Section 1: Overview

1.1 Background

1.1.1 UOCAVA Pilot Projects

The Uniformed and Overseas Citizens Absentee Voting Act (UOCAVA) of 1986 protects the right to vote in federal elections for this defined category of citizens. UOCAVA sets out federal and state responsibilities to assist these voters in exercising their voting rights. The Secretary of Defense is the presidential designee responsible for the federal functions of the Act. The Federal Voting Assistance Program (FVAP) administers this law on behalf of the Secretary of Defense and works cooperatively with other federal agencies and state and local election officials to carry out its provisions.

UOCAVA legislation was enacted before the advent of today's global electronic communications technology. Consequently it relied on U.S. domestic and military mail systems as well as foreign postal systems for the worldwide distribution of election materials. By the mid-1990s it became apparent that the mail transit time and unreliable delivery posed significant barriers for many UOCAVA citizens, preventing them from successfully exercising their right to vote. At the same time the Internet was being widely adopted by businesses, governments and the general public. Therefore it was a natural development for FVAP and states to consider the potential of the Internet as an alternative to the "by-mail" UOCAVA process.

FVAP sponsored Voting Over the Internet (VOI), a small pilot project for the November 2000 general election, to examine the feasibility of using Internet technology. Four states participated in this experiment, which enabled voters to use their own personal computers to securely register to vote, request and receive absentee ballots, and return their voted ballots. Following the successful completion of the VOI project, in the Fiscal Year 2002 National Defense Authorization Act (§1604 of P.L. 107-107:115 Stat.1277), Congress instructed the Secretary of Defense to carry out a larger demonstration project for the November 2002 general election. This project was to be "carried out with participation of sufficient numbers of absent uniformed services voters so that the results are statistically significant".

Since there was not sufficient time to define and implement a large project for 2002, the project was planned for implementation for the November 2004 election. Seven states agreed to participate and worked with FVAP to develop system requirements and operating procedures. However, the Secure Electronic Registration and Voting Experiment (SERVE) was cancelled before it was deployed due to concerns raised by several computer scientists. These individuals contended that the use of personal computers over the Internet could not be made secure enough for voting and consequently called for the project to be terminated. The Department of Defense, citing a lack of public confidence in the SERVE system, decided the project could not continue under these circumstances.

In response to this development, the Fiscal Year 2005 National Defense Authorization Act (§567 of P.L. 108-375;118 Stat.119) repealed the requirement for the Secretary of Defense to conduct an electronic voting demonstration project "until the first regularly scheduled general election for federal office which occurs after the Election Assistance Commission (EAC) notifies the Secretary that the Commission has established electronic absentee voting guidelines and certifies that it will assist

the Secretary in carrying out the project". Pursuant to this legislation, in September 2005, the EAC requested its voting system advisory group, the Technical Guidelines Development Committee (TGDC), to add this subject on their research agenda; however the request was declined. This effectively put all federally-sponsored projects involving electronic return of voted ballots on indefinite hold.

After the cancellation of the SERVE Project in 2004, FVAP developed and fielded the Interim Voting Assistance System (IVAS). This system provided for electronic submission of ballot requests and delivery of blank ballots using a Department of Defense secure server. The voter was notified by email when their ballot was available on the server. Then they could download and print the ballot, mark their selections and return the voted ballot by postal mail or facsimile, if their state permitted this option. Use of this system was restricted to voters enrolled in the Defense Enrollment Eligibility Reporting System (DEERS), which was the source for voter identification validation. A total of 108 counties in 9 states participated in this project. One hundred forty-nine voters submitted ballot requests and 17 voters received blank ballots.

In 2006 the capabilities of IVAS were extended to enable all UOCAVA voters to use the system for submitting ballot requests. This was used by 470 jurisdictions in 8 states. FVAP could not measure how many voters used this option. As in 2004, voters in the DEERS database could also receive blank ballots using the system. This capability was used by 103 jurisdictions in 3 states. Sixty-three voters submitted ballot requests and 29 downloaded blank ballots.

In 2008 IVAS was further modified to enable all UOCAVA voters to make ballot requests and receive blank ballots. This enhanced capability was called the Voter Registration/Ballot Delivery System. It was used by 45 jurisdictions in 11 states. Over 21,000 voters completed a ballot request form and 780 uploaded these forms to the system. One hundred twenty-four voters downloaded blank ballots.

Since the State of Florida conducts its own voting system certification process, Okaloosa County, Florida, decided to field a small pilot for the 2008 general election that would enable voters to return their voted ballots electronically. Okaloosa County set up staffed remote electronic voting locations called "kiosks" in England, Germany and Japan. These sites were equipped with vote capture devices connected by a secure communications link to a system server. Voters came to the site and used the vote capture devices to receive, mark and cast their ballots electronically. The cast ballots were encrypted and transmitted back to the system server where they were stored until the Okaloosa Canvassing Board was ready to decrypt and tabulate them at the close of the election. The kiosk workers who staffed these sites verified voter identity and eligibility using an on-line connection to the voter registration system. A paper record of each vote was printed and used to verify the electronic results when the votes were tabulated. Ninety-three voters cast their ballots using this system.

Also in 2008 the Arizona Secretary of State's office developed and implemented a web-based system to enable voters to securely return their voted ballots electronically. This system, called the Military and Overseas Voting System, is still operational. Voters can request to register to vote and/or request an absentee ballot. When a request is received, an email is sent to the voter's jurisdiction with the voter's information to prompt the local election office to send a Federal Post Card Application and/or an absentee ballot. Ballots are sent to the voter by postal mail, email or facsimile. The local election office also authorizes the voter to use the Military and Overseas Voting System to return their voted ballot. An email is generated by the system that provides the voter with instructions for returning their ballot and a password. When they receive the ballot, the voter marks their selections and scans the ballot image into a computer file. Then they log onto the system and upload the voted ballot. The system sends an email to the voter to confirm that the ballot was

received. The appropriate county official also receives an email that a ballot has been received so they can download it for processing and tabulation.

1.1.2 Testing Pilot Systems

Most states require voting systems to undergo a testing and certification process before the system may be used in an election. This provides a level of assurance that the system provides the required functionality and operates reliably and securely. The four states participating in the VOI project agreed to test that system utilizing the Department of Defense Information Technology Security Certification and Accreditation (DITSCAP) process combined with the State of Florida Division of Elections Voting Systems Certification process. The testing regimen planned for the SERVE system was a combined DITSCAP, National Association of State Election Directors (NASD), and State of Florida certification and accreditation process. The system used for Okaloosa County's remote voting pilot was tested and certified by the State of Florida Division of Elections.

Due to the nature of these new systems, existing voting system standards were not sufficient for testing specific aspects. Therefore, additional security requirements were needed to test the use of digital signatures, cryptography and secure communications protocols. The hardware and software standards, developed for DRE and optical scan systems used in polling places, also needed to be revised to reflect the characteristics of the remote voting technologies. Each of these pilot projects established a working group, comprised of election officials, security experts and test engineers, to define the additional requirements needed to supplement the existing voting system standards. Reference materials for the working groups came from various national and international sources of information technology standards, such as the Federal Information Processing Standards (FIPS), Common Criteria, and the International Standards Organization. These efforts resulted in testing requirements documents that were specific to the technical features of each of the pilot systems, which supplied the criteria for testing and certifying these particular pilot systems.

