iowa (table A). In most of the 19 States, the shares of nonfarm income accounted for by wage and salary disbursements (payrolls) in durables manufacturing exceeded the national average, and declines in durables payrolls exceeded the large national decline. Weakness in durables can be traced largely to production declines in motor vehicles, iron and steel, and lumber. Nondurables manufacturing payrolls, although increasing moderately in the Nation, declined or were virtually unchanged in most of the 19 States; weakness can be traced largely to production declines in textiles, paper, and chemicals. Reflecting weakness in construction activity, construction payrolls and nonfarm proprietors' income declined more than nationally in most of the 19. Among the 19, the seven Northeast-Great

Lakes States and the Southeast States of South Carolina, Mississippi, Tennessee, and Georgia had been severely affected by the 1974-75 recession. Michigan, Ohio, Indiana, and South Carolina also had been severely affected by postwar recessions prior to 1974-75, as had West Virginia, Alabama, and Kentucky.

The increase in nonfarm income in the second quarter was well (50 percent or more) above the national average in eight States. Six of these were in the West; the others were Florida and Louisiana. In most of the eight States, the shares of nonfarm income accounted for by mining payrolls exceeded the national average, and mining payrolls increased more than nationally. Both manufacturing and construction payrolls, although declining nationally, increased in most of the eight States. All eight had been affected relatively little by postwar recessions, except in 1974-75 in Florida and Arizona, where speculative over-building had occurred in the early 1970's.

Motor Vehicles, Model Year 1980

SALES of new motor vehicles declined in model year 1980 to 12.0 million from 14.7 million in 1979. This decline was the second in a row. Sales of both new passenger cars and new trucks were down sharply as a result of unfavorable economic and financial developments. Concern about fuel economy again raised the market shares of domestic small and imported cars and of imported trucks. Inventories of motor vehicles were reduced throughout the model year in response to slumping sales and increasing financing costs. Production of both cars and trucks was down sharply from 1979.

New Cars

Retail sales of new passenger cars totaled 9.2 million in the 1980 model year down from 11.0 million in 1979. The sharp decline was almost entirely due to a dropoff in domestic intermediate and full-size car sales. Intermediate sales fell from 2.6 million in 1979 to 1.9 million in 1980, and full-size sales from 2.4 to 1.6 million. Domestic small car (subcompacts and compacts) sales declined slightly from 3.7 to 3.4 million. Imported car sales were up slightly from 2.2 to a record 2.4 million and accounted for their largest share ever of total sales—26 percent. On a quarterly basis, total new car sales were 9.6 million (seasonally adjusted annual rate) in the fourth quarter of 1979, rose to 10.7 million in the first quarter of 1980, plunged to 7.7 million in the second quarter, and recovered somewhat to 8.7 million in the third (chart 5).

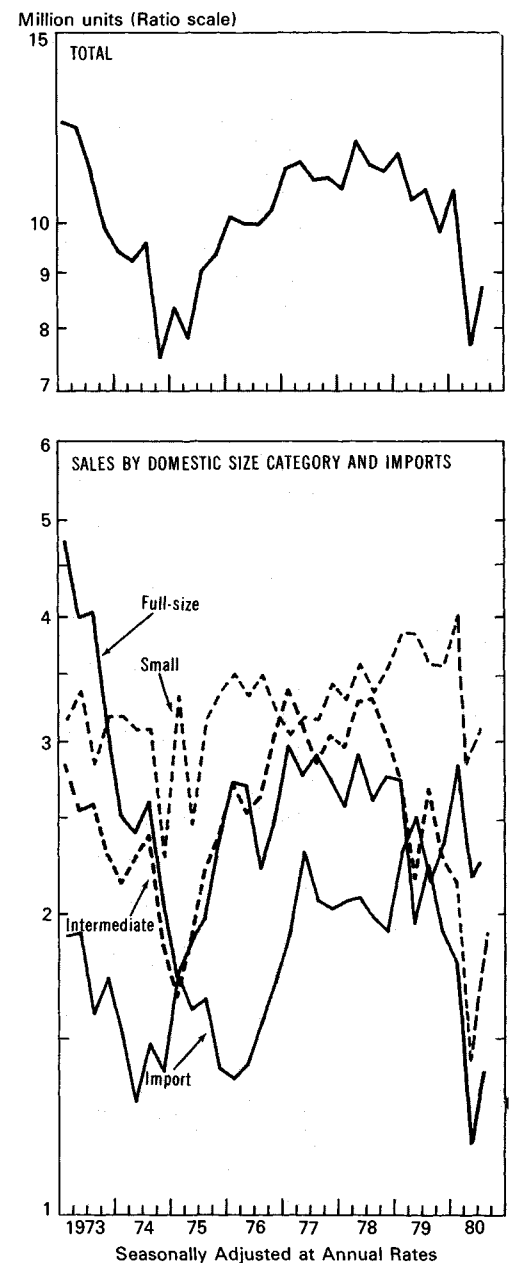

The decline in the volume and the quarterly pattern of sales can largely be traced to several economic and financial developments during the 1980 model

year. Real disposable personal income was virtually unchanged for six consecutive quarters through the first quarter of 1980, then dropped precipitously in the second quarter, before recovering somewhat in the third. Other factors that contributed to the reluctance of buyers to purchase a new car were: mounting uncertainty about job security and concern over future income losses due to plant closings and layoffs, losses in the value of financial assets and considerable instability in the financial markets, and a slowing in the monetization of capital gains on existing residences as the increase in housing prices decelerated and the volume of transactions declined. Finally, and perhaps most importantly, there were difficulties in financing new car purchases—approximately three-fifths of all new cars are purchased on credit—due to record-high interest rates on auto installment loans and constraints on the availability of credit. Finance rates on selected consumer auto installment loans by commercial banks, which had been about 12½ percent at the beginning of the 1980 model year, increased to 13½ percent in the first quarter of 1980 and to a record 15½ percent in the second quarter. Tight funds limited the availability of credit to marginal buyers. During this period, credit extensions were cut back—severely by commercial banks and credit unions, and moderately even by finance companies (which include automakers' subsidiaries).

Fuel economy

In 1980, as in the previous 2 years, auto manufacturers met federally mandated Corporate Average Fuel Economy (CAFE) standards. These standards are applied to each manufacturer and are based on the average miles per gallon

CHART 5
Retail Sales of New Passenger Cars

Note.—The components may not add to the total because each category was separately adjusted for seasonal variation.

Data: Motor Vehicle Manufacturers Association of the United States, Inc. and Ward's Automotive Reports; seasonal adjustment by BEA.

80-10-5

(mpg) ratings for each model, weighted by the number produced. The first CAFE standard, in 1978, was 18.0 mpg; it rose 1.0 mpg in each succeeding year through 1980. In 1981, the standard jumps to 22.0 mpg, but all manufacturers are expected to exceed that mark.

The steady improvements in CAFE can be attributed both to design and engineering changes in the cars produced and to shifts in the composition of cars sold. Downsizing—the reduction of exterior size and weight without reducing interior size—has greatly enhanced fuel economy. A popular full-size model had a wheelbase of 121 inches and weighed 4,281 pounds in 1974, was reduced to 116 inches and 3,771 pounds in 1977, and, by 1980, was down to 3,499 pounds. The lighter weight allowed reductions in engine size and the substitution of six-cylinder for eight-cylinder engines as standard. According to Environmental Protection Agency (EPA) estimates for city driving, fuel economy for this model improved from 11 mpg in 1974 to 16 mpg in 1977 to 18 mpg in 1980. Increased use of diesel engines also raised the fuel efficiency of large cars—diesel engines were rated about 5 mpg higher than gasoline engines in the same models. The diesel engine option was available on more models in 1980, and the number of diesels installed increased by almost one-third. It is likely that diesel engines for small cars will be available within the next few years. Another fuel-saving possibility is the development of engines that switch the number of cylinders in operation in response to driving demands.

In the latter half of the 1970's, most of the technological improvements and downsizing were concentrated on large cars. In 1980 and 1981, domestic manufacturers have introduced several redesigned, downsized small cars. These are termed "world cars," i.e., cars that share a basic design and have standardized components that can be manufactured in large volume at specialized plants in various countries and then assembled into final products near major consumer markets. These cars are smaller, lighter, and achieve significantly better fuel economy than their predecessors. Foreign manufac-

turers have broadened their product lines and have continued to upgrade the fuel economy of their cars.

A shift in the composition of new car sales to smaller cars has also contributed to the improvement in overall fuel economy. Fuel economy is closely correlated with size—smaller cars generally weigh less and use smaller engines. A 1980 model compact was rated at 22 mpg, an intermediate at 20 mpg, and a full-size car at 18 mpg. From the 1979 to the 1980 model year, domestic small cars increased their market share from 33½ percent to 36½ percent, and imports (which are nearly all subcompacts and compacts) from 20½ to 26 percent. The intermediate share fell from 24 to 20½ percent, and the full-size share from 22 to 17 percent.

The shift in the composition of sales in the 1980 model year was a continuation of a trend that began after the oil embargo in the fall of 1973. The ensuing gasoline shortage and huge runup in gasoline prices led buyers to consider fuel economy as a major factor in the selection of a new car. This consideration probably had a limited effect upon the volume of new car sales but greatly influenced the buyers' choice of car size. From the 1973 to the 1975 model year the full-size car share of the market plunged from 35½ percent to 23 percent. The domestic small and intermediate and the imported car shares all increased (chart 6). After the initial runup in late 1973 and early 1974, gasoline prices increased only gradually over the next 4½ years. From 1975 to 1978 the full-size market share stabilized, but at a level far below that which prevailed before the oil embargo. Buyers who might normally have been expected to purchase these models may have "traded down" to intermediates—intermediates increased their market share by 4 percentage points to 28½ percent. The small domestic and import shares receded somewhat during the period. In early 1979, another gasoline shortage and price runup led to a further sales shift toward smaller cars. Many buyers "traded down" to the newly redesigned and more fuel-efficient domestic and imported small cars. From 1978 to 1980 domestic small and imported

cars each increased their market shares by about 7 percentage points; the intermediate and full-size shares each fell by about 7 points.

New car prices

As they had in 1978 and 1979, domestic car manufacturers raised prices periodically during the 1980 model year. As before, the increases were selective—allowing manufacturers to adjust individual model and option prices to meet changes in market conditions. At model-year introduction in October 1979, prices were raised an average of 4½–5 percent on all models, about the same as in the prior year. Despite the further weakening of new

CHART 6

Market Share of New Car Sales by Model Year

Note.—Based on October through September Sales for each model year.
Data: Motor Vehicle Manufacturers Association of the United States, Inc. and Ward's Automotive Reports.

car sales, incremental price increases during the 1980 model year were as frequent and large as those in 1979. These increases, averaging about 1½-2 percent, were made at about 3-month intervals. Popular selling small cars and newly redesigned large cars bore the brunt of the increases.

Price increases at the time of the introduction of the 1981 models were in the 2-3 percent range, somewhat less than for the 1980 models. Again, the increases centered on the smaller models. The margins between the manufacturers' wholesale prices and the dealers' retail prices were realigned—margins on intermediate and full-size models and optional equipment were narrowed, and those on small car models were widened. Also, equipment that formerly was optional on many models was made standard. The effect of these changes was to lower the calculated price increase for 1981 models. Within the first week after introduction an additional increase of about 2½ percent was announced, bringing the average increase on the new models to the same range as last year.

Prices of imported cars were also raised periodically during the year. After a smaller increase at introduction, their prices were upped nearly as much as those of competing domestics. Announced increases for 1981 by several major foreign manufacturers were about 4½-5 percent.

New car inventories and production

At the beginning of the 1980 model year, domestic car inventories were 1,749,000 (seasonally adjusted), and the inventory/sales (I/S) ratio was 2.4, somewhat above the 2.0 level considered desirable. Further, a much larger portion of inventories than usual consisted of leftover 1979 models. In the fourth quarter of 1979, domestic new car sales slumped to 7.5 million, but production was cut back to only 7.3 million (seasonally adjusted annual rate). The cutback in production was largely accomplished by temporary—1 or 2 week—plant closings, although there was some permanent slowing of line

speeds and elimination of second work turns. By the end of the fourth quarter, 125,000 auto workers were on indefinite layoff, up from 88,000 at the beginning of the quarter. As a result of the production cutback, inventories declined to 1,674,000, but the I/S ratio climbed to 2.7. An oversupply of 1979 models continued to plague dealers. Sharply rising interest rates in the first half of 1980 also pressed dealers to pare inventories to reduce carrying costs.

In the first quarter, extensive dealer incentive and consumer rebate programs stimulated sales and enabled dealers to bring inventories closer to desired levels. Inventories were reduced sharply to 1,438,000, and the I/S ratio fell to 2.2. Production was down to 7.1 million, and two plants were closed permanently. Indefinite layoffs totaled about 170,000 at the end of the quarter. Coincident with the plunge in new car sales in the second quarter, production was slashed to 5.6 million, the lowest level since the first quarter of 1975. Inventories held steady, and the I/S ratio jumped to 3.2. The number of auto workers on indefinite layoff at the end of the quarter was nearly 250,000, considerably above the 205,000 peak registered during the 1974-75 recession.

Recent developments

Improving economic and financial conditions led to a partial recovery in new car sales in the third quarter. Real disposable personal income showed a sizeable increase, and interest rates were down considerably from the second quarter. Domestic small and intermediate car sales increased strongly—from 2.8 to 3.2 million and from 1.4 to 1.8 million, respectively. Domestic full-size sales increased moderately from 1.2 to 1.4 million, and imports were steady at 2.2 million. Domestic new car inventories declined sharply to about 1,300,000, the lowest level in more than a decade, and the I/S ratio was down to 2.4. Domestic production was up only slightly to 5.8 million.

The very low level of production in the third quarter indicates manufacturers' expectations of a slow start for the 1981 model year; inventories of new models are not at a level that would

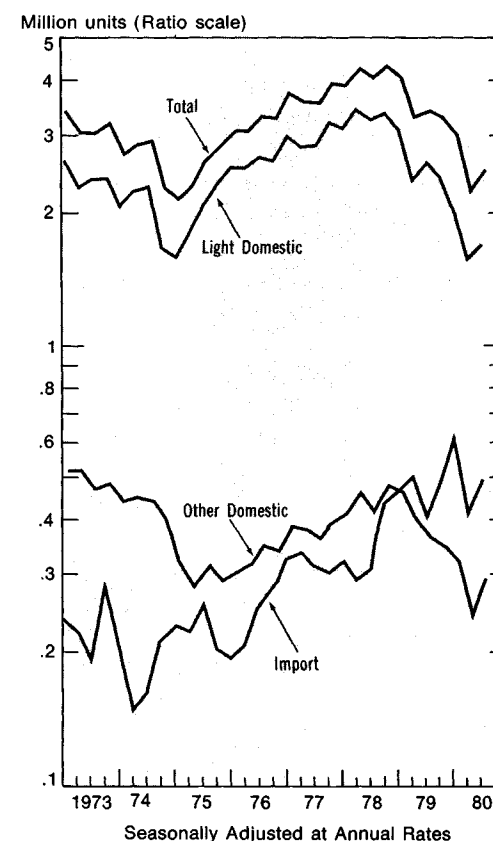

sustain a large increase in sales. According to current schedules, production is slated to pick up to about 7.1 million in the fourth quarter.

New Trucks

Retail sales of new trucks totaled 2.8 million in the 1980 model year, down sharply from 3.7 million in 1979. New truck sales were 3.3 million (seasonally adjusted annual rate) in the fourth quarter of 1979, declined to 3.0 million in the first quarter of 1980, plummeted to 2.3 million in the second quarter, and recovered slightly to 2.5 million in the third (chart 7).

