

# *The Future Electricity Fuels Mix: Key Drivers*

---

*for*

*Electric Power Conference & Exhibition*

*May 15<sup>th</sup>, 2012 | Baltimore, Maryland*

*by*

*Howard Gruenspecht, Acting Administrator*

## Key results from the *AEO2012* Reference case, which assumes current laws remain unchanged

- Projected growth of energy use slows over the projection period reflecting an extended economic recovery and increasing energy efficiency in end-use applications
- Domestic crude oil production increases, reaching levels not experienced since 1994 by 2020
- With modest economic growth, increased efficiency, growing domestic production, and continued adoption of nonpetroleum liquids, net petroleum imports make up a smaller share of total liquids consumption
- Natural gas production increases throughout the projection period and exceeds consumption early in the next decade
- Renewables and natural gas fuel a growing share of electric power generation
- Total U.S. energy-related carbon dioxide emissions remain below their 2005 level through 2035

# What is included (and excluded) in developing EIA's "Reference case" projections?

- Generally assumes current laws and regulations
  - excludes potential future laws and regulations (e.g., proposed greenhouse gas legislation and proposed fuel economy standards are not included)
  - provisions generally sunset as specified in law (e.g., renewable tax credits expire)
- Some grey areas
  - adds a premium to the capital cost of CO<sub>2</sub>-intensive technologies to reflect current market behavior regarding possible future policies to mitigate greenhouse gas emissions
  - assumes implementation of existing regulations that enable the building of new energy infrastructure and resource extraction
- Includes technologies that are commercial or reasonably expected to become commercial over next decade or so
  - includes projected technology cost and efficiency improvements, as well as cost reductions linked to cumulative deployment levels
  - does not assume revolutionary or breakthrough technologies