Since 2008, several states have enacted legislation enabling them to conduct electronic voting projects for UOCAVA voters, beginning with the 2010 elections. To be prepared to support the states with these projects, in July 2009 the EAC convened a UOCAVA Working Group to consider how to adapt the EAC's Testing and Certification Program to accommodate UOCAVA pilot systems. It was concluded that two products were needed: a modified set of system testing requirements; and a revised testing and certification process. It was determined that the working group would assist the EAC in drafting the testing requirements. The EAC staff would adapt the certification process to accommodate the needs of UOCAVA pilot projects and publish a Voting System Pilot System Testing and Certification Manual.

The EAC UOCAVA Working Group began with a review of the Voluntary Voting System Guidelines (VVSG) 2005; the Revision to the 2005 VVSG; and the Next Iteration to the VVSG to identify already established or proposed TGDC guidelines that would also apply to remote electronic voting systems. To fill gaps related to the introduction of technologies not covered in the VVSG and the additional security requirements associated with remote systems, VOI, SERVE and Okaloosa Project requirements documents were reviewed. In addition, FIPS and NIST Special Publications were consulted to identify federally specified information security requirements that would apply to the use of cryptography, public key infrastructure, secure communications and other security features of remote electronic voting systems.

A significant challenge for the EAC Working Group was to specify requirements that would not unduly constrain innovation in the design of UOCAVA systems. The VOI, SERVE and Okaloosa system testing requirements were tailored to test the particular system implementations developed for those projects. However, since many different designs for remote voting systems could be submitted to the EAC certification program, the EAC Working Group needed to identify generic system requirements to allow for system design flexibility. This document is the result of that effort.

1.1.3 Scope of EAC Pilot Project Testing Requirements

Pilot projects are small in scale and short in duration. Consequently, certification for pilot systems needs to be quicker and less expensive than the regular process currently used for conventional systems with an expected life of more than 10 years. Nevertheless, since actual votes will be cast on the pilot voting systems, the certification process must retain sufficient rigor to provide reasonable assurance that these systems will operate correctly and securely.

There is a fundamental dichotomy in complexity in remote voting system architectures: those where the vote capture device is controlled (e.g., provided by the election jurisdiction); and those where it is not controlled (e.g., the voter uses his own personal computer). Since the EAC planned to have the pilot certification process ready for implementation during the first half of 2010, it was decided that the EAC would focus its efforts on controlled platform architectures servicing multiple jurisdictions. This is a highly secure remote voting solution and the Okaloosa Project, which used remote kiosks with vote capture devices provided by the Supervisor of Elections office, provides an implementation example for reference. Defining requirements for this class of system architecture was determined to provide a reasonable test case that could be completed within the available timeframe. In addition, most of the core system processing functions are the same for both types of architectures, so a substantial number of requirements will carry over as this work is expanded by the TGDC to include other methods of remote electronic voting. This pilot testing requirements document will be provided to the TGDC as the basis and starting point for their research and deliberations.

1.1.4 Next Steps

While the EAC was working to ensure that the pilot certification effort was underway, legislation dealing with a number of UOCAVA voting issues was under consideration by Congress. Ultimately passed as part of the Fiscal Year 2010 National Defense Authorization Act (NDAA) (§581 of P.L. 111-84), the Military and Overseas Voters Empowerment Act contains a provision allowing the Secretary of Defense to establish one or more pilot programs to test the feasibility of new election technology for UOCAVA voters. This provision requires the EAC and the National Institute of Standards and Technology (NIST) to provide best practices or standards to support these pilot programs, "in accordance with electronic absentee voting guidelines established under" the earlier FY2005 NDAA. In December 2009, the EAC directed the TGDC to begin this work as a top research priority. The EAC expects the TGDC to make recommendations for the comprehensive set of remote electronic voting system guidelines mandated by the FY2005 NDAA. The TGDC has been tasked to consider the full range of remote voting architectures, including instances where the voter uses his own personal computer for voting.

1.2 EAC Certification Scope for UOCAVA Pilot Systems

An initial step in a system certification process is to define the boundaries of the system that will be tested and certified. There are several significant differences between UOCAVA remote electronic voting systems and conventional voting systems used in polling places. UOCAVA pilot systems operate as adjuncts to existing election administration systems in the participating jurisdictions. Pilot systems require election definition data from the local Election Management System (EMS) to set up the system for the election and define ballots. Information from the Statewide Voter Registration Database is needed to authenticate voters and determine their eligibility to vote, match them with the correct ballot style, and record voter history. Some processes that are handled procedurally in a polling place may be performed by a software application in a remote electronic system. Use of communications networks is necessary to connect to voters. Since the UOCAVA voting period currently extends for 45 days, pilot systems may be in operation for several weeks before polling place systems are activated for Election Day. Most, if not all, states prohibit tabulation of absentee ballots until after the polls are closed, so voted ballots may have to be stored on the system for several weeks. Pilot tabulation results will be integrated with the tabulation report generated by the local EMS. Consequently, there are many factors to consider when determining the scope for pilot system certification testing.

Figure 1-1 illustrates a generic process flow for remote electronic voting that does not presuppose any particular architectural solution. Even at this high level of abstraction, two alternative processing paths are needed to accommodate differences in individual state requirements. The first path, called the absentee model, has two distinguishing features. This is essentially an electronic rendering of the UOCAVA by-mail process. In this path, the voter's identity must remain linked to the cast ballot until the close of the voting period. At that time adjudication is made by the local jurisdiction on whether to accept or not accept the ballot. If the ballot is accepted, any identifiable link to the voter is removed. The now anonymous ballot is placed in the ballot box to be tabulated. If the ballot is rejected, the link is not removed and the disposition of the 'unopened' ballot is made in accordance with individual state procedures.

The second path, called the early voting model, does not maintain any association between the voter and the cast ballot. When the voter presses the 'Vote' button and receives notification that their ballot selections have been recorded, the ballot goes directly into the ballot box. There is no ballot adjudication step and therefore no need to maintain a connection between the voter and the ballot.

There are many of ways in which systems can be designed to perform these absentee functions. However, for the reasons discussed in 1.1.3, only one type of system architecture – kiosk-based remote voting -- is addressed in this document. There are four major components in kiosk-based voting systems:

1. A system server which runs the voting software, stores voted ballots, and provides system administration functions;
2. One or more kiosks which are designated remote locations that service multiple election jurisdictions are staffed by kiosk workers who verify voter identity and eligibility, and are equipped with electronic vote capture devices with printing capability.
3. A tabulation device at each participating local election office which decrypts and tabulates the ballots for that jurisdiction; and
4. Communications links which tie all the system components together.

For security purposes, no vote data is permanently retained by the vote capture device. The cast ballot is transmitted to an electronic ballot box stored on the system server. The

1.2 EAC Certification Scope for UOCAVA Pilot Systems

vote capture device produces a paper record of the voter's choices that the voter can review for verification purposes. The paper records will be deposited in a secure receptacle and returned to the appropriate jurisdiction for system audit purposes. Other elements of the system architecture are not specified.

All the system components supporting the functions inside the frame in Figure 1-1 are subject to EAC pilot certification testing. Any system submitted to the EAC for pilot certification must support both the absentee and early voting models. The interfaces between the pilot system and the local EMS are not included in EAC testing. Should a pilot jurisdiction decide to develop a software wizard or other automated method to move data between the EMS and the pilot system, that jurisdiction will be responsible for validating that element. Similarly, if a jurisdiction decides to provide an automated means for kiosk workers to access voter registration data to validate voter identity and eligibility, the jurisdiction will be expected to validate its performance.

