Survey of Current Business
Manuscript Editor: Dannelet A. Grosvenor
Managing Editor: Leland L. Scott**

Staff Contributors to This Issue: Wallace K. Bailey, Leo M. Bernstein, Robert L. Brown, Edwin J. Coleman, Vivian G. Conklin, Frank deLeeuw, Carol E. Evans, Douglas R. Fox, Gurumukh S. Gill, Linnea Hazen, Daniel J. Larkins, Thae S. Park, Milo O. Peterson, Regional Economic Measurement Division, Arthur L. Sensenig, Eugene P. Seskin, David F. Sullivan, Tracy R. Tapscott, Joseph C. Wakefield, Richard C. Ziemer.

SURVEY OF CURRENT BUSINESS: Published monthly by the Bureau of Economic Analysis of the U.S. Department of Commerce, Editorial correspondence should be addressed to the Editor-in-Chief, Survey of Current Business, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230.

Annual subscription: *second-class mail*—\$30.00 domestic; \$37.50 foreign. Single copy: \$4.75 domestic; \$5.95 foreign.

First-class mail rates and *foreign air mail* rates available upon request.

Mail subscription orders and address changes to the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Make checks payable to Superintendent of Documents.

Second-class postage paid at Washington, DC and at additional mailing offices. (USPS 337-790).

The Secretary of Commerce has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through April 1, 1985.

the BUSINESS SITUATION

THE pace of U.S. production slowed in the first quarter of 1985. Real GNP increased at an annual rate of 1½ percent, following an increase of 4½ percent in the fourth quarter of 1984. In the third quarter, GNP had increased 1½ percent. Increases in real GNP in these three quarters averaged 2½ percent, a considerably lower growth rate than earlier in 1984 and in 1983. Inflation remained moderate. The GNP fixed-weighted price index increased 4½ percent at an annual rate in the first quarter.¹

1. Quarterly estimates in the national income and product accounts are expressed at seasonally adjusted annual rates, and quarterly changes in them are differences between these rates. Quarter-to-quarter percent changes are compounded to annual rates. Real, or constant-dollar, estimates are expressed in 1972 dollars.

The first-quarter GNP estimates are based on the following major source data: For *personal consumption expenditures* (PCE), retail sales through March, and unit auto and truck sales through March; for *nonresidential fixed investment*, the same information for autos and trucks as for PCE, January and February

The recent variation in the quarterly increases in real GNP reflected sharp changes in several components, particularly net exports and change in business inventories (chart 1). In the first quarter, when the increase in GNP slowed, net exports swung sharply: Imports registered a large increase following a large decline in the

construction put in place, January and February manufacturers' shipments of machinery and equipment, and investment plans for the quarter; for *residential investment*, January and February construction put in place, and January and February housing starts; for *change in business inventories*, January and February book values for manufacturing and trade, and unit auto inventories through March; for *net exports of goods and services*, January and February merchandise trade, and fragmentary information on investment income for the quarter; for *government purchases of goods and services*, Federal unified budget outlays for January and February, and State and local employment through March; and for *GNP prices*, the Consumer Price Index for January and February, the Producer Price Index for January and February, and unit-value indexes for exports and imports for January and February. Some of the source data are subject to revision.

Looking Ahead . . .

- **NIPA Methodology.** A series of special papers documenting the concepts, sources, and methods of the national income and product accounts is being prepared. As these papers are completed, they will be made available. The first of these, "An Introduction to National Economic Accounting," appeared as an article in the March SURVEY. The second, on corporate profits, will be ready in May. For information about how to order a copy of this paper, contact the Public Information Office, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC (202-523-0777); order information will also appear in the May SURVEY.

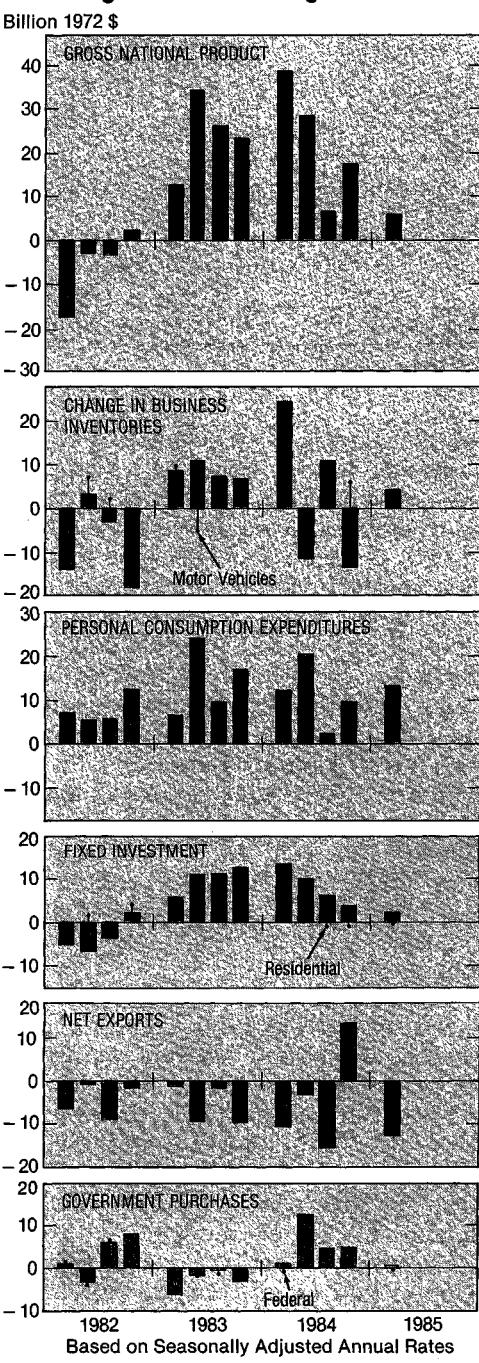

- **Capital Stocks by Industry.** Estimates of fixed private capital stocks by detailed industry for 1947-81 will be available soon. The estimates and methodology will be presented in an upcoming article in the SURVEY.

- **Regional Projections of Income, Employment, and Population.** An article summarizing projected trends to the year 2000 and the methodology for State-level estimates will appear in an upcoming issue of the SURVEY. Separate volumes containing detailed projections to the year 2035 will be published later this spring for States and in the fall for metropolitan statistical areas.

- **NIPA Revisions.** A comprehensive revision of the NIPA's is scheduled for completion in December 1985. The revision of the estimates for 1982-84 that would customarily be published this July will be combined with the December revision. For more information, see page 8.

1. Goods and services produced by labor and property supplied by U.S. residents.

Note.—Percent changes in major aggregates are found in the National Income and Product Accounts Tables, table 8.1. Dollar levels are found in tables 1.2 and 1.4.

fourth quarter. The swing in net exports was largely offset by a swing in the opposite direction in inventory investment, which increased moderately after a large decline. To some extent, changes in inventory investment and changes in imports are positively correlated because some merchandise imports go into inventory, rather than being sold, in the period in which they are brought into this country. (See the "Business Situation" in the January 1985 SURVEY OF CURRENT BUSINESS for a discussion of this relationship, as well as a discussion of how imports are treated in estimating GNP and why care must be taken in relating changes in imports to changes in GNP.)

In the three most recent quarters, increases in real gross domestic purchases, which includes imports but excludes exports, averaged 3½ percent. As was the case for GNP, the average was considerably lower than increases in earlier quarters. However, in contrast to GNP, this measure—which is a measure of U.S. demand for goods and services, whether produced in the United States or abroad—increased more in the first quarter than it had in the fourth (table 1).

With the exception of the fourth quarter of 1984, increases in U.S.

demand have exceeded those in U.S. production in every quarter since the fourth quarter of 1981. Over the entire period, gross domestic purchases increased 16 percent, while GNP increased 11 percent. The difference reflects two developments: An increasing portion of U.S. demand has been met by imports; a decreasing portion of U.S. production has been for export. The share of gross domestic purchases accounted for by imports had been 8 percent in the fourth quarter of 1981; by the first quarter of 1985, the import share was up to 10 percent. The increased share was mostly due to a sharp increase in merchandise imports. The share of GNP that is exported had been 10½ percent in the fourth quarter of 1981; by the first quarter of 1985, the export share was down to 8½ percent. Again, the change in share was mostly due to merchandise.

Productivity and costs.—Table 2 shows changes in real gross product, aggregate hours, and compensation in the business economy other than farm and housing. Productivity, as measured by real product per hour, has declined in two of the past three quarters; the poor performance can generally be related to the weakening in real product. Compensation and

Equals: Gross domestic purchases	4.1	3.8	3.4	3.9	
Addenda:					
Food and energy components of GNP: ¹					
Food components ²	-2.1	1.3	2.7	2.6	
Energy components ³	2.8	.3	1.7	-6.7	
GNP less food components	5.2	4.5	3.8	4.7	
GNP less energy components	4.3	4.3	3.7	5.1	
GNP less food and energy components	5.4	4.8	3.9	5.6	

1. Inasmuch as GNP is the sum of final products, the food and energy estimates in this table do not take into account the effect on the prices of final products of changes in the prices of food and energy that are costs of production.

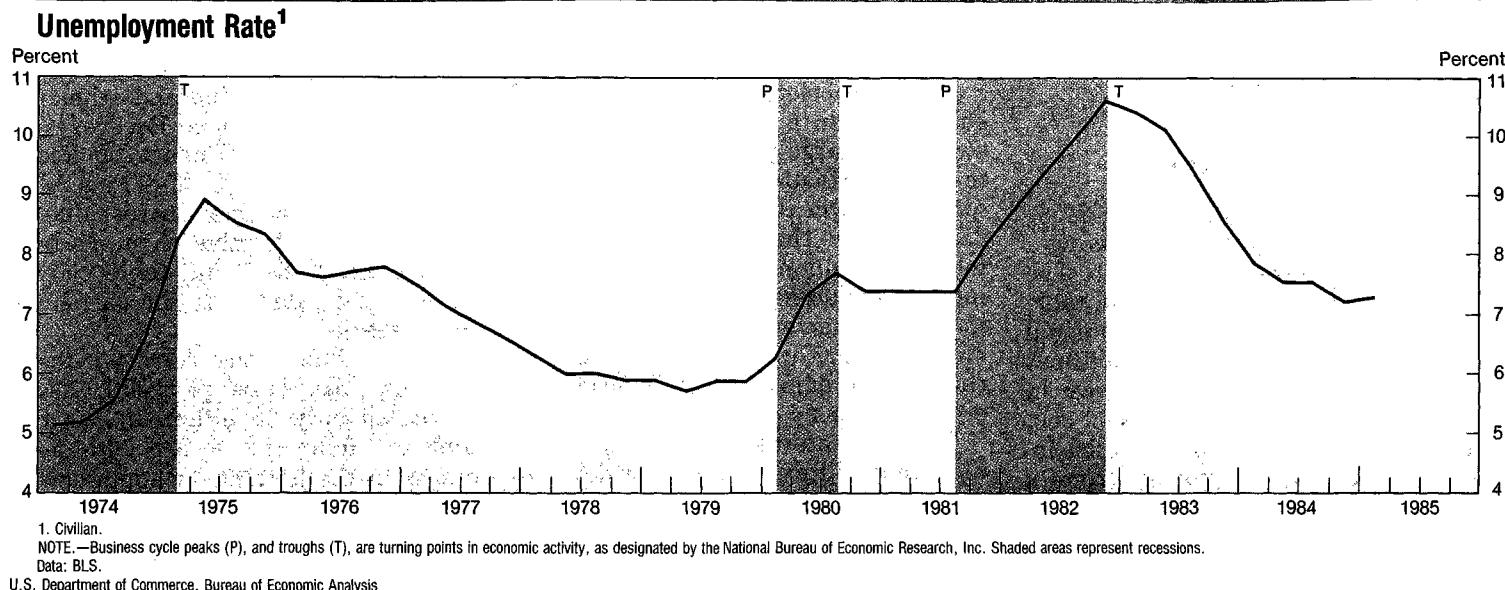

2. Consists of all components for which separate estimates are prepared. The major component that is not included is purchases of food by the Federal Government other than transactions by the Commodity Credit Corporation that are treated like purchases.

3. Consists of all components for which separate estimates are prepared. The major components that are not included are (1) exports of energy; (2) the gasoline and motor oil portions of inventories of gasoline service stations, and (3) the energy portions of inventories of businesses that do not produce energy for sale.

Note.—Most index number levels are found in the National Income and Product Accounts Tables, table 7.2.

compensation per hour accelerated in the first quarter; increases in Social Security tax rates and taxable wage base—effective January 1—contributed about ½ percentage point to the acceleration. The step-up in compensation, coupled with the falloff in real product, led to a sharp acceleration in unit labor cost in the first quarter.

CHART 2

Prices.—GNP prices, as measured by the fixed-weighted price index, increased 4½ percent in the first quarter, somewhat more than in the fourth, but within the range of 3½–4½ percent registered in the past several quarters (table 3). A Federal pay raise, which in the national income and product accounts (NIPA's) is treated as an increase in the price of employee services purchased by the Federal Government, accounted for 0.4 percentage point of the first-quarter acceleration in GNP prices.

Changes in the price of GNP, which is U.S. production of goods and services, may be contrasted with changes in the price of gross domestic purchases, which is goods and services bought by U.S. consumers, investors, and government. The exclusion of exports and the inclusion of imports in the price of gross domestic purchases makes this measure useful in analyzing inflation in the United States. (For example, an increase in the price of imported cars that is passed on to the final purchaser will affect the measure of purchases prices, but will be excluded from the measure of production prices.) Over the past 2 years, quarterly increases in the price of gross domestic purchases have been about ½ percentage point below increases in GNP prices.

Prices paid by consumers—PCE prices—were up less than in the fourth quarter. The deceleration was due to a slowdown in the increase in food prices and to a swing to a decline in energy prices, particularly gasoline

prices. The small step-up in other PCE prices can be attributed, in part, to a jump in new car prices. Prices paid by investors for structures—both nonresidential and residential—and for equipment increased more than in the fourth quarter, but remained moderate. Most of the step-up in prices paid by government was accounted for by the Federal pay raise.

Employment and hours.—Employment registered strong gains again in the first quarter—over 700,000 in both the household and the establishment surveys (table 4). Employment as a percent of the working-age popu-

lation increased to a record 60.1 percent. Adult women accounted for most of the first-quarter increase in employment, as their labor force participation rate set another record. The distributive (largely wholesale and retail trade) and services industries continued to register the largest increases in employment; manufacturing employment was flat.

The recent gains in employment have been accompanied by large increases in the civilian labor force. The civilian unemployment rate edged up to 7.3 percent in the first quarter. It has fluctuated between 7.1 and 7.5 percent for almost a year (chart 2).

1. Includes transportation and public utilities, wholesale trade, and retail trade.

2. Includes financial and nonfinancial services.

Source: Bureau of Labor Statistics.

Private nonfarm average weekly hours slipped another 0.1 hour in the first quarter. In manufacturing, the decline was 0.2 hour, following no change in the fourth quarter.

Personal Income

Personal income increased \$45½ billion in the first quarter, following a \$49 billion increase in the fourth. The special factors that are shown in table 5 significantly affected personal income in the two quarters. Without these special factors, the slowdown in personal income would have been considerably larger—to a \$36½ billion increase in the first quarter from a \$47½ billion increase in the fourth.

Wage and salary disbursements were up more in the first quarter than in the fourth; about one-half of the step-up was attributable to the \$3½ billion pay raise for Federal employees. Private wages and salaries picked up due to stronger increases in employment and average hourly earnings; average weekly hours again declined. Manufacturing, distributive, and services industries increased

roughly as much as they had in the fourth quarter. A step-up in other commodity-producing industries was concentrated in construction.

Farm proprietors' income dropped sharply after a small increase. The swing was largely due to subsidy payments, particularly deficiency payments for wheat. Subsidies increased \$5 billion in the fourth quarter and fell \$1½ billion in the first. Farm income excluding subsidies was down in both quarters. Nonfarm proprietors' income was up more than in the fourth quarter; retail trade increased after no change.

Personal interest income registered no change, after a sharp slowdown in the fourth quarter. This progressive deceleration reflected the continued effects of a decline in short-term interest rates in the second half of 1984.

Transfer payments were up sharply—\$18 billion—in the first quarter. Military retirement pay included an increase of \$5½ billion, following a decline of the same amount in the fourth quarter, due to a provision of the Deficit Reduction Act of 1984. This provision shifted the payment of benefits scheduled for December 31 to January 1. The impact of this shift on transfer payments was partly offset by a decline in retroactive Social Security benefit payments of \$1 billion, following an increase of \$2½ billion in the fourth quarter. Finally, cost-of-living adjustments added \$8½ billion to benefit payments under Social Security and several other retirement and income-support programs.

Personal contributions for social insurance, which are subtracted in deriving the personal income total, were boosted \$6½ billion by increases in Social Security tax rates and taxable earnings bases. These increases included an increase in the rate for employees from 6.7 percent to 7.05 percent and in the taxable wage base from \$37,800 to \$39,600.

Personal tax and nontax payments were up sharply—\$37½ billion—in the first quarter, largely due to delays in February and March in refund payments of Federal income taxes (table 6). As a result of these delays, refunds—which are deducted in calculating personal tax and nontax payments—were unusually small. Based on preliminary information, the delays amounted to \$27 billion (when put at an annual rate) in the first quarter. Partly offsetting the impact

of the refund delays, personal taxes were lowered \$7 billion due to the indexing of Federal income taxes, effective January 1. (For estimates of the impact of the indexing and other provisions of the Economic Recovery Tax Act of 1981, see "Impact of Recent Tax Law Changes" in this issue.) The increase in personal taxes due to growth in the taxable earnings base, shown as "other" in table 6, was roughly the same as in the past several quarters.

