

# Effects of Black Carbon and CO<sub>2</sub> Domes on Climate and Air Quality

Mark Z. Jacobson  
Stanford University

David G. Streets  
Argonne National Laboratory

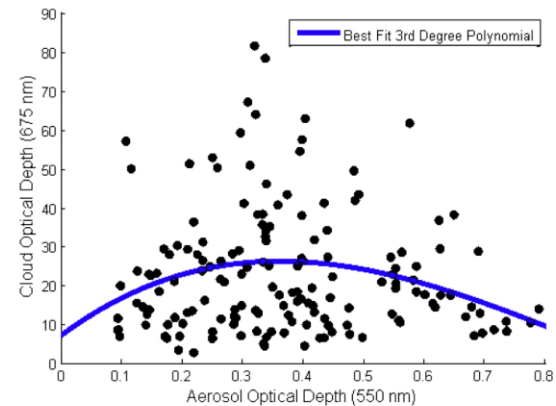

Consequences of Global Change for Air Quality Progress Review  
Oct. 4, 2010, U.S. EPA, Research Triangle Park, North Carolina

# MODIS Aqua Cloud Optical Depth vs. AOD Over Biomass-Burning Region Brazil Sep '06

Ten Hoeve, Remer, and Jacobson (2010)

# Boomerang Effect: Satellite COD vs. AOD

MODIS, binned by percentile column water vapor 2004-07 for (a) all clouds (b) low clouds → boomerang for all water bins

Calipso Lidar Aug. 12, 2006 → aerosols below/within clouds → boomerang from MODIS

Ten Hoeve, Remer, and Jacobson (2010)

# GATOR-GCMOM Model COD vs. AOD

Sep. '06

# Cloud Microphysical and Chemical Processes

Condensation/deposition of water vapor onto aerosol particles

Coagulation: Aerosol-aerosol    Aerosol-liquid    Aerosol-ice    Aerosol-graupel  
 Liquid-liquid    Liquid-ice    Liquid-graupel    Ice-ice  
 Ice-graupel    Graupel-graupel

Gas dissolution, aqueous chemistry, hom.-het. freezing, contact freezing

Shrinkage, precipitation, rainout, and washout

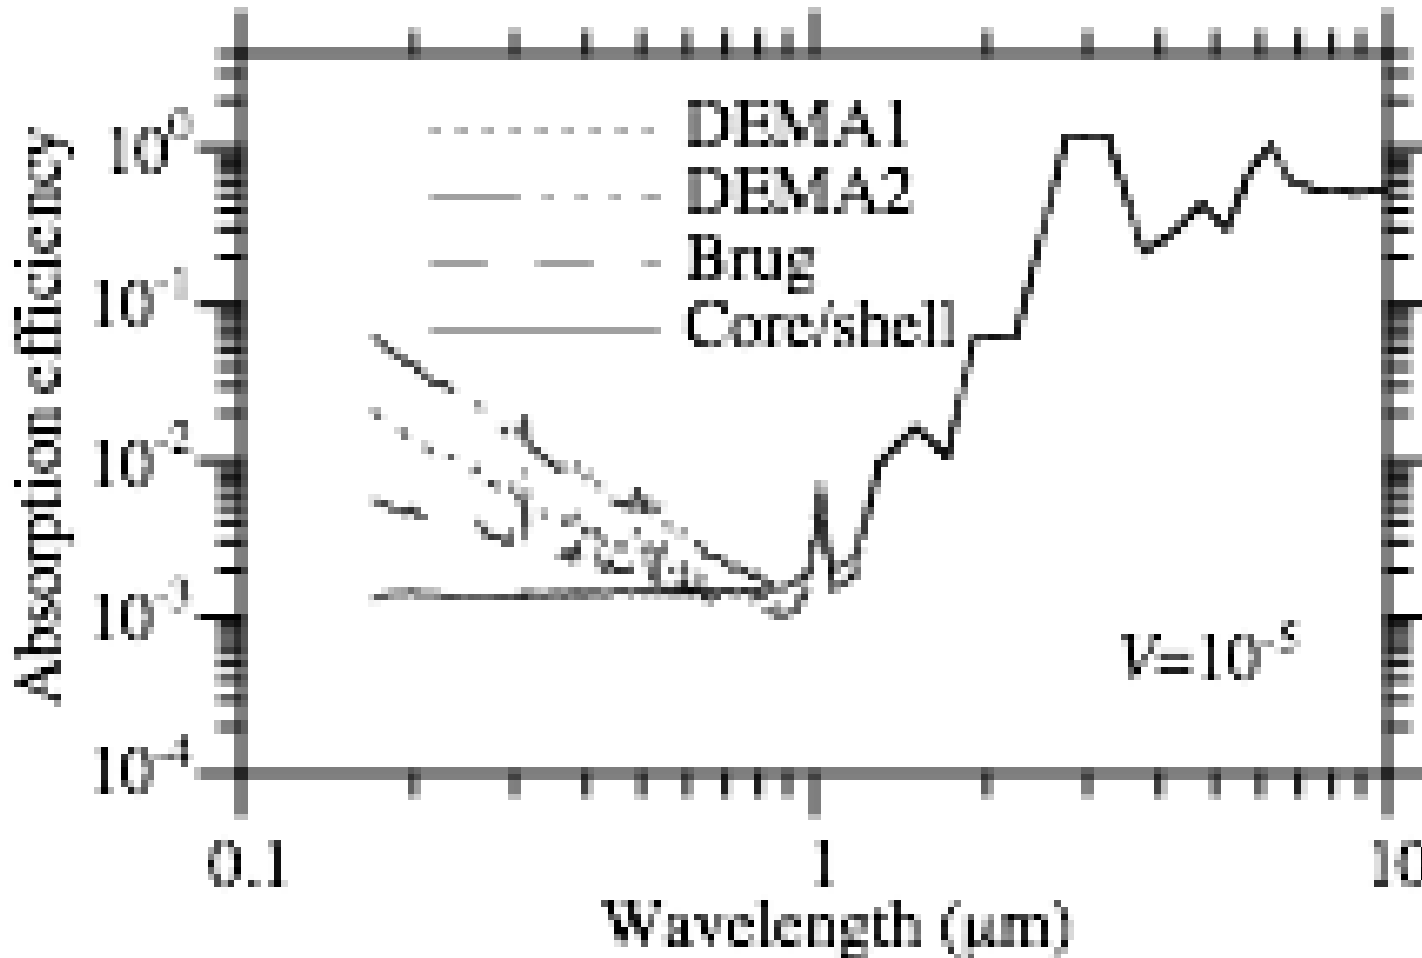

Cloud evaporation --> interstitial aerosol plus evaporated cores

# Absorption Efficiency 12.6-micron cloud drops

DEMA1,2=0.1-, 0.2-micron BC inclusions; Brug=Bruggeman (BC well-mixed); Core/shell=single BC core