It is important to bear in mind that, although kiosk-based remote electronic voting may appear to be very similar to poll site voting, there are some very significant differences in the underlying legislative basis and the policies and procedures that flow from that. UOCAVA voting is by definition absentee voting. The process employed in UOCAVA voting pilots follows the same rules as the conventional postal delivery process. This means that the voting period could begin 45 days or more before Election Day, depending on state law. If some event, such as a law suit or an accident, causes a change in candidates in a race after the UOCAVA voting period begins, there must be a defined protocol for how to count that race in ballots that have already been cast if those voters don't have an opportunity to vote again with a replacement ballot. Since kiosks could be located in many different time zones, the system server hosting the voting application has to be available essentially 24 hours a day, seven days a week. Therefore, the electronic voting process would most likely have to be interrupted to change the ballot definition data and rerun logic and accuracy testing. Since this is an absentee voting process, provisional ballots are not available. For the same reason, there are no legally-mandated accessibility requirements. For those states following the absentee model of UOCAVA voting described above, there is a formal process to decide whether or not to accept a ballot for counting. Consequently, UOCAVA system requirements will vary somewhat from those for poll site systems.

Figure 1-1 UOCAVA Process

1.3 Conformance Clause

1.3.1 Scope and Applicability

This document defines requirements for conformance of kiosk-based remote electronic voting systems, intended for use in UOCAVA pilot programs, that manufacturers of such systems SHALL meet pursuant to EAC pilot program

certification. As described in 1.2, these systems consist minimally of a system server connected through secure communications links to a number of staffed remote kiosk locations equipped with vote capture devices. The vote capture devices display the ballot data provided by the system server to the voter and capture the electronic record of voter choices. These choices are securely transmitted back to the server for storage when the ballot is cast. The vote capture device also prints a paper record for voter verification which is retained for use in system performance validation. The system server is also connected through secure communications links to each participating local election jurisdiction to transfer the encrypted ballot file at the close of the election period. This file is manually transferred to a standalone, air-gapped tabulation device which decrypts and tabulates the ballots. The functionality of each of these components and the integrated system functional performance and security features will be tested during the certification process.

EAC pilot system certification testing will not include pilot system linkages to local voter registration and election management systems except for defined data interchange interfaces. It is the responsibility of the participating state and local jurisdictions to validate the functionality of any connections to their local systems. It should also be noted that these testing requirements only relate to the performance of system hardware and software, they do not extend to election administration procedures. However, requirements are included for system documentation and the ability to produce data needed to support procedures such as system audit.

This document also provides the framework, procedures, and requirements that voting system testing labs (VSTLs) and manufacturers responsible for the certification testing of such pilot program systems SHALL follow. The requirements and procedures in this document may also be used by states to certify kiosk-based remote electronic voting systems for their own pilot programs.

This document defines the minimum requirements for remote electronic voting systems in the context of pilot programs conducted by states and local jurisdictions and the process for testing these systems. The requirements are intended for use by:

- Designers and manufacturers of voting systems;
- VSTLs performing the analysis and testing of systems in support of the EAC certification process;
- Election officials, including officials responsible for the installation, operation, and maintenance of voting systems for UOCAVA pilot programs; and
- VSTLs and consultants performing the state certification of voting systems for pilot programs.

Minimum requirements specified in this document include:

- Functional capabilities;
- Performance characteristics, including security;
- Documentation; and
- Test evaluation criteria.

1.3.2 Conformance Framework

This section provides the framework in which conformance is defined. It identifies the entities to which these requirements apply, the relationships among the various entities, the structure of the requirements, and the terminology used to indicate conformance.

1.3.2.1 Applicable entities

The requirements, prohibitions and options specified in these requirements apply to kiosk –based remote electronic voting systems, voting system manufacturers, and VSTLs. These requirements apply to all systems submitted for pilot certification under the EAC program.

1.3.2.2 Requirements of entities

It is the voting system manufacturer that must implement these requirements and provide the necessary documentation for the system. In order to claim conformance to the requirement, the voting system manufacturer SHALL satisfy the specified requirements. The voting system manufacturer SHALL successfully complete the prescribed test campaign with an EAC VSTL in order to obtain EAC certification.

The VSTL SHALL satisfy the requirements for conducting pilot program certification testing. Additionally, as indicated in the document, certain requirements SHALL be tested by the manufacturer rather than the VSTL. The VSTL may use an operational environment emulating that used by election officials as part of their testing to ensure that the voting system can be configured and operated in a secure and reliable manner according to the manufacturer's documentation and as specified by the requirements. The VSTL SHALL coordinate and deliver the requisite documentation, including a Test Plan and a Test Report, to the EAC for review and approval.

The EAC SHALL review the test results and associated documentation from both the VSTL and the manufacturer and make a determination that all requirements have been appropriately tested and the test results are acceptable. The EAC may conduct audits of manufacturer testing to ensure its adequacy. The EAC will issue a pilot program certification number that indicates conformance of the specified system to these requirements.

1.3.3 Extensions

Extensions are additional functions, features, and/or capabilities included in a voting system that are not required by this document. To accommodate the needs of states that may impose additional requirements and to accommodate changes in technology, this document allows extensions. The use of extensions SHALL NOT contradict nor cause the nonconformance of functionality required by this document.

1.3.4 Implementation Statement

The implementation statement SHALL describe the remote electronic voting system and SHALL document the requirements that have been implemented by the voting system. It SHALL also identify optional features and capabilities supported by the voting system, as well as any extensions (i.e., additional functionality beyond what is required in this document). The implementation statement SHALL include a checklist identifying all the requirements for which a claim of conformance is made.

The implementation statement SHALL be submitted with the manufacturer's application to the EAC for pilot program certification testing. It SHALL provide a concise summary and narrative description of the voting system's capabilities. It SHALL include identifying information about the voting system, including the hardware and software components, version number and date.

1.3.5 Equivalent Configurations

1.3.5.1 Background

Under the standard EAC certification program, the scope of certification is very specific and extends only to the exact voting system configuration tested. The certificate specifically identifies each of the various configurations of the voting system's components that were tested and certified, including the Operating System (OS) version and service pack, as well as the Central Processing Unit (CPU). Any modification to the system not authorized by the EAC will void the certificate. The certificate is applicable to the system configuration that has been tested during certification and is not applicable when any modification to hardware, software or COTS products has occurred.

There is a tradeoff between requiring the exact configuration that was tested and certified to be deployed and allowing "equivalent configurations" that have been tested by the voting system manufacturer and attested to perform identically on these configurations. Requiring only exact configurations that have been certified to be deployed guarantees that the customer is using the identical system that has been tested by the VSTL, but does not allow the flexibility needed to accommodate routine and expected changes to Commercial Off the Shelf (COTS) systems. The requirements in this document are designed to allow for such flexibility.

1.3.5.2 Procedures for changes to baseline configuration

Testing for UOCAVA Pilot Certification is conducted by the VSTL and voting system manufacturer on the baseline configuration consisting of:

1. Specific hardware;
2. Major Version of operating system and third-party COTS applications.
 - Major Versions are changed when an updated version is downloaded; major versions are not considered changed when a patch is applied to fix an individual item.
 - In Microsoft Operating Systems, Major Versions would include Service Packs— New Service Packs would be considered a different Major Version.
 - Downloading patches (i.e., security) would not be considered a change to the Major Version. However, manufacturers SHALL create a log of all patches downloaded and supply them to the EAC upon request.

Any change to hardware or software (Major Versions) SHALL be regression tested by the voting system manufacturer to ensure that all requirements affected by the change have been adhered to. Regression testing SHALL be documented and legally affirmed to by the manufacturer, and accepted by the EAC. Regression testing SHALL be done by the manufacturer when the EAC certified version differs from the one being deployed in any of the following ways:

- a. Any hardware is changed. However, de minimis changes, as defined in the EAC Pilot System Certification Manual, SHALL NOT undergo regression testing;
- b. Any change to Major Version of the OS is made; and
- c. Any major change to a third-party COTS application is made.