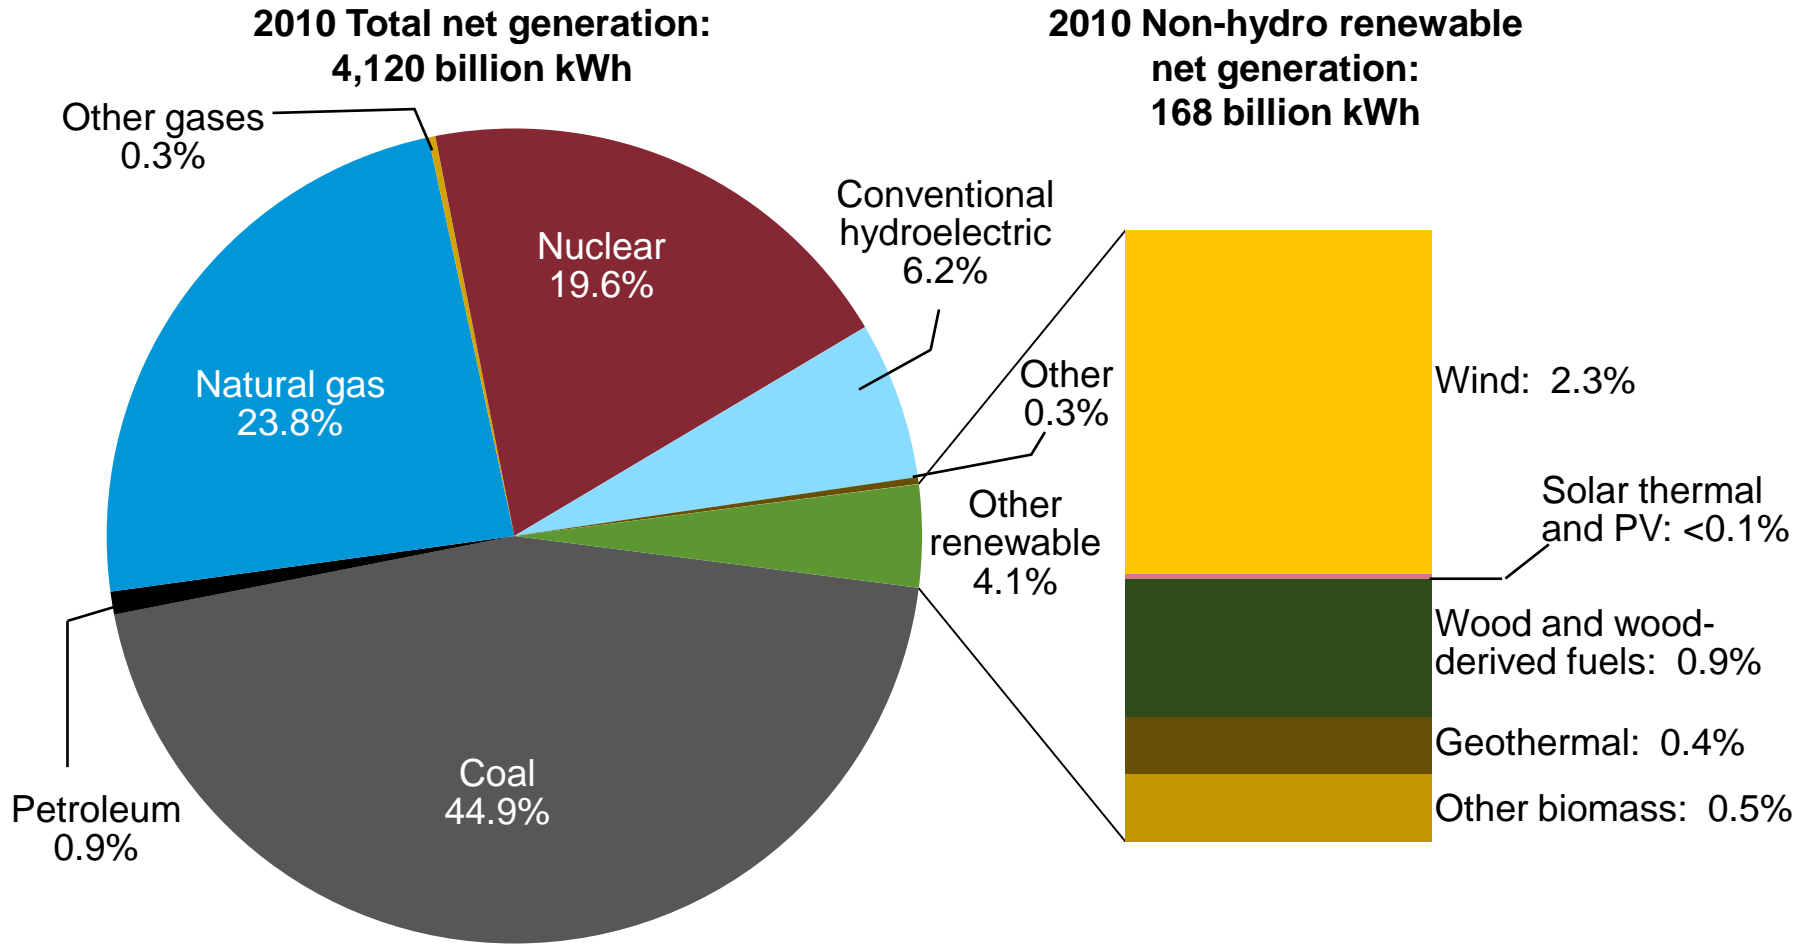

# Energy use grows slowly over the projection in response to a slow and extended economic recovery and improving energy efficiency