# MODIS / Model Aerosol Optical Depth

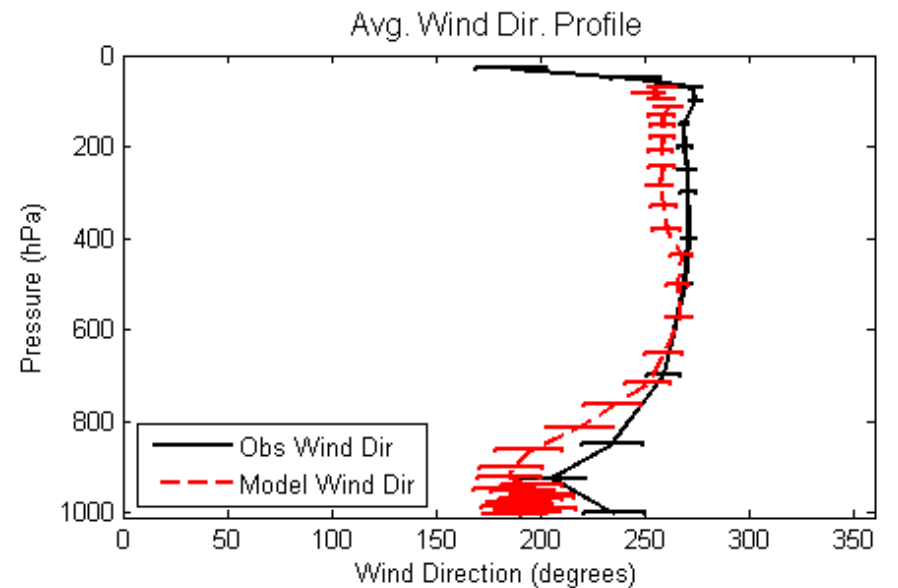

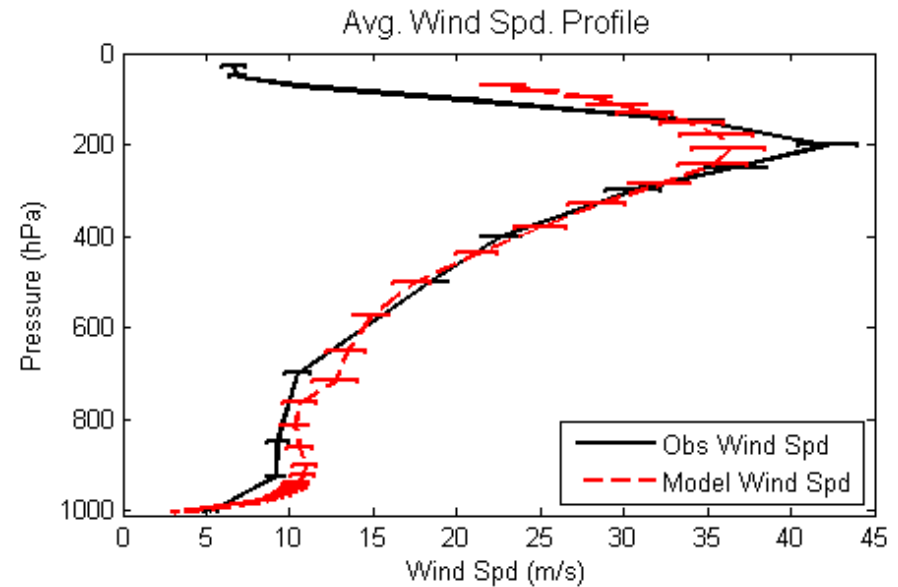

# Modeled vs. Aeronet Solar Irradiance at Cuiaba-Miranda, Brazil

# Model vs. Radiosonde Downwind of Biomass Burn, Sep. 2006

# Global Simulations

Simulate the relative effects of controlling fossil-fuel soot (FS), biofuel soot and gases (BSG), and methane on global and Arctic climate and human health.

## Simulations run

- 1) Baseline (all gases, particles from all sources)
- 2) Time-dependent simulations without FS
- 3) Time-dependent simulation without FS or BSG
- 4) Equilibrium climate simulations without methane, CO<sub>2</sub>.

# Aerosol Size Distributions

Two distributions, each with multiple size bins and components per bin

Emitted fossil-fuel soot (EFFS)

Emission sources: fossil-fuel combustion

Internally-mixed (IM)

Emission sources: biofuel burning, biomass-burning, sea spray, soil dust, road dust, volcanos, pollen, spores, bacteria

Homogeneous nucleation:  $\text{H}_2\text{SO}_4$ - $\text{HNO}_3$ - $\text{H}_2\text{O}$  into IM distribution

Coagulation:

$\text{EFFS} + \text{EFFS} = \text{EFFS}$

$\text{EFFS} + \text{IM} = \text{IM}$

$\text{IM} + \text{IM} = \text{IM}$

Growth: Organic matter,  $\text{H}_2\text{SO}_4$ ,  $\text{HNO}_3$ ,  $\text{HCl}$ ,  $\text{NH}_3$ ,  $\text{H}_2\text{O}$  grow on both EFFS & IM