Largely due to the slowdown in tax refunds, disposable personal income increased only \$8 billion in the first quarter, following a \$38 billion increase in the fourth. Without the special factors affecting personal income and taxes, disposable income still would have decelerated sharply—to a \$19½ billion increase from a \$36½ billion increase.

The small increase in disposable personal income, coupled with a sizable one in personal outlays, led to a substantial drop in personal saving in the first quarter. The personal saving rate fell sharply to 4.6 percent from 6.2 percent in the fourth quarter.

The deceleration in disposable personal income carried through to real income. Real disposable personal income declined 2 percent in the first quarter, following an increase of 3½ percent in the fourth. Without the special factors, real income would have been flat in the first quarter, following a 3-percent increase.

Components of Real GNP

Final sales of GNP decelerated more in the first quarter than did GNP (table 7). Changes in most of the components of final sales were affected by factors that may be viewed as

SURVEY OF CURRENT BUSINESS

transitory. PCE continued to increase, but weakened late in the quarter; part of this weakness may have reflected the effect of the slowdown in tax refunds. A deceleration in nonresidential fixed investment was largely due to a drop in computer purchases, which tend to be erratic. Changes in net exports have been particularly sharp in recent quarters, primarily due to imports; part of the large first-quarter increase in imports may have been a rebound from the unexpected drop in the fourth quarter. A pause in government purchases was largely in national defense purchases, which tend to fluctuate sharply.

Business inventories continued to register substantial increases. Despite these increases, from an historical perspective inventory-sales ratios do not appear to be out of line.

Personal consumption expenditures

Real PCE increased 4½ percent in the first quarter, about 1 percentage point more than in the fourth. The strength was in the first part of the quarter; PCE slipped in March. The slip may have reflected, to some extent, the slowdown in disposable income due to the delay in tax refunds. Some other indicators related to PCE were favorable in the first quarter; for example, the Conference Board's consumer confidence index rebounded to high levels in January and February after a drop in December, and employment increased strongly.

All of the major components of PCE—durables, nondurables, and services—contributed to the first-quarter increase. The slight acceleration was largely attributable to nondurables, which increased moderately after changing little in the fourth quarter.

Durables again increased, but less than in the fourth quarter. Motor vehicles and parts were up more in the first quarter than in the fourth, due to an acceleration in truck purchases. Furniture and household equipment and other durables increased much less than in the fourth quarter.

Nondurables increased after a slight decline in the fourth quarter. Each category increased: Food and energy, after declines; clothing and shoes, after an increase; and other nondurables, after changing little.

Services were up slightly more than in the fourth quarter. Electricity and gas purchases increased sharply following a decrease; the pattern reflected the effects of unseasonable weather on heating expenditures. In the fourth quarter, the weather was mild in the Eastern part of the country; in the early part of the first quarter, severe cold was widespread. Other services continued to increase moderately.

Nonresidential fixed investment

Real nonresidential fixed investment (NRFI) increased 3½ percent in the first quarter, following an 8½-percent increase in the fourth, as a small decline in producers' durable equipment (PDE) was more than offset by another strong increase in structures.

1. Gasoline and oil, and fuel oil and coal.

2. Electricity and gas.

Note.—Percent changes in major aggregates are found in the National Income and Product Accounts Tables, table 8.1. Dollar levels are found in tables 1.2, 1.15, 1.17, 3.8B, and 4.4.

Structures increased 16 percent in the first quarter, about the same increase as in the fourth. As in the fourth quarter, most of the strength was in commercial buildings, both offices and other commercial.

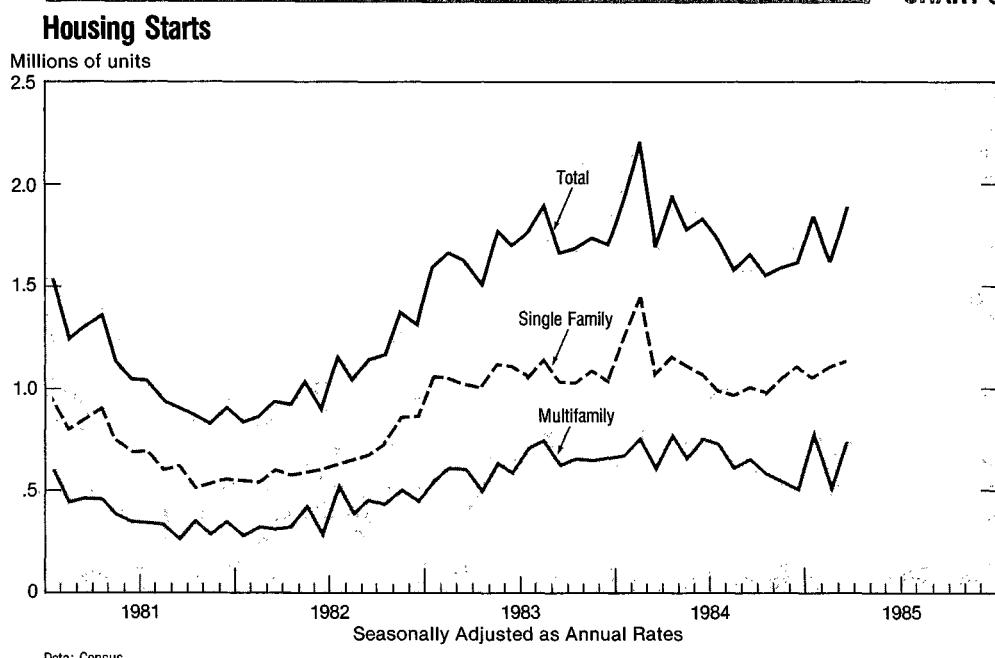

PDE, which had slowed sharply, to a 5½-percent rate of increase in the fourth quarter, declined 1 percent—the first decline since the recession trough at the end of 1982. The first-quarter decline was in PDE other than motor vehicles, especially computers.

Recent sharp changes in imports of capital goods have raised concerns that quarterly estimates of PDE, which include imported equipment, may fail to capture imports fully. An analysis of the first-quarter change in PDE that was carried out at a greater than usual level of detail showed that the change in imports included in it is consistent with the change in imports of capital goods, an end-use commodity category, in net exports. This result indicates that the first-quarter change in PDE is not understated because of imports.

In the first quarter, as on occasion in the past, BEA used two, largely independent, procedures in estimating NRFI. The use of the two procedures helped ensure that the estimate captured fully both domestic and imported PDE, although that was not the only reason the two procedures were used.

The first procedure measures activities of the suppliers of capital goods. Construction is measured as the value put in place. PDE other than motor vehicles is measured using an abbreviated version of what is often called the commodity flow procedure. In this procedure, manufacturers' shipments of capital goods are adjusted to exclude exports and purchases by government, and imports are added. The estimate of imports is prepared in two parts. The first is for a group of PDE categories for which imports are a sizable share of purchases. For this group, the percentage of the corresponding import end-use commodity category that is capital equipment is assumed to have remained constant within each category since 1972. For example, the content of, say, the communications equipment category is assumed to have remained constant in terms of equipment, which is to be included in PDE, and parts, which are to be excluded because they are to be

CHART 3

used in further production. The second part is for a group of P&E categories for which imports are a smaller share of purchases. For this group, imports are assumed to increase at the same rate as manufacturers' shipments. To the extent that these assumptions are incorrect, estimates based on this procedure may miss the mark.

The second procedure, based on BEA's plant and equipment (P&E) survey, measures expenditures by purchasers of capital, regardless of whether the items purchased are domestically produced or imported. However, the first-quarter P&E expenditure estimates (described elsewhere in this issue) are businesses' planned, not actual, expenditures; to the extent that an assumption that plans will be realized is incorrect, estimates based on this procedure may miss the mark.

For the first quarter, the first procedure implies that NRFI changed little; the second procedure implies a strong increase. Presumably, this difference reflects, among other things: time lags between shipments (in the commodity flow procedure) and expenditures (in the P&E survey); differences in the coverage of the data sources on which the two procedures are based; changes over time in the capital goods content of various import categories; and expenditures that were planned for the first quarter, but not made.

Residential investment

Real residential investment was flat in the first quarter, following declines averaging 5 percent in the second half of 1984. A drop in multifamily construction offset increases in single-family construction and in the group of components that includes additions and alterations, brokers' commissions on the sales of new and existing residences, and mobile home sales.

Starts of one-family structures had turned up in September and continued to move irregularly higher through March (chart 3). Starts were spurred by improving sales—especially sales of existing single-family homes, which increased 7 percent (not

NOTE.—Dollar levels are found in the National Income and Product Accounts Tables, table 5.9.

an annual rate) from September to February. Improved sales, in turn, reflected declining mortgage interest rates; the commitment rate dropped 1.75 percentage points from July to February before moving slightly higher in March (chart 4).

The first-quarter decline in multifamily construction reflected the general decline in multifamily starts in the second half of last year. Starts increased sharply—23 percent (not an annual rate)—in the first quarter, but, because construction lags starts, first-quarter multifamily construction was affected little.

The size of the first-quarter increase in multifamily starts is somewhat surprising. Rental vacancy rates had increased markedly in the last half of 1984; at 6.3 percent in the fourth quarter, the rate was higher than at any time in almost 10 years. Also indicative of possible excess capacity in the multifamily sector, the percentage of new apartments that were rented within 3 months of completion had dropped rather steadily to 63 percent in the third quarter. Moreover, the possibility of tax law changes added uncertainty to the multifamily market.

Change in business inventories

Real business inventories again accumulated at a substantial pace in the first quarter—up \$20½ billion, following an increase of \$17 billion in the fourth quarter (table 8). More than one-third of both increases were accounted for by motor vehicle inventories, which were up \$6½ billion in the fourth quarter and \$8 billion in the first, as automakers continued to

build inventories from a low level at the beginning of the 1985 model year. Farm inventories also accumulated in both quarters, but were up a little less in the first.

Nonfarm inventories other than motor vehicles increased \$9½ billion in the first quarter, compared with \$5½ billion in the fourth. The step-up was mainly accounted for by a swing in nondurable manufacturing from a decline to an increase. Also, nondurable retail inventories, particularly apparel, were up more than in the fourth quarter. The rate of inventory accumulation in both durable and nondurable wholesale inventories continued to drop.

Largely due to the first-quarter slowdown in final sales, the ratio of total inventories to total final sales moved up from 3.05 to 3.09. Although at the upper end of the range within which it has fluctuated over the past 2 years, the ratio remained well below its average for 1972–82.

Net exports

Real net exports registered a sharp decline—\$12½ billion—to negative \$26 billion, following an increase of \$13½ billion in the fourth quarter. The swing was concentrated in merchandise trade, primarily in imports; services changed little, following a decline.

Exports declined \$3 billion, following a slight decline in the fourth quarter. The deterioration was mainly accounted for by agricultural exports, which declined \$1 billion after a \$2 billion increase; nonagricultural merchandise exports changed little after a small increase. In services, invest-

ment income receipts declined a little less than in the fourth quarter, reflecting lower interest rates and some reduction in bank lending abroad.

Imports increased sharply—\$9½ billion—after a \$14 billion decline. Nonpetroleum merchandise imports continued to register large changes, recouping practically all of a \$13 billion drop in the fourth quarter. The pattern was discernable in all of the major end-use categories: Autos, consumer goods, and foods, feeds, and beverages more than made up fourth-quarter declines; capital goods other than autos, industrial materials and supplies, and other goods made up much of their declines. Petroleum imports fell sharply in the first quarter, following little change in the fourth. In services, investment income payments declined more than in the fourth quarter, reflecting lower interest rates.

Government purchases

Real government purchases registered no change, following a strong increase in the fourth quarter. The slowdown was concentrated in Federal defense purchases, which had increased sharply in the fourth quarter.

n.a. Not available.

NOTE.—Dollar levels are found in the National Income and Product Accounts Tables, table 3.2.

National defense purchases often fluctuate sharply from quarter to quarter, partly because these purchases—which include such large-ticket items as aircraft and missiles—are recorded in the NIPA's on a delivery basis, that is, when goods and services are delivered to the military. The timing of these deliveries tends to be erratic. Federal nondefense purchases were up a little less than in the fourth quarter. State and local government purchases again changed little.

The Federal sector.—Changes in current-dollar Federal receipts and expenditures on a NIPA basis are shown in table 9. Among expenditures, purchases—mainly defense purchases—were up much less than in the fourth quarter. Interest paid increased less than in the fourth quarter, reflecting the continued effects of the earlier decline in interest rates.

Grants-in-aid to State and local governments also increased less than in the fourth quarter. Transfer payments were up considerably more in the first quarter, mainly due to the shift in the timing of military retirement pay and the cost-of-living increases. A swing from an increase to a decline in subsidies less the current surplus of government enterprises can largely be traced to agricultural subsidies. Changes in these components, along with a small change in wage accruals less disbursements, sum to an increase of \$15½ billion in total expenditures, about one-half as much as the increase in the fourth quarter.

Among receipts, the jump in personal tax and nontax payments was largely due to the delays in income tax refund payments. The sizable increase in contributions for social insurance reflected the changes in the

tax rate and taxable earnings base. Indirect business taxes again changed little. Estimates of corporate profits, and, thus, of corporate profits tax accruals, are not yet available. Corporate profits tax accruals can be approximated by using a residual calculation of corporate profits that assumes that the statistical discrepancy in the NIPA's was the same as in the preceding quarter. On the basis of this calculation, total receipts increased about \$50 billion in the first quarter.

An increase of this size in receipts would substantially exceed that in expenditures, and the deficit on a NIPA basis would be about \$35 billion lower than the \$198 billion deficit in the fourth quarter. If the delay in refunds is excluded from this calculation, the deficit would be about \$10 billion lower than in the fourth quarter.

Comprehensive Revision of the National Income and Product Accounts

A comprehensive revision of the national income and product accounts is underway. It will incorporate benchmark data, such as the 1977 economic censuses; improved adjustments for misreporting of tax return information; and information from a variety of other sources. All series in the accounts will be revised back to 1973, and some will be revised for earlier years. Preliminary estimates for 1977 appeared in the May 1984 SURVEY OF CURRENT BUSINESS and the improved adjustments for misreporting of tax return information were described in the June 1984 SURVEY. The current schedule calls for completing the revision in December 1985.

The revision of the estimates for 1982-84 that would customarily be published this July will be combined with the December revision. However, selected national income and product account tables with detailed annual estimates for 1984 (on an unrevised basis) will appear in the July 1985 SURVEY.

National Income and Product Accounts Tables

New estimates in this issue: First quarter 1985, preliminary; for corporate profits and related items, fourth quarter and annual 1984, revisions. Corrections for 1984 annual fixed-weighted price index appear in table 7.2; corrections for 1984 annual percent change for fixed-weighted and chain price index appear in table 8.1; these corrections apply to the GNP and some of the GNP components.

The abbreviations used in the tables are:

CCAdj	Capital consumption adjustment
IVA	Inventory valuation adjustment
NIPA's	National income and product accounts
p	Preliminary
r	Revised

The NIPA estimates for 1929-76 are in *The National Income and Product Accounts of the United States, 1929-76: Statistical Tables* (Stock No. 003-010-00101-1, price \$10.00). Estimates for 1977-79 and corrections for earlier years are in the July 1982 SURVEY; estimates for 1980 and corrections for earlier years are in the July 1983 SURVEY; estimates for 1981-83 and corrections for earlier years are in the July 1984 SURVEY. Summary NIPA Series, 1952-83, are in the August 1984 SURVEY. These publications are available from the Superintendent of Documents and Commerce Department District Offices; see addresses inside front cover.

NOTE.—The implicit price deflator for GNP is a weighted average of the detailed price indexes used in the deflation of GNP. In each period, the weights are based on the composition of constant-dollar output in that period. In other words, the price index for each item (1972=100) is weighted by the ratio of the quantity of the item valued in 1972 prices to the total output in 1972 prices. Changes in the implicit price deflator reflect both changes in prices and changes in the composition of output. The chain price index uses as weights the composition of output in the prior period, and therefore reflects only the change in prices between the two periods. However, comparisons of percent changes in the chain index also reflect changes in the composition of output. The fixed-weighted price index uses as weights the composition of output in 1972. Accordingly, comparisons over any time span reflect only changes in prices.

1. The 1984 annual percent change for the fixed-weighted price index and chain price index for GNP and some of the GNP components reflect corrections.

Gross Product by Industry, 1984

ALL major domestic industries contributed to the 6.8-percent increase in real GNP in 1984. In 1983, when real GNP had increased 3.7 percent, all major domestic industries except the agriculture, forestry, and fisheries industry and the mining industry had increased. The "rest of the world" decreased 13 percent, following a 3-percent decrease in 1983.

The largest percentage increases in 1984 were in agriculture, forestry,

and fisheries (15 percent) and in wholesale trade (13 percent). The large increase in agriculture followed a decline in 1983 due to Federal acreage reduction programs and drought. The large increase in wholesale trade was partly due to the sharply increased volume of merchandise imports.

Construction increased at about three times its 1983 rate. Other industries that had large accelerations—in-

creases at about twice their 1983 rates—were manufacturing; transportation and public utilities; finance, insurance, and real estate; services; and government and government enterprises. Retail trade accelerated slightly.

Estimates for 1984 and earlier years will be revised as part of the comprehensive revision of the national income and product accounts scheduled for December 1985.