Domestic light (up to 10,000 pounds) truck sales, which comprise over two-thirds of total sales, continued to decline from their peak in the second quarter of 1978. Most of these trucks are pick-

CHART 7
Retail Sales of New Trucks

Note.—Retail sales of domestic new trucks are classified by gross vehicle weight as light—up to 10,000 pounds, and other—over 10,000 pounds. Import trucks include imports by U.S. manufacturers.

Data: Motor Vehicle Manufacturers Association of the United States, Inc. and Ward's Automotive Reports; seasonal adjustment by BEA

ups and vans, over one-half of which are purchased by consumers for personal use. Sales of light trucks were 2.4 million in the fourth quarter of 1979 and dropped to 2.0 million in the first quarter of 1980. Sales bottomed at 1.6 million—equaling the low in the 1974–75 recession—in the second quarter, and then edged up to 1.7 million. The sales pattern paralleled that of new cars and was influenced by the same economic and financial developments. Price increases on domestic light trucks exceeded those on cars in the 1980 model year.

Sales of imported trucks, which include trucks produced overseas but sold by domestic dealers, were up more than 10 percent in the 1980 model year. Imported truck sales were strong—499,000 (seasonally adjusted annual rate)—at the beginning of the model year, jumped to a record 618,000 in the first quarter of 1980, dropped precipitously to 418,000 in the second quarter, and rebounded to 497,000 in the third. Imported trucks accounted for over 20 percent of total light truck sales in the 1980 model year, the highest percentage ever.

The increase in imported truck sales at the expense of domestics can partly be attributed to buyers' concern about fuel economy. Nearly all imported

trucks are compact pickups, which are smaller and lighter than their domestic counterparts. Imports are equipped with four-cylinder engines; domestics require six-cylinder and offer eight-cylinder engines as options. According to EPA fuel economy estimates for 1980 models, imported compact pickups averaged 21–25 mpg, compared with 14–18 mpg for domestic conventional pickups.

Prices of imported trucks increased by about as much as those of domestics in the 1980 model year. At the time of 1981 introduction, however, they are likely to be up considerably more than domestics, principally due to a recent change in tariff rulings by the U.S. Customs Service. Previously, imported truck cab-chassis assemblies were imported at the 4 percent duty-rate for truck parts and later joined to truck bodies. Effective August 21, the 25 percent duty-rate for completed trucks is levied on these units.

Over the next few years, more compact pickup trucks will be produced domestically. One manufacturer began to produce these trucks this year, and the rest are scheduled to follow in 1982–83. Downsizing of conventional pickups is also planned. These developments will help domestic manufacturers meet

the CAFE standards for light trucks. The standard for 2-wheel drive trucks is slated to rise from 16.0 mpg in 1980 to 16.7 mpg in 1981 to 18.0 mpg in 1982, and for 4-wheel drives from 14.0 to 15.0 to 16.0 mpg. Several foreign manufacturers are planning to build plants in the U.S. to produce light trucks.

Sales of "other" (over 10,000 pounds) domestic trucks were down sharply in 1980. This broad category consists of medium-weight trucks, mostly general delivery trucks and buses, and heavy trucks, mainly large single-units and diesel tractors designed to pull trailers. Sales of these trucks peaked at 478,000 in the fourth quarter of 1978 and then declined steadily, bottoming at 240,000 in the second quarter of 1980. Sales recovered somewhat to 291,000 in the third quarter.

Domestic new truck inventories were 920,000 (seasonally adjusted) at the end of the third quarter of 1979, the highest ever at the time of new model introductions. Inventories were run off throughout the 1980 model year, falling to 530,000 at the end of the third quarter of 1980. New truck production roughly paralleled that of new cars, declining sharply in the first and second quarters of 1980, before flattening in the third quarter.

Revised Estimates of New Plant and Equipment

Expenditures in the United States, 1947-77

THIS article presents a comprehensive revision of the quarterly series for new plant and equipment (P&E) expenditures and of most of the other series compiled from the BEA P&E survey. Revised estimates of both actual and planned expenditures, which are universe totals of expenditures by non-farm business for new plant and equipment investment in the United States, are presented for 1947-77. Revised estimates of investment carryover and starts and of manufacturers' evaluation of their facilities are presented for 1963-77. Revised estimates of these series for 1978-80 will be published in the December 1980 issue of the SURVEY OF CURRENT BUSINESS.¹

Major features of this revision, which is the third in the history of the P&E survey series, are as follows:

- Coverage is expanded to all non-farm business by the inclusion of four industries: real estate; professional services; social services and membership organizations; and forestry, fisheries, and agricultural services. In addition, coverage is improved by the inclusion of portions of several industries; these portions were not included previously.
- Separate estimates of expenditures for plant and for equipment by major industry groups are introduced. These series are presented annually from 1947 and quarterly from 1972.

In this article, an overview of the revision of the plant and equipment expenditures series is provided first. Second, the sources of the revisions

1. Revisions of two other series will be published later. Revised annual capital expenditures by business for pollution abatement are scheduled for publication in June 1981. Manufacturers' capacity utilization rates, which are weighted combinations of rates reported by individual manufacturers, are not affected by revisions of the estimates of capital expenditures. However, the industry and size classifications of the reporting companies and the weights used in the computations will be reviewed, and revised estimates will be published.

of the expenditures series and the revised expenditures series are discussed, and the breakdown into plant and equipment is introduced. Third, the revised series for planned expenditures, for carryover and starts, and

for manufacturers' evaluation of facilities are briefly reviewed. Finally, some of the current problems of the P&E survey and plans for its improvement are discussed. Technical notes follow the article. They describe: (1)

Most of the work on this revision project, which took 5 years, was done in the Business Outlook Division.

George R. Green, Chief of the Business Outlook Division, directed the project and played a key role in the formulation of methodology and procedures.

Marie P. Hertzberg, Chief of the Special Analysis and Development Branch, participated in the formulation of methodology and procedures, developed detailed methodological specifications, supervised most of the work of estimating and reviewing the revised series for 1947-76, and developed specifications for the computer programs.

John T. Woodward, Chief of the Business Investment Branch, participated in the formulation of methodology and procedures, prepared some of the benchmark estimates, and supervised the reclassification of companies, the analysis of mergers, and the estimation of revised series for 1977 and later years.

Jon E. Trevathan prepared the quarterly estimates for 1972-76, coordinated major segments of the data compilation and review for 1947-76, prepared estimates for non-sample categories for recent years, and participated in the preparation of benchmark estimates.

Lawrence Bridge, a consultant to BEA, established the framework for the expanded coverage, prepared benchmark estimates for many industries, and prepared annual estimates for nonsample categories for 1947-75.

John E. Cremeans, until recently Associate Director for National Analysis and Projections, provided overall guidance.

BEA staff that made significant contributions to the revision project are listed below:

Benchmark estimates: LAWRENCE BRIDGE, Marie P. Hertzberg, Charles S. Robinson, Jon E. Trevathan, John T. Woodward

Revised estimates for 1947-71: FELICIA V. CANDELA, Karen Meltzer

Revised estimates for 1972-76: JON E. TREVATHAN, Karen Meltzer

Seasonal and bias adjustments: FELICIA V. CANDELA, Jon D. Silverman

Reclassification of companies; revised estimates for 1977 and later years—Manufacturing: MICHAEL PHILLIPS, Elaine E. DeMartino, Marie P. Smith, *Nonmanufacturing:* LAURENCE J. BLUMBERG, Abdul Majid, Charles S. Robinson, Luvenia L. Smith, David F. Sullivan, Terrence J. Woods

Analysis of merger activity: GARY L. RUTLEDGE, Laurence J. Blumberg

Analytical charts: MICHAEL J. MCKELVEY, Jon D. Silverman

Computer programming and services: LISA K. WESTERBACK, Colin B. Brown, Jesse Bunch, Maurice A. Schlak, Shirley L. Thompson, and the Computer Operations Branch

Secretarial: AIJA E. ROESS, Ernestine Brown, Robyn Hamill, Getty B. Mumford, Joanne E. Weingarden

Several divisions in BEA detailed persons to work on this project on a temporary basis or cooperated in other ways.

The P&E survey and the survey series, (2) the methodology used to estimate the survey series, including the separate estimates of plant and of equipment expenditures, (3) the extensions and improvements of coverage in this revision, and (4) alternative estimates of business investment.

An Overview of the Revision

This section describes briefly the three steps taken in the revision of the P&E expenditures estimates and the principal statistical procedures used in preparing them.

1. For selected years, the best possible estimates for each industry and size group—henceforth called tab group—were prepared. The years selected were determined by the greater availability of data for those years, and the estimates for those years are called benchmarks. This revision incorporated benchmark data for 1967 and 1972. Previously published estimates incorporated benchmark data for 1948, 1958, and 1963.

The benchmark estimates for the various industries were developed from a wide variety of sources. For manufacturing and mining, the principal source was *Enterprise Statistics*, prepared by the Bureau of the Census, which is available only for 1958, 1963, 1967, and 1972. For other industries, estimates were constructed using information from the Bureau of the Census, the Internal Revenue Service, the Interstate Commerce Commission, other regulatory agencies, and private sources. Adjustments were made to the estimates for all benchmark years to incorporate changes in industry coverage and changes in industry definitions necessary to conform to the 1972 Standard Industrial Classification (SIC), and to incorporate revised data published after the last revision was completed.

2. For the quarters prior to 1972, tab group universe estimates, as originally tabulated, were used to interpolate between benchmark estimates.

3. For the quarters of 1972 and later years, retabulations of individual company reports were used to extrapolate

late the 1972 benchmark estimates. Before retabulation, each individual respondent company's industry- and size-group classification was reviewed and appropriate changes were made, reclassifications were made to reflect major mergers and acquisitions occurring after 1972, responses received too late for inclusion in the previously published estimates were included, and the responses were reedited. The results of the extrapolation for manufacturing and for nonfarm business were checked against independent estimates.

Principal statistical procedures.—Individual companies are classified by industry and by size group. The industry classification assigned a company is based on its primary activity—that is, on the activity with the largest volume of sales or payrolls—and its total expenditure is included in the tabulation for that industry. The size-group classification is used to capture variations in investment behavior and in sample coverage rates among different sized firms. For this revision, the number of size groups in manufacturing and the commercial industries was reduced from five to three to achieve more stable groups, and the number in utilities, communication, insurance, and selected transportation industries was expanded to two to capture the behavior of small- and medium-sized firms.

The procedure for handling mergers and acquisitions was improved in this revision. Beginning in 1973, adjust-

ments were made in each quarter for companies involved in major merger transactions. When two industries were involved, the universe estimate for the industry into which the combined company was classified was increased to include the capital expenditures of the merged company, and the universe estimate for the other industry was reduced.

The seasonal adjustment factors for each industry were recomputed for all periods using the Census X-11 seasonal adjustment program.

P&E Expenditures: Sources of Revisions and the Revised Series

The revised estimates of P&E expenditures are substantially larger than the estimates published previously (chart 8). The sources of the revisions are shown in table 1 for the benchmark years and for 1973-77. Prior to 1964, the revisions are due to extensions and improvements in coverage. Beginning in 1964, the first year affected by the 1967 benchmark, statistical revisions become increasingly significant. Through the next benchmark (1972), they remain substantially smaller than the coverage revisions. In 1972, statistical revisions amount to about \$9 billion and coverage revisions amount to about \$23 billion. By 1977, statistical revisions are about \$26½ billion and coverage revisions are about \$36 billion. Table 2 shows the

sources of the revisions by industry for 1972-77.

Coverage revisions.—Coverage revisions may be classified as “extensions” or as “improvements.” Four industries were added to extend coverage to all nonfarm industries. This extension of coverage added about \$3 billion in 1948 and \$23½ billion in 1977. Spending by two of these industries, real estate and professional services, is of about equal size and accounts for most of the revision. The former is included in the by-industry tables with finance and insurance. The latter, which consists of hospitals, other medical services, legal services, educational services and museums, and other professional services, is included with personal and business services. The third and fourth industries—social services and membership organizations, and forestry, fisheries, and agricultural services—are included in the “other” category. Estimates for the first three of the industries are based on survey responses for the period since 1971. Prior to that year, and for forestry, fisheries, and agricultural services, estimates were compiled from a large number of other sources.

Coverage was improved in a number of industries by using nonsample sources to estimate P&E expenditures for portions of industries. The improvements include expenditures for amortized special tools by motor vehicle manufacturers in transportation equipment manufacturing; expenditures for nonrail operations of railroads; expenditures of the noncorporate parts of communication and some transportation and utilities industries; expenditures by Rural Electrification Administration cooperatives; expenditures of commercial banks for plant and equipment they lease to others; expenditures of Federal Reserve banks, Federal Land banks, Federal Home Loan banks, and credit unions; expenditures of insurance agents and brokers; and expenditures by persons who report rental income to the Internal Revenue Service on a supplemental schedule.

Statistical revisions.—Table 3 summarizes the sources of the statistical revisions for 1972-77. For 1972, the statistical revisions are \$9 billion, and reflect the benchmarking of the industries

covered by the previously published "all industries" series. Thereafter, the statistical revisions have two sources. The first, shown in line 4, is the effect of the larger 1972 base. The size of this kind of revision varies from year to year in proportion to P&E spending, because as mentioned earlier, the estimates are extrapolations. In 1977, it accounted for about 45 percent of the statistical revisions.

The remaining part of the statistical revisions in 1973-77 cannot be allocated to the several sources that are listed in lines 6-8. These sources are described below.

All available reports, including those that were received too late to be included in the previously published quarterly estimates, were incorporated in the retabulation of sample data. The number of late reports has increased in recent years, but it is not known exactly how the late reports affect the estimates.

CHART 8

Expenditures for New Plant and Equipment: Previously Published and Revised

Some companies were reclassified into different industries or size groups either as a result of the classification review or because they were involved in merger activity. The reclassification tended to raise the estimates, because reclassified companies were overwhelmingly the faster growing companies and, on balance, reclassified companies were moved to industries or size groups with faster growth and/or larger investment.

Reclassification of companies, the inclusion of "late" reports, and the reduction in the number of size groups in most industries made it necessary to reedit individual company reports for 1972 and later years. Editing is the examination of company responses with the aim of making each industry- and size-group estimate as representative of the universe as possible. Companies with relative changes in investment spending that are noticeably different from most companies in the group are examined, and some are classified as "outliers." In deriving a universe estimate, outliers are treated separately using their reported values. The value

Table 5.—P&E Expenditures: Average Annual Rates of Increase

Years	Total nonfarm business	[Percent]								
		Manufacturing			Nonmanufacturing					
		Total	Durable goods	Non-durable goods	Total	Mining	Transportation	Public utilities	Trade and services	Communication and other
1947-77	7.6	7.1	8.0	6.5	7.9	9.0	4.9	9.8	7.7	8.4
1947-57	8.2	7.2	9.8	5.3	8.9	9.4	4.2	13.8	8.4	9.5
1957-67	5.7	6.3	7.6	4.9	5.3	-2.0	6.6	4.6	5.3	6.4
1967-77	9.0	7.9	6.7	9.3	9.7	20.9	4.0	11.1	9.4	9.2

for the remainder of the universe is based on the relative change in investment spending for the nonoutlier company reports.

Expenditure data from nonsurvey sources were used as checks of reasonableness, especially when the sample was weak. This applies to the estimates of expenditures for real estate and for mining.