Clouds: Both distributions activate size-resolved liquid, ice, graupel clouds

# Fine Fossil-, Bio-fuel Emissions (Tg/yr)

Fossil-Fuel

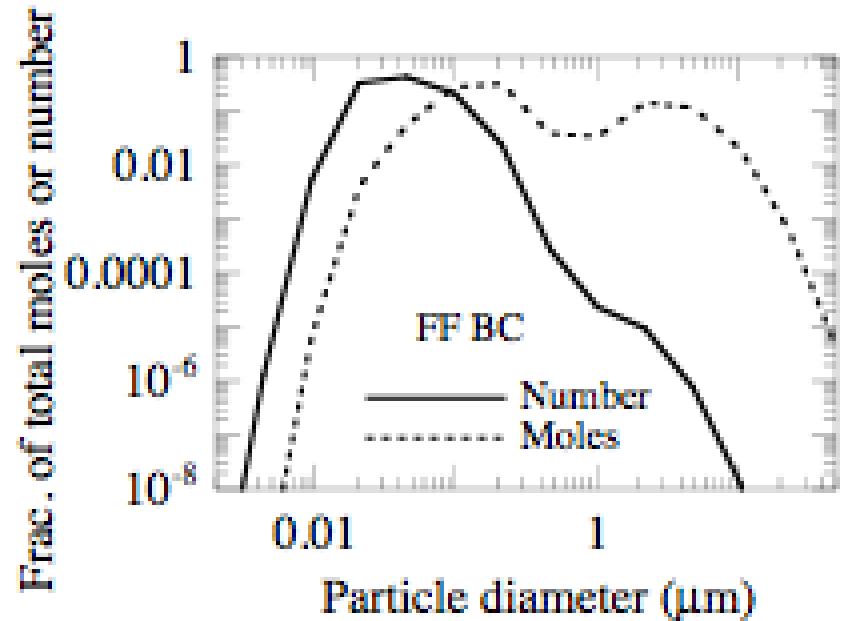

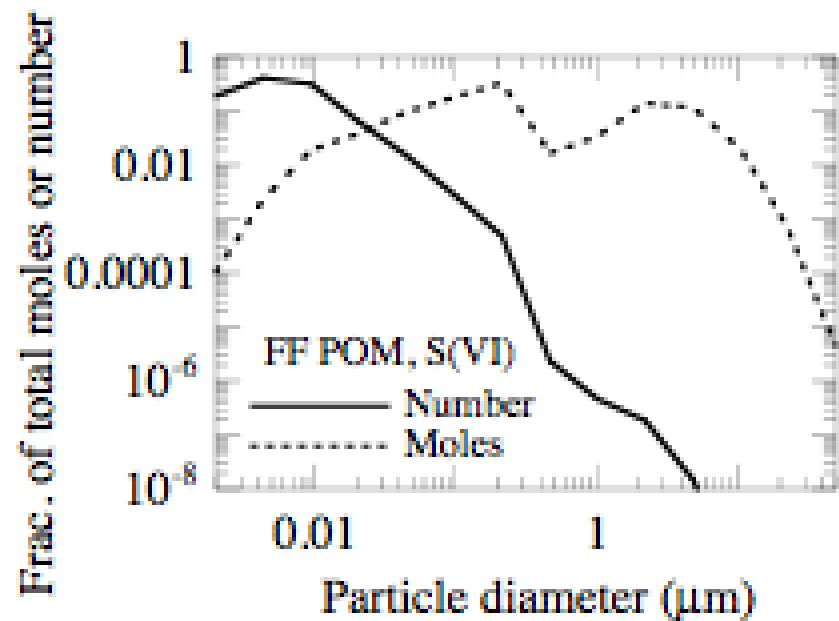

Biofuel

BC/POC from Bond et al. (2004); other emis factors Andreae, Ferek

# Relative Fossil-Fuel POM, S(VI), BC Emission Size Distributions

Distributions based on fits to EEPS data for vehicles and BC spherule size limits from EST 39, 9486, 2005, except that a coarse mode was added for FF-sources that emit coarse PM (e.g., tire particles, stationary sources).

# Baseline Modeled vs. Measured Precip.

Data from  
Huffman et al.  
(2007)

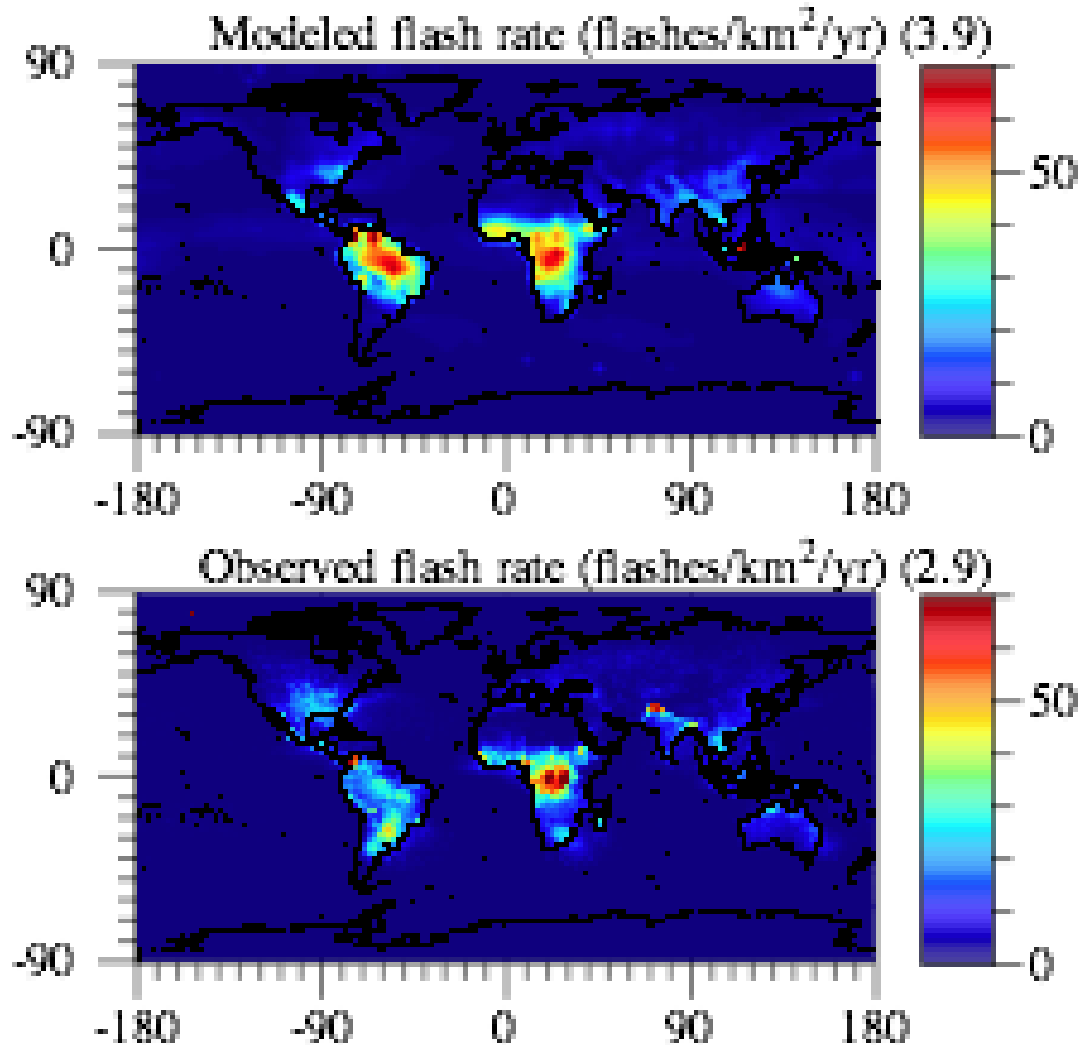

Despite factor of 20 lower resolution than data, model predicts locations of main features of observed precipitation and, with no flux adjustment, correctly does not produce a double ITCZ as nearly all models at coarse resolution do.

# Modeled vs. Measured Cloud Fraction

Data from  
MODIS

# Modeled vs. Measured Annual Lightning Flash Rate

Data from NASA  
LIS/OTD  
Science Team

Model calculates lightning by accounting for size-resolved bounceoffs and charge separation in clouds. It predicts nearly the magnitude and the location of the peak observed lightning (Congo) and most locations of lightning.

# Modeled vs. Measured Thermal-IR

Data from Kiehl et al., 1998

# Modeled vs. Measured 500-hPa Jan Temperature

Data from AIRs

# Modeled vs. Measured Paired in Space Monthly $T/T_d$

Global domain

Data from FSL (2008)

U.S. domain

Despite coarse resolution, model captures data features at exact location of data  
- Little numerical diffusion of water vapor or energy to stratosphere

# Modeled vs. Measured Paired in Space Monthly O<sub>3</sub>

Data from Logan et al. (1999)