1. Equals GNP in constant dollars measured as the sum of incomes less GNP in constant dollars measured as the sum of gross product by industry.

NOTE.—The industry classification is on an establishment basis and is based on the 1972 Standard Industrial Classification.

Plant and Equipment Expenditures, First and Second Quarters and Second Half of 1985

BUSINESS plans to spend \$384.4 billion for new plant and equipment (P&E) in 1985, 8.7 percent more than in 1984, according to the BEA survey conducted in January through March (tables 1 and 2, and chart 5).¹ Spending was \$353.5 billion in 1984, 16.0 percent more than in 1983. The latest estimate of planned spending for 1985 is \$1.3 billion higher than the comparable estimate based on the survey conducted in October and November. That survey showed planned spending of \$383.1 billion for 1985, 8.2 percent more than 1984 spending.²

Real spending—capital spending adjusted to remove price changes—is estimated to increase 7.3 percent in 1985. Real spending increased 14.9 percent in 1984, following a decline of

0.8 percent in 1983 (tables 2 and 3). Estimates of real spending are computed from survey data on current-dollar spending and from estimated capital goods price deflators developed by BEA.³ The capital goods deflator prepared by BEA for “all industries” increased 1.0 percent in 1984 and is projected to increase 1.3 percent in 1985. Survey respondents reported a 4.7-percent increase in prices of cap-

A comprehensive revision of the plant and equipment expenditures series for 1947–83 was completed in February. All P&E data in this article, including those for 1984 and 1985, are on the revised basis. An article describing the revision and presenting revised quarterly and annual estimates for 1947–83 appeared in the February 1985 SURVEY OF CURRENT BUSINESS.

ital goods purchased in 1984 and expect a 5.1-percent increase in 1985 (table 4). Respondents have overestimated capital goods price increases in 14 of the 15 years these data have been collected.

Current-dollar spending in the fourth quarter of 1984 increased 1.7 percent, to an annual rate of \$367.2

3. Specifically, the current-dollar figures reported by survey respondents are adjusted using implicit price deflators derived from unpublished detailed estimates in the national income and product accounts of current- and constant-dollar nonresidential fixed investment (adjusted to a P&E basis). To estimate planned real spending, the implicit price deflator for each industry is projected using its growth rate over the latest four quarters.

1. The survey covers expenditures both for new facilities and for expansion or replacement of existing facilities that are chargeable to fixed asset accounts and for which depreciation or amortization accounts are ordinarily maintained. The survey excludes expenditures for land and mineral rights; maintenance and repair; used plant and equipment, including that purchased or acquired through mergers or acquisitions; assets located in foreign countries; residential structures; and a few other items.

The estimates presented are universe totals of P&E expenditures in the United States based on sample data compiled from reports on a company basis, not from separate reports for plants or establishments. A company's capital expenditures are assigned to a single industry in accordance with the industry classification of the company's principal product or service.

P&E expenditures differ from nonresidential fixed investment, which is a component of GNP, in type of detail, data sources, coverage, and timing. For further information, see pages 24–25 of the February 1985 SURVEY.

2. Spending plans have been adjusted for systematic reporting biases. Quarterly estimates were adjusted for each industry, for each quarter of the year, based on the median of the ratios of planned to actual spending for that quarter in the preceding 8 years. Annual estimates for 1985 were adjusted for each industry when planned spending deviated from actual spending in the same direction in at least 5 of the preceding 7 years. When this criterion was met, an adjustment was made based on the median of the ratios of planned to actual spending for the preceding 5 years. Before adjustment, planned spending for 1984 was \$385.73 billion for “all industries,” \$162.21 billion for manufacturing, and \$223.51 billion for nonmanufacturing. The net effect of the adjustments was to lower manufacturing \$8.58 billion and to raise nonmanufacturing \$7.25 billion.

Changes in Business Investment

U.S. Department of Commerce, Bureau of Economic Analysis

SURVEY OF CURRENT BUSINESS

billion, following a 3.7-percent increase in the third quarter; fourth-quarter spending was 0.5 percent lower than anticipated in the previous survey. Plans reported in the latest survey indicate a 3.5-percent increase in the first quarter of 1985, a 2.3-percent increase in the second, and little change from the first to the second half of 1985.

Real spending increased 1.2 percent in the fourth quarter of 1984, following a 3.4-percent increase in the third quarter. Estimates indicate a 3.3-percent increase in the first quarter of 1985, a 2.0-percent increase in the second, and a 0.6-percent decline from the first to the second half of 1985.

Other highlights of the survey are:

- Current-dollar spending for new plant increased 12.1 percent in 1984;

spending for new equipment increased 18.1 percent. For plant, real spending increased 10.7 percent; for equipment, 16.5 percent (table 5).

- Manufacturers expect their sales to increase 9.2 percent in 1985; they reported an 11.1-percent increase for 1984, compared with an expected 11.5-percent increase. In nonmanufacturing, trade firms expect a 9.7-percent increase in 1985; they reported an 11.9-percent increase for 1984, compared with an expected 8.8-percent increase. Public utilities expect a 5.8-percent increase for 1985; they reported a 7.1-percent increase for 1984, compared with an expected 7.5-percent increase (table 6).

- Manufacturers expect the prices of the products and services they sell to increase at a slightly higher rate in 1985 than in 1984 (table 7). They

1. Manufacturing data are from the Bureau of the Census, Current Industrial Reports, Series M-3. Trade data are from the Bureau of the Census, Current Business Reports, Monthly Wholesale Trade and Monthly Retail Trade. Public utility figures are estimated by BEA from data collected annually in the P&E survey.

2. Expectations for 1984 are based on the survey conducted in January and February 1984.

3. Expectations for 1985 are based on the survey conducted in January through March 1985.

4. Includes industries not shown separately.

expect prices to increase 3.9 percent in 1985; they reported a 3.6-percent increase for 1984, compared with an expected 4.7-percent increase. Public utilities expect a 3.5-percent increase for 1985; they reported a 2.2-percent increase for 1984, compared with an expected 7.6-percent increase.

The planned increase in 1985 capital spending is smaller than the actual increase in 1984 and may reflect the mixed investment climate at the time the survey was conducted. Factors favorable to new investment included fourth-quarter increases in corporate profits and cash flow, as well as an increase in real final sales of GNP, following a decline in the third quarter. Factors less favorable to new investment included fourth-quarter declines in new orders for nondefense capital goods and in the manufacturing capacity utilization rate. Net new capital appropriations in manufacturing were unchanged in the fourth quarter, largely because of an increase in cancellations; appropriations declined sharply in the third quarter. Interest rates—an important factor influencing capital-spending decisions—continued to decline in the fourth quarter of 1984, but increased late in the first quarter of 1985.

Manufacturing Programs

In manufacturing, current-dollar spending increased 2.9 percent in the fourth quarter of 1984, to an annual rate of \$146.2 billion, following a 5.0-percent increase in the third quarter. Durable goods industries increased 4.1 percent in the fourth quarter; nondurables, 1.8 percent. Manufacturers plan a 3.3-percent increase in the first quarter of 1985, a 4.0-percent increase in the second, and a 0.5-percent decline from the first to the second half of 1985.

For the year 1985, manufacturers plan to spend \$153.6 billion, 11.0 percent more than in 1984; the previous survey indicated a planned increase of 10.4 percent. Manufacturers' spending increased 19.1 percent in 1984, following a decline of 3.7 percent in 1983.

Durable goods industries plan a 13.7-percent increase in 1985; almost one-half of this increase is in motor vehicles, which plans a 38.2-percent increase. More than one-third of the planned increase in durables is in electrical machinery, blast furnaces-steel works, and "other durables," which plan increases of 13.5 percent, 13.3 percent, and 13.3 percent, respectively. The planned increase in motor vehicles follows a 52.4-percent increase in 1984; the continued strength was sustained by high profits and the need to modernize in the face of foreign competition. The planned increase in electrical machinery is less than the 1984 increase, but coincides with expected strength in 1985 sales and with high levels of research and development in the semiconductor and defense-related segments of the

Table 8.—Petroleum Industry Expenditures for New Plant and Equipment, by Function

Other.....	5.48	5.18	4.36	-5.6

1. The reported plans are adjusted for biases when necessary; adjustments are applied separately to expenditures for each function. Before adjustments, plans for 1985 were \$28.53 billion.

industry, which may lead to new products and processes. The planned increase in blast furnaces-steel works follows a modest increase in 1984, which, in turn, followed a significant decline in 1983; the planned 1985 increase may indicate the need to catch up on investment deferred during the most recent recession. The planned increase in "other durables" is led by miscellaneous manufacturing, reflecting the need to modernize facilities to compete with imported goods, and by instruments, reflecting anticipated sales of high-technology and military-related products.

Nondurable goods industries plan an 8.5-percent increase in 1985; about two-thirds of the increase is in food-beverage, chemicals, and rubber, which plan increases of 17.0 percent, 13.3 percent, and 10.6 percent, respectively. The planned increase in food-beverage may be related to several recent acquisitions in this industry. The planned increase in chemicals follows strong 1984 profits resulting, in part, from lower oil prices, which significantly reduced production costs. In rubber, the planned 1985 increase, while less than one-half of the increase in 1984, may reflect constraints on current capacity; the industry was operating at 92.3 percent of capacity in the fourth quarter of 1984. In petroleum, the relatively modest planned 1985 increase is principally in production activities (table 8).

Real spending by manufacturers is estimated to increase 10.4 percent in 1985—12.0 percent in durables and 8.7 percent in nondurables. In 1984, durables increased 22.4 percent; nondurables, 16.1 percent.

Nonmanufacturing Programs

In nonmanufacturing, current-dollar spending increased 0.9 percent in the fourth quarter of 1984, to an annual rate of \$221.0 billion, following a 2.9-percent increase in the third quarter. Nonmanufacturing industries plan a 3.6-percent increase in the first quarter of 1985, a 1.2-percent increase in the second, and a 0.3-percent increase from the first to the second half of 1985.

For the year 1985, nonmanufacturing industries plan to spend \$230.8 billion, 7.8 percent more than in 1984; the previous survey indicated a planned increase of 6.9 percent. Nonmanufacturing industries' spending increased 14.1 percent in 1984, following a decline of 0.7 percent in 1983.

In 1985, the largest increases are planned in gas utilities, 19.1 percent; "commercial and other," 10.4 percent; air transportation, 8.6 percent; and railroads, 8.5 percent. Electric utilities and mining plan declines of 2.6 percent and 2.3 percent, respectively. The planned increase in gas utilities follows a sizable increase in 1984. Gas transmission companies are expanding in fast-growing regions, providing service to new production fields, and modernizing existing facilities. The planned increase in "commercial and other" accounts for most of the 1985 increase in nonmanufacturing. It may be related to increased competition brought about by deregulation in communication, efforts to automate and renovate facilities in wholesale and retail trade, and the continuing trend to finance capital expenditures by

leasing arrangements in finance and insurance. In air transportation, the planned 1985 increase would be the first since 1982 and would follow the sizable decline in 1984. Airlines' profit positions improved in 1984 and several announced fleet modernization programs. The planned increase in railroads, while substantially less than the increase in 1984, reflects continued spending or replacement and improvement of rails and roadbeds.

Real spending by nonmanufacturing industries is estimated to increase 5.4 percent in 1985; it increased 12.4 percent in 1984. The largest increase for 1985 is in "commercial and other," 7.5 percent. Smaller increases are estimated for transportation, 2.4 percent, and for public utilities, 0.5 percent. A decline of 0.6 percent is estimated for mining.

Federal Budget Developments

REVISED estimates of Federal unified budget receipts and outlays for fiscal years 1985 and 1986 were submitted to Congress by the Office of Management and Budget in mid-April. These estimates reflect revised economic assumptions, reestimates of agency spending and tax collections based on more recent experience, administration policy changes, and most of the legislation passed by Congress so far this year. The major policy change is to the proposed farm bill; it now proposes no change to the tobacco program, contrary to what had been anticipated in February. The revised estimates do not reflect legislation for emergency famine relief and recovery in Africa or the extension of the Federal supplemental unemployment compensation program, both of which were signed into law too late to be incorporated. The revised estimates do not include the compromise on spending cuts agreed to in early April by the administration and Senate leaders. This compromise replaced a fiscal year 1986 budget resolution approved by the Senate Budget Committee in mid-March.

On the basis of the revised economic assumptions, real GNP is expected to increase about 4 percent through the fourth quarter of 1986, the same as expected earlier this year (table 1). Corporate profits are revised up \$12 billion in 1985 and \$7 billion in 1986. Consumer prices rise at a slower rate in 1985—3.7 percent compared with 4.5 percent—but at the same rate in 1986, 4.3 percent, as assumed in February. The unemployment rate and the interest rate assumptions are unchanged.

For fiscal year 1985, a \$213.3 billion deficit is estimated, compared with \$222.2 billion in February (table 2). Receipts are \$3.7 billion higher, due to revised economic assumptions (\$2.6 billion) and reestimates (\$1.2 billion).

Outlays are \$5.2 billion lower; a \$5.6 billion downward revision due to reestimates is partly offset by a \$0.4 billion upward revision due to the revised economic assumptions.

On a program-by-program basis, the revision in outlays is the net of \$6.9 billion in downward revisions and \$1.6 billion in upward revisions. The largest downward revisions are for rural electrification loans (\$1.7 billion), medicare (\$0.7 billion), Social Security benefits (\$0.7 billion), and highway grants (\$0.5 billion). The largest upward revision is for unemployment compensation (\$0.7 billion).

For fiscal year 1986, a deficit of \$177.4 billion is estimated, compared with \$180.0 billion in February. Receipts are \$0.6 billion higher, including \$0.5 billion for the revised economic assumptions. Outlays are \$2.0 billion lower, due to reestimates (\$1.0 billion) and revised economic assumptions (\$1.0 billion).

On a program-by-program basis, the revision in outlays is the net of \$4.7 billion in downward revisions and \$2.6 billion in upward revisions. The largest downward revisions are for rural electrification loans (\$1.3 billion), net interest (\$1.0 billion), and

Revised NIPA estimates.—BEA has prepared estimates of the Federal sector on the national income and product accounting (NIPA) basis consistent with the revised unified budget estimates (table 2, and table 3 for the quarterly pattern). On this basis, fiscal year 1985 receipts are

\$3.5 billion higher, expenditures are \$3.5 billion lower, and the deficit is \$7.0 billion lower than estimated in February. (Details of the February estimates are discussed in the February 1985 SURVEY OF CURRENT BUSINESS.)

The upward revision in receipts is concentrated in corporate profits tax accrals (\$2.6 billion), reflecting higher corporate profits in the revised economic assumptions. Personal tax and nontax receipts are revised up \$0.9 billion, reflecting a reestimate. All other receipts, on balance, are unchanged.

All categories of expenditures are revised down. The largest revision is in the net interest paid (\$1.6 billion), reflecting changes in financing patterns and in the composition of debt. Grants-in-aid to State and local governments are revised down \$0.9 billion; grants for highways and education account for the revision. Transfer payments to persons are revised down \$0.8 billion; a downward revision in Social Security benefits (\$1.6 billion) is partly offset by an upward revision in unemployment benefits (\$0.6 billion) and by small revisions in other programs. All other expenditures together are revised down \$0.3 billion.

For fiscal year 1986, receipts are \$1.2 billion lower, expenditures are \$2.5 billion lower, and the deficit is \$1.3 billion lower. All categories of receipts are revised down, except contributions for social insurance, which are essentially unchanged. The largest revision is in personal tax and nontax payments (\$0.6 billion), reflecting a reestimate. Indirect business tax and nontax accruals are revised down \$0.4 billion, reflecting lower windfall profit taxes and customs duties, and corporate profits tax accrals are revised down \$0.3 billion.

The downward revision in expenditures is more than accounted for by net interest paid (\$2.0 billion) and transfer payments to persons (\$0.7 billion). The revision in net interest paid reflects the same factors mentioned for 1985. The revision in transfer payments to persons is the net result of a \$1.1 billion downward revision in Social Security benefits and a \$0.4 billion upward revision in unemployment benefits. All other expenditures categories together are essentially unchanged.

Text continues on p. 35.

Impact of Recent Tax Law Changes

TABLE 1 presents the direct impact on Federal Government receipts of major tax law changes enacted after 1980. These estimates are integrated conceptually and statistically with the national income and product accounts. The data shown in the table update estimates of the Economic Recovery Tax Act, the Tax Equity and Fiscal Responsibility Act, and other legislation that appeared in the February 1984 SURVEY OF CURRENT BUSINESS and estimates of the Deficit Reduction Act that appeared in the August 1984 SURVEY (referred to then as the Tax Reform Act of 1984).

The Economic Recovery Tax Act of 1981.— The Economic Recovery Tax Act (ERTA) was

enacted in August 1981; a complete description of ERTA is in the August 1981 SURVEY. Major provisions are:

- An across-the-board reduction in individual income tax rates over 33 months—5 percent on October 1, 1981, 10 percent on July 1, 1982, and 10 percent on July 1, 1983. These reductions compound to a reduction of 23 percent. Starting in 1985, income tax brackets, the zero bracket amount, and the personal exemption will be adjusted annually for inflation as measured by the Consumer Price Index.

- An accelerated cost recovery system that provides substantially faster depreciation write-offs for business. The new system assigns depre-

ciable lives of 3 years for most vehicles, 5 years for most equipment, 10 years for certain public utility property, and 15 years for most depreciable real estate and some long-lived public utility property.