The revised series

On the revised basis, P&E expenditures increased at an average annual rate of 7.6 percent from 1947 to 1977,

compared with 6.7 percent for the previously published series. Real expenditures, which are shown in chart 9, increased 3.6 percent over the thirty-year period. The rate of increase was 3.9 percent from 1947 to 1957, 4.4 percent from 1957 to 1967, and 2.5 percent from 1967 to 1977 (table 4). These calculations make use of the implicit price deflator for the nonresidential fixed investment component of GNP. The deflator increased 3.9 percent from 1947 to 1977. From 1947 to 1977 and from 1967 to 1977 the rate of increase in the prices of structures was higher than that in the prices of equipment

CHART 9

Expenditures for New Plant and Equipment: Total Nonfarm Business

1. Calculated using the implicit price deflator for nonresidential fixed investment.

Communication and other.....	2.4	.9	1.5	26.9	9.5	17.4	8.4	8.1	8.5	37.7	35.2

As shown in table 5, P&E expenditures in nonmanufacturing increased faster than in manufacturing from 1947 to 1977—7.9 percent compared with 7.1 percent. Public utilities accounted for

about one-half of the difference in the rates of increase. In real terms, there was little difference in the rates because prices for plant investment have increased more rapidly than those for

equipment, and plant investment is a larger proportion of total investment in nonmanufacturing than in manufacturing (46 percent compared with 31 percent in 1977). The proportion of plant investment is particularly large for utilities, trade and services, and mining—industries that account for over 70 percent of nonmanufacturing investment in 1977.

From 1947 to 1957, current-dollar P&E expenditures in the nonmanufacturing industries increased at a faster rate than in manufacturing. Public utilities, mining, airlines, communications, and the finance-insurance-real estate group accounted for the strength in nonmanufacturing. In manufacturing, growth in expenditures was especially strong in primary metals and aircraft.

CHART 10

Expenditures for New Plant and for New Equipment

From 1957 to 1967, P&E expenditures in manufacturing increased somewhat faster than in nonmanufacturing. Metal products, aircraft, textiles, "other durables," and "other nondurables" showed the strongest increases. In nonmanufacturing, air transportation reflected the growing use of jet aircraft by the major airlines; spending by most other nonmanufacturing industries showed significantly smaller growth than spending by manufacturing.

From 1967 to 1977, reflecting strength in mining, public utilities, communication, and finance-insurance-real estate, P&E expenditures in nonmanufacturing increased faster than in manufacturing. Construction of the Trans Alaska Pipeline contributed substantially to the increase in nonmanufacturing in the later years of the period. In manufacturing, growth was especially strong in chemicals, petroleum, rubber, paper, food-beverage, and stone-clay-glass.

Expenditures for plant and for equipment

Companies have been asked to report the breakdown of their total expenditures into plant and equipment on an annual basis since 1947 and on a quarterly basis since 1972. Only a

portion of the companies who report total expenditures provide such a breakdown. As a result, the two components are less reliable than the total, and separate estimates for plant and for equipment are presented only for the major industry groups shown in table 6.

In 1947, expenditures by nonfarm business for plant were \$8.4 billion, 39 percent of total expenditures, and expenditures for equipment were \$13.4 billion. From 1947 to 1977, expenditures for both categories increased at about the same average annual rate—7.8 percent for plant and 7.5 percent for equipment. Consequently, the relative proportions were little different in 1977—plant was up 1½ percentage points to 40½ percent. However, because prices rose somewhat more for structures (plant) than for equipment, real spending increased more for equipment, 3.8 percent, than for plant, 3.2 percent.

In nonmanufacturing, current-dollar expenditures for plant increased at a higher rate, 8.3 percent, than those for equipment, 7.6 percent, from 1947 to 1977. The faster relative growth of plant expenditures in nonmanufacturing mainly reflects the increasing proportion of spending for plant in mining (largely drilling structures) and the high proportion of plant in public utilities in

combination with above-average investment growth in these two industries. In contrast, in manufacturing—particularly in durable goods—equipment expenditures increased faster than those for plant.

As shown in chart 10, expenditures for plant showed less variability than those for equipment. The newly available quarterly estimates for plant and for equipment by major industry group will make it possible to study the cyclicity of plant and of equipment more intensively than previously. Table 7 presents information on several aspects of the cyclicity of plant and of equipment for 1974–75, the one period of cyclical decline covered by the quarterly estimates. Several patterns emerge. A comparison of columns 6 and 7 with columns 13 and 14 shows that generally plant declined less rapidly than equipment. It is the slower decline of plant, in combination with generally fewer quarters of decline (columns 3 and 10), that accounts for the smaller viability of plant just noted. A comparison of columns 4 and 6 with columns 11 and 13 highlights that the declines in plant coincided less with the reference decline than did the declines in equipment. Plant expenditures in four out of the seven industry groups shown in the table actually increased over the period 1974: IV

Table 7.—P&E Expenditures in the 1974–75 Cyclical Decline

Communication and other. ³	1974:III	1975:IV	5	-2.5	-.2	-1.9	-.3	1974:IV	1975:IV	4	-2.8	-.4	-3.5	-.5

1. Peak to trough in nonfarm business, 1974:IV to 1975:III.

2. For transportation, equipment expenditures rose in 1976:II and fell in 1976:III.

3. For communication and other, plant expenditures rose in 1976:I and fell in 1976:II.

IV to 1975:III; equipment expenditures of only one of the industry groups increased. Finally, behavior differs substantially from industry to industry. The "communication and other" group experienced above-average declines per quarter in both plant and equipment, as well as an above-average number of quarters of decline. In contrast, mining experienced no decline in plant and only a moderate, one-quarter decline in equipment. Steady growth in mining for recent years reflects increased efforts to stimulate domestic energy production in the face of more expensive and uncertain supplies of foreign oil.

Other Series: Planned Expenditures, Carryover and Starts, and Evaluation of Facilities

The series on planned expenditures, carryover and starts in manufacturing and public utilities, and manufacturers' evaluation of plant and equipment facilities were revised to be consistent with the actual P&E expenditure series.

Planned expenditures

Planned P&E expenditures reported by respondents are subject to systematic bias due to factors other than changes in economic and operating conditions. These factors are not fully understood.² However, because there are well-established patterns in these biases, respondents' plans have been adjusted for them since the mid-1950's. This revision introduces a bias adjustment that, for any given quarter, is based on the median of the ratios of planned to actual spending for that quarter in the preceding 8 years.

The planned expenditures for total nonfarm business are reasonably accurate indicators of actual expenditures. The mean absolute percentage deviation between planned and actual spending over the period from 1955 to 1977 was 1.8 percent for one-quarter-ahead plans and 2.6 percent for two-quarters-ahead plans. The deviation is about the same

in periods of expansion and contraction in real P&E spending.

The mean absolute percentage deviations for the major industry groups are larger than the deviations for total nonfarm business and vary from industry to industry. The deviations are smallest for nondurable goods manufacturing (3.1 percent for one-quarter-ahead and 3.8 percent for two-quarters-ahead plans), utilities (3.3 percent and 4.1 percent), and durable goods manufacturing (3.3 percent and 5.0 percent), and are largest for services (5.4 percent and 8.8 percent), transportation (4.2 percent and 8.8 percent), and finance, insurance, and real estate (5.2 percent and 7.5 percent).

Carryover and starts

Data on investment carryover are collected for two major industry groups, manufacturing and public utilities. Manufacturers' carryover was \$8.5 billion at the end of 1962 and increased to \$54.2 billion by the end of 1977. Carryover of utilities was \$5.2 billion and increased to \$124.5 billion. In the 15-year history of these series, manufacturers' carryover increased almost 6-fold, and that of utilities increased almost 24-fold. The sharp increase for utilities reflects the initiation of numerous large electric generating projects.

The ratio of seasonally adjusted carryover at the end of the quarter to seasonally adjusted expenditures for the quarter is the number of quarters needed to eliminate the carryover if expenditures continue at the current quarterly rate. For manufacturers, the ratio was 2.1 at the end of 1962, rose to 3.5 at the end of 1975, and then declined to about 2.9 in 1977. For utilities, the ratio increased sharply from 4.1 at the end of 1962, to 21.6 at the end of September 1975, and then declined to 18.0 at the end of 1977. The sharp increase was primarily due to the increase in the carryover of electric utilities.

Manufacturers' starts were \$19.4 billion in 1963 and \$77.4 billion in 1977—a fourfold increase. Starts for public utilities were \$5.7 billion in 1963 and \$34.5 billion in 1977—a sixfold increase.

Manufacturers' starts tended to follow the cyclical pattern of total ex-

penditures but the cycles were much more pronounced and the quarterly changes were more erratic. In years of increasing expenditure in the 1963-77 period, the ratio of annual starts to annual expenditures ranged from 1.0 to 1.3. In years of expenditure decline—1967, 1970, 1971, and 1975—the ratio generally fell to the 0.9 to 1.0 range.

For utilities, annual starts averaged 1.3 times annual expenditures in the 1960's. The ratio rose from 1.3 to 2.4 from 1970 to 1974, and then returned to 1.3 in 1976 and 1977.

Manufacturers' evaluation of capital facilities

Manufacturing companies in the P&E survey are asked to evaluate their capital facilities in relation to current and prospective sales by selecting one of the following three categories: more plant and equipment facilities are needed, plant and equipment facilities are about adequate, or existing plant and equipment facilities exceed needs.

The proportion of firms reporting "more facilities needed" tends to reach cyclical peaks about four quarters before the peaks in plant and equipment expenditures. The declines are often longer than those for expenditures, especially for durable goods industries. For all manufacturers, the proportions reached cyclical peaks at the end of March in the years 1966, 1969, and 1974; at these three dates the values were 56, 53, and 56 percent, respectively. In the subsequent declines, the proportions fell 11, 21, and 22 percentage points, respectively. After the decline in 1974-75, the recovery was slow.

Both the "facilities about adequate" proportion—which is relatively large and has ranged from 41 to 63 percent—and the "existing facilities exceed needs" proportion run counter to that of "more facilities needed." The "existing facilities exceeds needs" proportion has varied inversely with manufacturers' capacity utilization rates.

Plans for the Improvement of the P&E Survey

Changes in the business investment environment in recent years have made the task of estimating P&E spending

2. For a discussion of these factors, see "Revised Estimates of New Plant and Equipment Expenditures in the United States, 1947-69, Part II," in *SURVEY OF CURRENT BUSINESS*, February 1970, pp. 20-21.

more difficult than previously. One problem is the increasing reluctance of many businesses to participate in voluntary surveys. Reflecting this reluctance, the P&E survey response rate has fallen off. In addition, there has been a marked increase in the number of late responses. The mailing list was expanded somewhat in 1977-79, but a net loss in total on-time responses has occurred despite this effort.

Another problem is that purchases of new plant and equipment for lease to others have increased sharply in the 1970's; purchases of this type now account for a significant part of total investment. Moreover, several developments have made it increasingly difficult to measure adequately the magnitudes of these purchases. Since the mid-1970's, there has been a sharp increase in the purchase of plant and equipment for lease by trusts, single-purpose subsidiaries of banks, syndicates, and individuals. Some of these entities are formed solely to handle a single purchase-lease transaction, and have no full-time employees or permanent offices. Over the same period, the distinction between owned and leased equipment has become blurred by complex lease agreements that include a variety of purchase options. Also, changes in accounting rules, effective in 1977, by the Financial Accounting Standards Board have created additional difficulties in interpreting which organization is responsible for reporting leased plant and equipment. As a consequence, there may be some incorrect reporting of leased P&E in the BEA survey responses.

Two projects that have been underway at BEA will contribute to the evaluation of the P&E survey in the context of these and other problems. Work is underway on a detailed reconciliation of investment as reported in the P&E survey with the commodity-flow-based estimates of the nonresidential fixed investment component of GNP. Another project will provide estimates of constant-dollar investment for each of the industries covered by the P&E survey. These estimates will facilitate comparisons with other real measures of investment—in particular,

the business equipment component of the Index of Industrial Production.

Several procedural changes in the P&E survey are scheduled or are under consideration. The survey data will be revised more frequently than has been the practice; the benchmarking to the 1977 *Enterprise Statistics* will begin next year. Annual retabulation of responses to include late reports and preparation of revised estimates of investment in those industries for which annual benchmark data are available are under consideration. If these steps prove feasible, annual revisions may be instituted.

More substantial changes are contingent upon additional funding. The continuous updating and enlargement of the sample, now underway on a modest scale, should be expanded. A full-scale study of the leasing of new plant and equipment should be undertaken to improve the procedures for recording purchases for lease to others. A shuttle form could be introduced to permit validation of previously reported data and increase the number of usable responses. Finally, contact by the survey staff with the respondent companies should be increased in order to maximize participation, to encourage more on-time responses, and to identify problem areas as quickly as possible.

TECHNICAL NOTES

1. The P&E Survey and the Survey Series

The P&E Survey

The sample from which BEA collects data quarterly is a nonprobability sample of about 15,000 companies; the sample has been expanded from time to time to add new companies and to offset attrition. The reporting form for manufacturing, mining, and public utilities (Form BE-452) is shown at the end of this article; the reporting form for other industries (Form BE-456) is similar except that questions 4 and 5 are omitted.

In 1972, the responding companies accounted for 53 percent of total non-farm business P&E expenditures in the

United States; the corresponding percentages were 68 for manufacturing and 47 for nonmanufacturing. The survey coverage is highest in industries characterized by large firms, which account for a large share of total capital spending. Table 8 shows the coverage of the sample in each industry in 1972. Coverage was above 80 percent in primary metals, motor vehicles, petroleum, air transportation, public utilities, and communication. Coverage was below 25 percent in mining, all the trade and services industries, and "other."

The sample is stratified mainly into two-digit Standard Industrial Classification industries and, for many industries, into size groups. For the manufacturing, trade, construction, personal and business services, real estate, hospital, and education-museum industries, three size groups are used: total assets of \$100.0 million and over, of \$10.0 million

1. Includes industries not shown separately.

2. Consists of lumber, furniture, instruments, and miscellaneous.

3. Consists of apparel, leather, tobacco, and printing-publishing.

4. Consists of construction; social services and membership organizations; and forestry, fisheries, and agricultural services.

NOTE.—Percentages shown are ratios of 1972 sample expenditures to 1972 universe expenditures, times 100.

to \$99.9 million, and of under \$10.0 million. For utilities, communication, insurance, and selected transportation industries, two size groups are used: large companies with major portions of the industry's investment and all other companies. The remaining industries are not stratified, either because size diversity is limited or because the sample is too small to stratify.

BEA collects data from companies, generally on a fully consolidated basis. A company is classified by industry on the basis of its primary activity, that is, on the basis of the activity with the largest volume of sales or payrolls. All of its capital expenditures—for its primary activity as well as for all of its other activities—are assigned to that industry. Company classifications are checked by BEA about every 5 years and when companies are involved in major mergers.

With the exception of companies in two industries, companies report P&E expenditures on an ownership rather than a use basis. In other words, expenditures are included in the industry category of the company making the purchase and retaining title to the plant or the equipment purchased, even if the capital goods are for use by companies in other industries.

The exceptions to the ownership basis occur in airlines and railroads. Most airline companies include outlays for aircraft obtained through leasing or similar contractual arrangements in the capital expenditures they report to BEA. Separate data are available to adjust the reports of airlines that do not. Thus, because estimates for airlines include the value of all leased aircraft, the estimates for that industry are on a use rather than an ownership basis. Some information is obtainable on transactions involving the leasing of railroad equipment; this information is used to include these capital expenditures for railroad equipment in the railroad industry rather than in the industry holding title to the equipment. Most of the equipment leased by the airlines and the railroads is owned by manufacturers, banks, and insurance companies.

Respondents to the survey are instructed to report all expenditures for

plant and equipment—whether that plant and equipment is for their own use or for lease to others. In the course of the 1970's, evidence emerged that, despite the instructions, reporting of expenditures for plant and equipment for lease was incomplete. An adjustment was made to the estimate of P&E expenditures to correct for the underreporting.