Model predicts the magnitude and altitude of the lower-stratospheric ozone layer

# Modeled vs. Measured Sea Ice Area

Antarctic

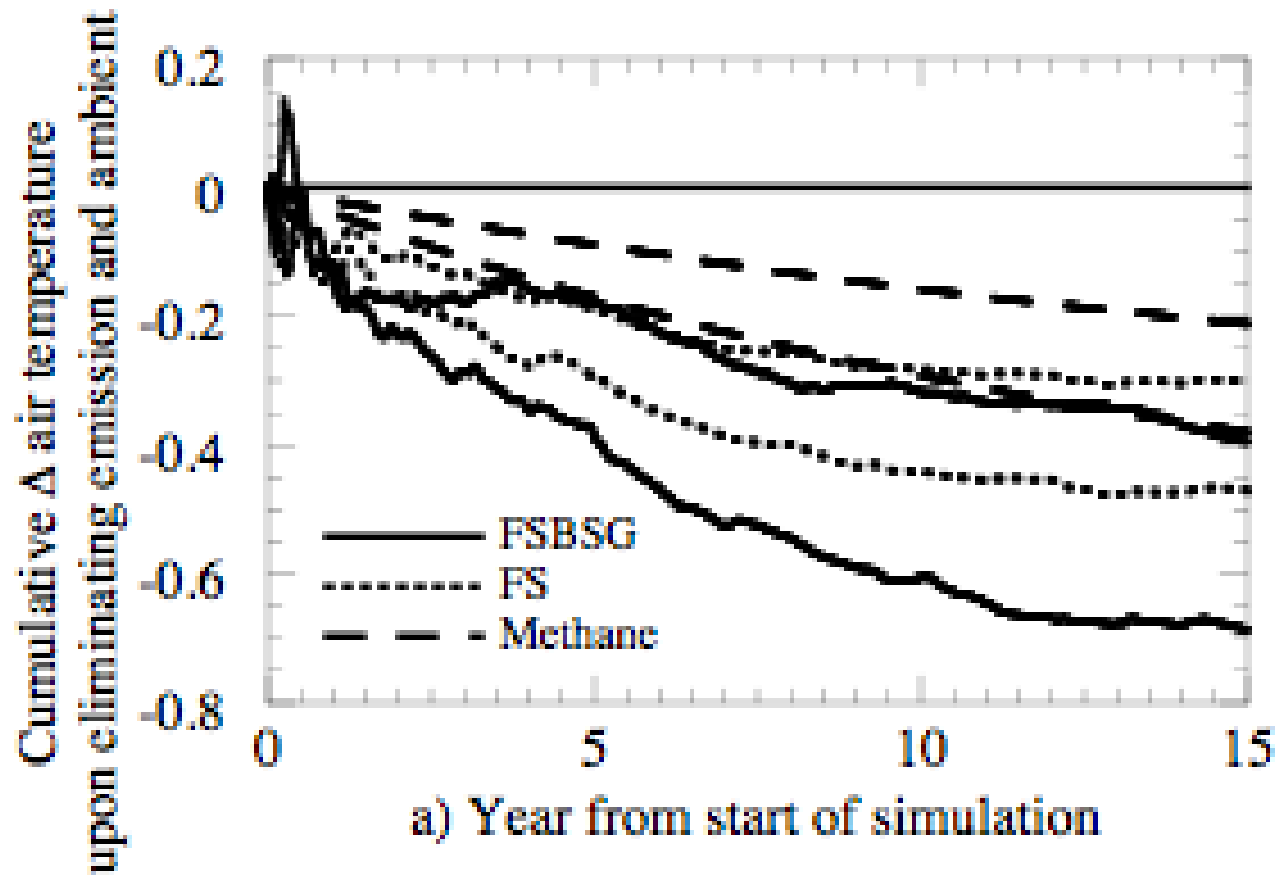

Arctic

Model (at 4 x 5 degree resolution) predicts stable sea ice area after only two years of simulation

# Global Cooling Due to Eliminating Anthropogenic CH<sub>4</sub>, Fossil Soot and Biofuel Soot+Gases (FSBSG) and FS Emissions only

# Global Cooling Due to Eliminating Anthropogenic $\text{CO}_2$ , $\text{CH}_4$ , FSBSG, and FS Emissions only

# Arctic Warming Due to Anth. CH<sub>4</sub>, Fossil Soot and Biofuel Soot+Gases (FSBSG), & FS

FF+BF soot + BF warm mid & high northern latitudes more than anthropogenic CH<sub>4</sub> or FF soot alone

# Radiative Forcing Estimates due to 100% Fossil-Fuel Soot (BC+OM) (W/m<sup>2</sup>)

| Methane       | 52-92      | 29-63       |

STRE = Surface Temperature Response per Unit Emission

= Near-surface temperature change after 20 or 100 years per unit continuous emission of X relative to the same for CO<sub>2</sub> (similar to GWP e.g., 20-, 100-yr

# Contributors to Global Warming

# Summary

Several factors affect soot's climate effect aside from indirect effects: cloud absorption, semidirect effect, snow albedo effect, water vapor effect, internal mixing effect.

With these effects, FSBSG soot may be the second-leading cause of global warming behind CO<sub>2</sub> and ahead of CH<sub>4</sub>. FS causes 3 x the warming of BSG, but BSG causes ~7x more deaths than FS.

Net global warming (0.7-0.8 K) appears due primarily to gross warming from FF GHGs (2-2.4 K) and FSBSG (0.4-0.7 K) offset by cooling due to non-FSBSG aerosol particles (-1.7 to -2.3 K).

FS and FSBSG may contribute to 13-16% and 17-23% of gross warming from pollutants. Controlling FS, FSBSG may be the fastest and only method of preventing Arctic loss.

# CO<sub>2</sub> Domes Over Cities

3-D modeled increases in CO<sub>2</sub> due to local emissions for February-April in Los Angeles - numbers in parentheses are population-weighted values

Change in surface/column CO<sub>2</sub> from local CO<sub>2</sub> emissions = “CO<sub>2</sub> Dome”

# Increases in Water Vapor and Temperature Both Increase Ground-Level Ozone in Polluted Air But Not in Background Air

→ California has 6 of the 10 most polluted U.S. cities → Suffers largest impact of higher T, H<sub>2</sub>O among states. GRL L03809 2008

# Feb-Apr L.A. Death Increases Due to CO<sub>2</sub> Domes

3-D model results

Additional O<sub>3</sub> deaths/yr

Additional PM deaths/yr

Local CO<sub>2</sub> emissions increase ozone and PM deaths

PM increases due to

- 1) increased stability, thus reduced winds and diffusion
- 2) higher RH thus more gas uptake in aerosols many locations
- 3) Increased biogenic (not L.A.), evaporative emissions VOCs