- Incentives for persons who put savings in specified savings accounts and repeal of the exclusion from gross income of interest and dividends.
 - A substantial reduction in estate and gift taxes.
 - An increase in the windfall profit tax credit for qualified royalty recipients.

Receipts of Selected Tax Law Changes

The Tax Equity and Fiscal Responsibility Act of 1982.—The Tax Equity and Fiscal Responsibility Act (TEFRA) was enacted in September 1982; a complete discussion of TEFRA is in the September 1982 SURVEY. Major provisions are:

- Withholding of 10 percent on interest and dividend payments, effective July 1, 1983. (This provision was repealed by the Interest and Dividends Tax Compliance Act of 1983, summarized later.)

Strengthening of compliance provisions, such as the reporting of State and local government income tax refunds.

Modification of the deductions for medical expenses and casualty losses, generally effective January 1, 1983.

Repeal of modified coinsurance transactions, effective January 1, 1982, and introduction of other changes that reduce insurance industry taxes.

Repeal of safe-harbor leasing, effective January 1, 1984 and enactment of various other modifications and restrictions for leasing that are generally effective July 1, 1982.

Modification and tightening of regulations governing long-term contract accounting, effective January 1, 1983 for new contracts.

Temporary increases in airport and airway taxes, cigarette taxes, and telephone taxes.

An increase in the wage base and tax rate for unemployment taxes, effective January 1, 1983.

Extension of hospital insurance coverage under medicare to Federal employees, effective January 1, 1983.

The Deficit Reduction Act of 1984.—The Deficit Reduction Act of 1984 (DRA) was enacted in August 1984; a complete description of DRA is in the August 1984 SURVEY. Major provisions that increase taxes are:

Tax freezes that delay, reduce, or repeal tax reductions—such as a net interest exclusion provided for by ERTA—that were to take effect in 1984 or later years.

Modification of the income averaging provisions.

Restrictions on depreciation allowable on assets leased to tax-exempt entities.

Increasing to 18 from 15 the number of years over which real property (other than low-income housing) can be depreciated under the accelerated cost recovery system of ERTA.

Modification of provisions relating to deferred payments for use of property and services.

Although the purpose of DRA is to increase taxes, the act does provide for some tax reductions for both individuals and corporations. Major provisions that reduce taxes are:

A 20-percent reduction in the tax liability of insurance companies.

A 4-year extension, through 1987, of the tax exemption for mortgage bonds issued by State and local governments.

A 1-year extension, through 1985, of the targeted jobs tax credit.

A 6-month reduction (from 1 year), through 1987, in the length of time an asset must be held before the proceeds from its sale can qualify for capital gains tax treatment.

A technical correction of the percentage depletion rules for secondary and tertiary oil and gas production.

Other

of Selected Tax Law Changes—Continued

The Highway Revenue Act of 1982.—This legislation was enacted in January 1983. Its major provision was to increase the existing excise tax on gasoline and diesel fuel by 5 cents per gallon (from 4 cents to 9 cents) from April 1, 1983, through September 30, 1988. Other provisions are:

- Repeal of taxes on automobile tires, small truck tires, nonhighway-use tires, inner tubes, and tread rubber.

- Repeal of taxes on lubricating oil and on retail sales of lightweight trailers and trucks.
 - An increase in taxes on heavy-duty trucks and trailers.

The Social Security Amendments of 1983.—This legislation was enacted in April 1983; a more complete discussion is in the February 1983 and April 1983 issues of the SURVEY. Major provisions, effective January 1, 1984, are:

- Acceleration of a previously scheduled payroll tax rate increase.
 - A 0.3-percentage-point reduction in the employee share of the rate increase in 1984.

- An increase in the self-employed tax rate to 100 percent of the combined employer-employee rate for Social Security and medicare. Previously the rate had been 75 percent and 50 percent, respectively, of the combined rates. A 2.7-percentage-point reduction was, in effect, provided in 1984; a reduction of 2.3 percentage points was provided in 1985 and of 2.0 percentage points in 1986-89.

- Mandatory coverage of new Federal civilian employees and employees of nonprofit organizations. Participating State and local governments will no longer be allowed to withdraw.

- Taxation of 50 percent of Social Security benefits when income exceeds \$25,000 for single taxpayers and \$32,000 for married couples. Previously, these benefits had been exempt from Federal income tax.

The Interest and Dividends Tax Compliance Act of 1983.—This legislation was enacted in August 1983. The major provision of this act was repeal of the 10-percent interest and dividend withholding provision of TEFRA. This act replaced the 10-percent withholding provision with a “backup withholding” of 20 percent for recipients who fail to provide accurate taxpayer identification information to specified payers of interest and dividends. Other provisions provided for tax incentives on expenses incurred in attending business conventions in qualifying Caribbean Basin countries.

The Railroad Retirement Revenue Act of 1983.—This legislation was enacted in August 1983. This legislation was necessary, as were the Social Security amendments, to provide for the long-term financial soundness of the employee retirement system. Major provisions are:

- An increase in railroad retirement payroll taxes for employers and employees.

- An increase in railroad unemployment insurance taxes effective January 1, 1984.

- Taxation of retirement benefits in excess of contributions.

Personal Income and Adjusted Gross Income 1981-83

THE reconciliation of the Bureau of Economic Analysis (BEA) measure of personal income and the Internal Revenue Service (IRS) measure of adjusted gross income (AGI) by type of income for 1981-82 is revised and extended to 1983 in this article. The revised reconciliation incorporates the revision of personal income for 1981-83 published in July 1984 and the final tabulation of AGI for 1982 published by IRS in 1984. The 1983 reconciliation is based on preliminary tax

data from individual income tax returns for tax year 1983.

The reconciliation items in tables 1-3 allow the construction from personal income (line 1) of a BEA-derived AGI (line 22) that conforms to the IRS definition of AGI (line 23). (These reconciliation items are explained in detail in articles in the November 1981 and April 1983 issues of the SURVEY OF CURRENT BUSINESS.) The difference between the BEA-derived

AGI and the IRS measure of AGI is called the AGI gap (line 24). The AGI gap can be viewed as evidence of non-compliance with the tax code, but with the following caveats: The AGI gap includes income earned by low-income individuals who are not required to file income tax returns, unreported income identified by IRS audit programs that is included in personal income, gross errors and omissions in the estimate of reconciliation items, and the net effect of

See footnotes at the end of table 3.

errors in personal income and AGI of IRS.¹

The AGI gap as a percentage of the BEA-derived AGI (hereafter, the relative gap) was revised down by very small amounts in 1981 and 1982, reflecting downward revisions in the relative gaps for nonfarm proprietors' income and personal interest income. The 1982 relative AGI gap still shows a decline from 1981, the first since 1976. However, the 1983 relative AGI gap shows an increase.

The combined relative gap for personal dividend income and personal interest income increased in 1983, following a substantial decline in 1982;

1. For a discussion of why the AGI gap is not a measure of the size of the underground economy, see Carol S. Carson, "The Underground Economy: An Introduction," SURVEY 64 (July 1984): 107.

however, it was still below the relative gap that prevailed in the 1977-81 period. The 1982 decline and 1983 increase may be partly attributable to legislative action on withholding on interest and dividends. The Tax Equity and Fiscal Responsibility Act of 1982 (TEFRA) imposed a 10-percent withholding on interest and dividend payments, effective July 1, 1983, but this provision was repealed by the Interest and Dividends Compliance Act of 1983. On the other hand, the relative gap for taxable pensions declined substantially in 1983, following an increase in 1982. The 1983 decline also may be partly attributable to TEFRA, which imposed an optional withholding system for taxable pension payments made after 1982.

The size and changes in the total gap and its components should be in-

terpreted with caution because the 1983 IRS data on AGI and its components, as reported in *Statistics of Income Bulletin*, are preliminary. In addition, a comprehensive revision of the national income and product accounts is in progress, and that revision is expected to increase wages and salaries and nonfarm proprietors' income substantially. The increase is based on new information about the extent of underreporting on tax returns and of the failure to file income and employment tax returns.²

Tables 4 and 5 provide historical data for the AGI gap and the relative gap.

2. For detail, see Robert P. Parker, "Improved Adjustments for Misreporting of Tax Return Information Used to estimate the National Income Product Accounts, 1977," SURVEY 64 (June 1984): 17-25.

* Less than \$0.1 billion.

** Less than 0.01 percent.

1. With inventory valuation and capital consumption adjustments.

2. With capital consumption adjustment.

3. Consists of taxable portion of government transfer payments to persons included in personal income. They are nondisability military retirement pay and Federal civilian and State and local government employee retirement benefits in excess of employee contributions.

4. Consists of other labor income, nontaxable portion of government transfer payments to per-

sons, business transfer payments, less personal contributions for social insurance.

5. Statutory adjustments.

6. Taxable private pensions represent the portion of nongovernment pension benefits received by individuals from annuity and pension plans in excess of the "investment in contract."

7. Net gain from sale of assets, which is the sum of sales of capital assets (net gain less loss) and sales of property other than capital assets (net gain less loss), small business corporation income, windfall profit tax overpayment less deduction for windfall profit tax withheld, and all other sources (net).

2. With capital consumption adjustment.

Text continued from p. 27.

Table 4 shows the relation between unified budget and NIPA receipts, and table 5 shows the relation between unified budget outlays and NIPA expenditures.

Table 4.—Relation of Federal Government Receipts in the National Income and Product Accounts to the Unified Budget

	Fiscal year		
	1984	1985	1986
Unified budget receipts	666.5	740.6	794.3
Less: Coverage differences	1.8	1.9	2.1
Plus: Netting differences:			
Contributions to government employees retirement funds	13.1	14.7	15.1
Other	12.3	13.9	16.1
Timing differences:			
Corporate income tax	−1.9	−6.8	.3
Federal and State unemployment insurance taxes	−.4	.5	−.4
Withheld personal income tax and Social Security contributions2	2.1	2.3
Excise taxes	−.7	−1.1	−.2
Other			
Miscellaneous			
Equals: Federal Government receipts, NIPA's	687.6	762.0	825.4

Table 5.—Relation of Federal Government Expenditures in the National Income and Product Accounts to the Unified Budget

	Fiscal year		
	1984	1985	1986
Unified budget outlays	851.8	953.9	971.7
Less: Coverage differences:			
Geographic	5.0	5.2	5.2
Other2	.2	−1.2
Financial transactions:			
Net lending	18.2	34.8	12.7
Other	−.1	−1.4	−1.7
Net purchases of land:			
Outer Continental Shelf	−3.5	−1.8	−3.3
Other1	.3	.1
Plus: Netting differences:			
Contributions to government employees retirement funds	13.1	14.7	15.1
Other	12.3	13.9	16.1
Timing differences:			
National defense purchases	2.2	1.5	.9
Other	−1.7	−1.9	−2.0
Miscellaneous			
Equals: Federal Government expenditures, NIPA's	857.9	945.0	990.2

County and Metropolitan Area Personal Income, 1981-83

Revision Schedule for Regional Estimates

The preliminary annual estimates of State personal income for the preceding calendar year, published in the April issue of the SURVEY OF CURRENT BUSINESS, are derived from the State quarterly series. In August, more reliable annual estimates are published. These estimates are developed independently of the quarterly series and are prepared in more component detail, primarily from Federal and State government administrative records. The August estimates are subsequently revised to incorporate newly available information used to prepare the current local area estimates.

These revised State estimates are published the following April, together with the consistent local area estimates. The State and local area estimates are subject to further revision for several years (the State estimates in August and April and the local area estimates in April only) to incorporate changes in the national totals and more complete information for States and local areas. Approximately every 5 years the estimates are further changed to incorporate a comprehensive revision in the national income and product accounts and to incorporate new or more current State or local area information.

the same time, new residence adjustment estimates will be introduced, based on 1980 census journey-to-work data.

Definition of total and per capita personal income

The personal income of an area is defined as the income received by, or on behalf of, all the residents of that area. It consists of the income received by persons from all sources: from participation in production, from transfer payments from government and business, and from government interest. Persons, in this definition, are individuals, nonprofit institutions, private noninsured welfare funds, and private trust funds. Personal income is measured as the sum of wage and salary disbursements, other labor income, proprietors' income with the inventory valuation and capital consumption adjustments, personal dividend income, personal interest income, rental income of persons with capital consumption adjustment, and transfer payments, less personal contributions for social insurance.

The definitions underlying the local area estimates are essentially the same as those underlying the personal income estimates in the national income and product accounts. The major difference is the treatment of U.S. residents temporarily working abroad. The national estimates include Federal civilian and military personnel stationed abroad and U.S. residents who are employed by private U.S. firms and are on temporary foreign assignment. The local area estimates include only persons residing in the 50 States and the District of Columbia.

Per capita personal income is computed by dividing the total personal income by population estimates provided by the Bureau of the Census.

THIS article presents summary estimates of total and per capita personal income for 1981-83 for metropolitan areas and counties. Table 1 contains estimates for county-based metropolitan areas as defined by the U.S. Office of Management and Budget. These include Consolidated Metropolitan Statistical Areas (CMSA's), which are large, complex areas that consist of two or more Primary Metropolitan Statistical Areas (PMSA's), and Metropolitan Statistical Areas (MSA's). The metropolitan areas in New England are defined in terms of cities and towns rather than counties; the estimates presented here are for the alternative area definition—New England County Metropolitan Areas (NECMA's).¹ Table 2 contains estimates for the 3,142 counties and county equivalents.

The 1983 estimates are presented for the first time. The 1981 and 1982 estimates are revised and supersede those presented in the April 1984 SURVEY. Estimates of personal income by type, including earnings by major

industrial source, for 1978-83 for metropolitan areas and counties (as shown in table A) will be published in the nine-volume set *Local Area Personal Income*, scheduled for release by July 1985. Each volume of that set will include a detailed description of the sources and methods used to derive the estimates. For further information, write to the address which precedes table A.

In addition to the routine annual revisions made to the 1981-82 estimates, the local area estimates for 1978 and later years reflect three major revisions resulting from the use of more current census data. Revisions have been made to: (1) farm proprietors' income, based on gross income and expense data from the 1978 Census of Agriculture; (2) the net rental value of owner-occupied nonfarm dwellings (imputed rent), based on housing value data from the 1980 Census of Housing; and (3) the residence adjustment to labor income, based on place-of-residence wage and salary data from the 1980 Census of Population. The farm proprietors' income and imputed rent revisions will be extended to years prior to 1978 as part of the next set of comprehensive revisions to the national and regional personal income estimates. At

1. For a discussion of the metropolitan area concepts and a list of the areas and their components, see U.S. Department of Commerce, Bureau of the Census, *Statistical Abstract of the United States: 1985* (Washington, DC: U.S. GPO, 1984), pp. 873-882.

The population is measured as of July 1, except for the college student population, which is measured as of April 1.

The local area per capita personal income estimates should be used with caution for several reasons. In many instances, an unusually high or low per capita personal income is the temporary result of unusual conditions, such as a bumper crop or a tornado or flood. In other instances, the income levels of certain groups not typical of the resident population may cause a longer term high or low per capita personal income that is not indicative of the economic well-being of the area. For instance, a major construction project—such as a defense facility, nuclear power plant, or dam—may substantially raise the per capita personal income of an area for several years because these projects attract highly paid workers whose income is measured at the construction site. This high per capita income is not indicative of the economic well-being of most of the residents of the area (or, in many cases, of the resident construction workers themselves, because they frequently send a substantial portion of their wages to dependents living in other areas).

Conversely, the presence of a large institutional population—such as that of college, prison, or State mental hospital—will tend to keep the per capita personal income of an area at a low level because the residents of these institutions have little income attributable to them at these institutions. This low per capita personal income is not indicative of the economic well-being of most residents of the area (or, in many cases, of the institutional populations, because some of these populations, such as college students, typically receive support from their families living in other areas).

The per capita personal income estimates can also be misleading in areas where population is changing rapidly. Population is measured at midyear, whereas income is measured as a flow over the year; therefore, a significant change in population during the year can cause a distortion in the per capita personal income estimates, particularly if the change occurs around midyear.

PERSONAL income by type of payment and earnings by major industry group, as shown in table A, are available for metropolitan areas and for counties for 1959, 1962, and 1965–83. Similar estimates for 1929, 1940, and 1950 are available for metropolitan areas and nonmetropolitan counties only.

This information can be obtained for one or more counties or metropolitan areas from the Regional Economic Information System of the Regional Economic Measurement Division, Bureau of Economic Analysis. For computer printouts, there is a charge

of \$2 for each State, metropolitan area, or county table containing 6 consecutive years of estimates. However, charges will not exceed \$500 for a complete set of metropolitan area tables and \$1,500 for a complete set of State and county tables for the United States. The tables are also available (at lower cost) in microfiche and magnetic tape form. The minimum charge for each request is \$5. Requests should be addressed to Regional Economic Information System, BE-55, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230.

Wilmington, DE-NJ-MD*	5,999	6,404	6,864	7.2	11,423	12,090	12,859	48									

1. Percent change was calculated from unrounded data.

2. The personal income level shown for the United States differs from that in the national income and product accounts, primarily because it omits income received by Federal Government employees overseas.

3. Only the name of the largest city in each Consolidated Metropolitan Statistical Area (CMSA)

is shown. Complete titles designated by the Office of Management and Budget include additional city names.

4. Includes Metropolitan Statistical Areas, Primary Metropolitan Statistical Areas (PMSA's, indicated by *), and New England County Metropolitan Areas (NECMA's). The Bridgeport-Stamford-Norwalk-Danbury, CT NECMA is presented as a PMSA (part of the New York CMSA).

