## An Overview of the Results and Methods of State RPS Cost-Benefit Projections

#### Ryan H. Wiser

Lawrence Berkeley National Laboratory rhwiser@lbl.gov; 510-486-5474

**EPA RPS Collaborative Conference Call** 

June 7, 2005

**Environmental Energy Technologies Division** • Energy Analysis Department

## **Project Overview**

#### • Project scope

- Survey of 22 RPS cost impact analyses
- Sample includes state or utility-level analyses completed since 1998

#### Comparison of key results

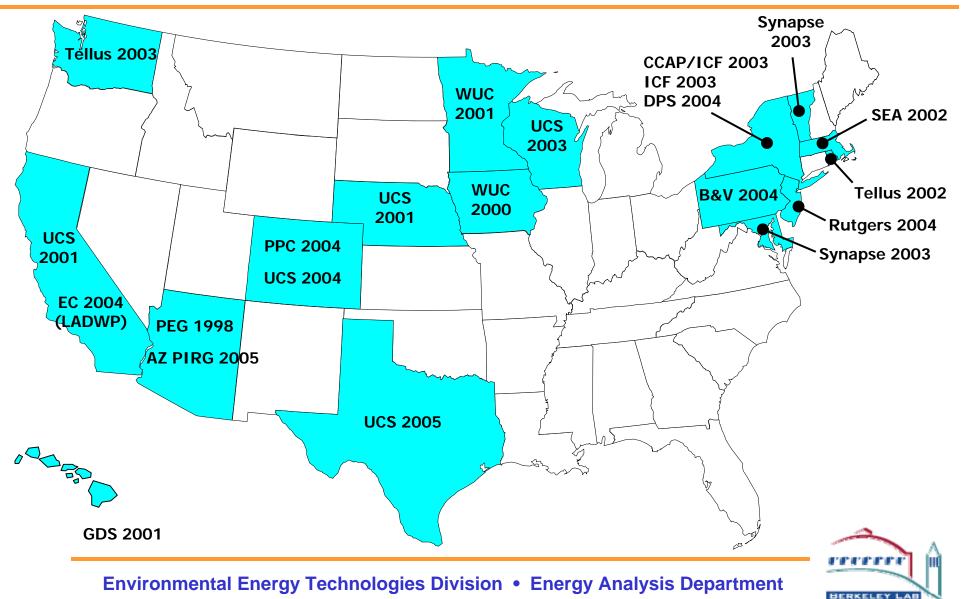

- Direct or inferred retail rate impacts
- Renewable deployment by technology
- Secondary cost impacts and benefits
- All results presented are taken from the first year that each RPS hits its ultimate target level (e.g. 2013 for New York, 2010 for California)

#### Comparison of study methodologies

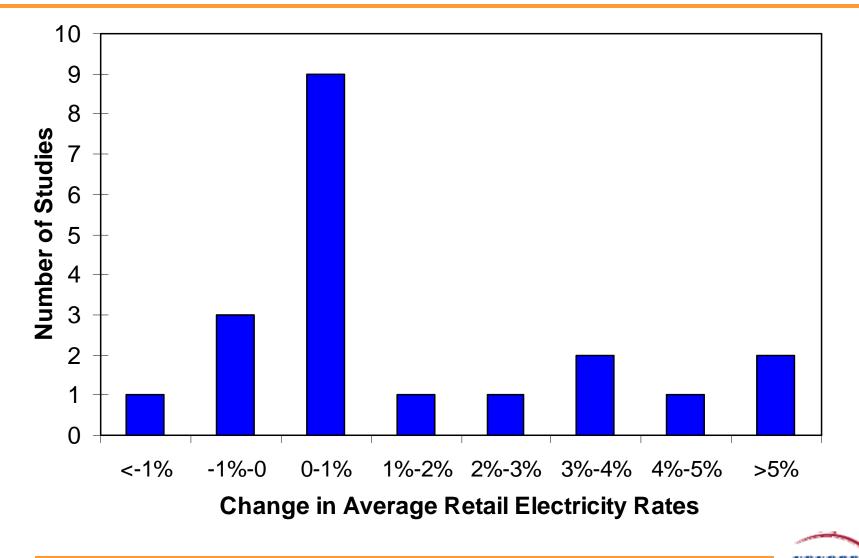

- General modeling approaches
- Renewable resource characterization
- Avoided fossil generation
- Sensitivity scenarios
- Other details