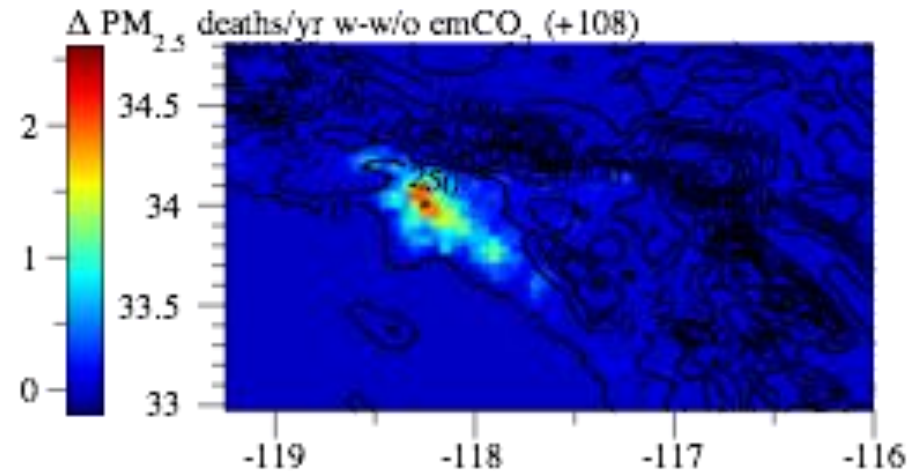

# Aug-Oct L.A. Deaths From CO<sub>2</sub> Dome

3-D model results

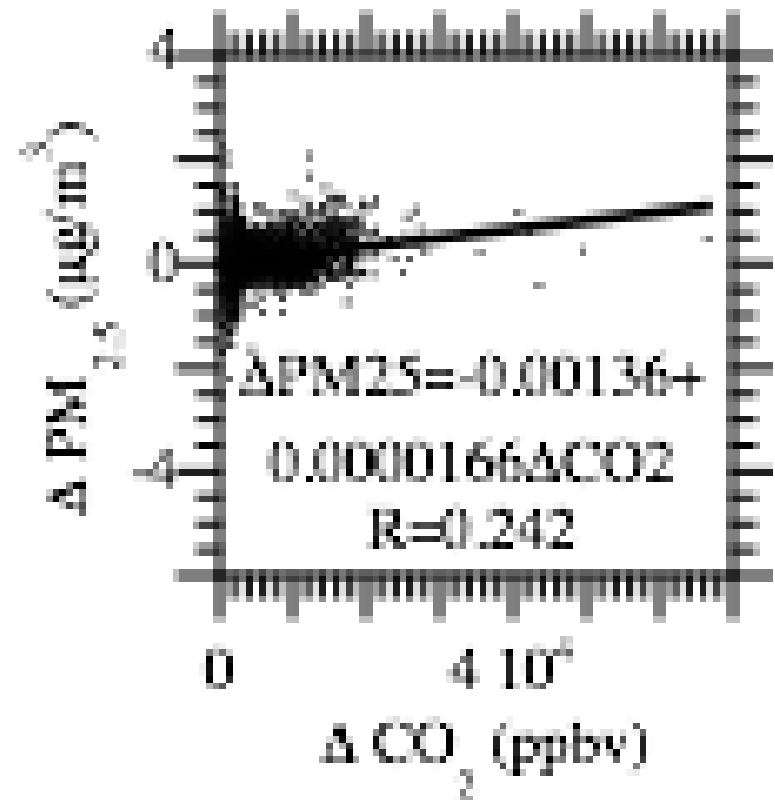

Additional O<sub>3</sub> deaths/yr

Additional PM<sub>2.5</sub> deaths/yr

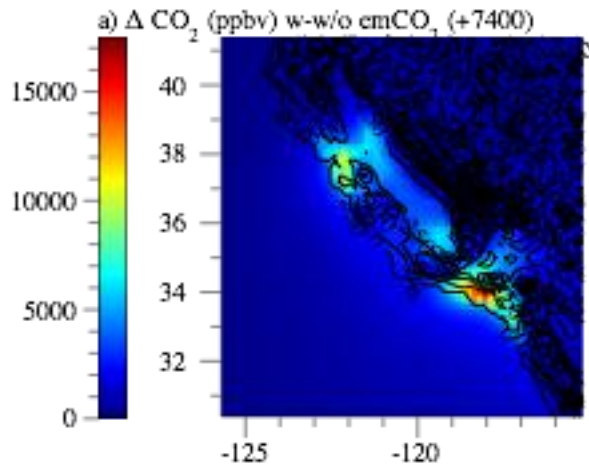

Local CO<sub>2</sub> emissions increase ozone and PM deaths

# Spatial Correlation Between Increased Local CO<sub>2</sub> and Increased O<sub>3</sub> (left) & PM<sub>2.5</sub> (right) in Los Angeles

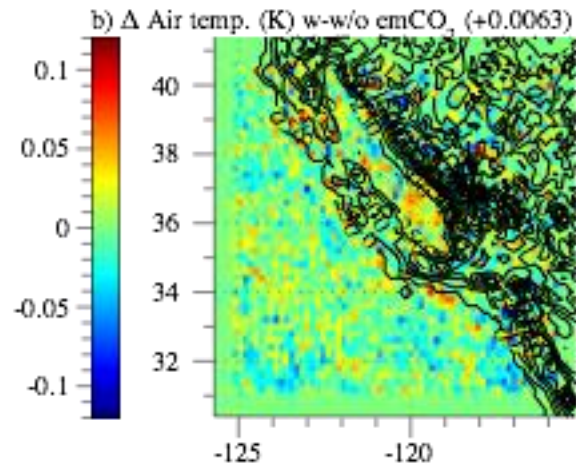

# Changes in California Due to Local CO<sub>2</sub>

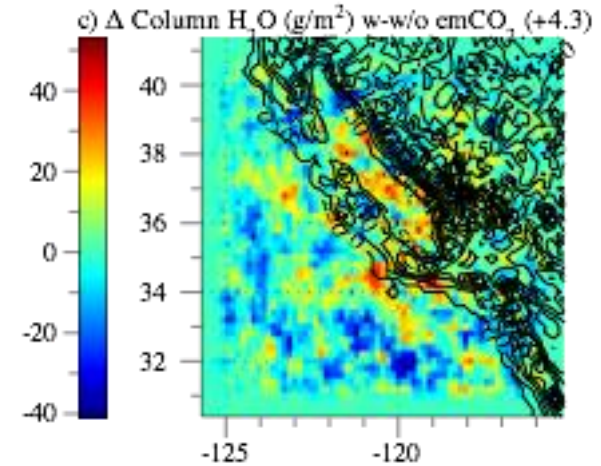

Numbers in parentheses are population-weighted values

Change in column CO<sub>2</sub>  
“CO<sub>2</sub> Domes”

Increase in  
surface air  
temperature

Increase in  
column H<sub>2</sub>O

Local CO<sub>2</sub> emissions increase temperatures, water vapor

# Additional O<sub>3</sub> deaths/yr From CO<sub>2</sub> Domes

Increase in surface O<sub>3</sub>

Additional O<sub>3</sub> deaths/yr

Local CO<sub>2</sub> emissions increase O<sub>3</sub> and O<sub>3</sub> deaths

# Additional PM deaths/yr From CO<sub>2</sub> Domes

Local CO<sub>2</sub> emissions increase PM<sub>2.5</sub> deaths

# 1-Year Death Inc. Due to CO<sub>2</sub> Domes

Additional ozone deaths/yr

Increase in CO<sub>2</sub> from local emissions

Additional PM deaths/yr

Local CO<sub>2</sub> emissions increase PM<sub>2.5</sub> and O<sub>3</sub> deaths

# Summary

Locally-emitted CO<sub>2</sub> produces CO<sub>2</sub> domes, which increase local ozone and PM<sub>2.5</sub> premature deaths in California by ~50-100/yr. Thus, reducing locally-emitted CO<sub>2</sub> may reduce local air pollution and mortality. If correct, this result contradicts the basis for all previous local air pollution regulation worldwide, which has ignored CO<sub>2</sub>, thus it provides the basis for controlling CO<sub>2</sub> due to its local health impacts.