All regression testing by manufacturers SHALL include accuracy and reliability testing. Other tests SHALL be repeated for requirements closely related to the functionality that was modified with the hardware or software (Major Version) changes.

Any change to the voting system application not covered by 3 a, b or c SHALL undergo testing by the VSTL.

Test Reports describing the manufacturer regression testing SHALL be submitted to the EAC. The EAC may conduct random audits to ensure that the manufacturer regression testing performed was sufficient.

1.3.6 Requirements Language and Structure

1.3.6.1 Language

Understanding how language is used is a pre-requisite to understanding this document. Language in this document is divided into two categories: normative, i.e., the requirements language itself, and informative. Normative language is prescriptive and must be followed to obtain conformance to this document and ultimately EAC certification. Informative parts of this document include discussion, examples, extended explanations, and other matter that are necessary for proper understanding of the requirements and how to ensure conformance. Informative text is not prescriptive and serves to clarify requirements.

Normative language is specifically for requirements. The following keywords are used within requirements text to indicate the conformance aspects of the requirement:

- SHALL indicates a mandatory requirement to do something;
- SHALL NOT indicates a mandatory requirement not to do something.

1.3.6.2 Structure of requirements

Each remote electronic voting system requirement in this document is identified according to a hierarchical scheme in which higher-level requirements (e.g., "The requirements for formatting the TDP are general in nature; specific format details are of the manufacturer's choosing.") are supported by lower-level requirements (e.g., "The TDP SHALL include a detailed table of contents for the required documents, an abstract of each document, and a listing of each of the informational sections and appendices presented."). Thus, requirements are nested. When the nesting hierarchy has reached four levels (i.e., 1.1.1.1), further nested requirements are designated with lowercase letters, then Roman numerals. Therefore, all requirements are traceable by a distinct reference.

Some requirements are directly testable and some are not. Lower-level requirements (i.e., leaf-node requirements that have no requirements directly beneath them) are directly testable. Higher-level requirements (i.e., requirements with directly testable requirements beneath them) are not directly testable. Higher-level requirements are included because: (1) they are testable indirectly insofar as their lower-level requirements are testable; and (2) they often provide the structure and rationale for the lower level requirements. Satisfying all the lower-level requirements will result in satisfying the corresponding higher-level requirement. Thus, VSTLs need to only directly test lower-level requirements, not higher-level requirements. However, if non-conformance with a higher-level requirement is determined through any other means (e.g., OEVT testing, inspection) then the voting system is deemed not to conform to that higher-level requirement.

1.4 Effective Date

The UOCAVA Pilot Program Testing Requirements SHALL become effective for pilot certification testing upon adoption by the EAC. At that time, all kiosk-based remote electronic pilot systems submitted for EAC certification SHALL be tested for conformance with these requirements.

These requirements are voluntary in that each of the states can decide whether to require the voting systems used in pilot programs for their state to have an EAC certification. States may decide to adopt these requirements in whole or in part at any time, irrespective of the effective date. In addition, states may specify additional requirements that pilot voting systems used in their jurisdictions must meet. The EAC certification program does not, in any way, pre-empt the ability of the states to have their own voting system certification process.

Section 2: Functional Requirements

2.1 Accuracy

Voting system accuracy addresses the accuracy of data for each of the individual ballot selections that could be selected by a voter, including the positions that are not selected. Accuracy is defined as the ability of the voting system to capture, record, store, consolidate and report the specific selections and absence of selections, made by the voter on each ballot without error.

For each processing function in the following list, the voting system SHALL achieve a target error rate of no more than one in 10,000,000 ballot positions, with a maximum acceptable error rate in the test process of one in 500,000 ballot positions. Types of functions include:

- Recording voter selections
- Recording voter selections into ballot image storage independently from voting data storage; and
- Consolidation of vote selection data from multiple voting sites to generate jurisdiction-wide vote totals.

2.1.1 Components and Hardware

2.1.1.1 Component accuracy

Memory hardware, such as semiconductor devices and magnetic storage media, SHALL be accurate.

Test Method: *Functional*

Test Entity: *VSTL*

2.1.1.2 Equipment design

The design of equipment in all voting systems SHALL provide for protection against mechanical, thermal, and electromagnetic stresses that impact voting system accuracy.

Test Method: *Functional*

Test Entity: *VSTL*

2.1.1.3 Voting system accuracy

To ensure vote accuracy, all voting systems SHALL:

- a. Record the election contests, candidates, and issues exactly as defined by election officials;
- b. Record the appropriate options for casting and recording votes;

- c. Record each vote precisely as indicated by the voter and be able to produce an accurate report of all votes cast;
- d. Include control logic and data processing methods incorporating parity and check-sums (or equivalent error detection and correction methods) to demonstrate that the voting system has been designed for accuracy; and
- e. Provide software that monitors the overall quality of data read-write and transfer quality status, checking the number and types of errors that occur in any of the relevant operations on data and how they were corrected.

Test Method: *Functional*

Test Entity: *VSTL*

2.1.2 Environmental Range

All voting systems SHALL meet the accuracy requirements over manufacturer specified operating conditions and after storage under non-operating conditions.

Test Method: *Functional*

Test Entity: *VSTL*

2.1.3 Content of Data Verified for Accuracy

2.1.3.1 Election management system accuracy

Voting systems SHALL accurately record all election management data entered by the user, including election officials or their designees.

Test Method: *Functional*

Test Entity: *VSTL*

2.1.3.2 Recording accuracy

For recording accuracy, all voting systems SHALL:

- a. Record every entry made by the user except where it violates voter privacy;
- b. Accurately interpret voter selection(s) and record them correctly to memory;
- c. Verify the correctness of detection of the user selections and the addition of the selections correctly to memory;
- d. Verify the correctness of detection of data entered directly by the user and the addition of the selections correctly to memory; and
- e. Preserve the integrity of election management data stored in memory against corruption by stray electromagnetic emissions, and internally generated spurious electrical signals.

Test Method: *Functional*

Test Entity: *VSTL*

2.1.4 Telecommunications Accuracy

The telecommunications components of all voting systems SHALL achieve a target error rate of no more than one in 10,000,000 ballot positions, with a maximum acceptable error rate in the test process of one in 500,000 ballot positions.

Test Method: *Functional*

Test Entity: *VSTL*

2.1.5 Accuracy Test Content

Voting system accuracy SHALL be verified by a specific test conducted for this objective. The overall test approach is described in Appendix C.

2.1.5.1 Simulators

If a simulator is used, it SHALL be verified independently of the voting system in order to produce ballots as specified for the accuracy testing.

Test Method: *Functional*

Test Entity: *VSTL*

2.1.5.2 Ballots

Ballots used for accuracy testing SHALL include all the supported types (i.e., rotation, alternative languages) of contests and election types (primary, general).

Test Method: *Functional*

Test Entity: *VSTL*

2.1.6 Reporting Accuracy

Processing accuracy is defined as the ability of the voting system to process stored voting data. Processing includes all operations to consolidate voting data after the voting period has ended.

The voting systems SHALL produce reports that are consistent, with no discrepancy among reports of voting data.

Test Method: *Functional*

Test Entity: *VSTL*

2.2 Operating capacities

2.2.1 Maximum Capacities

The manufacturer SHALL specify at least the following maximum operating capacities for the voting system (i.e. server, vote capture device, tabulation device, and communications links):

- Throughput,
- Memory,
- Transaction processing speed, and
- Election constraints:
 - Number of jurisdictions
 - Number of ballot styles per jurisdiction
 - Number of contests per ballot style
 - Number of candidates per contest
 - Number of voted ballots

Test Method: *Functional*

Test Entity: *VSTL*

2.2.1.1 Capacity testing

The voting system SHALL achieve the maximum operating capacities stated by the manufacturer in section 2.2.1.