#### RPS Cost-Impact Study Sample: Who, When, and Where?

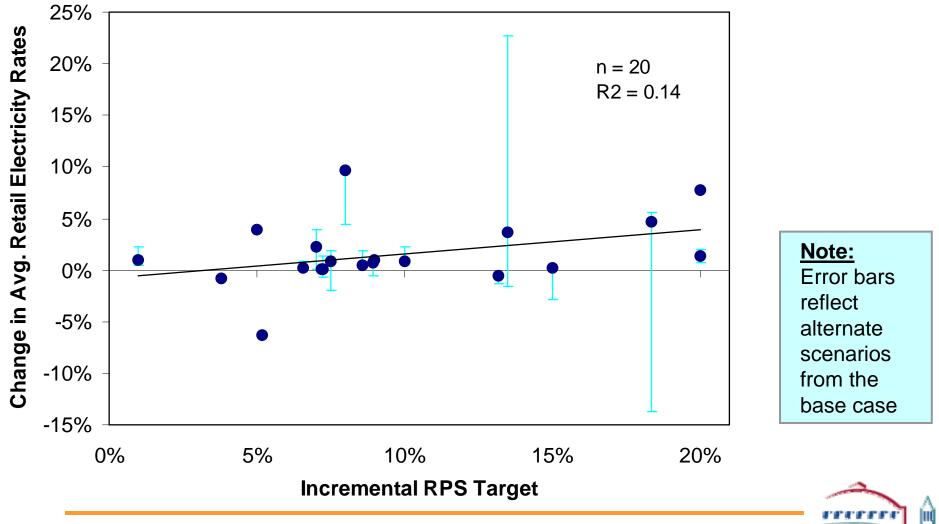

#### Distribution of Base-Case Impacts on Average Retail Electricity Rates

**Environmental Energy Technologies Division • Energy Analysis Department** 

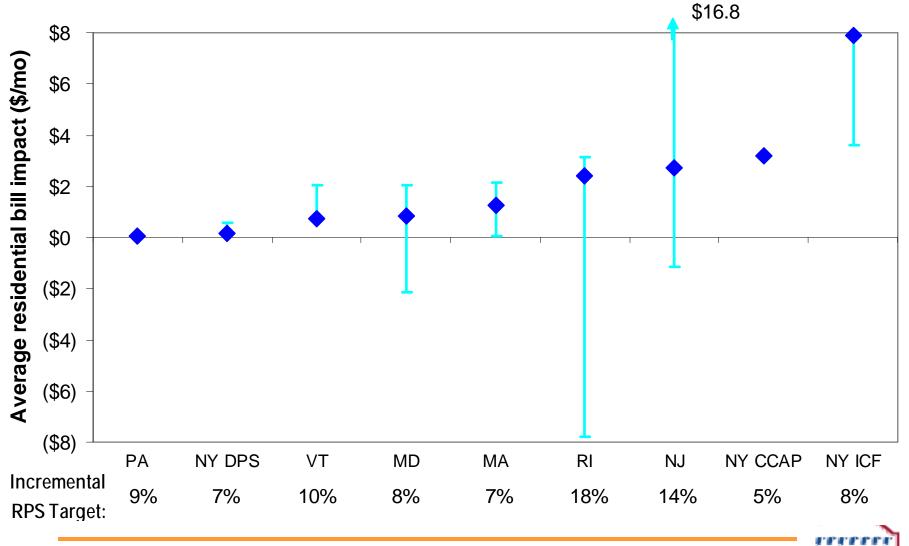

#### Relationship Between Incremental RPS **Targets and Retail Rate Impacts**

**Environmental Energy Technologies Division** • Energy Analysis Department

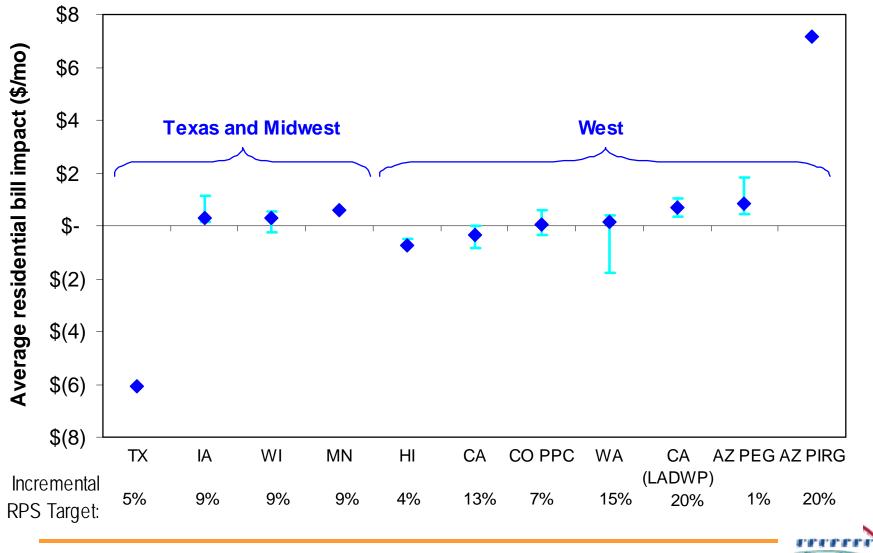

BERKELEY L