Expenditures are generally reported in the quarter in which payment is made to the supplier; in the case of force account work, expenditures are generally reported in the quarter in which costs are incurred. On long-term projects, progress payments are usually made during the period of construction or production.

The P&E survey series

Total P&E expenditures—both actual and planned—have been collected quarterly since the survey began in 1947. Expenditures for plant and for equipment separately have been collected annually since 1947 and quarterly since 1972. Quarterly collection of the carryover of investment projects for manufacturers and utilities and of manufacturers' evaluation of their capital facilities began late in 1962 and 1963, respectively.

P & E expenditures.—BEA prepares estimates of expenditures by companies engaged in nonfarm business for new plant and equipment located in the United States. The estimates cover expenditures to replace or to add to existing facilities and to provide new facilities, and for exploration and development of properties. These expenditures are generally charged to fixed asset accounts and are depreciated or amortized by the company. Expenditures for maintenance and repair; for used capital goods, including those purchased or acquired through mergers and acquisitions; for capital goods located outside the United States; for land and mineral rights; and for residential construction are excluded.

Capital expenditures have two major components: plant and structures, and machinery and equipment. The distinction between the former and the latter is not always clear-cut. However,

a useful guideline is that the former is not movable, but the latter is. Plant and structures include factories, warehouses, stores, shopping centers, mines, pipelines, and accessory structures; additions and alterations to structures; items that are integral parts of these structures, such as utility lines, elevators, power plants, and centralized heating and cooling equipment; parking lots and other land improvements; and exploration and development of properties. Machinery and equipment include machinery for factories, mines, warehouses, stores, and offices; and equipment, such as automobiles, trucks, computers, and furniture and fixtures.

Practice varies among companies with respect to handling trade-ins. If the supplier takes in a used item in trade—as is often the case for automobiles and trucks—and the actual payment is net of the trade-in, the net amount is usually reported. If the item being replaced is sold in a separate transaction, the gross expenditures item is typically reported.

Carryover and starts.—The series on carryover of investment projects in manufacturing and public utilities measures the expenditures to be incurred on projects underway at the end of each quarter. Starts of new projects are derived by adding expenditures for the quarter to the change in carryover during the quarter. A project may consist of one transaction (for example, the purchase of an automobile) or may be underway for a number of years (for example, the construction and equipping of a factory). A project is defined as started when the first charge is made to the capital account or when firm contracts or orders for all or part of the project are placed. From quarter to quarter, changes in carryover (and, thus, in starts) reflect not only expenditures made during the quarter for ongoing projects, but also the cutback, cancellation, or reestimation of the costs of ongoing projects and the addition of new projects.

Adequacy of capital facilities.—Manufacturing respondents are asked to characterize their P&E facilities in one of three ways, taking into account their current and prospective sales in the next 12 months: "more plant and equipment

needed," "about adequate," and "existing plant and equipment exceeds needs." Responses of sample companies are weighted by gross depreciable assets to compute the percent distribution of these three categories for each industry and for all manufacturers.

Benchmark revisions

The series from the P&E survey have undergone three major revisions. The first was completed in 1951 and 1952. In that revision, the stratification of the data into industry and size groups for computational purposes was established; expenditures for industries within manufacturing were published separately for the first time; and the series were benchmarked to a universe estimate for 1948. The second major revision was completed in 1970. The 1948 benchmark was modified for selected industries and all industries were adjusted to 1958 and 1963 benchmarks.

The present revision is more extensive than the previous two. P&E expenditures for all industries have been benchmarked to 1967 and 1972 for the first time and the 1963 benchmark was reworked to incorporate revised data from the Census Bureau. For the industries to which coverage was extended and for plant and for equipment separately, benchmarks were developed for each benchmark year. Adjustments were made to the 1948, 1958, 1963, and 1967 benchmarks to incorporate the changes in industry definition introduced by the 1972 SIC. Establishment data at the 4-digit level for investment from the Census of Business were used to estimate the changes; if these data were not available, data on wages and salaries that underlie the national income and product accounts were used. In addition, construction industry benchmarks were recomputed back to 1948 to incorporate new data. Expenditures by retail trade for 1947 were adjusted downward to reflect new data.

2. A Summary of the Methodology Used To Estimate the Survey Series

In this technical note, the methodology used to estimate the various series

compiled from the BEA P&E survey is summarized. Technical note 3 describes the extensions and improvements of coverage.

Total P&E expenditures

The methodology used to estimate the total P&E expenditure series is described in terms of three steps: benchmarks, interpolation between benchmarks, and extrapolation beyond the last benchmark.

Benchmarks.—For selected years, the best possible estimates for each industry and size group (tab group) were prepared. The years selected were determined by the greater availability of data for those years, and the estimates for those years are called benchmarks. Benchmarks were compiled for 1948, 1958, 1963, 1967, and 1972, and set the level of the P&E expenditures series.

The sources and methods used to prepare benchmark estimates vary from industry to industry. The sources for the 1948, 1958, and 1963 benchmarks were summarized in earlier SURVEY articles.³ The major sources for the 1967 and 1972 benchmarks are described below.

The 1967 and 1972 editions of *Enterprise Statistics*, prepared by the Bureau of the Census, were the major source. Benchmarks for the mining, manufacturing, and construction industries were derived from this source. For wholesale trade, retail trade, and personal and business services, benchmarks were constructed from a combination of enterprise and establishment statistics prepared by the Bureau of the Census. For these three industries, benchmarks were derived from capital expenditures and employment data for establishments from the Census of Business and employment matrixes cross-classified by establishments and companies from *Enterprise Statistics*. For the transportation industries, data from the Interstate Commerce Commission (ICC) were used in conjunction with data from the *Statistics of Income*, compiled by the

3. "Capital Expenditures by Manufacturing Industries in the Postwar Period," December 1951; "Capital Expenditures by Nonmanufacturing Industries," August 1952; "Revised Estimates of New Plant and Equipment Expenditures in the United States, 1947-69," Parts 1 and 2, January and February 1970.

Internal Revenue Service (IRS). The plant and equipment expenditures reported to the ICC cover only companies that engage in interstate commerce. The ICC sample estimates were multiplied by the ratio of universe gross capital assets (IRS) to gross capital assets of the ICC sample to obtain universe estimates. Petroleum pipelines were an exception to this procedure: Estimates of expenditures by pipelines, based on data from the U.S. Department of the Interior's *Minerals Yearbook*, were added to the ICC data. Nonrail operations of railroads are not under ICC jurisdiction; benchmarks were derived from nonrail operations data of twelve large rail systems published in Moody's *Transportation Manual*.

For utilities, benchmarks were based on a combination of data reported to BEA and data from the IRS *Statistics of Income*. The ratio of corporate gross depreciable assets reported by IRS to the gross depreciable assets reported by companies in the P&E sample was multiplied by the expenditures reported in the P&E survey to obtain the estimates.

Balance sheet and income data compiled by the Board of Governors of the Federal Reserve System, the Federal Deposit Insurance Corporation, the Federal Home Loan Bank Board, and the IRS were used to derive benchmarks for the financial industries.

For industries with a substantial number of nonprofit organizations, data on employment, payrolls, and number of companies from the Census Bureau's *County Business Patterns* were used to develop either the benchmark or the nonprofit portion of it.

For most of the remaining industries, data from the IRS *Statistics of Income* were used to develop the benchmarks. In most cases, the ratio of corporate gross depreciable assets reported to IRS to the gross depreciable assets reported by the P&E sample was multiplied by expenditures reported in the P&E survey. For the noncorporate portion, a similar procedure was followed using a ratio based on business receipts or depreciation charges. Some noncorporate benchmarks were estimated by adding depreciation charges for the current year to that year's change in net depreciable assets.

A corporate-noncorporate breakdown for P&E expenditures was usually available from the benchmark source. The stratification of corporate expenditures by industry into size groups was prepared using the asset distribution in the *IRS Statistics of Income*. For 1972, the Bureau of the Census prepared special tabulations for BEA by size group for the mining, manufacturing, and construction industries.

Quarterly expenditures, 1947-71.—Quarterly P&E expenditures were revised back to 1947, because the procedure used to estimate the quarterly universe has been changed. Previously, the interpolation procedure made use of not only benchmark estimates and quarterly estimates from the P&E survey, but also the annual estimates collected once each year in the P&E survey. In the revised procedure, only benchmark and quarterly estimates are used.

The interpolation procedure described below was applied and was carried out by tab groups.

1. Quarterly universe estimates, as originally tabulated, were assembled, and quarterly series for newly covered industries or portions of industries were compiled from nonsample data.⁴

2. For each of two adjacent benchmark years, the sum of the 4 quarters of P&E expenditures was adjusted to the benchmark level and each quarter was multiplied by the ratio of the sum of the 4 quarters to the benchmark.

3. The quarters between the fourth quarter of the first of the two adjacent benchmark years and the first quarter of the second of the two were obtained as follows:

a. The fourth-quarter level for the first of the two benchmark years was extrapolated by a chain of link relatives based on the universe estimates as originally tabulated.

b. If the extrapolated level for the first quarter of the second of the two benchmark years did not equal the level obtained in step 2, the percentage difference was distributed linearly to the quarters between the two adjacent benchmark years.

4. For 1972, the quarterly estimates were based on retabulated sample data. The nonsample data sources are summarized in technical note 3.

Quarterly expenditures, 1972-77.—The extrapolation procedure used to obtain quarterly expenditures for 1972 and subsequent years utilized retabulations of individual company reports. The sum of the 4 quarters of P&E expenditures for 1972 was adjusted to the 1972 benchmark level for each tab group. Successive quarters starting in the first quarter of 1973 were estimated by extrapolating forward the estimate for the fourth quarter of 1972 using a chain of link relatives derived from retabulated sample data.

The quarterly universe estimates incorporated the following improvements in data and procedures: (1) Reports received too late to be incorporated in the previously published estimates were included. (2) Each company in the sample was reclassified by industry and size class on the basis of data reported by respondents for 1972. (Few companies' industry classifications changed from 1967, the date of the previous classification, but many companies' size classifications changed.) (3) Company reports were reedited. Editing is the examination of company responses with the aim of making each industry, and size-group estimate as representative of the universe as possible. Companies with relative changes in investment spending that are noticeably different from most companies in the group are examined, and some are classified as "outliers." In deriving a universe estimate, outliers are treated separately using their reported values. The value for the remainder of the universe is based on the relative change in investment spending for the nonoutlier company reports. (4) The procedure for handling mergers and acquisitions was improved. Beginning in 1973, adjustments were made in each quarter for companies involved in major merger transactions. When two industries were involved, the universe estimate for the industry into which the combined company was classified was increased to include the capital expenditures of the merged company, and the universe estimate for the other industry was reduced. The industry and size classifications of the companies were checked after the mergers. (5) Expenditure data from nonsurvey sources were used as

checks of reasonableness, especially when the sample was weak. This applies to the estimates of expenditures for real estate and for mining.

The results of the extrapolation for nonfarm business and for manufacturing were checked against independent estimates. These independent estimates are discussed in technical note 4.

Expenditures for plant and for equipment

Although companies in the sample have reported expenditures for plant and for equipment on an annual basis since 1947 and on a quarterly basis since 1972, the data have not been published previously.

The methodology for preparing the universe estimates for plant and for equipment expenditures separately is similar to the methodology just described for the total P&E expenditure series. First benchmarks are prepared. In most cases, the same sources that provide information on total expenditures provide information on the breakdown. There are a few exceptions, e.g., in the case of utilities, the breakdowns are primarily from reports of the Federal Power Commission and the American Gas Association. The benchmarks were interpolated and extrapolated by a chain of link relatives based on universe estimates prepared by tab group for plant and for equipment separately. Because the response rate for the separate expenditures is lower and varies considerably among industries, the quarterly universe estimates are forced to equal the total P&E expenditure universe for each tab group. The separate estimates are provided for major industry groups, the level at which sample coverage was adequate.

Planned P&E expenditures

In each quarterly survey the following expenditures data are collected: actual expenditures for the previous quarter and planned expenditures one-quarter ahead (current quarter), two-quarters ahead, and three-quarters-ahead.⁵

5. In the fourth-quarter survey, a second-half plan is derived by subtracting from the annual plan, which is collected only in that survey, the sum of the one-quarter-ahead and two-quarters-ahead plans.

Therefore, expenditures for each quarter are estimated four times in successive surveys: as planned expenditures three-quarters ahead, two-quarters ahead, and one-quarter ahead, and as actual expenditures.

The revised universe estimates for planned expenditures were estimated as follows. For 1947-71, for each tab group, ratios of planned to actual expenditures for each planning horizon were multiplied by revised actual expenditures to obtain revised planned expenditures. The actual and planned universe estimates used in calculating the ratios were those prepared before the revision published in 1970. For industries and portions of industries for which coverage was provided for the first time in this revision, plans were estimated by multiplying actual expenditures for each series by ratios of planned to actual expenditures for the most closely related sample category.

For 1972 and later years, the universe estimates for plans by tab group were retabulated in the same way as those for actual expenditures for that period. Relative change ratios based on the retabulated sample reports were calculated for each planning horizon based on paired values of actual and planned expenditures or paired values of planned expenditures collected in the same survey. These ratios were linked to actual expenditure universes from the same survey to obtain planned expenditure universes.

Comparison of planned expenditures with actual expenditures for the same quarter reveals systematic biases in the planned expenditures that are not due to changes in economic and operating conditions. There are well-established patterns in these biases, however, and, for most purposes, it is desirable to adjust the plans data for them.

Correction factors for each quarter were calculated by industry for each planning horizon. For any given quarter, the correction factor was the median of the ratios of planned to actual expenditures for that quarter in the preceding 8 years. Adjusted plans series were prepared by dividing reported plans by the correction factor.

In the previous revision, the correction factors were ratios of planned to actual expenditures derived from regressions on four seasonal dummy variables and a time trend.

Carryover and starts

For carryover, which is collected for the end of the quarter for manufacturing and public utilities, there are no benchmarks and the response rates of companies reporting it are somewhat lower than those for P&E expenditures. The carryover universes should, however, be comparable with the expenditure universes to the extent possible. Accordingly, universe estimates for carryover were adjusted.

The sample data provide two estimating ratios: the ratio of carryover to expenditures for a quarter derived from companies that report both sets of data, and the ratio of carryover in one quarter to carryover in the next derived from companies that report carryover in two successive surveys. Carryover universes estimated by multiplying expenditures by the carryover-expenditure ratio are highly volatile due to wide differences in the ratio among companies and changes in the companies that report carryover each quarter. Carryover universes estimated by linking the quarterly change ratios to the previous quarter's carryover may lead to cumulative error, which goes uncorrected because there are no benchmarks.

The procedure used to obtain carryover estimates was designed to provide a sensitive estimate of quarterly change in carryover but prevent cumulative divergence between the expenditure and carryover series. The carryover universes computed by the two methods were combined with weights of 30 percent for the universe linked to expenditures and 70 percent for the universe linked by change ratios to the weighted carryover of the previous quarter. The ratios underlying the two methods were, for December 1962 to December 1971, from the previously published series and, for the subsequent period, from the retabulated sample. In the previous revision, weights of 20 per-

cent for the universe tied to expenditures and 80 percent for the universe based on change ratios were used.

As mentioned earlier, it was necessary to maintain comparability between the carryover and P&E expenditures series. For each tab group, the originally tabulated ratio of carryover to P&E expenditures was maintained in benchmark years. The carryover estimates were adjusted by a procedure similar to that for P&E expenditures; in effect, the percentage corrections for P&E were applied to the carryover series.