U.S. primary energy consumption  
quadrillion Btu per year

Source: EIA, Annual Energy Outlook 2012 Early Release

# In 2010, U.S. electricity generation was 70% fossil fuels, 20% nuclear, and 10% renewable

Source: EIA, Annual Energy Review, October 2011

# The fuel mix for electricity generation varies widely across U.S. regions (2010)

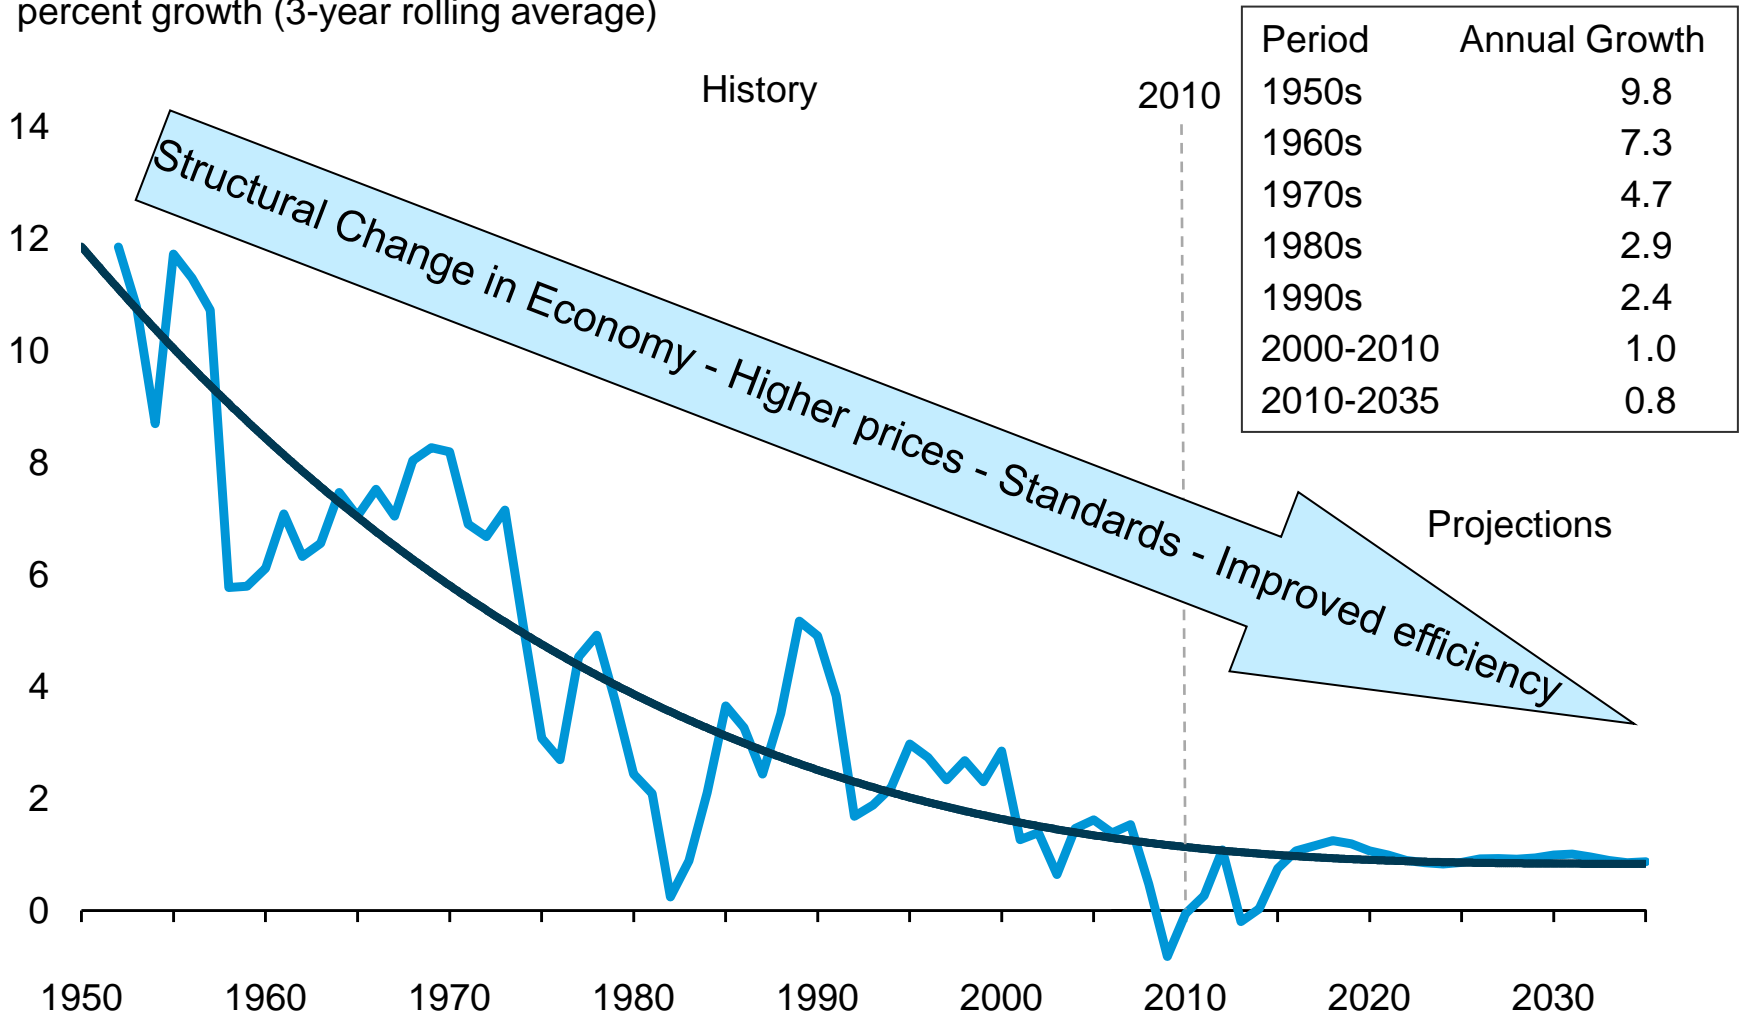

Share of Generation by Fuel, 2010

	National Average	Minimum	Maximum
Coal	45%	0%	80%
Natural Gas	24%	3%	85%
Nuclear	20%	0%	40%
Renewables	10%	0%	50%
Oil / Other	1%	0%	8%

Source: EIA AEO2012 (Early Release), based on Form EIA-923

# While electricity consumption grows by 23% over the projection, the annual rate of growth slows

percent growth (3-year rolling average)

Source: EIA, Annual Energy Outlook 2012 Early Release

# Electricity mix gradually shifts to lower-carbon options, led by growth in renewables and natural gas

electricity net generation

trillion kilowatthours per year

Source: EIA, Annual Energy Outlook 2012 Early Release

# Non-hydro renewable sources more than double between 2010 and 2035

non-hydropower renewable generation  
billion kilowatthours per year

Source: EIA, Annual Energy Outlook 2012 Early Release

## Examples of updated environmental retrofit costs

<b>Flue Gas Desulfurization (2010\$/kW)</b>		
	Capital Costs (\$/kW)	VOM (\$/MWh)
300 MW	\$602	\$1.72
500 MW	\$521	
700 MW	\$474	

<b>Selective Catalytic Reduction (2010 \$/kW)</b>		
	Capital Costs (\$/kW)	VOM (\$/MWh)
300 MW	\$203	\$1.30
500 MW	\$185	
700 MW	\$177	