#### Residential Electricity Bill Impacts: Northeast

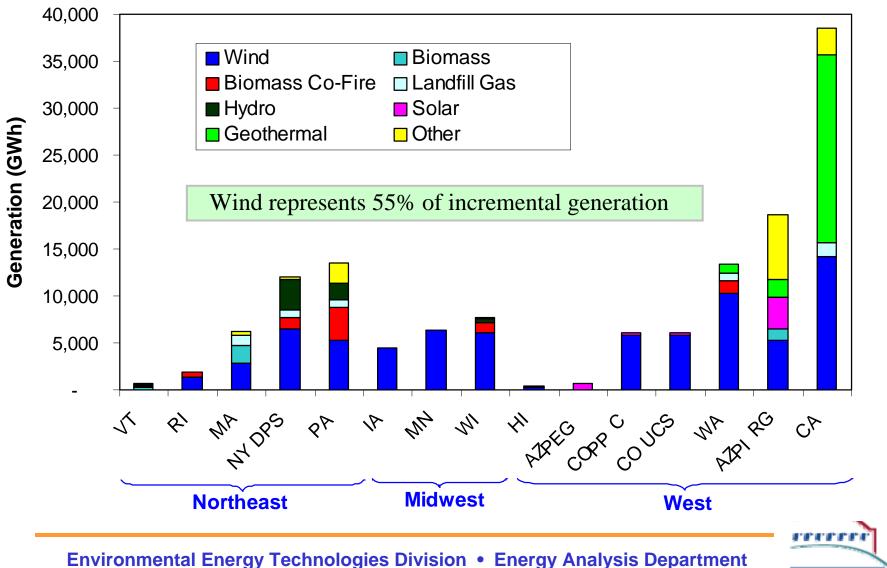

**Environmental Energy Technologies Division** • Energy Analysis Department

#### Residential Electricity Bill Impacts: Midwest, Texas, West

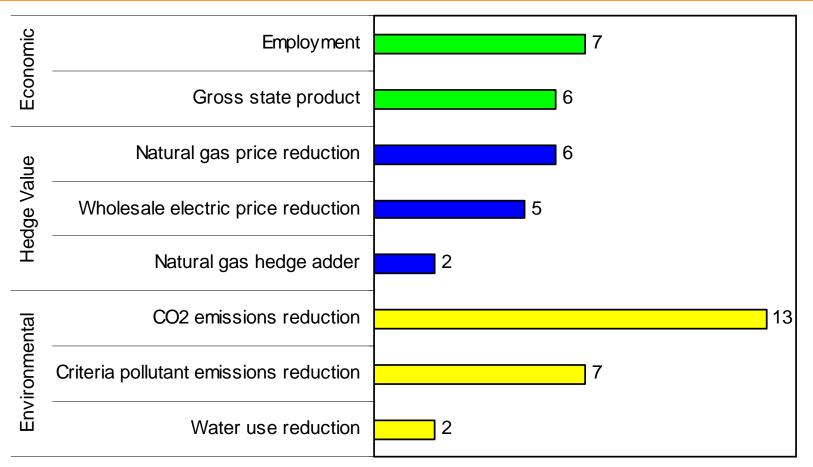

**Environmental Energy Technologies Division** • Energy Analysis Department

### Incremental Renewable Deployment by Study and Technology

BERKELEY L

#### Many Studies Also Evaluate Potential Public Benefits

Number of studies considering each scenario