ACKNOWLEDGMENTS

The personal income estimates were prepared under the direction of Edwin J. Coleman, Chief, and Linnea Hazen, Assistant Chief, Regional Economic Measurement Division.

Estimates of civilian labor income (wages and salaries and other labor income) were prepared by the Regional Wage Branch, under the supervision of Carol E. Evans, Chief. Major responsibilities were assigned to Sharon C. Carnegale, C. Brian Grove, Michael G. Pilot, Tou Chen Pomsouvan, and James M. Scott.

Estimates of Federal military income, transfer payments, personal contributions for social insurance, and the residence adjustments were prepared by the Quarterly Income Branch, under the su-

pervision of Robert L. Brown, Chief. Major responsibilities were assigned to John M. Reed and Albert Silverman.

Estimates of dividends, interest, rent, and proprietor's income were prepared by the Proprietor's Income Branch under the supervision of Arthur L. Sensenig, Chief. Major responsibilities were assigned to Charles A. Jolley and James M. Zavrel.

Public use tabulations and data files, and the text and tables for the article were prepared by the Regional Economic Information System Branch, under the supervision of Vivian G. Conklin, Assistant Chief. Major responsibilities were assigned to Kathy A. Albetski, Wallace K. Bailey, and Eunice P. James.

An Indirect Technique for Measuring the Underground Economy

BECAUSE measurement of the underground economy is both elusive and important for an accurate portrayal of the Nation's economy, it is worth experimenting with a variety of approaches to measurement. This article describes a new, indirect technique for measuring underground income and applies it to the possible understatement of the growth of national income in the United States from 1949 to 1982.¹

The basic idea underlying the new indirect technique is that although there is little agreement about the size of the underground economy, there is widespread agreement about the industries in which much underground activity takes place. Working "off the books," underreporting tips, and similar activities do not take place in the steel industry or the telephone industry; they are thought to take place in the services, construction, and a few other industries. If, as is sometimes alleged, official estimates of national income have been missing a growing portion of the "suspect" industries because of the underground economy, then certain indicators for these industries ought to be declining relative to the same indicators for "well-measured" industries.

The first section of the article discusses the classification of industries into suspect, well measured, and intermediate. The second section develops a framework and proposes a set of indicators for comparing suspect,

well-measured, and intermediate industries. The third section reports regression results for 56 industries over 34 years. The section concludes with an estimate—subject to considerable uncertainty—that the underground economy caused the growth of national income in private domestic industries to be understated by an average of one-quarter of 1 percent per year from 1949 to 1982. The final section appraises this new estimate of understatement.

I. Classification of Industries

The underground economy refers to activities such as working "off the books," padding expense accounts, shoplifting, underreporting tips, or skimming (pocketing some part of cash register receipts). It also includes provision of prohibited goods and services through such activities as prostitution or narcotics dealing.²

The new indirect technique will be used to estimate only a portion of the 1949-82 growth of income derived from underground activities. The technique will not be used to estimate income that is excluded by definition from the national income and product accounts (NIPA's)—for example, income from the production of prohibited goods and services. Nor will it be used to estimate income that is missing from tax returns but that is included in current estimates of the NIPA's because of (a) use of source data other than tax returns and (b) current adjustments for misreporting where tax returns are used. What it will be used to measure is the growth of income that belongs in the NIPA's, that is not included in the current es-

timates, and that is concentrated in suspect industries.³

Three sources of information are in close agreement as to the industries in which underground activities are concentrated. The first is journalistic accounts of underground activities.⁴ Underground activities, according to these accounts, are heavily concentrated by industry in construction, agriculture, retail trade, and services. By type of firm, they are concentrated in small unincorporated enterprises. Occasionally, manufacturing and mining industries with a concentration of small enterprises, such as apparel manufacturing, are mentioned in this source.

The second source of information is the results by industry (unpublished) of Internal Revenue Service audits of a random sample of tax returns—the Taxpayer Compliance Measurement Program (TCMP) results for 1976. More than 80 percent of the understatement of either business receipts or profits detected by these audits was in the construction, retail trade, and services industries.

The third source of information, less direct than the first two, is NIPA estimates of employee compensation in noncorporate and corporate enterprises, by industry. The assumptions underlying the use of this source are (1) that the importance of noncorporate enterprises in an industry is correlated with the likelihood of underground activity, and (2) that employee

3. Carson, "Underground Economy," discusses the relation of the underground economy to the NIPA's on pp. 106-117. Parker, "Improved Adjustments," discusses the source data and adjustments for misreporting in current NIPA estimates, as well as presenting a set of new adjustments for misreporting for 1977.

4. See, for example, Jerry Knight, five-part series on the underground economy, business section, *Washington Post*, 21-24, 26 July 1981 (July 21, Sec. C, pp. 1-2; July 22, Sec. E, pp. 1-2; July 23, Sec. D, pp. 1-8; July 24, Sec. E, pp. 1,3; July 26, Sec. F, pp. 1,4); Irwin Ross, "Why the Underground Economy is Booming," *Fortune*, 9 October 1978, pp. 92-98; and "The Underground Economy," *U.S. News and World Report*, 22 October 1979, pp. 49-52.

NOTE.—Statistical assistance for this article was provided by Barbara Harrison and Alma Missouri.

1. This is the third article on the underground economy to appear in the *SURVEY OF CURRENT BUSINESS*. The first was Carol S. Carson, "The Underground Economy: An Introduction," in two parts: 64 (May 1984): 21-37, and 64 (July 1984): 106-117. The second was Robert P. Parker, "Improved Adjustments for Misreporting of Tax Return Information Used to Estimate the National Income and Product Accounts, 1977," 64 (June 1984): 17-25.

2. Carson, "Underground Economy," discusses definitional problems on pp. 21-25.

compensation for such enterprises is measured more accurately than other income components such as proprietors' income. These assumptions, supported by the first two sources, imply that the ratio of noncorporate employee compensation to total employee compensation in an industry should be an indicator of the likelihood of underground activity. Ratios were examined for 1968 and 1981, and they generally pointed to the same "suspect" industries as the first two sources.

The division of industries into three groups was based solely on the third source, because this source was more detailed and available for more years than the other sources and gives similar results. The industries that this source was used to classify are those shown for the most detailed annual estimates published in section 6 of the NIPA tables. They follow approximately two-digit standard industrial classification detail. There are 21 manufacturing industries and 39 other private domestic industries. Income originating in government and rest of the world was omitted from the analysis. Three industries in which a large and variable portion of national income is imputed—banking, credit agencies, and real estate—were omitted from the analysis because the imputations greatly affect certain of the comparisons to be presented below for reasons that have no relation to the underground economy. One other industry, holding companies and other investment companies, was omitted because its negative national income in a number of years is difficult to interpret in the framework of this article.

Suspect industries were defined as industries for which the ratio of noncorporate employee compensation to total employee compensation was more than 0.1 in either 1968 or 1981, or for which noncorporate employee compensation was more than 1 percent of economywide noncorporate employee compensation in either 1968 or 1981. These cutoffs were chosen so as to be consistent with the TCMP results and the journalistic accounts. The industries are:

Farms
Agricultural services, forestry, and fisheries
Construction
Lumber and wood products (manufacturing)
Trucking and warehousing

SURVEY OF CURRENT BUSINESS

Wholesale trade
Retail trade
Security, commodity brokers, and services
Insurance agents, brokers, and services
Hotels and other lodging places
Personal services
Business services
Auto repair, services, and garages
Miscellaneous repair services
Motion pictures
Amusements and recreation services
Health services
Legal services
Educational services
Social services and membership organizations
Miscellaneous professional services
Private households

Telephone and telegraph
Radio and television broadcasting
Insurance carriers

In all, there are 22 industries in the well-measured group, 22 in the suspect group, and 12 in the intermediate group. In 1968, well-measured industries accounted for 35 percent of the published national income of all industries included in this analysis; intermediate industries accounted for 13 percent; and suspect industries accounted for 52 percent.

II. Framework of the Analysis

Decomposition of national income

The indicators to be compared among industries in the three groups are related to national income through the following identity, in which NI is national income, E is total employment, FTE is full-time equivalent employment, and C is employee compensation:

$$NI = E \times \frac{FTE}{E} \times \frac{C}{FTE} \times \frac{NI}{C}$$

National income originating in each industry is expressed in this identity as the product of four factors: Total employment, the ratio of full-time equivalent employment to total employment, employee compensation per full-time equivalent employee, and the ratio of total national income to compensation. *If the growth of national income in an industry is understated, then the growth of at least one of these four factors must be understated.* The next subsection will explain why only three of these four factors are used as indicators of understatement of income growth.

The four panels of chart 6 plot the four factors from 1949 through 1982 for well-measured, intermediate, and suspect industries in total.⁵ Table 1 shows average growth rates of the four factors for the three groups of industries. The chart and table offer a preliminary look at the data in summary form, although they do not reveal any of the industry detail or

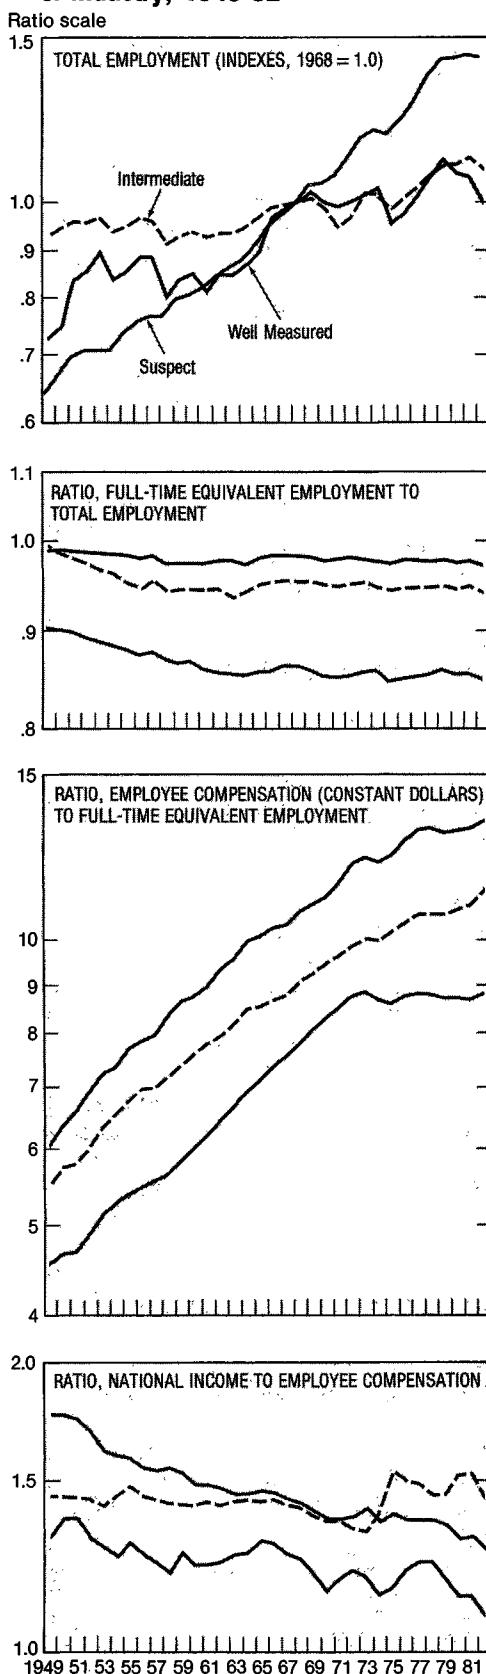

Metal mining
Coal mining
Oil and gas extraction
Nonmetallic minerals, except fuels
Furniture and fixtures
Food and kindred products
Apparel and other textile products
Printing and publishing
Miscellaneous manufacturing industries
Local and interurban passenger transit
Transportation services
Electric, gas, and sanitary services

The remaining industries were classified as well measured. These industries are:

Stone, clay, and glass products
Primary metal industries
Fabricated metal products
Machinery, except electrical
Electric and electronic equipment
Motor vehicles and equipment
Other transportation equipment
Instruments and related products
Tobacco manufactures
Textile mill products
Paper and allied products
Chemicals and allied products
Petroleum and coal products
Rubber and miscellaneous plastic products
Leather and leather products
Railroad transportation
Water transportation
Transportation by air
Pipelines, except natural gas

5. One of the factors, compensation per full-time equivalent employee, is converted to constant dollars by dividing by the fixed-weighted price index for gross domestic business product. This conversion has no effect on relative movements of well-measured, intermediate, and suspect industries. It makes the chart easier to examine by permitting a wider vertical scale, and it also has advantages, discussed in the next section, for regression analysis.

CHART 6

Selected Indicators by Type of Industry, 1949-82

Table 1.—Average Annual Rates of Growth of Selected Aggregates by Type of Industry, 1949-82

[Percent]

	Well-measured industries	Intermediate industries	Suspect industries
Total employment	1.01	0.50	2.44
Ratios:			
Full-time equivalent employment to total employment	-.06	-.17	-.19
Employee compensation (constant dollars) to full-time equivalent employment	2.45	2.21	2.00
National income to employee compensation (current dollars)	-.57	-.01	-.98

Note.—See text for classification of industries into well measured, intermediate, and suspect.

the timepaths of any of the other variables that will enter the regression analysis. For employment, the chart makes clear that suspect industries as a group have grown much more rapidly than the other groups of industries—the opposite of what might be expected if growth in underground activities were large and heavily affected measured employment. For the other three factors, the chart indicates that suspect industries as a group have risen less, or declined more, than well-measured industries as a group. The regression analysis will provide a more refined estimate of this relative understatement by taking account, industry by industry, of influences on the three factors other than the possible growth of underground activity.

Omission of employment

Employment will be omitted from the regression analysis because it is not feasible to take systematic account of all the diverse forces that affect industry employment trends. These factors include changes in income and relative prices, foreign competition, and changes in input costs, competitive structure, and technology—as well as, perhaps, the underground economy. The omission of employment means that if surveys of employment are in fact increasingly understated, then the indirect measure in this article is also understated.

Evidence outside the framework of this article has been cited to indicate that underreported employment is an important source of growth in the underground economy, but the evidence is not convincing. One argument is that employment reported by business establishments, which comes from the

same source as important components of national income, has grown less rapidly than employment reported in sample surveys of households tied to Census estimates of total population. From 1970 to 1980, however, the difference in growth between these two estimates of employment can be entirely accounted for by the Census Bureau's own estimate of the higher degree of coverage in the 1980 than in the 1970 Census of Population.⁶ Another argument is that the declining labor force participation rate of males over the last two decades (in contrast to females) is attributable to increasing concealment of employment. One student of these trends, however, finds that changes in Federal disability insurance provisions probably account for much of the decline.⁷ A third argument is that illegal activities are increasing and that persons engaged in such activities may fail to report that they are employed. Illegal activities, however, are outside the scope of the NIPA's.

There is, in short, no solid evidence that employment in activities covered by the NIPA's is increasingly understated. A rapidly growing underground economy, however, can exist without any understatement of employment; journalistic examples abound in which hours of work or receipts are underreported, but employment is correctly reported.

Inclusion of other factors

For the three factors other than employment, it is possible by means of regression analysis to determine whether, holding other variables constant, suspect and intermediate industries tend to have lower rates of growth than well-measured industries. After this determination, the understatements of the various factors can be combined to provide an overall estimate of the understatement of the growth of national income.

To understand the implications of the regression analysis, it is impor-

6. Census undercounts in 1970 and 1980 are discussed in U.S. Department of Commerce, Bureau of the Census, *Coverage of the National Population in the 1980 Census by Age, Sex, and Race*, by Jeffrey S. Passel, Jacob S. Siegel, and J. Gregory Robinson, U.S. Census Current Population Reports, Series P-23, No. 115 (Washington, DC: Government Printing Office, February 1982).

7. See Donald O. Parsons, "The Decline in Male Labor Force Participation," *Journal of Political Economy* 88 (February 1980): 117-134; and "Racial Trends in Male Labor Force Participation," *American Economic Review* 70 (December 1980): 911-920.

tant to be clear about what the new measure is and is not designed to detect. What the measure is designed to detect is income unreported or underreported because of such activities as working "off the books," skimming, and the like. As mentioned earlier, the measure is not designed to detect income from the production of prohibited goods and services, nor is it designed to detect underground activities already included in the NIPA's because of use of source data other than tax returns or because of adjustments for underreporting where tax return data are used. Thus, the measure will clearly *not* reflect the large volume of activity unreported on tax returns but included in the NIPA's.⁸ Finally, the new technique is designed to detect only those underground activities that are concentrated in suspect industries. Padding of expense accounts is an example of an underground activity unlikely to be concentrated in suspect industries, and therefore not detected by the new technique.

III. Regression Analysis

The regression analysis is based on 56 industry observations for each year from 1949 through 1982, or 1,904 observations in all. The regressions weight observations for each industry by that industry's proportion of national income in 1972, so that the effect of an industry on the estimated coefficients depends on its size.⁹

There are three dependent variables: the logarithms of the ratio of full-time equivalent employment to total employment, the ratio of employee compensation to full-time equivalent employment, and the ratio

of national income to employee compensation. Logarithms of the ratios rather than the ratios themselves are the dependent variables because (a) estimated understatements of the ratios due to the underground economy can then simply be added rather than combined in a more complex way, and (b) for one ratio, compensation per full-time equivalent employee, specifying influences on rates of growth (implicit in a logarithmic specification) makes more sense than specifying influences on absolute changes.