Starts during the quarter are derived for each quarter by computing the dollar change in carryover during the quarter and adding to it the P&E expenditures for the quarter.

Adequacy of capital facilities

As noted in technical note 1, manufacturers in the P&E sample are asked to characterize the adequacy of their capital facilities by checking one of three categories listed in the plant and equipment survey form. These responses are combined into tab groups by weighting the responses of the companies by their gross depreciable assets. Percentage distributions for the three categories are then computed from these weighted totals.

The universe values for a tab group are a combination of two sets of estimates: (1) a distribution of the evaluations of all companies in the tab group that responded in the current quarter, weighted 30 percent, and (2) a distribution based on quarterly changes in the three categories (the change in the distribution reported by companies that respond in two successive quarters multiplied by the distribution for the previous quarter), weighted 70 percent.

The gross depreciable asset weights used to combine the universe values for each tab group were based on end-of-year gross depreciable assets data from *IRS Statistics of Income*.

In this revision, the distributions underlying the two sets of estimates were, for 1962 to 1971, from the previously published series and, for the subsequent period, from the retabu-

NOTE.—
Procedures:

"Adjusted to universe" is sample P&E expenditures times the ratio of a sample variable to a universe variable.

"Capitalization method" estimates capital outlays as annual change in net depreciable assets plus depreciation charges for the year, based primarily on IRS *SOI* data. Net depreciable assets for partnerships and for proprietorships were estimated for missing years.

Sources:

Census *CBP* is the Bureau of the Census, *County Business Patterns*.
Census *Construction* is the Bureau of the Census, *Value of New Construction Put in Place*.
IRS *SOI* is Internal Revenue Service *Statistics of Income*. Balance sheet and income data for corporations and depreciation charges for partnerships and proprietorships were available through 1975. Balance sheet data for partnerships were available for 1953, 1959, 1963, 1965, and biennially beginning in 1969.
NIWD is National Income and Wealth Division of BEA.

lated sample. The gross depreciable assets weights are updated annually as IRS data become available.

Seasonal adjustment

The Census Bureau's X-11 program is used to compute multiplicative seasonal factors for the actual plant expenditures, actual equipment expenditures, actual total P&E expenditures, and investment carryover series. Each series is divided by its seasonal factor to produce the seasonally adjusted series. The seasonally adjusted series for plant and for equipment expenditures are then forced to the seasonally adjusted total P&E expenditures for each quarter. The seasonal factors for total P&E expenditures are used to seasonally adjust the planned expenditures. Seasonally adjusted starts are defined as the change in seasonally adjusted carryover during the quarter plus the seasonally adjusted P&E expenditures for the quarter. The series on the adequacy of capital facilities does not require seasonal adjustment.

3. Extensions and Improvements of Coverage

Previously, the "all industries" coverage of the P&E survey had omitted four industries necessary to provide coverage for all nonfarm business in the United States. This revision extended coverage to the four industries, which are listed in table 9 along with information about them and an abbreviated methodology used in estimating P&E expenditures for them.

Coverage was improved by inclusion of P&E expenditures for portions of industries; previously, these portions had been omitted. Nonsample information was used to prepare the estimates for these portions, which are listed below.

1. Expenditures for amortized special tools by motor vehicle manufacturers
2. Expenditures for nonrail operations by railroads

3. Expenditures of the noncorporate portions of the following industries:

- Air transportation
- Water transportation
- Transportation not elsewhere classified
- Utilities other than gas and electric
- Communication

4. Expenditures by Rural Electrification Administration cooperatives:

- Electric utilities
- Communication

5. Expenditures of the following financial institutions:

- Federal Reserve banks
- The Federal Home Loan and Federal Land banks
- Credit unions

6. Expenditures by commercial banks not reported by respondents for items leased to others

7. Expenditures of insurance agents and brokers

8. Expenditures by individuals who report rental income to the Internal Revenue Service on Schedule E, form 1040.

All but two need no further explanation. Expenditures for amortized special tools by motor vehicle manufacturers cover dies and castings unique to particular models. Estimates were compiled from published financial reports for years prior to 1973; companies supplied quarterly data for more recent years.

An adjustment was made for underreporting of expenditures by commercial banks for items leased to others beginning in 1972, on the basis of information from the Comptroller of the Currency and the Federal Deposit Insurance Corporation. It is estimated that this underreporting by commercial banks was about \$3 billion in 1977.

4. Alternative Estimates of Business Investment

As noted earlier, the estimates of P&E expenditures that are based on

extrapolations of the 1972 benchmark were checked for reasonableness by comparing them with alternative estimates of business investment. The first of these covers only manufacturing. Data from the Censuses of Manufactures for 1972 and 1977 indicate that, on an establishment basis, plant and equipment expenditures by manufacturers increased 98.1 percent from 1972 to 1977, compared with 95.4 percent for the manufacturing portion, on a company basis, of expenditures from the P&E survey.

The second covers total business investment, and utilizes a preliminary version of the nonresidential fixed investment (NRFI) component of GNP that will be published this winter as part of the comprehensive benchmark revisions of the national income and product accounts. This component consists of nonresidential structures, based on the Census Bureau's *Value of Construction Put in Place*, and of producers' durable equipment (PDE), which is estimated using the commodity flow method. This method has several variants ranging from very summary to very detailed; the availability of source data determines which is used. The variant used for years for which detailed and comprehensive information from the Census of Manufactures is available can be summarized as follows: Shipments by manufacturers at the most detailed product level available are allocated to the several categories of final users. Imports of capital goods destined for use by U.S. business are added to shipments allocated to business investors. Finally, wholesale margins and the change in wholesale inventories are added to obtain the value of PDE.

Table 10 summarizes the results of a comparison of estimates of P&E expenditures adjusted to the definitions and coverage of NRFI with estimates of that component of GNP. From 1972 to 1977, P&E expenditures adjusted to the NRFI basis increased 70.2 percent compared with 72.8 percent for NRFI.

Adjusted P&E expenditures are higher than NRFI for 1947-77. As a percentage of adjusted P&E expenditures, the difference averaged about 5.3 percent in 1972-77, down from about

1977.....	198.1	17.2	215.3	205.9	9.4	-1.0	4.6

1. Consists of capital expenditures by farmers; items charged as current expenses by business but included in the NRFI component of GNP, i.e., certain expenditures for new motor vehicles, for portions of oil and gas well drilling costs, and for other mining assets not capitalized; reimbursable expenditures for new motor vehicles purchased by employees for business use; transactions in used plant and equipment; less capital expenditures by business for residential structures and equipment.

2. Preliminary version of the NRFI component of GNP that will be published this winter as part of the comprehensive benchmark revision of the national income and product accounts.

6.3 percent in 1961-71. Table 10 also shows the year-to-year change in the difference for recent years. Although the evidence is not clear-cut, NRFI estimates appear to increase relative to the adjusted P&E expenditure estimates in years of rapid increase in business investment; in other years, they appear to decline or remain about the same relative to the adjusted P&E expenditure estimates. This pattern could be due to the fact that NRFI estimates reflect construction put in place and shipments of equipment whereas the P&E estimates reflect payments. However, this explanation in terms of

timing is not fully satisfactory, because some payments, e.g., architectural and engineering fees, are made before any construction is put in place or any shipment of equipment occurs. In any event, timing is not likely to be the main source of the difference between the two series; work is underway on a detailed reconciliation of them.

The revised estimates are presented in tables 11-18, which are listed below.

Table 11.—New Plant and Equipment Expenditures by U.S. Nonfarm Business: Annually, 1947-77, and Quarterly, Unadjusted for Seasonal Variation, 1947-77.

Table 12.—New Plant and Equipment Expenditures by U.S. Nonfarm Business: Quarterly, Seasonally Adjusted at Annual Rates, 1947-77.

Table 13.—Expenditures for New Plant and for New Equipment by U.S. Nonfarm Business: Annually, 1947-77, and Quarterly, Seasonally Adjusted at Annual Rates, 1972-77.

Table 14.—Planned Expenditures for New Plant and Equipment by U.S. Nonfarm Business, One-Year Ahead, as a Percentage of Actual Expenditures: Annually 1955-77.

Table 15.—Planned Expenditures for New Plant and Equipment by U.S. Nonfarm Business, One- and Two-Quarters Ahead, as a Percentage of Actual Expenditures: Quarterly, 1955-77.

Table 16.—Carryover of Plant and Equipment Projects, Manufacturing and Public Utilities: Quarterly, Adjusted for Seasonal Variation, 1962-77.

Table 17.—Starts of Plant and Equipment Projects, Manufacturing and Public Utilities: Quarterly, Adjusted for Seasonal Variation, 1963-77.

Table 18.—Manufacturers' Evaluation of their Plant and Equipment Facilities (Percent Distribution of Gross Depreciable Assets): Quarterly, 1963-77.

The series presented in tables 11-18, plus the plans series (before and after bias and seasonal adjustment), bias correction factors for plans, and seasonal factors for all series, are available from BEA in magnetic tape and computer printout form. The cost of the tape is \$125; the cost of the printout is \$35. For further information, write to P&E Survey Statistics, Business Outlook Division, (BE-52), Bureau of Economic Analysis, U.S. Department of Commerce, Washington, D.C. 20230, or telephone 202-523-0701.

INSTRUCTIONS

1. Report data on a consolidated basis for this enterprise and its domestic subsidiaries wherever possible; the figures should cover U.S. domestic operations only.
2. The capital expenditures (see definitions) to be reported should reflect costs incurred or to be incurred by this enterprise which are generally charged to depreciable or amortizable fixed asset accounts in connection with all of its operations during the reporting periods. Exclude expenditures, such as investments in land, securities, purchases for resale, etc., which are not generally of the type charged to depreciable fixed asset accounts, and residential property whether for sale or lease.
3. Omit from the reported expenditures any work, such as construction of structures, performed by this enterprise on contract for others.
4. If on a fiscal period basis, report your data in the calendar quarters which most closely approximate your fiscal periods.
5. If your company has merged or acquired other enterprises, include the activities for the expanded entity in your report; please show the names of such companies in the "Remarks" space. If your company is merged or acquired by another company, please indicate the name and address of the acquiring company.
6. Carefully prepared estimates or approximations are acceptable if data requested are not available directly from records.
7. Do not leave blank boxes or use dashes; if you have not made or do not expect to make any capital expenditures enter "none" in the appropriate box. If requested information cannot be determined or estimated, enter "not available."

DEFINITION OF TERMS

CAPITAL EXPENDITURES – Refers to all costs – both for replacement of existing facilities and for expansion – by your enterprise which are chargeable to fixed asset accounts and for which depreciation or amortization accounts are ordinarily maintained except the specific exclusions listed below.

Outlays should cover expenditures for structures and equipment (whether on contract or by your own organization) within the United States including items purchased abroad for installation or use within the U.S.

Include major alterations, capitalized repairs and improvements, and expenditures for establishments under construction but not yet in operation.

Also include expenditures for structures and equipment available for lease or rental to others.

Expenditures for each reporting period should be equal to construction and other additions (structures, machinery and equipment) completed during the period plus additions in progress at the end of the period minus additions in progress at the beginning of the period. If your enterprise is erecting or expects to erect a building (or acquire equipment) under a sale and leaseback arrangement and retains ownership during construction period, report expenditures for these additions under new expenditures. In the case of capital expenditures made for both business and personal use (e.g., structures, motor vehicles, etc.) include only that portion allocated to business use.

Exclude the following:

(a) Expenditures for land and for mineral rights (except for land development and improvements, and for capitalized exploration and development costs of mineral properties);

(b) Expenditures for maintenance and repairs which are not capitalized;

(c) Expenditures for residential construction (single family and apartment houses) whether for sale or rent except the estimated value of the portion devoted to commercial and business use;

(d) Expenditures for construction of structures and equipment installed or used outside the United States;

(e) Expenditures by your landlords and lessors. Purchase of facilities for lease to others should be reported only by the lessors.

Item 1a. New Structures and Additions – Includes new buildings and new construction owned by your enterprise, such as buildings, stores, shopping centers, warehouses, plants, mines, pipelines, etc.; additions to and improvements of buildings, parking areas, land improvements, and all other construction and major alterations; include expenditures for exploratory and development work chargeable to fixed asset accounts; also include the costs for items which are an essential part of the structure, such as utility lines, elevators, power plant, heating and cooling equipment, etc.

Item 1b. New Machinery and New Equipment – Includes machinery and equipment for factories, mines, warehouses, stores, offices, etc.; include expenditures for automobiles, trucks, tractors, etc.; furniture and fixtures; office machinery, and all other new equipment.

Item 2. Used Structures and Used Equipment – Includes any capital item that is not completely new when purchased by your enterprise; include additions to fixed assets acquired through mergers and direct purchases or acquisitions of their enterprises, and fixed assets acquired from others on a "sale and leaseback" arrangement.

Actual Expenditures and Expected Expenditures – **Actual Expenditures** represent capital expenditures incurred during the time period indicated. **Expected Expenditures** should cover all capital expenditures you expect to make in each of the forthcoming time periods shown, whether or not commitments or orders have already been placed.

1. Carryover refers to expenditures yet to be incurred on plant and equipment projects already underway at the end of the period.

2. Includes industries not shown separately.

Table 17.—Starts of Plant and Equipment Projects, Manufacturing and Public Utilities: Quarterly, Adjusted for Seasonal Variation, 1963-77¹

[Billions of dollars]

	Manufacturing industries											Public utilities	
	Total	Durable goods ²					Nondurable goods ²						
		Total	Primary metals	Electrical machinery	Machinery, except electrical	Transportation equipment	Stone, clay, and glass	Total	Food including beverage	Paper	Chemicals		Petroleum

PCE Energy Prices, 1978-80

THIS article reviews the pattern of changes in the price of personal consumption expenditures (PCE) on energy over the period since 1978, and discusses major factors that help explain that pattern. A chronology of energy-related events and a summary of major legislation that affected energy prices are provided.

Table 1 shows quarterly changes at annual rates in the price of PCE energy as measured by the fixed-weighted price index. In the period covered, quarterly PCE energy price increases varied widely. In 1978, they ranged from 4½ to 9 percent at annual rates. In 1979, increases were larger—ranging from 19½ to 65 percent—and varied widely from quarter to quarter. In 1980, increases decelerated, and, by the third quarter of 1980, dropped back to about rates registered in 1978. These quarterly increases cumulated to a 75-percent increase from the first quarter of 1978 to the third quarter of 1980.

Price changes of two of the PCE energy components—gasoline and oil, which has a weight of about 50 percent in the PCE energy price indexes, and fuel oil and coal, which has a weight of about 13 percent—show the same pattern as the one just described, except

that they generally increased more and changed more sharply (chart 11). The major factor affecting them is the price of the crude petroleum (oil) from which they are refined.

Price changes of electricity and natural gas—the two other components—differed substantially from those of gasoline and fuel oil. In 1978–80, the price of PCE on electricity ranged from a decline at an annual rate of 11 percent to an increase of 28½ percent. The subsequent acceleration was less clearcut than in the case of gasoline and fuel oil. Crude oil and petroleum products are used as inputs to the production of electricity, but most of electricity is produced using other inputs, so that electricity prices reflect other prices as well. The price of PCE on natural gas increased at annual rates varying from 2½ to 16 percent in 1978; in 1979 and 1980, it increased at rates varying from 6½ to 33½ percent. Crude oil prices have only indirect effects on these prices.

Because the price of crude oil is the predominate factor affecting two of the energy components, and is a contributing factor affecting the other two, a discussion of crude oil prices precedes the discussions of the prices of the four

PCE energy components.