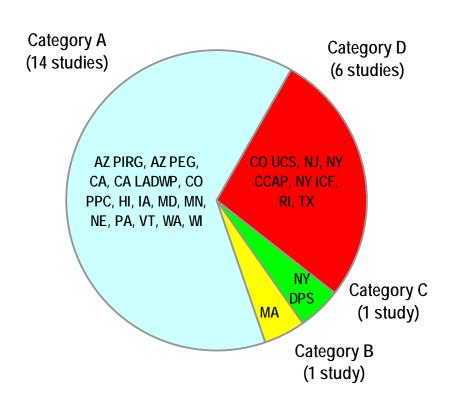

### Four General Modeling Approaches Have Been Used

#### Four broad categories:

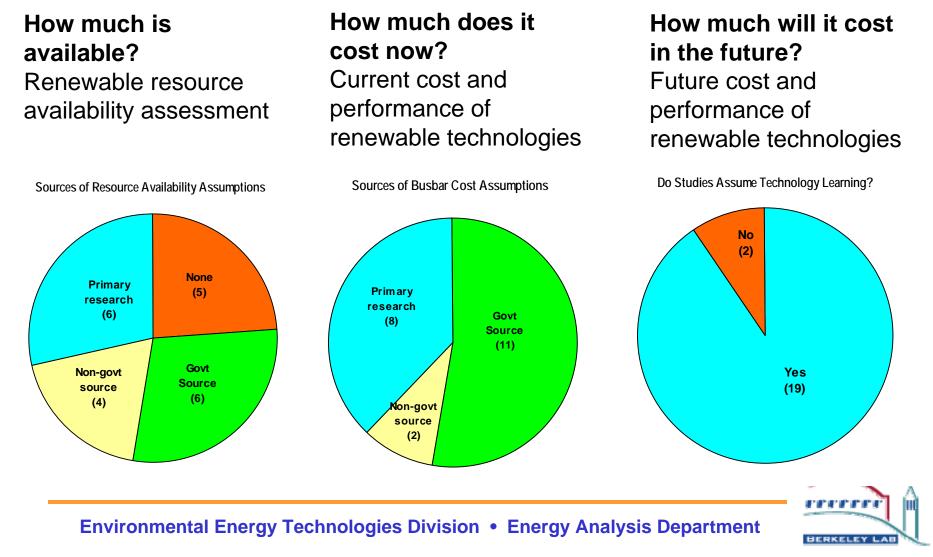

- Category A: Linear spreadsheet model of both RE + avoided utility cost
- Category B: Linear spreadsheet model of RE + generation dispatch model of avoided utility cost with basecase resource mix
- Category C: Linear spreadsheet model of RE + generation dispatch model of avoided utility cost with implied RPS mix
- Category D: Integrated energy model

