

Volume II

Appendices C-H, Employment Outcomes

Technical Notes on Reading the Tables in Appendices C-H

Significance Testing

There are two different tests of significance for the SCSSEP employment outcome measures: the Fisher's Exact test for percentages and the t-test for means (averages). The Fisher's Exact test is used for the entered employment and employment retention measures. The t-test is used for the average earnings measure. Both tests use the Bonferroni method to adjust for multiple comparisons. Both tests are two-sided tests with significance level $p < 0.05$, meaning there were fewer than 5 chances in 100 that this result would have occurred by chance.

The differences in pairs of percentages or averages are denoted by different subscripts in the individual cells. However, cells in a particular row in a table are highlighted only when the disparity in the numbers indicates that the majority is favored over the minority group. For example, if the White cell has an "a" and the Black cell has a "b," and the percentage for the White cell is larger than that for the Black cell, those two percentages or averages are significantly different and the cells will be highlighted. If White is "a" and Black is "a," then there is no significant difference and there will be no highlighting. Moreover, if the table row has White as "a" and Black as "b," but the Black group's percentage or average is higher than the White group's, the row is not highlighted because the disparity favors the minority group.

In certain instances there are slight discrepancies between the percentages or averages presented for national and state grantees in Volume I and the same numbers presented in the tables in Volume II. These discrepancies, usually a fraction of a percent or a few dollars (in the case of average earnings) are the result of differences in the calculation methods. In no instance are they substantive.

Additional Notations

- Cells with no subscript are not included in the test. Tests assume equal variances.
- If marked with "1," the cell is not used in comparisons because the sum of case weights is less than two.
- If marked with "2," the cell is not used in comparisons because there are no other valid categories to compare.
- If marked with "3," Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
- If marked with "4," pairwise comparisons are not performed for some subtables because of numerical problems.

Appendix C. Entered Employment Tables, Grantees

Table 1: Entered Employment, Grantees by Race