Crude oil.—Several types of regulation affect the price and supply of crude oil. Federal regulations set maximum prices for categories of domestically

produced crude oil; these controls are being phased out, with all controls to end September 30, 1981. A system of cash transfers, or "entitlements," substantially offsets disparities in refiners' acquisition costs that result from the price controls. Customs duties and import fees may be levied on imports, and imports may be restricted. Other Federal regulations include those regarding the leasing of Federal lands and offshore tracts, mandatory allocations to refiners of crude oil, and the stocking of the Strategic Petroleum Reserve.

During 1978-80, the portion of domestic refiners' acquisition of crude oil accounted for by imports varied between 38 and 45 percent: the remaining portion was accounted for by domestically produced crude oil. Prices of imported oil are subject to influences that, to a large extent, are different from those to which prices of domestic oil are subject.

In 1978, the cost of imported crude oil remained virtually unchanged through the third quarter; in contrast, the cost of domestic crude oil increased. Three measures may be used to shed light on the cost of U.S. crude oil imports. Two are foreign crude oil prices: the OPEC average price, and the price of Saudi Arabian Light, which is referred to as the OPEC benchmark (table 2). The former was within a few cents of the average of \$12.94 per barrel, and the latter was steady at \$12.70 per barrel. The stability of OPEC prices reflected the continuing surplus of crude oil on the world market. The refiner acquisition cost for imported crude oil, the third measure, is shown in chart 12. It is a weighted average that reflects shifting grades and sources of crude oil imported to the United States, and includes transportation costs and Federal import fees. It too was steady, at about \$14.50 through these three quarters.

Over this period, the refiner acquisition cost of domestic crude oil, which is also shown in chart 12, moved up about \$0.35 per barrel, to \$10.63, as the result of two factors. First, prices increased for two categories of U.S. crude oil production—lower-tier oil and upper-tier oil; these increases reflected adjustments under the Energy Policy and

Conservation Act (EPCA) of 1975. The price of stripper oil, which is exempt from controls and follows world market prices, was about steady. Partly offsetting was a decline in the price of Alaskan North Slope (ANS) oil.¹ Second, the composition of U.S. production shifted toward higher priced supplies. As shown in table 3, the percentage of domestic production that was effectively decontrolled—the percent accounted for largely by stripper and ANS oil—increased from about 25 percent in the first quarter to about 29 percent in the

1. The major categories in 1978, in somewhat simplified terms, were: Lower-tier, or old, oil is that from properties producing in 1972; upper-tier, or new, oil is that production in excess of 1972 levels, and from properties that began producing after 1972; stripper oil is that from very low yield wells (10 barrels a day or less); and Alaskan North Slope oil.

third. It was acquired by refiners at world market prices, rather than at the lower, controlled prices of lower- and upper-tier oil.

In the fourth quarter of 1978, increases in the cost of domestic oil continued and the refiner acquisition cost of imported oil moved up. The cost of imported oil reflected the increase in international spot market prices and an increased volume of spot market purchases. Spot market prices fluctuate with worldwide supply and demand, and can be either above or below contract prices, of which the OPEC prices are representative. The increased volume of spot market purchases reflected buying to beat an expected OPEC price increase for 1979 and replacement of supplies

Summary of Major Legislation Affecting Energy Prices

Energy Policy and Conservation Act (EPCA) of 1975, passed in December 1975, superseded the Emergency Petroleum Allocation Act of 1973. It continued Federal controls on the price of domestic crude oil; only the price of stripper oil (production from wells that yield less than 10 barrels per day) was left uncontrolled. Ceiling prices, set for categories largely based on time of discovery, were to be adjusted monthly to allow for inflation, and could be increased to provide an incentive to production. Price controls were mandated until June 1, 1979; they were to be discretionary until expiration of the price control provision of the EPCA on September 30, 1981.

Other major provisions authorized removal of controls on the prices of petroleum products and on the allocation of these products among consumers; established mandatory fuel economy standards for new automobiles; provided for the creation of the Strategic Petroleum Reserve; expanded authority to order major powerplants and fuel burning installations to switch to coal from oil or natural gas; increased Presidential authority to control the flow of energy supplies and energy-related materials; and provided standby powers to deal with an energy emergency.

The Federal Energy Administration, the predecessor of the Department of Energy, acted under the authority of the EPCA to eliminate price and allocation controls except on crude oil, gasoline, and propane (1976 for most petroleum products; 1979 for jet fuel, natural gasoline, and butane); to continue authorization of a 10-percent increase in the average price of a barrel of domestic crude oil (1977); and to phase out crude oil price controls (1979).

National Energy Act of 1978, passed in October 1978, was a five-part package:

Natural Gas Policy Act extended Federal jurisdiction to intrastate natural gas supplies; established ceiling prices for various categories of gas, some of which were to be deregulated in January 1985; and provided for the establishment of "incremental pricing"—a system of surcharges levied on industrial users of natural gas to reduce price increases for residential and small commercial users.

Powerplant and Industrial Fuel Use Act required that new industrial and utility plants use coal or some fuel other than petroleum and natural gas, and that most existing utility plants and, where feasible, industrial plants make the switch by 1990.

Public Utility Regulatory Policies Act required that State regulatory authorities consider new rate structures, such as "time-of-day" rates, that promote energy conservation.

National Energy Conservation Policy Act provided a series of general conservation measures, such as requiring utilities to provide information on conservation to consumers and arrange financing for residential users to install energy-saving insulation.

Energy Tax Act provided tax credits for installation of energy-saving devices on residences and small businesses, tax incentives for the production of synthetic fuels, and the exemption of gasohol from the 4 cents per gallon Federal excise tax.

individual OPEC and non-OPEC producers, beginning in December 1979. Some increases were made retroactive to November 1, so that despite lags in the transportation and financing of crude oil imports, first-quarter petroleum product prices were affected from the start of the quarter. The gap between the OPEC benchmark and the OPEC average widened substantially as the OPEC pricing structure broke down further. The OPEC average reached \$28.72 per barrel. The embargo of Iranian oil, which began November 12, 1979, had only a small impact on the cost of U.S. crude oil imports. A large impact had been expected, because replacement of Iranian supplies would

come from the spot market, but reduced speculation in the spot market narrowed the gap between contract and spot market prices.

The compositional shift towards higher priced domestic supplies accelerated in the first quarter of 1980 under the second phase of the crude oil decontrol program. In the second phase, which began January 1, upper-tier oil is transferred to uncontrolled status in equal monthly installments and the rate of transfer of lower-tier oil to upper-tier status is stepped up. The refiner acquisition cost of domestic oil reached \$21.02 per barrel.

In the second and third quarters, crude oil price increases decelerated. The major factors underlying the deceleration were the effects of weakening economic activity and price-induced conservation on world demand. Stocks of crude oil and petroleum products were high. In the third quarter, domestic refiners cut the price they offered for uncontrolled domestic crude oil, and some spot market prices fell below contract prices. Cuts in production by OPEC members—second-quarter OPEC production was lower than in other quarters of the period—were followed by some third-quarter cuts in premiums on their oil prices. In September, OPEC members agreed to a price freeze for the remainder of the year, for all members except Saudi Arabia;

Saudi Arabia increased its prices 7 percent (\$2 per barrel) retroactive to August 1 to align them better with those of other members. The outbreak of war between Iran and Iraq later in September did not have any immediate effect on prices, other than on those in the spot market.

Gasoline and oil

The price of gasoline is subject to Federal controls at all levels of production and distribution. It is linked to crude oil, which is subject to several types of regulation, and, unlike other petroleum products, it remains subject to controls regarding refiners' allocations and passthroughs of costs at all levels.

In 1978, prices of gasoline and oil principally reflected the course of crude oil prices: relatively small increases through the third quarter, due to increases in the price of domestic oil, and acceleration in the fourth, due to a step-up in prices of imported oil.

Throughout 1979, gasoline prices reflected increasing retail margins and new refiner cost passthroughs, as well as the continued increases for both imported and domestic crude oil. Federal regulatory changes contributed to the increase in retail margins and allowed refiners to pass through additional costs. In January, retailers were allowed to pass through additional costs, specifi-

cally, rent increases and the cost of vapor recovery systems. In March, the "tilt" regulation permitted refiners to allocate to gasoline prices a larger than proportionate amount of costs. In August, a maximum allowable gross margin on sales became mandatory. It was set at 15.4 cents per gallon, and was to be adjusted semiannually for inflation. It replaced for retailers the system of "banks," which—under the Emergency Petroleum Allocation Act of 1973—allowed retailers (and also refiners and distributors) to "bank" allowable costs that had not been passed through because of softness in gasoline markets. The gross margin was increased 4½ percent in December, to 16.1 cents per gallon. Also, beginning in December refiners were allowed to increase prices on stepped-up production of unleaded gasoline, and to pass through the cost of ethanol used for gasohol production and other additives used for gasoline production.

The shortages of gasoline that developed in some areas of the country in May and continued through the summer also contributed to the increase in retail margins. Several factors were responsible for the shortages. First, crude oil supplies were tight. Supplies from Iran had been disrupted and U.S. production in the second and third quarters was below year earlier levels. Second, refiners were reluctant to purchase higher priced spot market supplies of crude oil because such purchases would have put upward pressure on spot market and contract crude oil prices. Third, beginning in April, refiners were encouraged by the Federal Government to replenish stocks of heating oil, which were drawn down during the severe winter. Because fuel oil and gasoline are joint products of the refining process, the increased volume of fuel production was obtained at the expense of gasoline production. Fourth, refiners' allocations to retailers, which are federally regulated, did not fully take into account rapid growth of consumption in some areas. Finally, as shortages became apparent, demand increased sharply but temporarily as consumers "topped off" their gasoline tanks.

In 1980, gasoline price changes covered an unusually wide range: The 82½ percent annual rate increase in the first quarter was the largest increase in the period; a substantial deceleration occurred in the second quarter; and the only decline in the period—7 percent—was registered in the third quarter. Price increases for both imported and domestic oil were unusually large in the first quarter. Thereafter, gasoline prices reflected smaller increases for imported oil and the emergence of more competitive conditions in the retail gasoline market. Over the period of sharp increases in gasoline prices, from the first quarter of 1979 to the first of 1980, these prices increased over 60 percent. Stated in terms of the pump price of regular gasoline the increase was \$0.45 per gallon—from \$0.70 per gallon in the first quarter of 1979 to about \$1.15 in the first quarter of 1980.² Mainly as a reaction to these increases, gasoline consumption declined sharply. As measured by real PCE, consumption declined 15 percent through the first quarter, and continued to decline in the second and third quarters (table 4). These reductions, in combination with high stocks, led some refiners to cut wholesale prices and some retailers to cut margins.

2. The pump price of regular gasoline is shown in chart 12, where it, like the price of crude oil, is measured in terms of dollars per 42-gallon barrel. The increasing share of the price of crude oil in the pump price, which is apparent in the chart over most of the period, reflects the fact that some of the difference between the two prices consists of items that, at least in the short run, are fixed in dollars. Federal and State and local taxes are an example.

Fuel oil and coal

In contrast to gasoline, fuel oil is not subject to Federal price and allocation controls. However, as a refined petroleum product, it is linked to crude oil, which is subject to several types of regulation. The link is more direct than in the case of gasoline, because the cost of crude oil makes up a much larger part of the consumers' price of fuel oil. Accordingly, fuel oil prices in 1978–80 reflected the increases for domestic and imported crude oil described earlier—that is, relatively small price increases through the third quarter of 1978, sharply accelerating increases through the third quarter of 1979, and increases thereafter that were lower than in the third quarter but still large. In addition, severe winter weather resulted in a drawdown of distillate stocks in the first quarter of both 1978 and 1979, putting upward pressure on fuel oil prices.

As a result of the 1979 drawdown, Federal actions were taken in mid-1979 to stimulate the replenishment of fuel oil stocks. First, in May, an "entitlement" subsidizing imports of middle distillates (fuel oil or heating oil) was introduced to reduce the disparity between the prices of imported and domestically refined heating oil. The costs were absorbed by domestic refiners. Second, as mentioned earlier, refiners were encouraged to increase production of fuel oil at the expense of gasoline production.

A subsequent buildup of stocks, a milder than usual winter, and continuing price-induced conservation and conversion to natural gas helped hold down fuel oil price increases in 1980. Conversion to natural gas has been particularly important in the Northeast, where reliance on imports of crude oil and petroleum products is greatest.

Electricity

Retail electricity rates are regulated by State utility commissions. However, in most States full-scale hearings are not always required for utilities to increase rates, because fuel adjustment clauses permit them to pass through increased fuel costs. Wholesale rates for interstate sales are federally regulated. Electricity rates are also affected by Federal regulation of energy inputs to electricity production. Changes in the prices of the principal inputs—coal, petroleum, and natural gas, which in terms of kilowatt-hours produced account, respectively, for about 45, 15, and 15 percent of production—are shown in chart 13. Of these inputs, only coal is not federally regulated.

In the first two quarters of 1978, electricity prices rose faster than those of the other PCE energy components, mainly as a result of the effects of the record-long coal strike from December 1977 to March 1978. Higher electricity prices reflected utilities' substitution of higher priced power on a short-term emergency basis from utilities less affected by the strike. Also, as a result of coal shortages caused by the strike and of higher labor costs established in the miners' new contract, the price increase for coal used by electric utilities accelerated sharply in the second quarter and was high also in the third.

There was upward pressure on first-quarter 1978 electricity prices also because of strong consumer demand—as evidenced by real PCE on electricity—during severe winter weather. Less efficient plants—often those using higher priced energy inputs—were brought into operation. In some cases the increased costs were passed through to consumers through fuel adjustment clauses; in others, a longer lag occurred

because rate increases had to be approved by State utility commissions. Increased costs were passed through either as a lump sum, or a surcharge extended over several months.

Third- and fourth-quarter changes in 1978 include some effect of seasonal pricing—a step-up in rates during summer months when demand for electricity is larger because of its heavy use in air conditioning and a step-down during winter months. (The second-quarter increase was also affected, but to a smaller extent.) Data for preceding years did not show sufficient evidence of a seasonal pattern to require seasonal adjustment. The decline in the fourth quarter also included rebates by some utilities; some fuel adjustment charges imposed during or after the coal strike were subsequently found to be larger than warranted.

In 1979, substantial price increases for crude oil and natural gas, shown in chart 13, and for petroleum products such as residual fuel, resulted in somewhat higher price increases for electricity. In addition, several factors influenced the quarterly pattern. A second winter of severe weather put upward pressure on prices in the first quarter. An accident at the Three Mile Island nuclear plant in March, which resulted in temporary shutdowns of other nuclear plants, had an effect similar to that of the previous year's coal strike: Utilities were forced to substitute less efficient powerplants and higher priced fuels. The second- and third-quarter increases were partly due to the introduction of high summer rates; seasonal adjustment of electricity prices began with the fourth-quarter data.