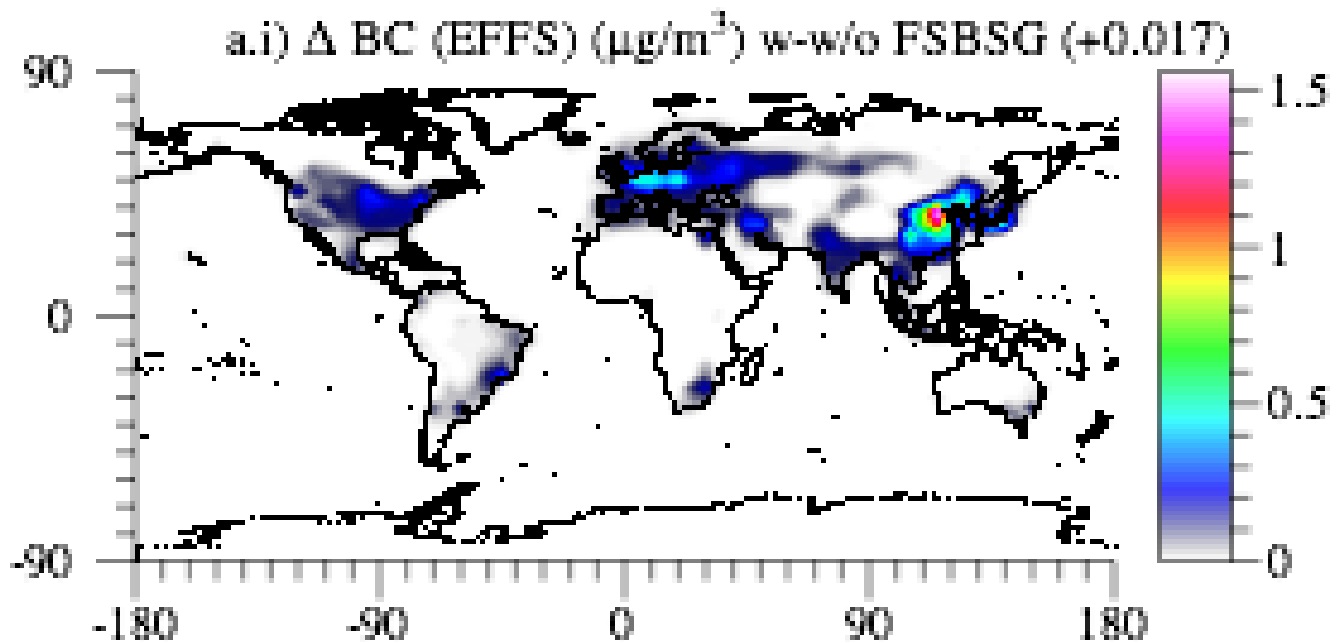

The result also implies that the main assumption behind “cap and trade” that CO<sub>2</sub> impacts are the same regardless of where CO<sub>2</sub> is emitted, is incorrect.