Test Method: *Functional*

Test Entity: *VSTL*

2.2.2 Operating Capacity notification

The voting system SHALL provide notice when any operating capacity is approaching its limit.

Test Method: *Functional*

Test Entity: *VSTL*

2.2.3 Simultaneous Transmissions

The voting system SHALL protect against the loss of votes due to simultaneous transmissions.

Test Method: *Functional*

Test Entity: *VSTL*

2.3 Pre-Voting Capabilities

2.3.1 Import and Verify Election Definition

2.3.1.1 Import the election definition

The voting system SHALL:

- a. Keep all data logically separated by, and accessible only to, the appropriate state and local jurisdictions;
- b. Provide the capability to import or manually enter ballot content, ballot instructions and election rules, including all required alternative language translations from each jurisdiction;
- c. Provide the capability for the each jurisdiction to verify that their election definition was imported accurately and completely;
- d. Support image files (e.g., jpg or gif) and/or a handwritten signature image on the ballot so that state seals, official signatures and other graphical ballot elements may be properly displayed; and
- e. Support multiple ballot styles per each local jurisdiction.

Test Method: *Inspection/Functional*

Test Entity: *VSTL*

2.3.1.2 Protect the election definition

The voting system SHALL provide a method to protect the election definition from unauthorized modification.

Test Method: *Functional*

Test Entity: *VSTL*

2.3.2 Readiness Testing

2.3.2.1 Voting system test mode

The voting system SHALL provide a test mode to verify that the voting system is correctly installed, properly configured, and all functions are operating to support pre-election readiness testing for each jurisdiction.

Test Method: *Functional*

Test Entity: *VSTL*

2.3.2.2 Test data segregation

The voting system SHALL provide the capability to zero-out or otherwise segregate test data from actual voting data.

Test Method: *Functional*

Test Entity: *VSTL*

2.4 Voting Capabilities

2.4.1 Opening the Voting Period

2.4.1.1 Accessing the ballot

The voting system SHALL:

- a. Present the correct ballot style to each voter;
- b. Allow the voting session to be canceled; and
- c. Prevent a voter from casting more than one ballot in the same election.

Test Method: Functional

Test Entity: VSTL

2.4.2 Casting a Ballot

2.4.2.1 Record voter selections

The voting system SHALL:

- a. Record the selection and non-selection of individual vote choices;
- b. Record the voter's selection of candidates whose names do not appear on the ballot, if permitted under state law, and record as many write-ins as the number of candidates the voter is allowed to select;
- c. Prohibit the voter from accessing or viewing any information on the display screen that has not been authorized and preprogrammed into the voting system (i.e., no potential for display of external information or linking to other information sources);
- d. Allow the voter to change a vote within a contest before advancing to the next contest;
- e. Provide unambiguous feedback regarding the voter's selection, such as displaying a checkmark beside the selected option or conspicuously changing its appearance;
- f. Indicate to the voter when no selection, or an insufficient number of selections, has been made for a contest (e.g., undervotes);
- g. Provide the voter the opportunity to correct the ballot for an undervote before the ballot is cast;
- h. Allow the voter, at the voter's choice, to submit an undervoted ballot without correction.
- i. Prevent the voter from making more than the allowable number of selections for any contest (e.g., overvotes); and
- j. In the event of a failure of the main power supply external to the voting system, provide the capability for any voter who is voting at the time to complete casting a ballot, allow for the successful shutdown of the voting system without loss or degradation of the voting and audit data, and allow

2.4 Voting Capabilities

voters to resume voting once the voting system has reverted to back-up power.

Test Method: Functional

Test Entity: VSTL

2.4.2.2 Verify voter selections

The voting system SHALL:

- a. Produce a paper record each time the confirmation screen is displayed;
- b. Generate a paper record identifier. This SHALL be a random identifier that uniquely links the paper record with the cast vote record;
- c. Allow the voter to either cast the ballot or return to the vote selection process to make changes after reviewing the confirmation screen and paper record; and
- d. Prompt the voter to confirm his choices before casting the ballot, signifying to the voter that casting the ballot is irrevocable and directing the voter to confirm his intention to cast the ballot.

Test Method: Functional

Test Entity: VSTL

2.4.2.3 Cast ballot

The voting system SHALL:

- a. Store all cast ballots in a random order; logically separated by, and only accessible to, the appropriate state/local jurisdictions;
- b. Notify the voter after the vote has been stored persistently that the ballot has been cast;
- c. Notify the voter that the ballot has not been cast successfully if it is not stored successfully, and provide clear instruction as to steps the voter should take to cast his ballot should this event occur; and
- d. Prohibit access to voted ballots until such time as state law allows for processing of absentee ballots.

Test Method: Functional

Test Entity: VSTL

2.4.2.4 Ballot linking to voter identification

2.4.2.4.1 Absentee model

The cast ballot SHALL be linked to the voter's identity without violating the privacy of the voter.

Test Method: Functional

Test Entity: VSTL

2.5 Post Voting Capabilities

2.4.2.4.2 Early voting model

The cast ballot SHALL NOT be linked to the voter's identity.

Test Method: *Inspection*

Test Entity: *VSTL*

2.4.3 Vote Secrecy

2.4.3.1 Link to voter

The voting system SHALL be capable of producing a cast vote record that does not contain any information that would link the record to the voter.

Test Method: *Functional*

Test Entity: *VSTL*

2.4.3.2 Voting session records

The voting system SHALL NOT store any information related to the actions performed by the voter during the voting session.

Test Method: *Functional*

Test Entity: *VSTL*

2.5 Post Voting Capabilities

2.5.1 Ballot Box Retrieval

2.5.1.1 Seal and sign the electronic ballot box

The voting system SHALL seal and sign each jurisdiction's electronic ballot box, by means of a digital signature, to protect the integrity of its contents.

Test Method: *Functional*

Test Entity: *VSTL*

2.5.1.2 Electronic ballot box retrieval

The voting system SHALL allow each jurisdiction to retrieve its electronic ballot box.

Test Method: *Functional*

Test Entity: *VSTL*

2.5.1.3 Electronic ballot box integrity check

The voting system SHALL perform an integrity check on the electronic ballot box verifying that it has not been tampered with or modified before opening.

Test Method: *Functional*

Test Entity: *VSTL*

2.5.2 Tabulation

2.5.2.1 Tabulation device connectivity

The tabulation device SHALL be physically, electrically, and electromagnetically isolated from any other computer network.

Test Method: *Inspection*

Test Entity: *VSTL*

2.5.2.2 Open ballot box

The tabulation device SHALL allow only an authorized entity to open the ballot box.

Test Method: *Functional*

Test Entity: *VSTL*

2.5.2.3 Absentee model

2.5.2.3.1 Adjudication

The tabulation device SHALL allow the designation of electronic ballots as “accepted” or “not accepted” by an authorized entity.

Test Method: *Functional*

Test Entity: *VSTL*

2.5.2.4 Ballot decryption

The tabulation device decryption process SHALL remove all layers of encryption and breaking all correlation between the voter and the ballot, producing a record that is in clear text.

Test Method: *Functional*

Test Entity: *VSTL*

2.5.2.5 Tabulation report format

The tabulation device SHALL have the capability to generate a tabulation report of voting results in an open and non-proprietary format.