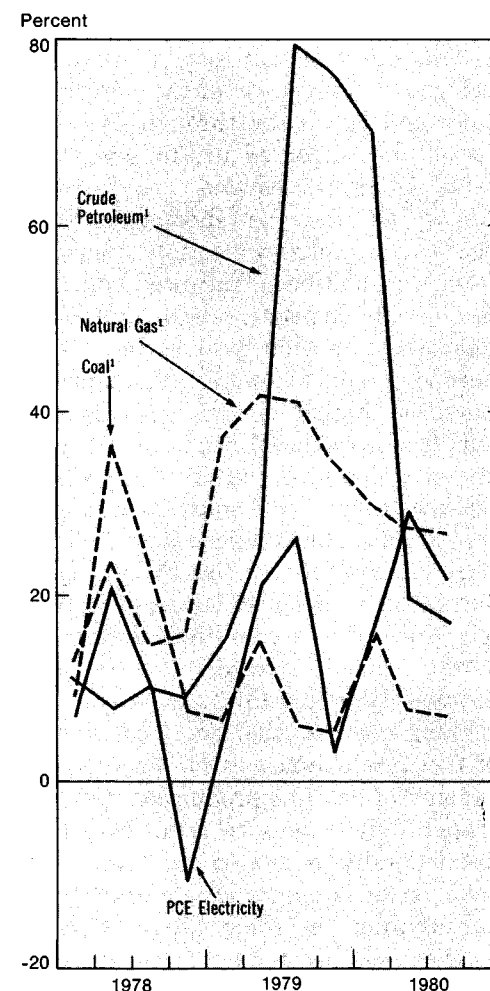

In 1980, electricity price increases again mainly reflected price increases for the energy inputs. Weather abnormalities were also a factor. A warm winter held down demand in the first quarter. In the second and third quarters, demand was high, because of the extensive use of air conditioning during a heat wave and drought that began in June. Also, hydroelectric production in some areas was cut by the drought, causing increased reliance on higher priced energy inputs.

Natural gas

The price of natural gas is affected by the prices of domestic supplies as well as those of natural gas imports, which are principally from Canada. The cost of natural gas accounted for an increasing share of the residential price: 36 percent in 1978, 42 percent in 1979, and 46 percent in early 1980. The remaining costs are for transportation by pipeline and for distribution. At the distribution level, gas utilities' rates are subject to regulation by State utility commissions.

Prior to the passage of the Natural Gas Policy Act of 1978 (NGPA), two markets existed for supplies of domestic natural gas. The interstate market was

CHART 13
Prices for PCE Electricity and Principle Energy Inputs to Electricity Production: Change From Preceding Quarter

1. Not seasonally adjusted.
Data: Bureau of Labor Statistics.

U.S. Department of Commerce, Bureau of Economic Analysis

80-10-13

subject to Federal regulation; the intrastate market was subject to State regulations. Price differentials led to shortages in the interstate market, where the maximum prices were set at relatively low levels, and surpluses in the intrastate market. The NGPA, a part of the National Energy Act of 1978, extended Federal price controls to the intrastate market and set prices designed to stimulate production of some categories of gas. An incremental pricing program, implemented only in 1980, passed high prices for newly discovered supplies to industrial users.

In 1978, supplies were tight in the interstate market. Tightness due to price disparities between the two markets had been accentuated in the first quarter by increased residential consumption during severe winter weather. In periods of high demand, such as in

the first quarter, auxiliary sources of gas are used to supplement primary sources. In 1978, intrastate gas was purchased under Federal regulations that allow emergency purchases for periods up to 60 days. Tightness persisted through the first three quarters and well into the fourth. On December 1, provisions of the NGPA took effect; natural gas prices rose, and the distribution of supplies was improved.

In 1979, price increases accelerated. Domestic prices were affected by monthly inflation adjustments under the NGPA as well as decontrol of four categories of gas in November. Also, import prices increased. Demand for natural gas continued strong. There was a second winter of severe weather, and, as a result of the even sharper price increases for fuel oil, a large number of

residences were converted from fuel oil to natural gas. The number of residential natural gas customers increased by about 500,000 in 1979.

Natural gas prices continued to increase in 1980. Prices of domestic gas rose under the NGPA, and there were substantial increases in the price of natural gas imports. Areas heavily dependent on Canadian natural gas were strongly affected by a 30-percent price increase in February. Conversion from fuel oil to natural gas heating continued; the number of residential customers increased 600,000 in the first quarter and 200,000 in the second. In the first quarter, however, consumer demand was held down by warmer-than-average weather. Conservation by consumers also helped limit 1980 price increases.

CURRENT BUSINESS STATISTICS

THE STATISTICS here update series published in the 1977 edition of BUSINESS STATISTICS, biennial statistical supplement to the SURVEY OF CURRENT BUSINESS. That volume (available from the Superintendent of Documents for \$6.25) provides a description of each series, references to sources of earlier figures, and historical data as follows: For all series, monthly or quarterly, 1973 through 1976 (1966-76 for major quarterly series), annually, 1947-76; for selected series, monthly or quarterly, 1947-76 (where available).

The sources of the data are given in the 1977 edition of BUSINESS STATISTICS; they appear in the main descriptive note for each series, and are also listed alphabetically on pages 181-182. Statistics originating in Government agencies are not copyrighted and may be reprinted freely. Data from private sources are provided through the courtesy of the compilers, and are subject to their copyrights.

Unless otherwise stated in footnotes below, data through 1976 and descriptive notes are as shown in the 1977 edition of BUSINESS STATISTICS	1977	1978	1979	1977	1978				1979				1980

FOOTNOTES FOR PAGES S-1 THROUGH S-36

General Notes for all Pages:

r Revised.
p Preliminary.
e Estimated.
c Corrected.

Page S-1

1. Estimates (corrected for systematic biases) for July-Sept. and Oct.-Dec. 1980 based on planned capital expenditures of business. Planned capital expenditures for the year 1980 appear on p. 23 of the Sept. 1980 SURVEY.

2. Includes communication.

¶ Data for the individual durable and nondurable goods industries appear in the Mar., June, Sept., and Dec. issues of the SURVEY.

Page S-2

† Revised series. Estimates of personal income have been revised back to 1975; revised data appear on p. 36 of the July 1979 SURVEY.

‡ Includes inventory valuation and capital consumption adjustments.

* New series. Detailed descriptions and historical data back to 1959 begin on p. 18 of the Nov. 1979 SURVEY.

§ Monthly estimates equal the centered three-month average of personal saving as a percentage of the centered three-month moving average of disposable personal income.

Includes data for items not shown separately.

¶ Revised data for 1976-78 will be shown in the 1979 BUSINESS STATISTICS.

Page S-3

1. Based on data not seasonally adjusted.

¶ See note "¶" for p. S-2.

Includes data not shown separately.

‡ Revised series. Data for both the manufacturing and retail sectors have been revised. For manufacturing see note "†" for p. S-4. For retail see note "†" for p. S-10.

† See note "†" for p. S-4.

§ See note "§" for p. S-10.

* New series. Data back to 1967 are available from the National Income and Wealth Division, Bureau of Economic Analysis.

Page S-4

1. Advance estimate; total manufacturers' shipments for the previous month do not reflect revisions for the selected components.

2. Based on data not seasonally adjusted.

‡ Revised series. Data for both the manufacturing and retail sectors have been revised. For manufacturing see note "†" for this page. For retail see note "†" for p. S-10.

† Revised series. Data revised back to 1958 to reflect (1) benchmarking of shipments and inventories to the 1974, 1975, and 1976 Annual Surveys of Manufacturers, (2) recalculation of new orders estimates, and (3) updating of the seasonal factors. A detailed description of this revision and historical data appear in reports "Manufacturers' Shipments, Inventories, and Orders" M3-1.7 (1958-1977), M3-1.8 (1967-1978), and M3-1.9 (1977-1979), available from the Bureau of the Census, Washington, D.C. 20233.

§ See note "§" for p. S-10.

* New series. Data back to 1967 are available from the National Income and Wealth Division, Bureau of Economic Analysis.

Includes data for items not shown separately.

Page S-5

1. Advance estimate; total manufacturers' new and unfilled orders for the previous month do not reflect revisions for the selected components.

2. The Sept., Oct., and Nov. 1979 issues of the SURVEY incorrectly show annual data for 1977 and 1978 and monthly data for 1978 that had been superseded by the August 1979 revision. The Aug. 1979 SURVEY shows the correct data.

3. Based on data not seasonally adjusted.

† See note "†" for p. S-4.

Includes data for items not shown separately.

‡ Includes textile mill products, leather and products, paper and allied products, and printing and publishing industries; unfilled orders for other nondurable goods industries are zero.

¶ For these industries (food and kindred products, tobacco, apparel and other textile products, petroleum and coal, chemicals and allied products, and rubber and plastics products) sales are considered equal to new orders.

Page S-6

1. Based on unadjusted data.

2. Beginning Jan. 1978, includes TV and sound equipment and repairs formerly in "health and recreation."

3. Beginning Jan. 1978, residential.

4. Beginning Jan. 1978, includes additional items not previously priced.

5. Includes bottled gas.

6. Effective Jan. 1980, data are no longer seasonally adjusted.

7. Effective May 1980, data are no longer shown in the SURVEY. Beginning Jan. 1977 data have been based on the Consumer Price Index.

8. Data for Mar.-June 1980 will be available later. Cumulative totals for the first seven months of 1980 are Failures: Commercial service, 856; Construction, 1,304; Manufacturing and mining, 904; Retail trade, 2,821; Wholesale trade, 724. Liabilities in thousands of dollars: Commercial service, 208,209; Construction, 513,600; Manufacturing and mining, 740,464; Retail trade, 581,737; Wholesale trade, 355,834.

‡ Compiled by Dun & Bradstreet, Inc.

Includes data for items not shown separately.

§ Ratio of prices received to prices paid (parity index).

¶ Data through 1977 are for urban wage earners and clerical workers; beginning Jan. 1978, there are two indexes, all wage earners and clerical workers, revised (CPI-W), and all urban consumers (CPI-U). These indexes reflect improved pricing methods, updated expenditure patterns, etc.; complete details are available from the Bureau of Labor Statistics, Washington, D.C. 20212.

* New series. Earlier data available from BLS.

† Beginning Jan. 1978, CPI-U.

Page S-7

1. Annual average computed by BEA.

§ For actual producer prices of individual commodities see respective commodities in the Industry section beginning p. S-22. All data subject to revision four months after original publication.

Includes data for items not shown separately.

‡ Beginning Mar. 1980 SURVEY, data have been revised (back to 1967) to reflect new seasonal factors.

* New series. Data back to 1975 will be shown in the 1979 BUSINESS STATISTICS.

Page S-8

1. Computed from cumulative valuation total.

2. Data are no longer available; 1978 annual represents Jan.-July.

3. Data shown here are based on 1979 seasonal factors. Effective Jan. 1980, data are no longer seasonally adjusted.

¶ Beginning Jan. 1979 SURVEY, monthly and annual data have been restated to reflect the purchasing power of the dollar as measured by finished goods; comparable data for periods prior to November 1977 will be shown in the 1979 BUSINESS STATISTICS.

‡ Beginning Jan. 1978, based on CPI-U; see note "¶" for p. S-6.

Includes data for items not shown separately.

§ Data for Aug., Nov. 1979, and Jan., May, and July 1980 are for five weeks; other months four weeks.

@ Data for new construction have been revised back to Jan. 1975 and are available from the Bureau of the Census, Washington, D.C. 20233.

@@ Monthly revisions back to Jan. 1975 will be shown in the 1979 BUSINESS STATISTICS.

‡‡ Monthly data back to Jan. 1970 on the 1972=100 base will be shown in the 1979 BUSINESS STATISTICS.

Page S-9

1. Index as of Oct. 1, 1980: building, 293.3; construction, 311.3.

¶ Home mortgage rates (conventional first mortgages) are under money and interest rates on p. S-15.

§ Data include guaranteed direct loans sold.

‡ Source: Media Records, Inc. 64-City Newspaper Advertising Trend Chart.

@ Monthly data back to 1972 on the 1972=100 base are available upon request.

Page S-10

1. Advance estimate.

2. Effective Jan. 1979 data, sales of mail-order houses are included with department store sales.

† Effective April 1980 SURVEY, retail trade data have been revised back to 1973. Effective April 1979 SURVEY, data have been revised from 1967-1972. Revised data and a summary of the changes are available from the Census Bureau, Washington, D.C. 20233.

Includes data for items not shown separately.

§ Includes sales of mail-order catalog desks within department stores of mail-order firms.

Page S-11

1. As of July 1.

Includes data for items not shown separately.

‡ Revisions for Jan. 1977-Oct. 1979 appear in "Current Population Reports," Series P-25, No. 870. Revisions for July-Dec. 1976 appear in "Populations: Estimates of the Population of the United States and Components of Change—1940-79," P-25 No. 802 (June 1979), Bureau of the Census.

† Effective July 1980 SURVEY, data have been revised based on March 1979 benchmark levels and updated seasonal adjustment factors; they are not comparable with previously published data. Effective Oct. 1979 SURVEY, data have been revised based on March 1978 benchmark levels and updated seasonal adjustment factors; effective Oct. 1978 SURVEY, data have been revised to conform to the 1972 SIC and adjusted to March 1977 benchmark levels, therefore, data are not strictly comparable with earlier periods. See "BLS Establishment Estimates Revised to March 1979 Benchmarks," in the July 1980 issue of *Employment and Earnings*. See also Oct. 1979 and Oct. 1978 issues of *Employment and Earnings* for similar articles.

¶ Effective with the Jan. 1980 SURVEY, the labor force series reflect new seasonal factors. Data have been revised back to 1975; comparable monthly data for 1975-79 appear in the Feb. 1980 issue of *Employment and Earnings*, U.S. Department of Labor, Bureau of Labor Statistics.

Page S-12

- † See corresponding note on p. S-11.
- § Effective October 1978 SURVEY, includes data formerly shown separately under ordinance and accessories.
- @ Formerly shown as Electrical equipment and supplies.
- ¶ Production and nonsupervisory workers.
- ‡ This series is not seasonally adjusted because the seasonal component is small relative to the trend-cycle and/or irregular components and consequently cannot be separated with sufficient precision.

Page S-13

- † See note “†” on p. S-11.
- § See note “§” on p. S-12.

Page S-14

- † See corresponding note on p. S-11.
- ¶ Production and nonsupervisory workers.
- ‡ Earnings in 1967 dollars reflect changes in purchasing power since 1967 by dividing by Consumer Price Index; effective Mar. 1979 SURVEY, data reflect new seasonal factors for the CPI.
- § Wages as of Oct. 1, 1980: Common, \$12.25; Skilled, \$15.91.
- # Includes data for items not shown separately.
- @ Insured unemployment (all programs) data include claims filed under extended duration provisions of regular State laws; amounts paid under these programs are excluded from state benefits paid data.
- @@ Insured unemployment as a percent of average covered employment in a 12-month period.

Page S-15

1. Average for Dec.
 2. Average for the year.
 3. Daily average.
 4. Effective April 1980, data are no longer available.
- # Includes data for items not shown separately.
 - § For demand deposits, the term “adjusted” denotes demand deposits other than domestic commercial bank and U.S. Government, less cash items in process of collection; for loans, exclusive of loans to and Federal funds transactions with domestic commercial banks and include valuation reserves (individual loan items are shown gross; i.e. before deduction of valuation reserves).
 - ¶ Adjusted to exclude domestic commercial interbank loans and Federal funds sold to domestic commercial banks.
 - ‡ Data beginning Dec. 1978 reflect a reduction in the number of banks reporting (from 317 to 171) and changes in consolidation basis as well as content of several asset and liability items. Unless otherwise stated, comparable data for earlier periods will be available later.
 - * New series. Beginning Dec. 1978, data are for all investment account securities; comparable data for earlier periods are not available.
 - † Revised series. Data are now monthly averages and the coverage has been expanded. Comparable data back to Dec. 1972 are available from the Federal Reserve Board, Washington, D.C. 20551.
 - ‡‡ Rates on the commercial paper placed for firms whose bond rating is Aa or the equivalent. Data through Oct. 1979 show a maturity for 120-179 days. Beginning Nov. 1979, maturity is for 180 days.
 - @ Data through Oct. 1979 show a maturity for 150-179 days. Beginning Nov. 1979, maturity is for 180 days.