# Simulation-Averaged Emitted FF-soot BC

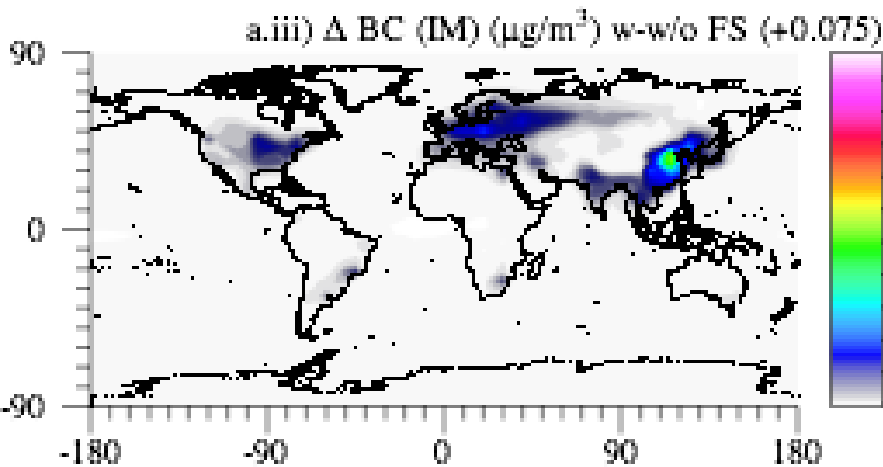

BC from FF soot is about half that of BC from FF+BF soot

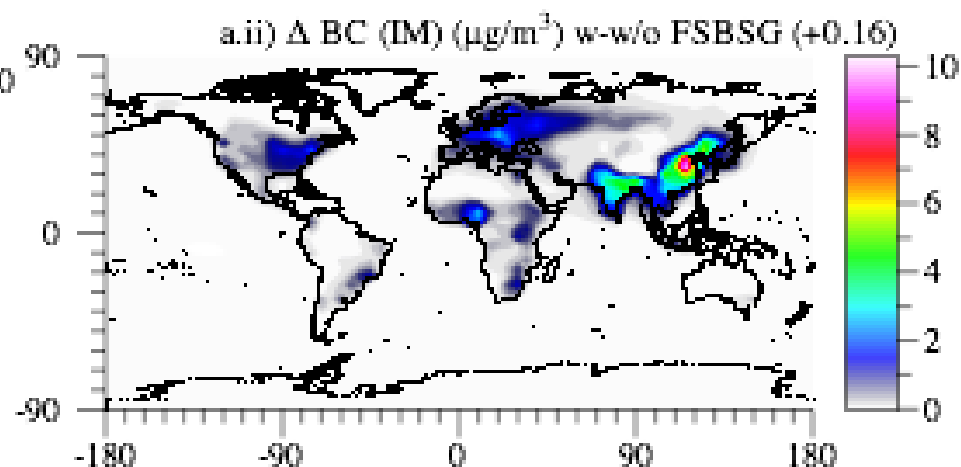

# Internally-Mixed BC From the FF Soot Simulation and from FF+BF Soot Simulation

Internally-Mixed FF BC

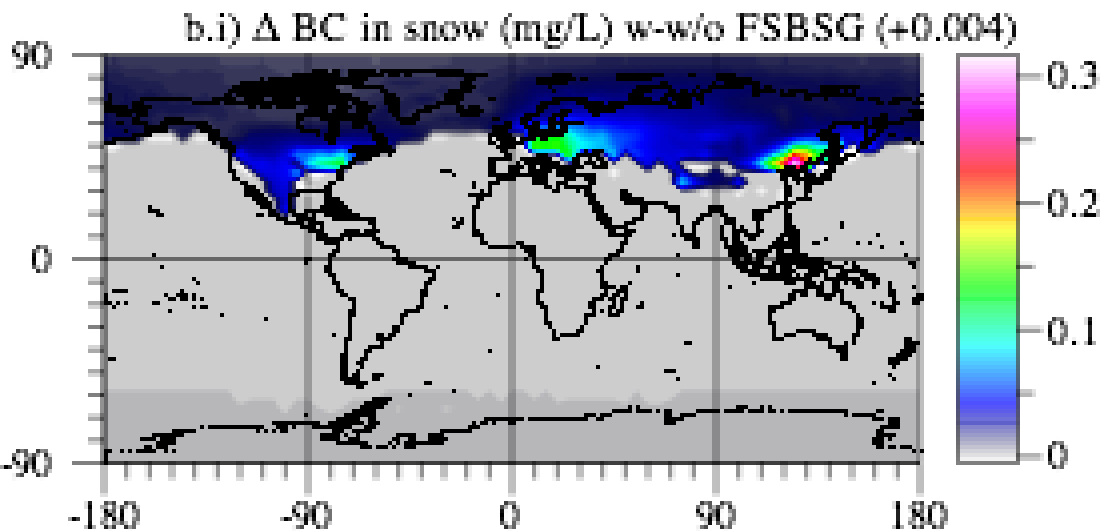

Internally-Mixed FF+BS BC

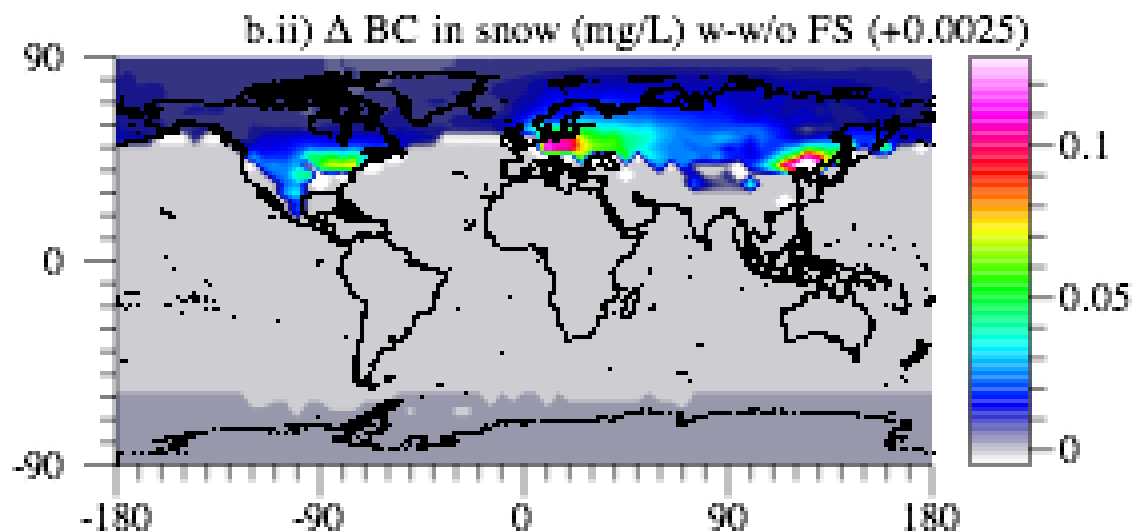

BC from FF soot is about half that of BC from FF+BF soot

# BC in Snow Due to FF+BF Soot + BF gases and FF Soot Alone

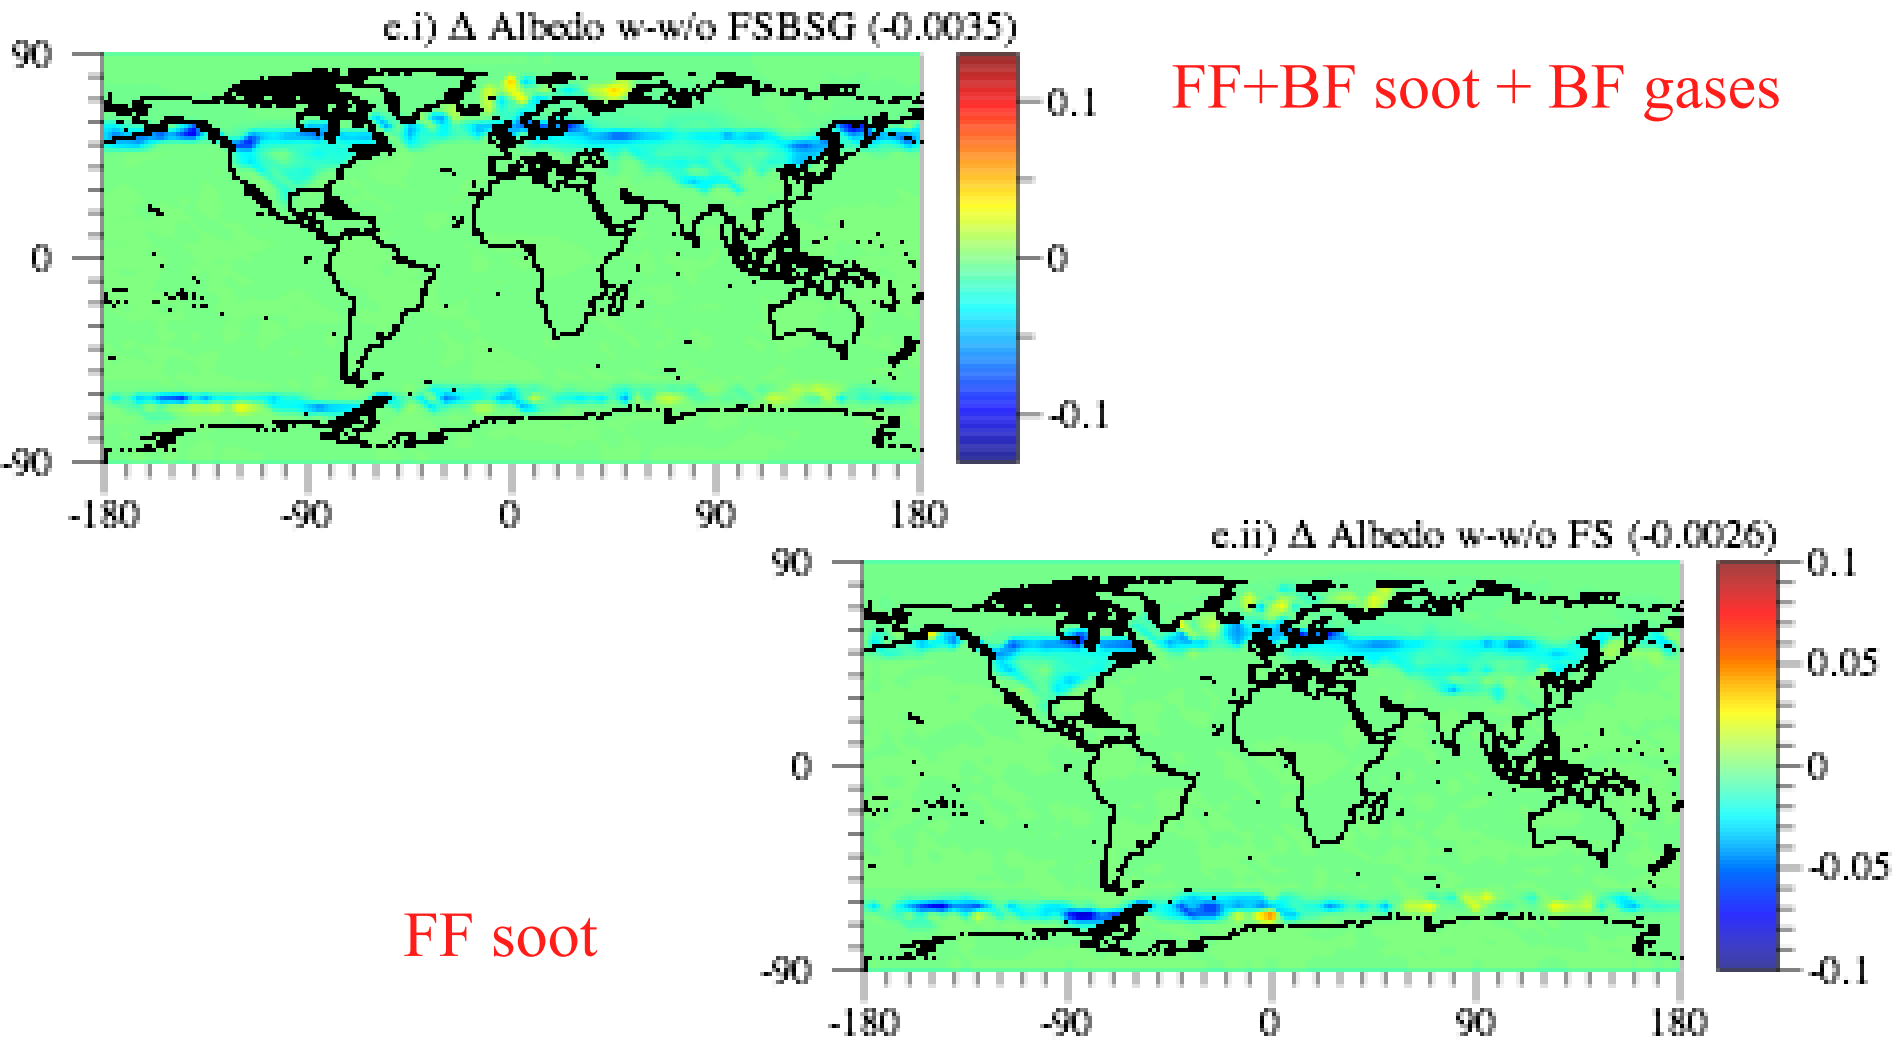

FF soot

FF+BF soot + BF gases

Both FF+BF soot and FF soot increase BC in snow

# Surface Albedo Changes Due to FF+BF Soot + BF gases + BF gases and to FF Soot Alone

Most albedo loss due to FF+BF soot +BF gases is due to FF soot

# AOD Changes Due to FF+BF Soot + BF gases and to FF Soot Alone

(i)  $\Delta$  AOD w-w/o FSBSG (+0.023)