Test Method: *Functional*

Test Entity: VSTL

2.6 Audit and Accountability

2.6.1 Scope

This section presents requirements for the voting system to provide the capability for conducting the types of system performance verifications listed below. The intention is to provide for independent verification of the agreement of the paper record and electronic tabulation results. These audits could be conducted on the entire set of records or on a sampling basis, depending on the preferences of state/local jurisdictions:

- a. Hand audit – Validation of electronic tabulation results via comparison with results of a hand tally of paper records; and
- b. Comparison of ballot images and the corresponding paper records.

It should be noted that these audits are for the purpose of verifying system performance and are conducted independently from the election audits that many jurisdictions conduct to verify overall election results. It is expected that ballots cast on a UOCAVA pilot voting system will be included with ballots cast by all other means when audit samples are drawn for election results verification.

2.6.2 Electronic Records

In order to support independent auditing, a voting system SHALL be able to produce electronic records that contain the necessary information in a secure and usable manner. Typically, this includes records such as:

- Vote counts;
- Counts of ballots recorded;
- Paper record identifier;
- Event logs and other records of important events; and
- Election archive information.

The following requirements apply to records produced by the voting system for any exchange of information between devices, support of auditing procedures, or reporting of final results:

- a. Requirements for electronic records to be produced by tabulation devices; and
- b. Requirements for printed reports to support auditing steps.

2.6.2.1 All records capable of being exported

The voting system SHALL provide the capability to export its electronic records in an open format, such as XML, or include a utility to export log data into a publicly documented format.

Test Method: Functional

Test Entity: VSTL

2.6.2.2 Ballot images

The voting system SHALL have the capability to generate ballot images in a human readable format.

Test Method: Functional

Test Entity: VSTL

2.6.2.3 Ballot image content

The voting system SHALL be capable of producing a ballot image that includes:

- a. Election title and date of election;
- b. Jurisdiction identifier;
- c. Ballot style;
- d. Paper record identifier; and
- e. For each contest and ballot question:
 - i. The choice recorded, including write-ins; and
 - ii. Information about each write-in.

Test Method: Functional

Test Entity: VSTL

2.6.2.4 All records capable of being printed

The tabulation device SHALL provide the ability to produce printed forms of its electronic records. The printed forms SHALL retain all required information as specified for each record type other than digital signatures.

Test Method: Functional

Test Entity: VSTL

2.6.2.5 Summary count record

The voting system SHALL produce a summary count record including the following:

- a. Time and date of summary record; and
- b. The following, both in total and broken down by ballot style and voting location:
 - i. Number of received ballots
 - ii. Number of counted ballots
 - iii. Number of rejected electronic CVRs
 - iv. Number of write-in votes
 - v. Number of undervotes.

Test Method: Functional

Test Entity: VSTL

2.6.3 Paper Records

The vote capture device is required to produce a paper record for each ballot cast. This record SHALL be available to the voter to review and verify, and SHALL be retained for later auditing or recounts, as specified by state law. Paper records provide an independent record of the voter's choices that can be used to verify the correctness of the electronic record created by the vote capture device.

2.6.3.1 Paper record creation

Each vote capture device SHALL print a human readable paper record.

Test Method: Functional

Test Entity: VSTL

2.6.3.2 Paper record contents

Each paper record SHALL contain at least:

- a. Election title and date of election;
- b. Voting location;
- c. Jurisdiction identifier;
- d. Ballot style;
- e. Paper record identifier; and
- f. For each contest and ballot question:
 - i. The recorded choice, including write-ins; and
 - ii. Information about each write-in.

Test Method: Inspection

Test Entity: VSTL

2.6.3.3 Privacy

The vote capture device SHALL be capable of producing a paper record that does not contain any information that could link the record to the voter.

Test Method: Inspection

Test Entity: VSTL

2.6.3.4 Multiple pages

When a single paper record spans multiple pages, each page SHALL include the voting location, ballot style, date of election, and page number and total number of the pages (e.g., page 1 of 4).

Test Method: *Functional*

Test Entity: *VSTL*

2.6.3.5 Machine-readable part contains same information as human-readable part

If a non-human-readable encoding is used on the paper record, it SHALL contain the entirety of the human-readable information on the record.

Test Method: *Inspection*

Test Entity: *VSTL*

2.6.3.6 Format for paper record non-human-readable data

Any non-human-readable information on the paper record SHALL be presented in a non-proprietary format.

Test Method: *Inspection*

Test Entity: *VSTL*

2.6.3.7 Linking the electronic CVR to the paper record

The paper record SHALL:

- a. Contain the paper record identifier; and
- b. Identify whether the paper record represents the ballot that was cast.

Test Method: *Inspection*

Test Entity: *VSTL*

2.7 Performance Monitoring

2.7.1 Voting System and Network Status

2.7.1.1 Network monitoring

The system server SHALL provide for system and network monitoring during the voting period.

Test Method: *Functional*

Test Entity: *VSTL*

2.7 Performance Monitoring

2.7.1.2 Tool access

The system and network monitoring functionality SHALL only be accessible to authorized personnel from restricted consoles.

Test Method: *Functional*

Test Entity: *VSTL*

2.7.1.3 Tool privacy

System and network monitoring functionality SHALL NOT have the capability to compromise voter privacy or election integrity.

Test Method: *Functional*

Test Entity: *VSTL*

Section 3: Usability, Accessibility, and Privacy Requirements

3.1 Overview

The importance of usability and accessibility in the design of voting systems has become increasingly apparent. It is not sufficient that the internal operation of these systems be correct; in addition, voters and kiosk workers must be able to use them effectively. There are some particular considerations for the design of usable and accessible voting systems:

- The voting task itself can be fairly complex; the voter may have to navigate an electronic ballot, choose multiple candidates in a single contest, or decide on abstrusely worded referenda
- Pilot projects by definition are implementing new kinds of voting systems, so there is limited opportunity for voters and kiosk workers to gain familiarity with the process
- Usability and accessibility requirements include a broad range of factors, including physical abilities, language skills, and technology experience

3.1.1 Purpose

The challenge, then, is to provide a voting system that voters can use comfortably, efficiently, and with confidence that they have cast their votes correctly. The requirements within this section are intended to serve that goal. Three broad principles motivate this section:

1. All eligible UOCAVA voters SHALL have access to the voting process without discrimination.

The voting process SHALL be accessible to individuals with disabilities. The voting process includes access to the kiosk site, instructions on how to vote, initiating the voting session, making ballot selections, review of the ballot and the paper record, final submission of the ballot, depositing the paper record in a secure receptacle, and getting help when needed.

2. Each cast ballot SHALL accurately capture the selections made by the voter.

The ballot SHALL be presented to the voter in a manner that is clear and usable. Voters should encounter no difficulty or confusion regarding the process for recording their selections.

3. The voting process SHALL preserve the secrecy of the ballot.

The voting process SHALL preclude anyone else from determining the content of a voter's ballot, without the voter's cooperation. If such a determination is made against the wishes of the voter, then his or her privacy has been violated.

All the requirements in this section have the purpose of improving the quality of interaction between voters and voting systems.

Note that these principles refer to the entire voting process. The UOCAVA Pilot Program Testing Requirements apply only to voting systems; other aspects of the

process (such as administrative rules and procedures) are outside the scope of EAC certification, but are nonetheless crucial for the full achievement of the principles.

3.1.2 Special terminology

The following terms are used frequently in this chapter; they are defined in the Glossary in Appendix A:

- Alert time
- Audio-Tactile Interface (ATI)
- Common Industry Format (CIF)
- Completed system response time
- Initial system response time
- Voter inactivity time

3.2 General Usability

The voting system SHALL support voters in the task of effectively and accurately casting their ballots. The features of the voting system SHALL not contribute to the commission of voter error within the voting session.