Each dependent variable is related to (a) time trends, and (b) other influences that vary from one dependent variable to another. The time trends include one that takes on values of 1, 2, 3, etc., in successive years for each industry; a second that takes on these values only for industries in the intermediate group (it equals zero for all years for other industries); and a third that takes on these values only for industries in the suspect group (it equals zero for all years for other industries). The coefficients of the last two time trends indicate whether intermediate and suspect industries have grown at faster or slower rates than well-measured industries. Positive coefficients indicate faster growth than well-measured industries; negative coefficients, slower growth. The standard errors of these coefficients indicate whether the growth rate differentials depart significantly from what might be expected from a purely random assignment of industries into three groups.

The ratio of full-time equivalent employment to total employment

The first dependent variable is the logarithm of the ratio of full-time equivalent employment to total employment. It measures the importance of part-time work; the lower the variable, the more important part-time work. It will be sensitive to underground activity if such activity takes the form of underreporting the hours of part-time workers, or of misreporting full-time workers as part-time workers.¹⁰

The independent variables in the regression include variables to measure differentials in both level and growth between suspect and well-measured industries and between intermediate and well-measured indus-

tries. Coefficients of a dummy variable equal to 1.0 for suspect industries and zero for other industries, and a similar variable for intermediate industries, measure average differences in levels between these industries and well-measured industries, after allowing for the other factors in the regression. Coefficients of time trends for suspect industries and for intermediate industries, described earlier, measure average differences in rates of growth between suspect and intermediate industries on the one hand and well-measured industries on the other, again after allowing for the influence of the other variables in the regression.

Apart from the underground economy, an important influence on employers in setting average hours is the state of demand for their output. When demand falls, employers will want to reduce labor input; and part of the reduction, especially if the reduction is viewed as temporary, will take the form of fewer hours per employee. The variable used to represent cyclical influences is the change from the previous year in the logarithm of total employment in each industry. Of several cyclical variables tested, this one was most consistently significant with coefficients of plausible magnitude.

Beyond this cyclical influence, employers will have to balance a number of influences on unit costs. For jobs that require a lot of job-specific knowledge and training—managerial jobs or complex technical jobs, for example—it will be advantageous to have full-time employees even if their hourly compensation is higher than

10. More precisely, let h be average weekly hours of all employees (part time or full time), h_F average hours per full-time employee, E total number of persons employed, and FTE full-time equivalent employment. FTE is equal to total hours of all employees, $E \times h$, divided by average hours per full-time employee, h_F , or:

$$FTE = E \times h/h_F$$

Dividing both sides of this equation by E shows that the ratio of FTE to E is equal to h divided by h_F . The more part-time workers there are, the lower this ratio. The dependent variable is the logarithm of the ratio.

Underreporting of hours need not always lower this ratio. Understatement of the hours of part-time employees will lower the ratio, but complete nonreporting of part-time employees will raise the ratio. Understatement of the hours of full-time employees will lower the ratio if, as a result of the understatement, they are incorrectly classified as part-time workers. Understatement of the hours of full-time employees, however, will raise the ratio if they continue to be classified as full-time. If underreporting raises this ratio, however, it will lower the ratio of compensation to full-time equivalent employment, the second dependent variable in this study.

8. A reconciliation of income reported on personal tax returns and BEA personal income for recent years is presented in Thae S. Park, "Personal Income and Adjusted Gross Income, 1981-83," in this issue. Carson, "Underground Economy," p. 109, discusses the relevance of this reconciliation to the underground economy.

9. National income estimates (without capital consumption adjustment) by detailed industry are published in table 6.3 of the NIPA tables. Compensation of employees is published in table 6.5, total employment in table 6.7, and full-time equivalent employment in table 6.8. The national income estimates used in this study differ slightly from the estimates published in table 6.3. The industry distribution of corporate profits before tax component has been adjusted from a distribution by the primary industry of the company to one by the primary industry of the establishment. These adjustments, which sum to zero for all industries, are those that are incorporated in the NIP by industry series shown in NIPA table 6.1. Including them makes national income more comparable to employee compensation by industry.

that of competent part-time employees. The attractiveness to employers of using part-time employees probably varies substantially by industry; for example, petroleum refining, with its highly skilled work force, is probably much less suited to part-time employment than retail trade.

To differentiate between industries not suited to part-time work and others, an additional dummy variable and a time trend were used in the regression. The dummy variable was set equal to 1.0 for all industries with a 1949 ratio of full-time equivalent employment to total employment of 0.95 or greater, and set equal to zero for all other industries. A 1949 ratio of 0.95 or greater was thus taken to indicate an industry not suited to part-time work. The time trend is equal to 1, 2, 3, etc. for successive years in each industry with a high 1949 ratio, and zero for all years in other industries. The coefficient of this variable measures the greater growth, or smaller decline, in the hours ratio for industries not suited to part-time work.

If the high-hours industries were all in the well-measured group and the low-hours industries in the suspect group, then it would not be possible to separate the effect of high hours from the effect of the underground economy. Fortunately, the suspect group includes both industries in the high-hours group (construction, for example) and industries in the low-hours group (retail trade, for example).

Preferences of employees as well as employers affect hours of work. Employee preference for part-time work clearly varies with household status. Primary earners in central age groups generally have a stronger preference for full-time work than secondary earners with child-care responsibilities or than students. To represent the influence of household status, the initial regression analysis included the proportion of the total labor force accounted for by males from ages 25 through 54, on the grounds that this is a group with an especially high preference for full-time work. However, the coefficient of this variable was either negative or insignificant in alternative specifications of the regression. It was therefore dropped from the analysis.

Institutional arrangements that bear on the choice of hours worked include the practice, partly due to legis-

Table 2.—Regression Results

	Dependent variable: logarithm of—

Note.—Figures in parentheses are t-ratios. CHLE=change from previous year in the logarithm of employment (full time and part time). DH=1 for high-average-hours industries (see text); zero for other industries. DHTREND=time trend for high-average-hours industries, zero for other industries. NCC=ratio of noncorporate employee compensation to total employee compensation. See text for explanation of differential constants and time trends.

lation, of restricting certain fringe benefits to those who work full time or nearly full time. The importance of this practice has grown as fringe benefits have become a larger fraction of labor compensation. The regression does not include a variable measuring this factor specifically; its influence will affect the coefficient of the time trend for all observations.

To recapitulate: the independent variables in the regression include a constant term for all industries and constant terms for intermediate industries and for suspect industries; a time trend for all industries and time trends for intermediate industries and for suspect industries; the change in the logarithm of employment; and a constant term and a time trend for industries with high hours in 1949. The dependent variable is the logarithm of the ratio of full-time equivalent employment to total employment.

The regression results are shown in the first column of table 2. The constant term and constant-term differentials shown in the table have no implications for the estimated growth of underground activity and therefore will not be discussed for this regres-

sion or the others. The negative coefficient of the time trend for all industries reflects a slight downward trend in average hours since 1949. The coefficients of the time-trend differentials, especially that for suspect industries, are indicators of the missing growth of national income. The coefficient for suspect industries indicates missing growth of just over 0.1 percent per year, and the coefficient for intermediate industries is still smaller. Both coefficients, however, have *t*-ratios of 2.0 or greater (in absolute value), indicating that their negative values are unlikely to be due to chance.

Coefficients of other variables are plausible. The positive coefficient for the change-in-employment variable, CHLE, indicates a pro-cyclical movement of average hours. The positive coefficients for the dummy variable and time trend for industries with high hours in 1949 indicate that these industries have higher average hours and a smaller rate of decline in average hours than other industries.

Constant-dollar employee compensation per full-time equivalent employee

The second dependent variable is the logarithm of employee compensation per full-time equivalent employee divided by a price index for gross domestic business product.¹¹ Dividing by a price index converts the variable to a measure of real compensation, but does not affect the differentials among industries. One reason for incorporating the price variable into the analysis in this way, rather than including it among the independent variables, is the high correlation of the price index with other independent variables in the analysis. In the discussion that follows, the dependent variable is referred to as "real compensation per employee". It will be sensitive to underground activity if such activity takes the form of under-reporting of wages or fringe benefits.

Independent variables include dummy variables and trends to measure differentials in levels and growth

11. The fixed-weighted price index for gross domestic business product was used starting in 1958. Because it was not available before 1958, it was linked to the implicit deflator for gross domestic business product for years before 1958.

rates among the three industry groups. These variables are the same as the ones used in the previous regression.

Prominent among influences on real compensation per employee are cyclical fluctuations in economic activity, which cause parallel changes in real compensation per employee. Cyclical influences are again represented by the change from the previous year in the logarithm of total employment.

For employers, the trend of productivity is also an important influence. The coefficient of a time trend for all observations reflects the average growth of productivity from 1949 to 1982, but not its deceleration. To reflect the deceleration of productivity, a variable was constructed that is equal to zero until 1968 and then equal to 1, 2, etc. in succeeding years.

The mix of full-time and part-time workers is also an important influence on real compensation per employee. The dependent variable in the first regression, the logarithm of the ratio of full-time equivalent employment to total employment, is a measure of this mix, but if the underground economy has affected the accuracy of this variable, then it is a biased measure. Instead of including this variable in the second regression, therefore, the determinants of the variable—the set of variables from the first regression—are included in the second regression. Most of the variables from the first regression are already included on other grounds; the only additions are the dummy variable and time trend for industries with high hours in 1949.

Among other influences on real compensation per employee, union membership and minimum wages are obvious possibilities. The regression does not, however, include variables representing these factors. In the case of union membership, the reason is that estimates of the distribution of union membership by industry are subject to large errors and are not available in any case for recent years. Rough calculations suggest that the influence of this variable cannot have been large.¹² In the case of the minimum wage, several alternative specifications of a variable representing its level and coverage gave regression coefficients with signs opposite to expectations.

SURVEY OF CURRENT BUSINESS

An important influence on the measurement of employee compensation is legal form of organization. In a noncorporate enterprise, remuneration of proprietors or partners is not counted as employee compensation, whereas in a corporation, remuneration of executives is. Because executives have remuneration far above the average, compensation per employee will tend to be higher for corporations than for noncorporate enterprises. It may be higher for other reasons as well—for example, if the corporate form tends to be associated with firms that pay high salaries. To represent legal form of organization, the variable used is the ratio of noncorporate employee compensation to total employee compensation. Of several possible variables, this one is least likely to be distorted by errors of measurement.¹³ A disadvantage of this variable is that it is the variable used to classify industries as well measured, intermediate, or suspect. It is possible that the growth of the variable is correlated with the growth of underground activity, and therefore might bias the regression results. For this reason, regression results omitting this variable will be compared with results including it.

12. Periodic surveys of the distribution of union membership (discontinued since 1978) suggest that the decline in union membership has been proportionally greater in predominantly well-measured sectors, such as manufacturing and transportation, than in other sectors, such as construction, trade, and services; see U.S. Department of Labor, Bureau of Labor Statistics, *Directory of National Unions and Employee Associations*, Bulletin 2079 (Washington, DC: Government Printing Office, 1980) and bulletins with the same or similar titles for earlier years. The surveys suggest that the change in the proportion of workers in unions over the 22-year period 1956–78 may have differed by about 10 percentage points between the two types of industry. Union wages exceed nonunion wages for comparable jobs by an average of about 10 percent, with some of the difference perhaps offset by higher productivity of union members; see J.T. Addison and A.H. Barnett, "The Impact of Unions on Productivity," *British Journal of Industrial Relations* 20 (July 1982): 145–162. If union wages exceed nonunion wages by 10 percent, a 10 percent growth differential would cause a 1 percentage point difference (10 percent of 10 percent) in the growth of employee compensation. Over a 22-year period, this difference amounts to a little less than one-twentieth of a percentage point per year.

13. Benchmark revisions of noncorporate employee compensation prepared in 1980 were carried back only to 1968. The estimates before 1968 are discontinuous with estimates starting in 1968. For this study, industries with large changes (more than 5 percentage points) in the ratio of noncorporate to total employee compensation from 1949 to 1967 were identified, and estimates of their ratios were constructed back to 1949. For other industries, ratios before 1968 were held constant at their 1968 values.

A final institutional influence on real compensation per employee is the presence of underground activity itself. Off-the-books activity is often conducted at reduced rates of compensation, because taxes are not paid on the earnings. Where off-the-books activity is a significant part of an industry, competition may compel fully reporting enterprises in that industry to lower their employee compensation rates and other forms of income (or restrict increases in them). In such a situation, the approach to measuring the underground economy adopted in this paper will exaggerate the growth of underground activity. The differential growth rate for a suspect industry will reflect not only unreported employee compensation, but also reduced compensation in fully reporting enterprises due to competition from underground enterprises. There is no variable in the regression analysis to represent this influence; it must simply be kept in mind as a possible source of overstatement in the estimated growth of underground income.

The results of the regression appear in the second column of table 2. The coefficients of the time trends for all observations indicates that real compensation per employee rose at an average rate of 2.65 percent until 1968, but only 0.77 percent (2.65 minus 1.88) afterwards. For intermediate and suspect industries, coefficients of time-trend differentials are negative and statistically significant. These coefficients suggest growing underground activity in the form of unreported real compensation per employee amounting to more than six-tenths of 1 percent per year for intermediate industries and one-quarter of 1 percent per year for suspect industries.

Other variables performed as expected. The coefficient of the ratio of noncorporate to corporate employee compensation, NCC, is negative and highly significant. The possibility that this variable is biasing the coefficients of time-trend differentials was discussed earlier. Rerunning the regression without this variable does change those coefficients. The alternative coefficients are closer to zero: -0.0040 instead of -0.0062 for intermediate industries and -0.0007 instead of -0.0025 for suspect industries. The alternative regression thus indicates less missing growth in employee compensation than does the regression

shown in table 2. The implications of this alternative regression will be discussed after reporting on a similar alternative for the next dependent variable.

The ratio of national income to employee compensation

The third dependent variable is the logarithm of the ratio of national income to employee compensation. It measures the return to all factors of production relative to the return to employed labor. It will be sensitive to underground activity if underreporting of profits, proprietors' income, or other property income is greater, in percentage terms, than underreporting of employee compensation.

Once again, cyclical factors are an important influence on the behavior of the ratio, mainly because they have a greater percentage impact on profits than on employee compensation. The change from the previous year in the logarithm of employment therefore appears in this regression as well as in the first two.

An additional factor that influences the ratio of national income to employee compensation, as it does real compensation per employee, is legal form of organization. The influence arises because the denominator of the ratio, employee compensation, does not include the return to the labor of proprietors and partners, but does include the return to the labor of corporate executives. The result of this characteristic is that the ratio tends to be far higher for proprietorships and partnerships than for corporations. The variable selected to represent this factor, the ratio of noncorporate employee compensation to total employee compensation, is expected to have a positive coefficient in this regression, whereas its coefficient in the previous regression was (and was expected to be) negative.

Eight industries are omitted from this regression, for various reasons. National income consists entirely of employee compensation for one industry, private households, and consists very largely of employee compensation for two industries that include many nonprofit organizations, educational services and social services. These industries are omitted because their ratios of national income to employee compensation are always equal

to, or are very close to, one. The other five omitted industries—farms, agricultural services, oil and gas extraction, petroleum refining, and electric and gas utilities—are so heavily influenced by large swings in farm and fuel prices that they are of little value in drawing inferences about other factors affecting the ratio of national income to employee compensation.

The results of the regression appear in the third column of table 2. The negative coefficient of the time trend for all observations reflects the declining share of profit-type income in national income since 1949. For intermediate industries, the coefficient of the time-trend differential is positive, indicating no understatement of the ratio. For suspect industries, the corresponding coefficient is negative, but it is small and not significant. The other two variables, CHLE and NCC, both have coefficients of expected sign and are highly significant.

The possibility that the presence of NCC biases the coefficients of differential time trends was discussed earlier. Omitting this variable alters these coefficients; for intermediate industries the coefficient is lowered from 0.0040 to 0.0036, and for suspect industries, it is lowered from -0.0004 to -0.0032. These alterations are roughly the opposite of the alterations due to omitting NCC from the regression for compensation per full-time equivalent employee. The alternative regression thus leaves the estimated total understatement about the same.

However, the regressions reported in table 2 and the alternative regressions differ in their estimates of the composition of the understatement. According to the regressions in table 2, the understatement lies mainly in employee compensation; according to the alternative regressions, the understatement lies mainly in other forms of income. Direct evidence from tax audits and special surveys accords with the results of the alternative regressions in this respect.

The growth of underground income

The new estimate of understatement in the growth of national income in this study is based on the coefficients of differential time trends for suspect and intermediate industries. For suspect industries, the coef-

ficients in the three regressions are -0.0011, -0.0025, and -0.0004. Their sum, -0.0040, is an estimate of understated growth in suspect industries; the estimate suggests that growth in these industries was understated by an average of 0.40 percent per year during 1949-82. Because suspect industries account for a little over one-half of published national income of the industries in this study, the understatement of growth in total private domestic national income due to this understatement is 0.21 percent per year, or just over one-fifth of 1 percent.¹⁴

For intermediate industries, the corresponding three coefficients in table 2 are -0.0007, -0.0062, and 0.0040. Their sum implies that growth in the intermediate industries was understated by 0.29 percent per year, or a little less than three-tenths of 1 percent. The understatement of growth in total private domestic national income due to intermediate industries is only 0.04, or four one-hundredths of 1 percent, per year.