AOD change due to FF+BF soot + BF gases

(ii)  $\Delta$  AOD w-w/o FS (+0.0038)

AOD change due To FF soot

FF+BF soot +BF gases increased AOD more than did FF soot

# Cloud Absorption Due to BC Inclusions in Clouds

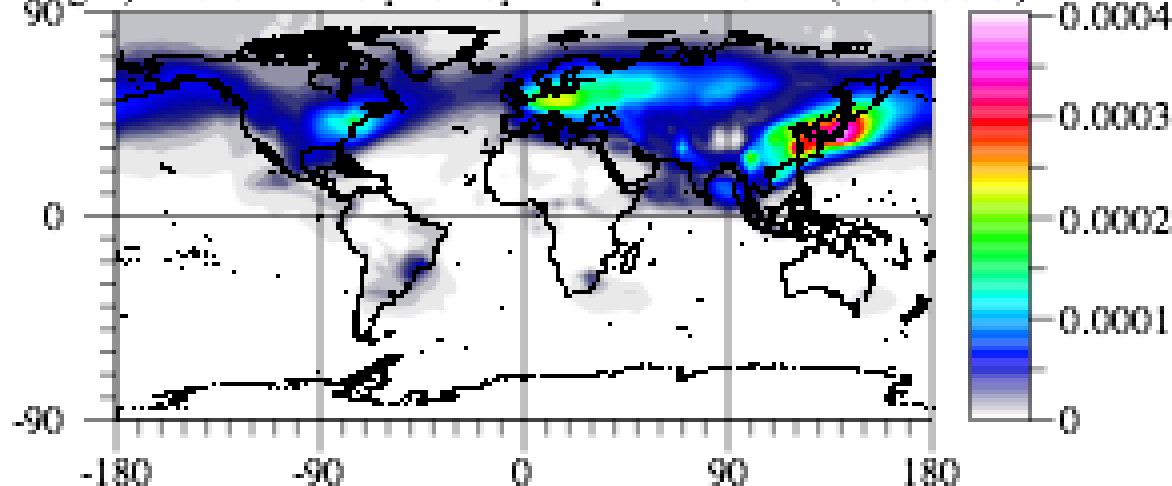

g.i)  $\Delta$  Cloud absorption opt. depth w-w/o FSBSG (+0.000036)

Cloud absorption OD  
change due to FF+BF soot  
+ BF gases

Cloud absorption OD  
change due to FF soot

g.ii)  $\Delta$  Cloud absorption opt. depth w-w/o FS (+0.000019)

→ FF+BF soot +BF gases increased cloud absorption more than FF soot

# Cloud OD Changes Due to FF+BF Soot + BF gases and to FF Soot Alone

Cloud OD change due to FF+BF soot + BF gases

Cloud OD change due to FF soot

FF+BF soot +BF gases increased COD; FF soot decreased COD

# Surface Solar Changes Due to FF+BF Soot + BF gases and to FF Soot Alone

i.i)  $\Delta$  Surface solar ( $\text{W/m}^2$ ) w-w/o FSBSG (-0.16)

Surface solar change due to FF+BF soot + BF gases

i.ii)  $\Delta$  Surface solar ( $\text{W/m}^2$ ) w-w/o FS (+0.53)

Surface solar change due to FF soot

→ FF+BF soot +BF gases decreased surface solar; FF soot increased it

# Temperature Changes Due to FF+BF Soot + BF gases and to FF Soot Alone

Air temperature change due to FF+BF soot + BF gases

Air temperature change due to FF soot

Most temperature inc. due to FF+BF soot +BF gases is due to FF soot

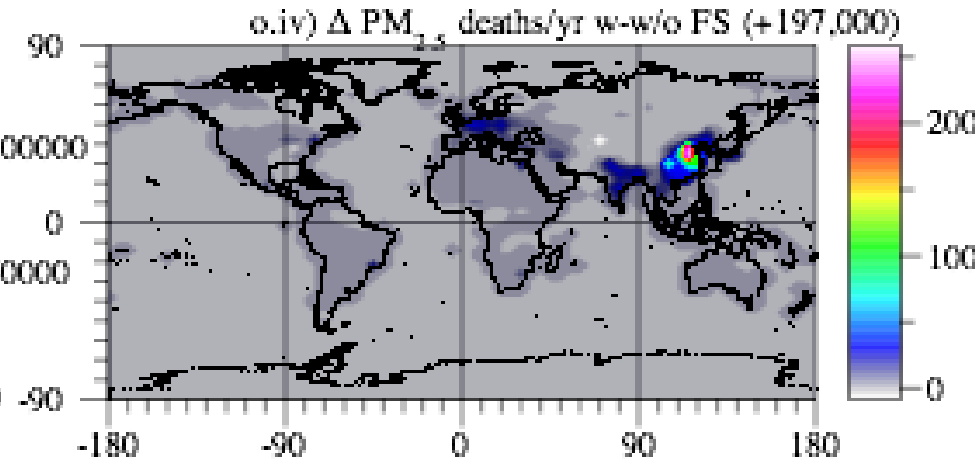

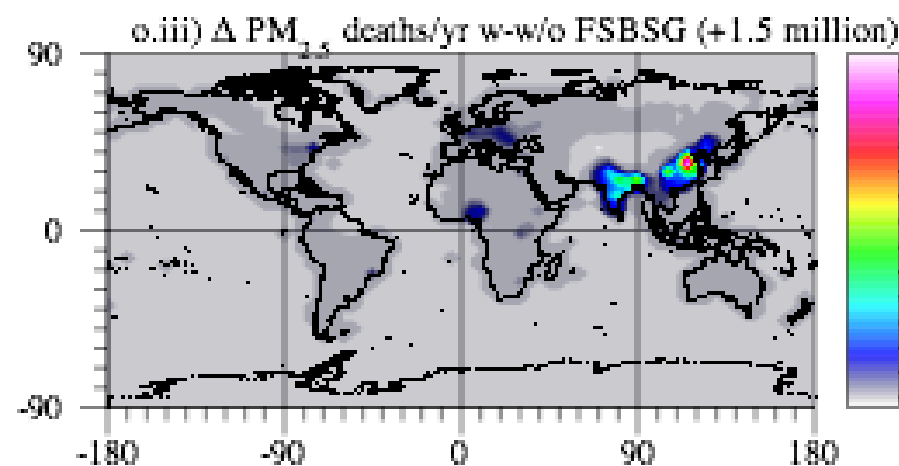

# Changes in PM and Resulting Deaths due to FF+BF soot + BF gases and to FF soot

FF+BF soot + BF gases

FF soot

Deaths due to BF soot+gases ~7 times those due to FF soot