3.2.1 Privacy

The voting process must preclude anyone else from determining the content of a voter's ballot without the voter's cooperation. Privacy ensures that the voter can cast votes based solely on his or her own preferences without intimidation or inhibition.

3.2.1.1 Privacy at the kiosk locations

- a. The vote capture device SHALL prevent others from determining the contents of a ballot.
- b. The vote capture device SHALL support ballot privacy during the voting session and ballot submission.
- c. During the voting session, if an audio interface to the vote capture device is provided, it SHALL be audible only to the voter.
- d. The vote capture device SHALL issue all warnings in a way that preserves the privacy of the voter and the confidentiality of the ballot.
- e. The vote capture device SHALL not issue a receipt to the voter that would provide proof to another of how the voter voted.

3.2.1.2 No recording of alternative format usage

When voters use non-typical ballot interfaces, such as large print or alternative languages, their anonymity may be vulnerable. To the extent possible, only the logical contents of their ballots should be recorded, not the special formats in which they were rendered.

- a. No information SHALL be kept within an electronic cast voter record that identifies any alternative language feature(s) used by a voter.

- b. No information SHALL be kept within an electronic cast voter record that identifies any accessibility feature(s) used by a voter.

3.2.2 Cognitive issues

The features specified in this section are intended to minimize cognitive difficulties for voters. They should always be able to operate the vote capture device and understand the effect of their actions.

- a. The vote capture device SHALL provide instructions for all its valid operations.
- b. The vote capture device SHALL provide a means for the voter to get help directly from the system at any time during the voting session.
- c. Instructional material for the voter SHALL conform to norms and best practices for plain language.
 - i. Warnings and alerts issued by the vote capture device SHALL be distinguishable from other information and should clearly state:
 - The nature of the problem;
 - Whether the voter has performed or attempted an invalid operation or whether the vote capture device itself has malfunctioned in some way; and
 - The set of responses available to the voter.
 - ii. When an instruction is based on a condition, the condition should be stated first, and then the action to be performed.
 - iii. The vote capture device should use familiar, common words and avoid technical or specialized words that voters are not likely to understand.
 - iv. Each distinct instruction should be separated spatially from other instructions for visual or tactile interfaces, and temporally for auditory interfaces.
 - v. The vote capture device should issue instructions on the correct way to perform actions, rather than telling voters what not to do.
 - vi. The instructions should address the voter directly rather than use passive voice constructions.
 - vii. The vote capture device should avoid the use of gender-based pronouns.
- d. Consistent with election law, the voting application SHALL support a process that does not introduce bias for or against any of the contest choices to be presented to the voter. In both visual and aural formats, the choices SHALL be presented in an equivalent manner.
- e. The voting system SHALL provide the capability to design a ballot with a high level of clarity and comprehensibility.
 - i. The vote capture device should not visually present a single contest spread over two pages or two columns.
 - ii. The ballot SHALL clearly indicate the maximum number of candidates for which one can vote within a single contest.

- iii. The relationship between the name of a candidate and the mechanism used to vote for that candidate SHALL be consistent throughout the ballot.
- iv. The vote capture device should present instructions near to where they are needed.
- f. The use of color SHALL agree with common conventions: (a) green, blue or white is used for general information or as a normal status indicator; (b) amber or yellow is used to indicate warnings or a marginal status; (c) red is used to indicate error conditions or a problem requiring immediate attention.
- g. When an icon is used to convey information, indicate an action, or prompt a response, it SHALL be accompanied by a corresponding linguistic label.

3.2.3 Perceptual issues

The requirements of this section are designed to minimize perceptual difficulties for the voter. Some of these requirements are designed to assist voters with poor reading vision. These are voters who might have some difficulty in reading normal text, but are not typically classified as having a visual disability.

- a. The electronic display screen of the vote capture device SHALL have the following characteristics:
 - Flicker frequency NOT between 2 Hz and 55 Hz.
 - Minimum display brightness: 130 cd/m²
 - Minimum display darkroom 7×7 checkerboard contrast: 150:1
 - Minimum display pixel pitch: 85 pixels/inch (0.3 mm/pixel)
 - Minimum display area 700 cm²
 - Antiglare screen surface that shows no distinct virtual image of a light source
 - Minimum uniform diffuse ambient contrast for 500 lx illuminance: 10:1
- b. Any aspect of the vote capture device that is adjustable by either the voter or kiosk worker, including font size, color, contrast, audio volume, or rate of speech, SHALL automatically reset to a standard default value upon completion of that voter's session.
- c. If any aspect of a vote capture device is adjustable by either the voter or kiosk worker, there SHALL be a mechanism to allow the voter to reset all such aspects to their default values while preserving the current votes.
- d. For all text the vote capture device SHALL provide a font with the following characteristics
 - Height of capital letters at least: 3.0 mm
 - x-height of a least: 70% of cap height
 - Stroke width at least: 0.35 mm.
- e. The vote capture device electronic image display SHALL be capable of showing all information in at least two font sizes:

- 3.0-4.0 mm cap height, with a corresponding x-height at least 70% of the cap height and a minimum stroke width of 0.35 mm;
 - 6.3-9.0 mm cap height, with a corresponding x-height at least 70% of the cap height and a minimum stroke width of 0.7 mm; under control of the voter. The device SHALL allow the voter to adjust font size throughout the voting session while preserving the current votes.
- f. Text should be presented in a sans serif font.
- g. Vote capture devices providing paper verification records SHALL provide features that assist in the reading of such records by voters with poor reading vision.
- i. The vote capture device may achieve legibility of paper records by supporting the printing of those records in at least two font sizes, 3.0-4.0mm and 6.3-9.0mm.
 - ii. The vote capture device may achieve legibility of paper records by supporting magnification of those records. This magnification may be done by optical or electronic devices. The manufacturer may either: 1) provide the magnifier itself as part of the system, or 2) provide the make and model number of readily available magnifiers that are compatible with the system.
- h. The minimum figure-to-ground ambient contrast ratio for all text and informational graphics (including icons) SHALL be 10:1. For paper records, contrast is measured based on ambient lighting of at least 300 lx.
- i. The electronic display screen of the vote capture device SHALL be capable of showing all information in high contrast either by default or under the control of the voter. If the device allows the voter to adjust contrast during the voting session it SHALL preserve the current votes. High contrast is a figure-to-ground ambient contrast ratio for text and informational graphics of at least 50:1.
- j. The default color coding SHALL support correct perception by voters with color blindness.
- i. Ordinary information presented to the voter should be in the form of black text on a white background. The use of color should be reserved for special cases, such as warnings or alerts.
 - ii. No information presented to the voter SHALL be in the form of colored text on a colored background. Either the text or background SHALL be black or white.
 - iii. If text is colored other than black or white:
 - 1. The background SHALL be black or white.
 - 2. The text SHALL be presented in a bold font (minimum 0.6 mm stroke width).
 - 3. If the background is black, the text color SHALL be yellow or light cyan.
 - 4. If the background is white, the text color SHALL be dark enough to maintain a 10:1 contrast ratio.
 - iv. If the background is colored other than black or white, the presentation SHALL follow these guidelines:
 - 1. The text color SHALL be black.

2. The background color SHALL be yellow or light cyan.
- k. Color coding SHALL not be used as the sole means of conveying information, indicating an action, prompting a response, or distinguishing a visual element.

3.2.4 Interaction issues

The requirements of this section are designed to minimize interaction difficulties for the voter.