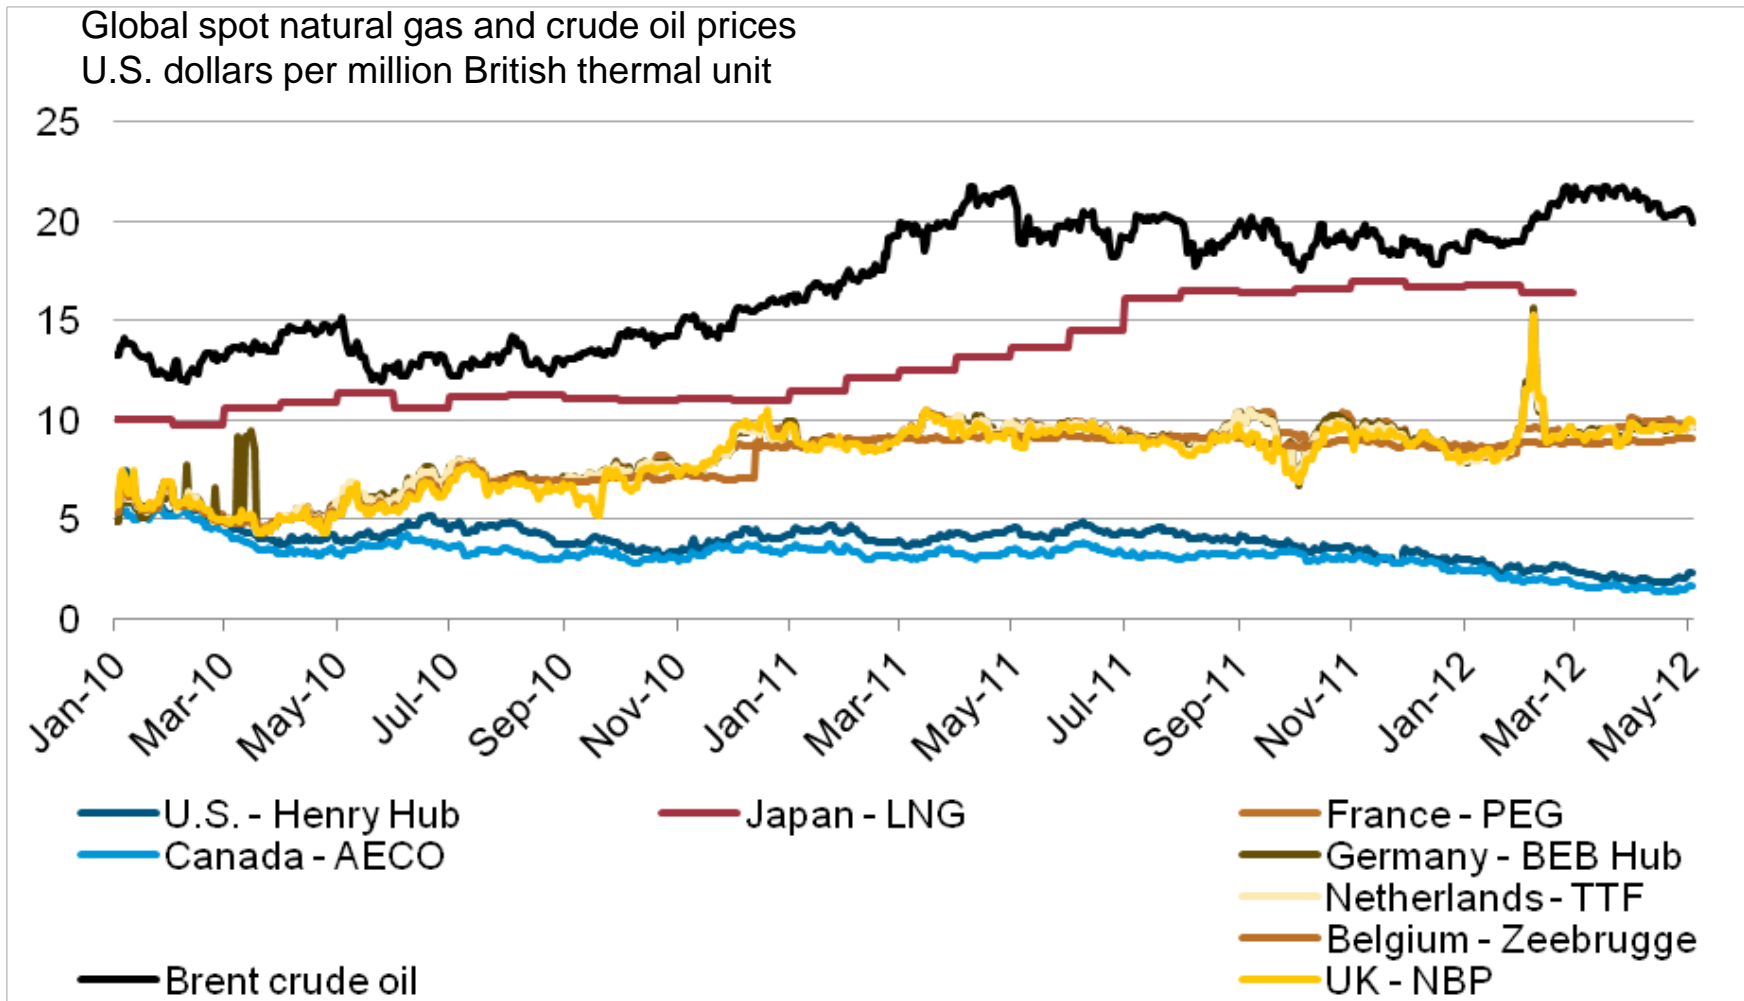

<b>Dry Sorbent Injection + Full Fabric Filter (Baghouse) (2010\$/kW)</b>		
Size (MW)	Capital Cost (\$/kW)	VOM (\$/MWh)
300	197	6.72
500	180	
700	171

# Operating costs: existing plants with and without a value on carbon

## Fuel Cost for Existing Coal and Combined Cycle Natural Gas Units with a Value Placed on Carbon Dioxide Emissions

- The “crossover point” for least-cost dispatch of coal and natural gas capacity depends on both fuel prices and the carbon value. At lower natural gas prices, the “crossover” occurs at a lower carbon value.
- Environmental operating costs and retrofit costs for pollution controls at existing coal-fired plants can “raise the bar” for their continued operation.
  - For retrofit decisions, the unit’s perceived “useful life,” which plays a critical role, can be affected by views regarding future climate policies