Page S-16

1. Data are for fiscal years ending Sept. 30 and include revisions not distributed to the months.
- † Beginning Jan. 1979 SURVEY, the consumer credit group has been completely restructured; comparable data for periods prior to Nov. 1977 are available from the Federal Reserve Board, Washington, D.C. 20551.
 - # Includes data for items not shown separately.
 - § The Department of Health, Education, and Welfare was redesignated as the Department of Health and Human Services by the Department of Education Organization Act. Data for the months Oct. 1979-Apr. 1980 include 7,500 million dollars in outlays by the Department of Education.

Page S-17

1. Total for Jan.-May and Oct.-Dec.
- § Or increase in earmarked gold (-).
 - † The Federal Reserve has redefined the monetary aggregates. The redefinition was prompted by the emergence in recent years of new monetary assets—for example, negotiable order of withdrawal (NOW) accounts and money market mutual fund shares—and alterations in the basic character of established monetary assets—for example, the growing similarity of and substitution between the deposits of thrift institutions and those of commercial banks. Monthly data from 1959 to date are available from the Banking Section of the Division of Research and Statistics at the Federal Reserve Board, Washington, D.C. 20551.

‡ Composition of the money stock measures is as follows:

- M1-A*.—This measure is currency plus demand deposits at commercial banks. It is essentially the same as the old M1 except that it excludes demand deposits held by foreign commercial banks and official institutions.
- M1-B*.—This equals M1-A plus interest-earning checkable deposits at all depository institutions—namely NOW accounts, automatic transfer from savings (ATS) accounts, and credit union share draft balances—as well as a small amount of demand deposits at thrift institutions that cannot, using present data sources, be separated from interest-earning checkable deposits.
- M2*.—This measure adds to M1-B overnight repurchase agreements (RP's) issued by commercial banks and certain overnight Eurodollars (those issued by Caribbean branches of member banks) held by U.S. nonbank residents, money market mutual fund shares, and savings and small-denomination time deposits (those issued in denominations of less than \$100,000) at all depository institutions. Depository institutions are commercial banks (including U.S. agencies and branches of foreign banks, Edge Act corporations, and foreign investment companies), mutual savings banks, savings and loan associations, and credit unions.
- M3*.—This measure equals M2 plus large-denomination time deposits (those issued in denominations of \$100,000 or more) at all depository institutions (including negotiable CD's) plus term RP's issued by commercial banks and savings and loan associations.
- L*.—This broad measure of liquid assets equals M3 plus other liquid assets consisting of other Eurodollar holdings of U.S. nonbank residents, bankers acceptances, commercial paper, savings bonds, and marketable liquid Treasury obligations.
- ‡‡ Includes ATS and NOW balances at all institutions, credit union share draft balances, and demand deposits at mutual savings banks.
- * Overnight (and continuing contract) RP's are those issued by commercial banks to the nonbank public, and overnight Eurodollars are those issued by Caribbean branches of member banks to U.S. nonbank customers.
- @ Small time deposits are those issued in amounts of less than \$100,000. Large time deposits are those issued in amounts of \$100,000 or more and are net of the holdings of domestic banks, thrift institutions, the U.S. Government, money market mutual funds, and foreign banks and official institutions.
- # Includes data for items not shown separately.

Page S-18

1. Beginning Jan. 1978, data are based on a new classification system and include nonmonetary gold; the overall total and the commodity groups (but not the items within the groups) have been revised back to Jan. 1977 to reflect these changes.
2. Effective Oct. 1979 SURVEY, data are no longer available.
3. Average for Jan.-Aug.
- § Number of issues represents number currently used; the change in number does not affect the continuity of the series.
- ¶ Prices are derived from average yields on the basis of an assumed 3-percent 20-year bond.
- ‡ For bonds due or callable in 10 years or more.
- # Includes data for items not shown separately.
- @ Data may not equal the sum of the geographic regions, or commodity groups and principal commodities, because of revisions to the totals not reflected in the component items.
- @@ Effective Feb. 1979 SURVEY, seasonally adjusted data have been revised to reflect sums of commodity components; comparable data for periods prior to 1977 will be shown in the 1979 BUSINESS STATISTICS.

Page S-19

1. See note 1 for p. S-18.
- # Includes data not shown separately.
 - § Data may not equal the sum of geographic regions, or commodity groups and principal commodities, because of revisions to the totals not reflected in the components.
 - @ See note “@@” for p. S-18.

Page S-20

1. See note 1 for p. S-18.
- # Includes data not shown separately.

Page S-21

1. Domestic trunk operations only (averaging about 90 percent of domestic total).
 2. Annual total; quarterly or monthly revisions are not available.
 3. Before extraordinary and prior period items.
 4. For month shown.
 5. Beginning Jan. 1979, data are based on a new sample of freight shipments for 1976. The new indexes have been linked to the old indexes to maintain comparability.
 6. Beginning Jan. 1977, data are for unlinked passenger trips.
 7. Beginning Jan. 1980 data, another company is included.
- # Includes data for items not shown separately.
 - § Total revenues, expenses, and income for all groups of carriers also reflect nonscheduled service.
 - ‡ Beginning Jan. 1977, defined as those having operating revenues of \$50 million or more.
 - ¶ Average daily rent per room occupied, not scheduled rates.
 - @ Beginning Jan. 1979, data include visits to Badlands and Theo. Roosevelt National Parks (formerly classified as recreational areas). Beginning Jan. 1980, data include visits to Channel Islands (formerly classified as a monument). Beginning June 1980, data include visits to Biscayne (formerly classified as a monument).

Page S-22

1. Reported annual total; monthly revisions are not available.
 2. Data withheld to avoid disclosing operations of individual companies.
 3. Beginning Jan. 1979, data include chemically-treated fertilizer and sodium nitrate containing over 16.3% nitrogen by weight; not strictly comparable with data shown for earlier periods.
 4. Because of an overall revision to the export commodity classification system effective Jan. 1, 1978, data may not be strictly comparable with those shown for earlier periods.
 5. See note "¶" for this page.
 6. Represents solutions containing ammonia and ammonium nitrate/urea solutions; not comparable with other published data.
 7. Annual total for monthly data where available; not comparable with earlier periods.
 8. Data beginning Jan. 1979 are for value of shipments and comprise three new product categories. Comparable data for these new categories are not available prior to Jan. 1979. However, the difference between total value of shipments and total factory sales (formerly shown) is considered statistically insignificant.
 9. Reported annual total; includes monthly data withheld to avoid disclosing operations of individual companies.
 10. Data are no longer available.
- # Includes data for items not shown separately.
 § Data are reported on the basis of 100 percent content of the specified material unless otherwise indicated.
 ‡ Monthly revisions, back to 1975 for some commodities, will be shown in the 1979 BUSINESS STATISTICS.
 @ Monthly revisions for Oct. 1976-Feb. 1978 will be shown in the 1979 BUSINESS STATISTICS.
 ¶ Data for Jan. 1977-June 1979 exclude potassium magnesium sulfate; not strictly comparable with those shown for other periods.

Page S-23

1. Includes Hawaii, not available on a monthly basis; monthly revisions for 1976-78 will be shown in the 1979 BUSINESS STATISTICS.
2. Reported annual total, including Hawaii; monthly data are preliminary and subject to change.
3. Data are no longer available.
- § Data are not wholly comparable from year to year because of changes from one classification to another.
- @ Monthly revisions, for some series back to 1976, will be shown in the 1979 BUSINESS STATISTICS.

Page S-24

 2. Crop estimate for the year.
 3. Stocks as of June 1.
 4. Stocks as of June 1 and represents previous year's crop; new crop not reported until June (beginning of new crop year).
 5. Previous year's crop; new crop not reported until Oct. (beginning of new crop year).
 6. Less than 50 thousand bushels.
 7. Ten-month average; Feb. and June prices not available.
 8. See note "@@" for this page.
 9. October 1 estimate of the 1980 crop.
 10. Data are no longer available.
- § Excludes pearl barley.
 # Bags of 100 lbs.
 ¶ Revised crop estimates for 1970-75 will be shown in the 1979 BUSINESS STATISTICS.
 @ Monthly revisions, for some series back to 1976, will be shown in the 1979 BUSINESS STATISTICS.
 ‡ Monthly revisions back to 1975 will be shown in the 1979 BUSINESS STATISTICS.
 @@ Data are quarterly except for June (covering Apr. and May) and Sept. (covering June-Sept.).

Page S-25

1. See note 4 for p. S-22.
2. See note "#" for this page.
3. Effective Mar. 1979, prices are for Central U.S. and Los Angeles; comparability not affected.
4. Prices for Sept. 1977-Mar. 1979 are estimated; actual price not available. Annual average for 1978 reflects those estimates. Annual average for 1979 is based on actual price (Apr.-Dec.).
5. Average for five months (Aug.-Dec.).
 § Cases of 30 dozen.
 ¶ Bags of 132.276 lbs.
 ‡ Monthly revisions back to Jan. 1975 will be shown in the 1979 BUSINESS STATISTICS.
 @ Monthly revisions back to 1976 will be shown in the 1979 BUSINESS STATISTICS.
 # Effective Feb. 1979, prices are for Central U.S. (including East Coast); comparability is not affected.

Page S-26

1. See note 4 for p. S-22.
2. Beginning Aug. 1978, prices are estimated; not comparable with those shown for earlier periods. Annual average for 1978 represents Aug.-Dec.
3. Crop estimate for the year.
4. Beginning Sept. 1979, estimated prices are derived from a different source and are not comparable with those shown for earlier periods. Annual average for 1979 represents Sept.-Dec.
5. October 1 estimate of the 1980 crop.
 § Monthly data reflect cumulative revisions for prior periods.
 @ Producers' and warehouse stocks.
 ¶ Factory and warehouse stocks.

Page S-27

1. See note 4 for p. S-22.
 2. Annual total; monthly revisions are not available.
 3. Average for Jan.-May and July-Dec.
 4. Average for Jan.-Oct.
 5. Average for July-Dec.
- # Includes data for items not shown separately.

Page S-28

1. Annual data; monthly revisions not available.
2. Average for 11 months; price not available for Nov.
3. Effective Jan. 1980, data are no longer available.

Page S-29

1. Annual data; monthly revisions are not available.
 2. For month shown.
- § Beginning with Jan. 1979 data, units are metric tons; to convert, multiply short tons by 0.907185.

Page S-30

1. Data beginning Jan. 1978 exclude stocks of lead base bullion in transit and at refineries.
2. Less than 50 tons.
3. Data are for five weeks; other months 4 weeks.
4. For month shown.
5. Data withheld to avoid disclosing information for individual companies in the 4th quarter of 1979. Annual total for 1979 is the sum of available data.
6. Effective July 1980 SURVEY, data are revised and shown on a new base. Revised data are not comparable to previously published data.
 § Beginning with Jan. 1979 data, units are metric tons; earlier data are shown in short tons; to convert, multiply short tons by 0.907185.
 ¶ Includes secondary smelters' lead stocks in refinery shapes and in copper-base scrap.
 @ All data (except annual production figures) reflect GSA remelted zinc and zinc purchased for direct shipment.
 # Includes data not shown separately.
 † Revised series. The sample size has been restored to 100 firms and the base has been changed to 1977=100.
 * New series. These indexes are based on shipments of hydraulic and pneumatic products reported by participating members of the National Fluid Power Association. Data back to 1959 are available upon request.

Page S-31

1. Reflects revisions not available by months.
2. Beginning May 1980 SURVEY, monthly data are available only at quarterly intervals.
3. Effective Jan. 1980, stocks for bituminous coal and lignite of retail dealers are no longer available. This exclusion will be reflected in and affect the comparability of total stocks for bituminous coal, which, beginning May 1980 SURVEY, will be available only at quarterly intervals.
4. Beginning Jan. 1979, data reflect coverage of additional processing facilities; not strictly comparable with data shown for earlier periods.
 # Includes data for items not shown separately.
 @ Beginning July 1977, data include shipments to mobile home and travel trailer manufacturers (formerly excluded); they are not directly comparable with data for earlier periods.
 * New series. Annual data prior to 1978 and monthly data prior to April 1979 are available upon request.
 § Includes nonmarketable catalyst coke.
 ¶ Includes small amounts of "other hydrocarbons and hydrogen refinery input," not shown separately.
 ‡ Monthly revisions for the following series will be shown in the 1979 BUSINESS STATISTICS: bituminous coal—back to 1975; coke—back to 1977; petroleum and products—back to 1976; anthracite coal production—1977; and wholesale price indexes covering bituminous coal and petroleum and products—1977.

Page S-32

1. Less than 50 thousand barrels.
2. See note 4 for p. S-31.
3. Reported annual totals; revisions not allocated to the months.
4. See note "¶" for this page.
 ‡ See note "‡" for p. S-31.
 ¶ Prices are mid-month and through 1978, exclude taxes. Beginning Jan. 1979, taxes are included; comparable prices for earlier periods are not available.
 # Includes data for items not shown separately.

Page S-33

1. Beginning Jan. 1977, data cover passenger car and truck and bus tires; motorcycle tires and tires for mobile homes are excluded.
2. Effective Jan. 1979, data are no longer available.
3. Effective Jan. 1980, data are no longer available.
4. Effective Jan. 1980, data are reported on a monthly basis and are not comparable with data shown for earlier periods.
 ¶ As reported by publishers accounting for about 75 percent of total newsprint consumption.
 § Monthly data are averages of the 4-week periods ending on the Saturday nearest the end of the month; annual data are as of Dec. 31.

Page S-34

1. Reported annual total; revisions not allocated to the months.
 2. Crop for the year.
 3. Data cover five weeks; other months, four weeks.
 4. First-of-the-month estimate of the 1980 crop.
 5. Beginning Jan. 1980, data include sales of 5/16 mobile home board; not shown separately.
- @ Monthly revisions back to 1976 will be shown in the 1979 BUSINESS STATISTICS.
 * New series. Data for finishing mills have replaced data for weaving mills, which are no longer available.
 # Includes data for items not shown separately.
 ¶ Cumulative ginnings to the end of month indicated.
 § Bales of 480 lbs.

Page S-35

1. Effective Jan. 1, 1978, includes reexports, formerly excluded.
 2. Effective 1st quarter 1977, data are not directly comparable with earlier periods.
 3. Average for crop year; Aug. 1-Jul. 31.
 4. For five weeks; other months four weeks.
 5. Monthly average.
 6. Average for Jan.-Oct.
 7. Average for Feb.-Jun.
 8. Average for 11 months; no price for Oct.
 9. Average of Jan.-June.
 10. Less than 500 bales.
- § Bales of 480 lbs.

¶ Based on 480-lb. bales, preliminary price reflects sales as of the 15th; revised price reflects total quantity purchased and dollars paid for the entire month (revised price includes discounts and premiums).

Includes data not shown separately.

@ Effective Apr. 1979 SURVEY data include 600 additional firms; comparable data back to Jan. 1977 (except for slacks, jean cut, casual, shown on p. S-36) will appear in the 1979 BUSINESS STATISTICS.

Page S-36

1. Annual total includes revisions not distributed to the months.
 2. Estimates of production, not factory sales.
 3. See note 4 for p. S-22.
 4. Excludes one state.
 5. Excludes two states.
 6. Excludes three states.
 7. Excludes four states.
 8. Effective Jan. 1979, data are not directly comparable with earlier periods because of the inclusion of Volkswagens produced in the U.S.
 9. Effective Jan. 1980, passenger vans previously reported as passenger cars are now included with trucks.
- @ See note "@" p. S-35.
 # Total includes backlog for nonrelated products and services and basic research.
 § Domestic include U.S.-type cars produced in the United States and Canada and foreign-type cars produced in the U.S.; imports cover all other foreign-type cars and captive imports, and exclude domestics produced in Canada.
 ¶ Courtesy of R.L. Polk & Co.; republication prohibited.
 ‡ Excludes railroad-owned private refrigerator cars and private line cars.