The estimated understatement due to both suspect and intermediate industries is 0.21 plus 0.04, or 0.25 percent per year. The standard error of the overall estimate is 0.08 percent, or one-third of the estimate itself.¹⁵

The estimated understatement is small compared to the average 1949-82 growth rate of published national income in private domestic industries. The understatement is one-thirtieth of the growth rate based on current dollar national income, 7.41 percent per year. It is one-thirteenth of the growth rate based on constant-dollar national income, 3.30 percent per year (the latter comparison is meaningful if, as seems plausible, the understatement is in real growth and not in inflation).

14. The translation into an estimated understatement of the growth rate of total national income requires an assumption about the level of underground income, although the translation is not sensitive to that assumption. The assumption used here (and in the next two paragraphs) is that the level of national income missing from the NIPA's for the underground activities covered in this study was zero in 1949.

15. To derive the standard error, the three dependent variables were added to form a single dependent variable, the logarithm of national income per employee. This variable was regressed on independent variables from the three regressions. The estimated understatement of total national income in private domestic industries derived from this shortcut procedure was the same as the estimate from the full procedure described in the text. The standard error was derived from the shortcut procedure.

SURVEY OF CURRENT BUSINESS

IV. Appraisal

This section appraises the new indirect estimate of understatement of the growth of national income in three ways. First, it compares the estimate with a direct estimate of understatement recently reported in the SURVEY. Second, it compares the estimate and the procedures used to construct it with other indirect estimates. Finally, it discusses possible sources of understatement or overstatement in the new estimate.

Comparison with a direct estimate

A recent study has led to improved adjustments in 1977 for misreporting on the tax return information used in constructing the NIPA's. It is estimated that national income for that year should be adjusted upward by \$58 billion, in addition to the adjustments for underreporting already incorporated in the published estimate.¹⁶ This upward adjustment covers essentially the same activities as the estimate in this article.

Comparison between this direct estimate and the indirect estimate in this article is difficult because the former is a dollar level and the latter is a rate of growth. To compare them, the latter can be converted into a dollar level by assuming a level of zero (no understatement) in 1949 and then cumulating understated growth from 1950 through 1977. Because of the zero assumption for 1949, this procedure gives a lower bound to the understatement in 1977.

The result of this calculation is an estimate of \$88 billion, or \$30 billion more than the direct estimate. The difference between the two estimates is equal to roughly one standard deviation of the former estimate—a difference that could easily arise by chance due to the uncertainties of statistical estimation. The two methods thus do not give significantly different results, if income missing from the NIPA's was negligible in 1949. If income missing in 1949 was substantial, however, then the indirect estimate might imply significantly more missing

income than the direct estimate for 1977.¹⁷

The direct estimate places most of the understatement of national income in proprietors' income. The indirect estimate based on the regression results in table 2 places most of the understatement in employee compensation; however, an estimate based on alternative regressions, mentioned earlier, would place most of the understatement in other forms of income (including proprietors' income). The indirect method thus does not lead to any firm conclusion about the distribution of the understatement.

Comparison with other indirect estimates

It is difficult to compare the estimate in this article with other published indirect estimates because it is quite unlikely that the various estimates are measuring the same thing. The estimate in this article, as noted earlier, refers to activities unreported or underreported in the NIPA's because of working off the books, skimming, and the like. It does not cover (a) prohibited activities excluded from the NIPA's, such as the production and distribution of illegal drugs, and (b) incomes unreported on tax returns, but included in the NIPA's.

The indirect estimates of Feige, Gutmann, and Tanzi—all of which are based on financial ratios—probably include both these categories. They should therefore be larger than the estimate in this article (and larger than appropriate for gauging possible understatement in the NIPA's). In fact, Gutmann's estimate is nearly twice as large, and Feige's estimate is four or five times as large. Tanzi's estimate, however, is about the same size.¹⁸

It is far from clear, however, that the excess of the Gutmann and Feige estimates over the one in this article is due to income from prohibited goods and services, or to income missing from tax returns but included in

the NIPA's. The estimate in this article involves a careful attempt to correct for influences other than the growth of the underground economy. This correction is accomplished by examining differences between suspect and well-measured industries rather than movements in suspect industries alone, and by using a multiple regression procedure that takes account of important influences on the indicators other than the underground economy. The two larger of the three other indirect estimates do not attempt to correct carefully for other influences on the indicators they use. It is not possible to account systematically for the excess of their estimates over the one in this article.¹⁹

Sources of understatement and overstatement of the new measure

Although the estimate in this article does not share some of the shortcomings of other indirect estimates of the underground economy, it is subject to uncertainty for several reasons. It is appropriate to end this article with a brief summary of these sources of possible understatement or overstatement.

One source is the uncertainties of statistical estimation. The variation in the estimate that can be attributed to this source is summarized by the standard deviation of the estimate, equal to about one-third of the estimate itself.

A second source of uncertainty is the omission, for reasons discussed earlier, of an analysis of employment differences among suspect, well-measured, and intermediate industries. While there is no convincing evidence that the growth of employment is understated, there is no way to be sure

18. Edgar Feige, "How Big Is the Irregular Economy?" *Challenge* (November/December 1979): 5-13; Peter M. Gutmann, "The Subterranean Economy," *Financial Analysts Journal* (November/December 1977): 26-27, 34; and Vito Tanzi, "The Underground Economy in the United States: Annual Estimates, 1930-1980," *International Monetary Fund Staff Papers* 30 (June 1983): 283-305. A table comparing these and other estimates of the size of the underground economy appears in Carson, "Underground Economy," p. 33. These estimates are not all available for 1977 and are not all expressed in terms of national income. The comparisons in the text are after adjustment for these differences.

19. For other criticisms of these financial-ratio indicators, see Richard D. Porter and Amanda S. Bayer, "A Monetary Perspective on Underground Economic Activity in the United States," *Federal Reserve Bulletin* 70 (March 1984): 177-190.

16. Parker, "Improved Adjustments," p. 20, table 3. The adjustment appropriate for national income is the sum of the adjustments reported in the table for employee compensation, proprietors' income, rent, corporate profits, and net interest (the last three of these adjustments are zero).

17. If missing income in 1949 was 5 percent or more of published national income in domestic private industries, then the indirect method implies missing income in 1977 that is two standard deviations or more larger than the direct estimate. It seems unlikely that missing income in 1949 was as large as 5 percent of published national income, because income tax returns were not an important source of the estimates for 1949.

what a detailed analysis of employment growth would show.

A third source of uncertainty is due to the fact that the new estimate covers only those underground activities that are concentrated in suspect industries or intermediate industries and absent from well-measured industries. It does so because it is based on unexplained differences between these groups of industries. The covered activities probably include the great bulk of working "off the books" and skimming. They probably do not include padded expense accounts and employee theft, both of which take place in well-measured as well as suspect industries. This partial coverage is a factor that makes the new measure understate the level of underground activity. Partial coverage could make the new measure of un-

derstated growth either too low or too high, depending on how rapidly the uncovered activities have grown.²⁰

A final source of uncertainty may cause the measure in this article to overstate both the level and the rate of growth of underground income. That factor, discussed earlier, is the impact of the underground economy on incomes in correctly reporting enterprises. Price competition from a growing underground sector in an industry may compel correctly reporting enterprises to limit increases in their incomes. The measure in this article reflects any such induced slowing of the growth of compensation, even though it is not itself a part of the underground economy.

20. Unresolved issues concerning the correct treatment of shoplifting and employee theft in the NIPA's add to this uncertainty.

Because of these sources of uncertainty, it is not possible to say whether the new measure understates or overstates the growth of underground income missing from national income. Nevertheless, in an area where quantitative information is extremely scarce, even an uncertain measure is of some help. It would be of interest to calculate the measure for other bodies of data, such as tax returns classified by industry of employment or national income by industry for other countries, and compare the results with those of the present study. It will also be of interest to recalculate the measure after the next benchmark revision of the NIPA's, because that revision will incorporate new adjustments for the underground economy.

CURRENT BUSINESS STATISTICS

The statistics here update series published in **BUSINESS STATISTICS: 1982**, a statistical supplement to the **SURVEY OF CURRENT BUSINESS**. That volume (available from the Superintendent of Documents for \$8.00, stock no. 003-010-00124-1) provides a description of each series, references to sources of earlier figures, and historical data as follows: For all series, monthly or quarterly, 1979 through 1982; annually, 1961-82; for selected series, monthly or quarterly, 1961-82 (where available).

The sources of the series are given in **BUSINESS STATISTICS: 1982**; they appear in the main methodological note for each series, and are also listed alphabetically on pages 135-136. Series originating in Government agencies are not copyrighted and may be reprinted freely. Series from private sources are provided through the courtesy of the compilers, and are subject to their copyrights.

Unless otherwise stated in footnotes below, data through 1982 and methodological notes are as shown in BUSINESS STATISTICS: 1982	Units	Annual		1984												1985

[†] Revised series. See Tables 2.6-2.9 in the July 1984 SURVEY for revised estimates for 1981-84.

[‡] Includes inventory valuation and capital consumption adjustments.

[§] Monthly estimates equal the centered three-month average of personal saving as a percentage of the centered three-month moving average of disposable personal income.

Page S-2

1. Based on data not seasonally adjusted.

Includes data not shown separately.

[‡] See note "‡" for p. S-8.

[†] See note "†" for p. S-8.

^{††} See note "††" for p. S-3.

@ Revised series. For manufacturing see note "††" for p. S-3. For retail see note "‡" for p. S-8. For wholesale see note "†" for p. S-8.

[§] Revised series. Data have been revised back to 1981, effective with the August 1984 SURVEY. Revisions are available upon request.

Page S-3

Includes data for items not shown separately.

[‡] See note "‡" for p. S-8.

[†] See note "†" for p. S-8.

^{††} Effective May 1984 SURVEY, data have been revised for Jan. 1977-Dec. 1983. A detailed description of this revision and data appear in the report "Manufacturers' Shipments, Inventories, and Orders" M3-1.13 (1977-1983), copies of this report can be purchased from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. A computer tape of the report, including data back to 1958 can be purchased from the Data User Services Division, Customer Services Branch, Bureau of the Census, Washington, DC 20233.

@ See note "@" for p. S-2.

[§] See note "§" for p. S-2.

Page S-4

1. Based on data not seasonally adjusted.

Includes data for items not shown separately.

[‡] Includes textile mill products, leather and products, paper and allied products, and printing and publishing industries; unfilled orders for other nondurable goods industries are zero.

[†] See note "††" for p. S-3.

[◊] For these industries (food and kindred products, tobacco, apparel and other textile products, petroleum and coal, chemicals and allied products, and rubber and plastics products) sales are considered equal to new orders.

Page S-5

1. Based on unadjusted data.

2. The annual liabilities figure for 1983 is \$16,072,860,000.

3. See note "◊" for this page.

@ Compiled by Dun & Bradstreet, Inc. Monthly data are now available through 1982, and are available upon request. The 1983 annual figure for the failure annual rate and the 1983 monthly data will be available at a later date.

Includes data for items not shown separately.

[§] Ratio of prices received to prices paid (parity index).

[†] See note "†" for p. S-4.

^{††} Effective with the Feb. 1984 SURVEY, data (back to 1981 for some commodities) have been revised. Effective with July 1984 SURVEY, data for 1982-83 have been revised. Effective with the Feb. 1985 SURVEY, data (back to 1982, for some commodities) have been revised. These revisions are available upon request.

[◊] Beginning with data for Jan. 1983 (Jan. 1985, for CPI-W), the index is affected by a change in methodology used to compute the homeownership component. For additional information regarding this change, see p. S-36 of the Feb. 1983 SURVEY.

* New series.

^{††} See note "††" for p. S-3.

Page S-6

[§] For actual producer prices or price indexes of individual commodities, see respective commodities in the Industry section beginning p. S-19. All indexes subject to revision four months after original publication.

Includes data for items not shown separately.

* New series. This index (first shown in the Feb. 1984 SURVEY) reflects costs associated with homeowners' consumption of shelter service. This new index combines the subindexes of owners' equivalent rent and household insurance. Indexes prior to Dec. 1982 are not available. For additional information, see p. S-36 of the Feb. 1983 SURVEY.

[†] Effective with the Feb. 1984 SURVEY, data have been revised back to 1979. Effective with the Mar. 1985 SURVEY, data have been revised back to 1980. These revisions are available upon request.

^{††} Effective with the Feb. 1984 SURVEY, data back to 1979 have been revised. Effective with the Feb. 1985 SURVEY, data back to 1980 have been revised. These revisions are available upon request.

[◊] See note "◊" for p. S-5.

r Revised.
p Preliminary.
e Estimated.
c Corrected.

Page S-7

1. Computed from cumulative valuation total.

2. Index as of Apr. 1, 1985: building, 359.2; construction, 389.1.

3. Data are for 16,000 permit-issuing places.

Includes data for items not shown separately.

[§] Data for Mar., May, Aug., and Nov. 1984, and Jan. 1985 are for five weeks; other months four weeks.

[†] Effective Feb. 1984 SURVEY, data for seasonally adjusted housing starts have been revised back to 1981. Effective Feb. 1985 SURVEY, data have been revised from 1982-84. These revisions are available upon request.

[‡] Effective Feb. 1985 SURVEY, data for building permit authorizations are based on 17,000 permit-issuing places beginning with Jan. 1984. These revisions are available upon request.

[§] Effective Feb. 1984 SURVEY, data for seasonally adjusted manufacturer's shipments of mobile homes have been revised back to 1981. Effective Feb. 1985 SURVEY, unadjusted data for Jan. 1982 through June 1984, and seasonally adjusted data from Jan. 1982 through Nov. 1984 have been revised. These revisions are available upon request.

Page S-8

1. Advance estimate.

2. Direct endorsement cases are included beginning with June data.

3. January and February 1983 revised monthly figures are not available from source, but they are included in the 1983 revised annual total.

[◊] Home mortgage rates (conventional first mortgages) are under money and interest rates on p. S-14.

\$ Data include guaranteed direct loans sold.

Includes data for items not shown separately.

[†] Effective April 1985 SURVEY, wholesale trade data have been revised for Jan. 1977-Dec. 1984. A detailed description and the revised series appear in the report "Revised Monthly Wholesale Trade" BW-13-85, available from the Bureau of the Census, Washington, DC 20233; \$2.50 per copy.

[‡] Effective April 1985 SURVEY, retail trade data have been revised for Jan. 1977-Dec. 1984. Revised data and a summary of changes appear in the report "Revised Monthly Retail Sales and Inventories" BR-13-85, available from the Bureau of the Census, Washington, DC 20233; \$2.75 per copy.

* New series. Annual data for earlier periods are available upon request. Monthly data for earlier periods will be available later.

Page S-9

1. Advance estimate.

Includes data for items not shown separately.

[◊] Effective with the January 1985 SURVEY, the seasonally adjusted labor force series have been revised back to January 1980. Effective with the January 1984 SURVEY, the seasonally adjusted labor force series have been revised back to January 1979. Revised monthly data back to 1980 appear in the January 1985 issue of *Employment and Earnings*. Revised monthly data for 1979 appear in the February 1984 issue of *Employment and Earnings*.

[†] The participation rate is the percent of the civilian noninstitutional population in the civilian labor force. The employment-population ratio is civilian employment as a percent of the civilian noninstitutional population, 16 years and over.

[‡] See note "‡" for p. S-8.

* New series.

@ Data include resident armed forces.

Page S-10

[◊] See note "◊" for p. S-9.

* New series.

[†] Effective June 1984 SURVEY, data have been revised back to April 1982 (not seasonally adjusted) and January 1979 (seasonally adjusted) based on the March 1983 benchmark, an improved method for estimating the employment effect of new firms entering the economy, and revised seasonal factors. The June 1984 issue of *Employment and Earnings* contains a detailed discussion of the effects of the revisions.

Page S-11

[‡] This series is not seasonally adjusted because the seasonal component is small relative to the trend-cycle and/or irregular components and consequently cannot be separated with sufficient precision.

[◊] Production and nonsupervisory workers.

* New series.

[†] See note "†" for p. S-10.

Page S-12

1. This series is not seasonally adjusted because the seasonal component is small relative to the trend-cycle and/or irregular components and consequently cannot be separated with sufficient precision. Use the corresponding unadjusted series.

◇ Production and nonsupervisory workers.

† Earnings in 1977 dollars reflect changes in purchasing power since 1977 by dividing by Consumer Price Index.

§ Wages as of Apr. 1, 1985: Common, \$15.91; Skilled, \$20.89.

* New series.

@ New series. The Employment Cost Index (ECI) is a quarterly measure of the average change in the cost of employing labor. See p. S-36 of the August through October 1984 issues of the SURVEY for a brief description of the ECI.

† Excludes farm, household, and Federal workers.

†† See note "†" for p. S-10.

M3.—This measure equals M2 plus large-denomination time deposits (those issued in denominations of \$100,000 or more) at all depository institutions (including negotiable CD's) plus term RP's issued by commercial banks and savings and loan associations.

L.—This broad measure of liquid assets equals M3 plus other liquid assets consisting of other Eurodollar holdings of U.S. nonbank residents, bankers acceptances, commercial paper, savings bonds, and marketable liquid Treasury obligations.

‡‡ Includes ATS and NOW balances at all depository institutions, credit union share draft balances, and demand deposits at thrift institutions.

◇ Overnight (and continuing contract) RP's are those issued by commercial banks to the nonbank public, and overnight Eurodollars are those issued by Caribbean branches of member banks to U.S. nonbank customers.

* New series. For "Other checkable deposits," see also note "‡‡" for this page.

@ Small time deposits are those issued in amounts of less than \$100,000. Large time deposits are those issued in amounts of \$100,000 or more and are net of the holdings of domestic banks, thrift institutions, the U.S. Government, money market mutual funds, and foreign banks and official institutions.