### Estimating the Busbar Cost of Renewable Energy

#### Three major components of renewable generation cost estimation:

# Many Studies Appropriately Consider the Secondary Costs of Renewable Generation

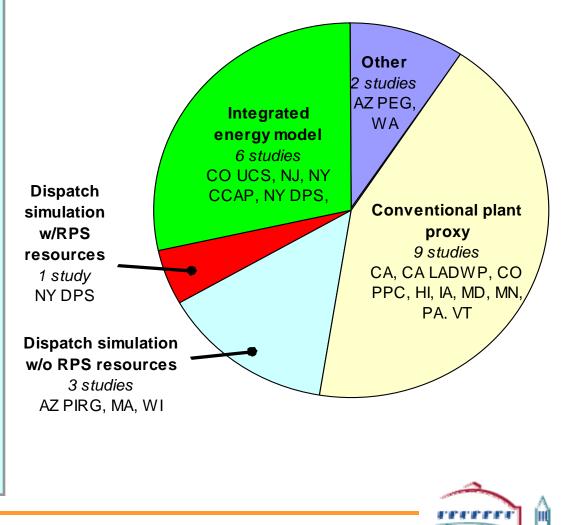

Cost Variable	Number of studies	Studies
Capacity value	13	AZ PEG, CO PPC, CO UCS, IA, MD, MA, MN, NY DPS, NY ICF, PA, RI, TX, WI
Time differentiation of renewable generation	10	CA, CO UCS, MA, NJ, NY CCAP, NY DPS, NY ICF, RI, TX, WI
Transmission cost	10	CA, CA LADWP, CO PPC, CO UCS, IA, MA, MN, TX, VT, WI
Integration cost	8	CO PPC, CO UCS, IA, MN, NJ, TX, WA, WI
Admin. & transaction cost	4	CA, MA, WA, WI

## Methodologies for Estimating Avoided Costs Vary Among the Studies

#### Five major categories:

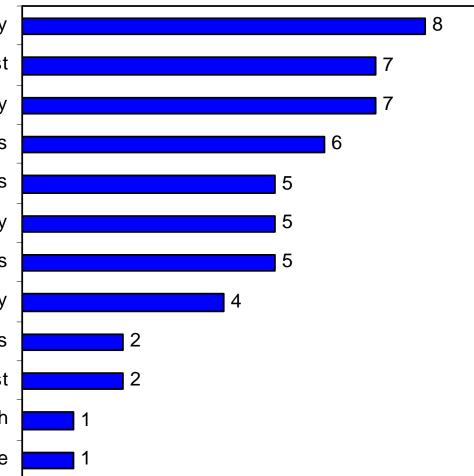

- 1. Conventional fossil fuel plant proxy
- 2. Dispatch simulation model w/o RPS resources
- 3. Dispatch simulation model w/RPS resources
- 4. Integrated energy model
- 5. Other

BERKELEY

#### Scenario Analysis Is Often Used to Bound the Possible Impacts

Fossil fuel price uncertainty Renew able technology cost Production Tax Credit availability Alternate RPS target levels Availability of imports Wholesale market price uncertainty Financing/contract assumptions Resource eligiblity Demand for RE from other sources Maximun compliance penalty cost Load grow th Carbon credit value

Number of studies considering each scenario

## Conclusions

- The cost of RPS policies is typically projected to be relatively modest
  - less than 5% increase in rates and less than \$5/month for an avg. household, with cost savings a possibility; high end of range typically from the Northeast
- Wind power expected to serve 55% of the RPS-driven RE demand
- Recent trend toward studies that forecast not just costs and environmental benefits, but also macroeconomic and hedge benefits
- Studies use a variety of methods and data sources to calculate costs and benefits: a standard study "template" has not yet emerged
- Sophistication and detail of cost-impact analysis is largely a function of available funds and the purposes of the study
  - Not entirely clear that more sophisticated *models* necessarily improve accuracy
- Assumptions for primary and secondary costs and benefits likely to be more important than what model is used
  - natural gas price forecast, whether PTC is assumed to exist, projected transmission costs, supply curves for renewable energy

## Some Possible Areas of Improvement...

- Improved Treatment of Transmission Costs: these costs are often poorly understood and imprecisely modeled
- **Competing RPS Requirements:** consider potential RPS policies in nearby states, and impact on RE resource supply and cost
- **Coal as the marginal price setter:** at high natural gas prices, need to consider possibility that RE will increasingly offset coal
- Greater Use of Scenario Analysis: natural gas and wholesale price forecasts, PTC availability
- Consideration of Future Carbon Regulation: consider impacts in the event that future carbon regulations are established
- More Robust Treatment of Public Benefits: in particular, employment, economic development, and hedge benefits