Includes data for items not shown separately.

§ Number of issues represents number currently used; the change in number does not affect the continuity of the series.

@@ Annual data for 1978-82 and monthly data for 1982 have been revised to exclude private placements. Monthly revisions for 1978-81 are not available.

Page S-13

1. Average for Dec.

2. Reported annual; monthly revisions are not available.

3. Effective December 1, 1982, there was a break in the commercial paper series because of changes in reporting panels, modifications to reporting instructions and corrections to misreported bank data.

‡ Effective January 1984, series revised due to changes in the reporting panel and in the item contents. The new panel includes 168 banks that had domestic office assets exceeding \$1.4 billion as of December 31, 1982.

Includes data for items not shown separately.

‡‡ Reflects offsetting changes in classification of deposits of thrift institutions. Deposits of thrifts were formerly grouped with deposits of individuals, partnerships, and corporations, instead of with deposits of commercial banks in the United States.

"Transaction balances other than demand deposits" consists of ATS, NOW, super NOW, and telephone transfer accounts, which formerly were classified with savings deposits. "Nontransaction balances" reflects the combination of deposits formerly reported separately as time deposits and the savings deposits remaining after deduction of the items now reported separately under "transaction balances."

§ Excludes loans and federal funds transactions with domestic commercial banks and includes valuation reserves (individual loan items are shown gross; i.e., before deduction of valuation reserves).

◇ Securities of Federal agencies and corporations have been shifted out of "other securities" and are now combined with U.S. Treasury securities. Also, loan obligations of States and political subdivisions have been shifted out of "other securities" and are now shown separately among the loan items.

@ Insured unemployment (all programs) data include claims filed under extended duration provisions of regular State laws; amounts paid under these programs are excluded from state benefits paid data.

@@ Insured unemployment as a percent of average covered employment in a 12-month period.

Page S-14

1. Data are for fiscal years ending Sept. 30 and include revisions not distributed to the months.

2. Weighted by number of loans.

† Effective March 1985 SURVEY, the consumer installment credit series have been revised back to July 1980 to reflect more complete benchmark data for some of the components.

Includes data for items not shown separately.

◇ Adjusted to exclude domestic commercial interbank loans and federal funds sold to domestic commercial banks.

‡ Rates on the commercial paper placed for firms whose bond rating is Aa or the equivalent.

‡‡ Courtesy of Metals Week.

@@ Average effective rate

* New series. For an explanation of the prime rate and historical data, see p. S-36 of the June or July 1984 SURVEY.

Page S-15

1. Beginning 1983, the reporting frequency has been changed from a monthly to a quarterly basis.

2. This series has been discontinued.

† Effective Feb. 1985 SURVEY, the money stock measures and components have been revised and are available from the Banking Section of the Division of Research and Statistics at the Federal Reserve Board, Washington, D.C. 20551

‡ Composition of the money stock measures is as follows:

M1.—This measure is currency plus demand deposits at commercial banks and interest-earning checkable deposits at all depository institutions—namely NOW accounts, automatic transfer from savings (ATS) accounts, and credit union share draft balances—as well as a small amount of demand deposits at thrift institutions that cannot, using present data sources, be separated from interest-earning checkable deposits.

M2.—This measure adds to M1 overnight repurchase agreements (RP's) issued by commercial banks and certain overnight Eurodollars (those issued by Caribbean branches of member banks) held by U.S. nonbank residents, money market mutual fund shares, and savings and small-denomination time deposits (those issued in denominations of less than \$100,000) at all depository institutions. Depository institutions are commercial banks (including U.S. agencies and branches of foreign banks, Edge Act corporations, and foreign investment companies), mutual savings banks, savings and loan associations, and credit unions.

M3.—This measure equals M2 plus large-denomination time deposits (those issued in denominations of \$100,000 or more) at all depository institutions (including negotiable CD's) plus term RP's issued by commercial banks and savings and loan associations.

L.—This broad measure of liquid assets equals M3 plus other liquid assets consisting of other Eurodollar holdings of U.S. nonbank residents, bankers acceptances, commercial paper, savings bonds, and marketable liquid Treasury obligations.

‡‡ Includes ATS and NOW balances at all depository institutions, credit union share draft balances, and demand deposits at thrift institutions.

◇ Overnight (and continuing contract) RP's are those issued by commercial banks to the nonbank public, and overnight Eurodollars are those issued by Caribbean branches of member banks to U.S. nonbank customers.

* New series. For "Other checkable deposits," see also note "‡‡" for this page.

@ Small time deposits are those issued in amounts of less than \$100,000. Large time deposits are those issued in amounts of \$100,000 or more and are net of the holdings of domestic banks, thrift institutions, the U.S. Government, money market mutual funds, and foreign banks and official institutions.

Includes data for items not shown separately.

§ Number of issues represents number currently used; the change in number does not affect the continuity of the series.

@@ Annual data for 1978-82 and monthly data for 1982 have been revised to exclude private placements. Monthly revisions for 1978-81 are not available.

Page S-16

1. The Aaa public utility average was suspended Jan. 17, 1984, because of a lack of appropriate issues. The average corporate and the Aaa corporate do not include Aaa utilities from Jan. 17 to Oct. 12. The Aaa utility average was reinstated on Oct. 12; the Oct. monthly average includes only the last 14 days of the month.

Number of issues represents number currently used; the change in number does not affect the continuity of the series.

‡ For bonds due or callable in 10 years or more.

Includes data for items not shown separately.

@ Data may not equal the sum of the geographic regions, or commodity groups and principal commodities, because of revisions to the totals not reflected in the component items.

◇ As of Jan. 25, 1984, the base period was changed to 1982=100.

Page S-17

1. Beginning with Jan. 1982 data, the Customs value is being substituted for the f.a.s. value.

Includes data not shown separately.

§ Data may not equal the sum of geographic regions, or commodity groups and principal commodities, because of revisions to the totals not reflected in the components.

Page S-18

1. See note 1 for p. S-17.

2. Annual total; quarterly or monthly revisions are not available.

3. Before extraordinary and prior period items.

4. For month shown.

5. Domestic trunk operations only (averaging about 90 percent of domestic total).

6. Restaurant sales index data represent hotels and motor hotels only.

Includes data for items not shown separately.

§ Total revenues, expenses, and income for all groups of carriers also reflect nonscheduled service.

‡ Beginning Jan. 1977, Class I railroads are defined as those having operating revenues of \$50 million or more.

◇ Average daily rent per room occupied, not scheduled rates.

Data represent entries to a national park for recreational use of the park, its services, conveniences, and/or facilities.

* New series.

Page S-19

1. Reported annual total; monthly revisions are not available.

2. Data for 1984 are not comparable to 1983 because of court ordered divestiture.

3. Less than 500 short tons.

4. Data are unavailable after 1983.

Includes data for items not shown separately.

§ Data are reported on the basis of 100 percent content of the specified material unless otherwise indicated.

‡ Monthly data back to 1981 have been revised and are available upon request.

* New series, first shown in the Mar. 1984 SURVEY. Annual and monthly data back to 1980 are available upon request.

@ Because of deregulation, carriers are free to enter both domestic and international markets. Previously, carriers were limited either to domestic or overseas markets. Separate data for domestic or overseas are no longer available.

Page S-20

1. Reported annual total; monthly or quarterly revisions are not available.

2. Annual total includes data for Hawaii; not distributed to the months.

Data are not wholly comparable from year to year because of changes from one classification to another.

‡ Revised quarterly data for 1981-83 are available upon request.

◇ Effective 1983, data are based on a new sample of approximately 150 establishments, which was selected using the 1981 annual survey "Paints and Allied Products" panel as a universe frame. Comparable data for 1979-82 and revisions for 1983 are available upon request.

† Effective with the July 1984 SURVEY, data for 1980-82 (and 1975 for revenue from sales to customers) have been revised. Effective with the Feb. 1985 SURVEY, data for 1982-83 have been revised. These revisions are available upon request.

Page S-21

- † See note "†" for p. S-28.
- # Compiled by the American Newspaper Publishers Association.

Page S-30

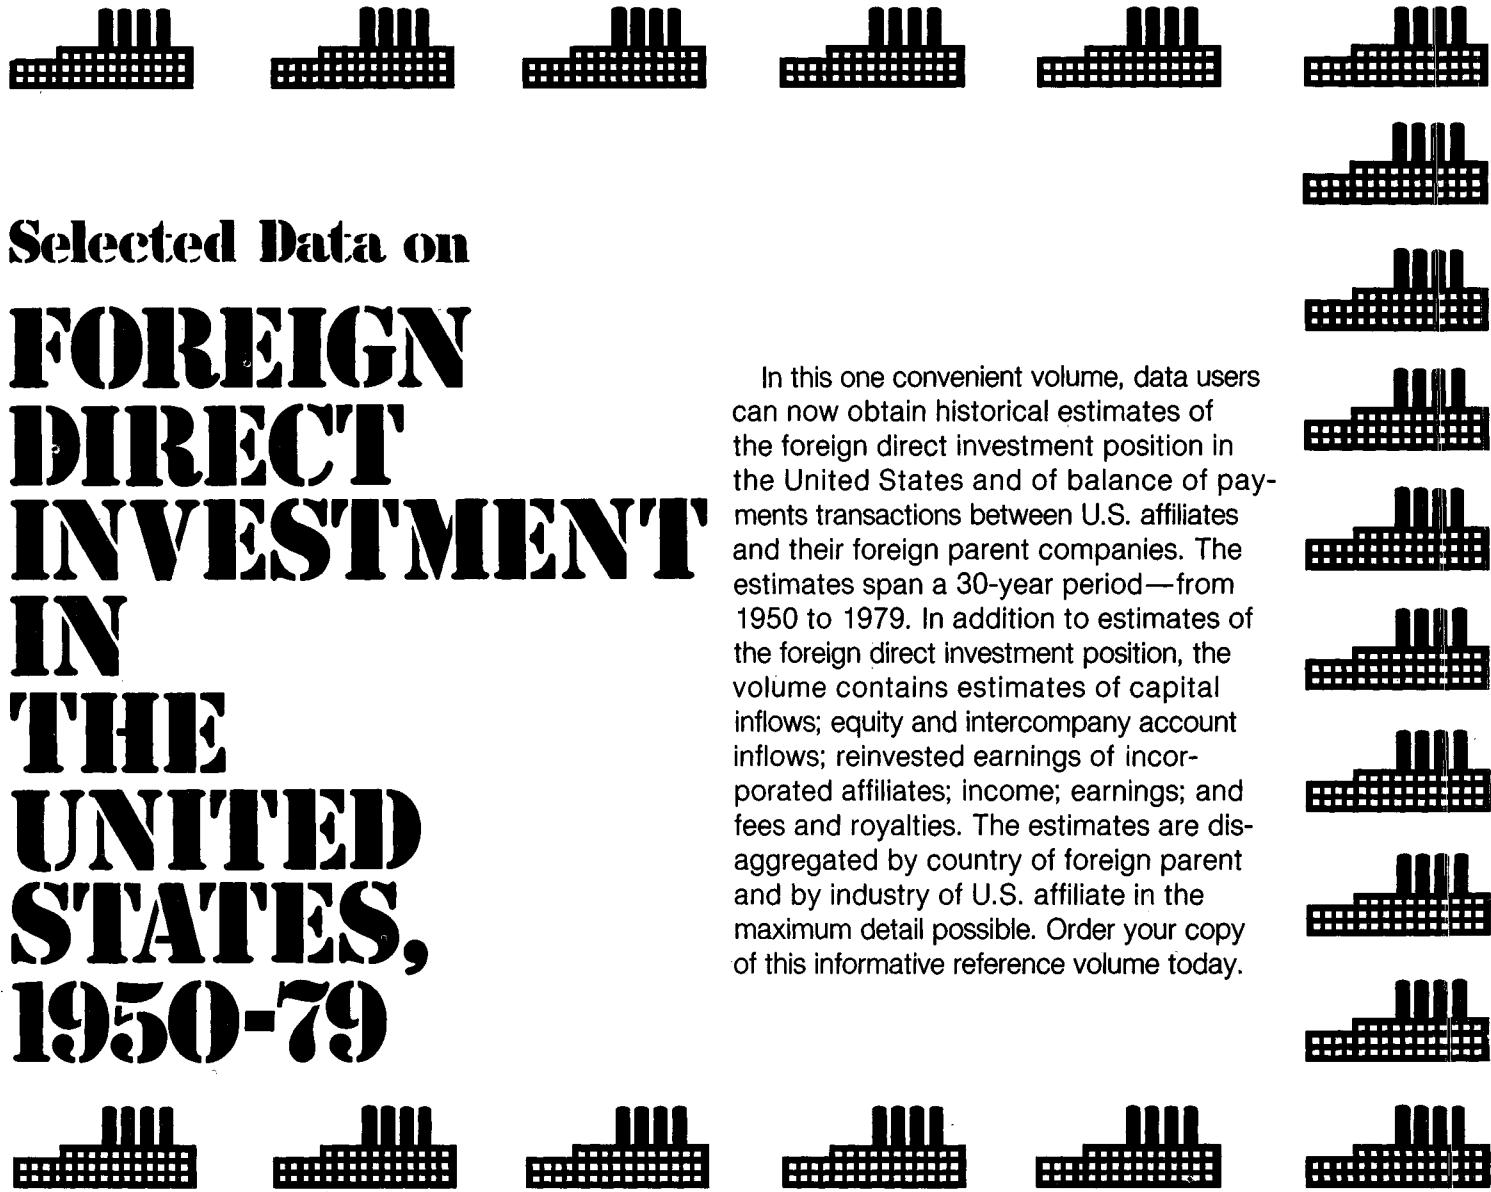

1. Reported annual total; revisions not allocated to the months.
 2. Crop for the year.
 3. Data cover five weeks; other months, four weeks.
 4. Data are no longer available.
- # Includes data for items not shown separately.
- ◊ Cumulative ginnings to the end of month indicated.
- § Bales of 480 lbs.
- ‡ Monthly revisions for 1982 and 1983 are available upon request.
- † Monthly revisions for 1981-83 are available upon request.
- @ Effective with the Mar. 1984 SURVEY, sales of regular basecoat and all other building plasters (including Keene's cement) have been combined to represent sales of total building plasters. For comparability, earlier published figures for these two series should be combined.

Page S-31

1. Less than 500 bales.
 2. Annual total includes revisions not distributed to the months.
 3. Average for crop year; Aug. 1-Jul. 31.
 4. For five weeks; other months four weeks.
 5. Average for 10 months; no data for Jan.-Feb.
- ◊ Based on 480-lb. bales, preliminary price reflects sales as of the 15th; revised price reflects total quantity purchased and dollars paid for the entire month (revised price includes discounts and premiums).
- # Includes data not shown separately.
- * New series.
- § Bales of 480 lbs..
- @ Monthly data discontinued for the year 1982; reinstated beginning Jan. 1983.

Page S-32

1. Annual total includes revisions not distributed to the months.
 2. Production of new vehicles (thous. of units) for Mar. 1985: passenger cars, 747; trucks and buses, 295.
 3. Effective with the Feb. 1984 SURVEY, data have been revised back to 1981. Effective with the Mar. 1985 SURVEY, data have been revised back to 1982. These revisions, which were made to reflect updated seasonal factors, are available upon request.
 4. See note "##" for this page.
 5. Series has been discontinued.
 6. Effective with the July 1984 SURVEY, data for 1983 have been revised and are available upon request.
 7. See note "†" for this page.
- # Total includes backlog for nonrelated products and services and basic research.
- § Domestic cars comprise all cars assembled in the U.S. and cars assembled in Canada and imported to the U.S. under the provisions of the Automotive Products Trade Act of 1965. Imports comprise all other cars.
- ◊ Courtesy of R.L. Polk & Co.; republication prohibited. Because data for some states are not available, month-to-month comparisons are not strictly valid.
- ‡ Excludes railroad-owned private refrigerator cars and private line cars.
- † Monthly revisions for aircraft shipments and airframe weight for 1982 and 1983 are available upon request. Monthly revisions for truck trailers, etc. for 1981-83 are available upon request.
- @ Includes passenger vans.
- * New series, first shown in the Mar. 1984 SURVEY. Annual and monthly data back to 1967 are available upon request.
- †† Includes Volkswagen produced in the U.S.
- ## Sizes (gross vehicle weight) are classified as follows: Light-duty, up to 14,000 lbs.; medium-duty, 14,001 - 26,000 lbs.; and heavy-duty, 26,001 lbs. and over.
- ## Annual and monthly data back to 1981 have been replaced with total imports of passenger cars published by the International Trade Commission, which exclude estimated quantities of passenger cars assembled in foreign trade zones. These new data, which are comparable with data previously published for 1980 and earlier periods, are available upon request.
- @@ Monthly data discontinued for the year 1982; reinstated beginning Jan. 1983.

Selected Data on FOREIGN DIRECT INVESTMENT IN THE UNITED STATES, 1950-79

In this one convenient volume, data users can now obtain historical estimates of the foreign direct investment position in the United States and of balance of payments transactions between U.S. affiliates and their foreign parent companies. The estimates span a 30-year period—from 1950 to 1979. In addition to estimates of the foreign direct investment position, the volume contains estimates of capital inflows; equity and intercompany account inflows; reinvested earnings of incorporated affiliates; income; earnings; and fees and royalties. The estimates are disaggregated by country of foreign parent and by industry of U.S. affiliate in the maximum detail possible. Order your copy of this informative reference volume today.