- a. The vote capture device SHALL not require page scrolling by the voter.
- b. The vote capture device SHALL provide unambiguous feedback regarding the voter's selection, such as displaying a checkmark beside the selected option or conspicuously changing its appearance.
- c. Vote capture device input mechanisms SHALL be designed to prevent accidental activation.
 - i. On touch screens, the sensitive touch areas SHALL have a minimum height of 0.5 inches and minimum width of 0.7 inches. The vertical distance between the centers of adjacent areas SHALL be at least 0.6 inches, and the horizontal distance at least 0.8 inches. Touch areas SHALL not overlap.

3.2.4.1 Timing issues

These requirements address how long the system and voter wait for each other to interact.

- a. The initial system response time of the vote capture device SHALL be no greater than 0.5 seconds.
- b. When the voter performs an action to record a single vote, the completed system response time of the vote capture device SHALL be no greater than one second in the case of a visual response, and no greater than five seconds in the case of an audio response.
- c. The completed system response time of the vote capture device SHALL be no greater than 10 seconds.
- d. If the vote capture device has not completed its visual response within one second, it SHALL present to the voter, within 0.5 seconds of the voter's action, some indication that it is preparing its response.
- e. If the vote capture device requires a response by a voter within a specific period of time, it SHALL issue an alert at least 20 seconds before this time period has expired and provide a means by which the voter may receive additional time

3.2.5 Alternative languages

HAVA Section 301 (a)(4) states that the voting system SHALL provide alternative language accessibility pursuant to the requirements of Section 203 of the Voting Rights Act of 1965 (42 U.S.C. 1973aa-1a). Ideally every voter would be able to vote independently and privately, regardless of language. As a practical matter, alternative language access is mandated under the Voting Rights Act of 1975, subject to certain thresholds (e.g., if the language group exceeds 5% of the voting

age population). Thus, election officials must ensure that the pilot voting system is capable of handling the languages meeting the legal threshold within their districts.

- a. The voting system SHALL be capable of presenting the ballot, contest choices, review screens, paper verification records, and voting instructions in any language declared by the manufacturer to be supported by the system.

3.2.6 Usability for kiosk workers

Voting systems are used not only by voters to record their votes, but also by kiosk workers who are responsible for kiosk site set-up, light maintenance, and kiosk site closing. Because of the variety of possible implementations, it is impossible to specify detailed design requirements for these functions. The requirements below describe general capabilities that all pilot systems must support.

- a. Messages generated by the vote capture device for kiosk workers in support of the set up, maintenance, or safety of the system SHALL adhere to the requirements for clarity in Section 3.2.4 “Cognitive issues”.

3.2.6.1 Operation

Kiosk workers are responsible for opening the kiosk locations each day of the voting period, keeping them running smoothly during voting hours, closing the kiosk locations at the end of each day of the voting period, and shutting down the kiosks at the end of the voting period.

Operations may be categorized in three phases: initial system set up, daily set up and operation, and shutting down the system at the end of the voting period.

Initial setup includes all the steps necessary to remove the system from its shipping crate, physically set up and configure the vote capture devices and peripherals, verify the integrity of the software, load and check out the software, initiate and check out the communications links. .

Daily operation of the kiosk location includes such functions as:

- voter identification and authorization;
- provision of smartcard to voter to initiate the voting session ;
- assistance to voters who need help;
- system recovery in the case of voters who abandon the voting session without having cast a ballot; and
- routine supplies replenishment, such as adding paper to the printer.

Daily shutdown includes all the steps necessary to take the vote capture device from the state in which it is ready to record votes to its overnight storage state.

- a. The procedures for voting system setup, polling, and shutdown, as documented by the manufacturer, SHALL be reasonably easy for the typical poll worker to learn, understand, and perform.
- b. The manufacturer SHALL provide clear, complete, and detailed instructions and messages for kiosk location setup, daily operation, and shutdown.
 - i. The documentation SHALL be presented at a level appropriate for kiosk workers who are not experts in voting system and computer technology.
 - ii. The documentation SHALL be in a format suitable for use in the kiosk location.

3.3 Accessibility requirements

- iii. The instructions and messages SHALL enable the kiosk worker to verify that the vote capture device, peripherals, and communications links
 - Has been set up correctly;
 - Is in correct working order to record votes; and
 - Has been shut down correctly.

3.2.6.2 Safety

All voting systems and their components must be designed so as to eliminate hazards to personnel or to the equipment itself. Hazards include, but are not limited to:

- Fire hazards;
- Electrical hazards;
- Potential for equipment tip-over (stability);
- Potential for cuts and scrapes (e.g., sharp edges);
- Potential for pinching (e.g., tight, spring-loaded closures); and
- Potential for hair or clothing entanglement.

Devices associated with the voting system SHALL be certified in accordance with the requirements of UL 60950-1, Information Technology Equipment – Safety – Part 1 by a certification organization accredited by the Department of Labor, Occupational Safety and Health Administration’s Nationally Recognized Testing Laboratory program. The certification organization’s scope of accreditation SHALL include IEC/UL 60950-1.

IEC/UL 60950 is a comprehensive standard for IT equipment and addresses all the hazards discussed above under Safety.

3.3 Accessibility requirements

The voting process is to be accessible to voters with disabilities through the use of a specially equipped voting station. A machine so equipped is referred to herein as an accessible voting station (Acc-VS).

The requirements in this section are intended to address this HAVA mandate. Ideally, every voter would be able to vote independently and privately. As a practical matter, there may be some number of voters who, because of the nature of their disabilities, will need personal assistance with any system. Nonetheless, these requirements are meant to make the voting system independently accessible to as many voters as possible. This includes access across all voting processes: capabilities to generate, verify and cast an official ballot must be provided.

This section is organized according to the type of disability being addressed. For each type, certain appropriate design features are specified. Note, however, that a feature intended primarily to address one kind of disability may very well assist voters with other kinds. Moreover, this organization in no way implies that the various sets of requirements are optional or mutually exclusive. In order to conform, an Accessible Voting Station must fulfill all the requirements of all the sub-sections of Chapter 3.3.

3.3 Accessibility requirements

There are many other requirements, such as the general usability requirements, that apply to the Acc-VS besides those in this section. Please see Section 3.1.3 “Interaction of usability and accessibility requirements” for a full explanation.

3.3.1 General

The requirements of this section are relevant to a wide variety of disabilities.

- a. The Acc-VS SHALL be integrated into the manufacturer’s complete voting system so as to support accessibility for disabled voters throughout the voting session.
 - i. The manufacturer SHALL supply documentation describing 1) recommended procedures that fully implement accessibility for voters with disabilities and 2) how the Acc-VS supports those procedures.
- b. When the provision of accessibility for Acc-VS involves an alternative format for ballot presentation, then all information presented to non-disabled voters, including instructions, warnings, error and other messages, and contest choices, SHALL be presented in that alternative format.
- c. The support provided to voters with disabilities SHALL be intrinsic to the accessible voting station. It SHALL not be necessary for the accessible voting station to be connected to any personal assistive device of the voter in order for the voter to operate it correctly.
- d. If a voting system provides for voter identification or authentication by using biometric measures that require a voter to possess particular biological characteristics, then Acc-VS SHALL provide a secondary means that does not depend on those characteristics.
- e. If the Acc-VS generates a paper record (or some other durable, human-readable record) for the purpose of allowing voters to verify their votes, then the system SHALL provide a means to ensure that the verification record is accessible to all voters with disabilities, as identified in 3.3 “Accessibility requirements”.
 - i. If the Acc-VS generates a paper record (or some other durable, human-readable record) for the purpose of allowing voters to verify their votes, then the system SHALL provide a mechanism that can read that record and generate an audio representation of its contents.

3.3.2 Low vision

These requirements specify the features of the accessible voting station designed to assist voters with low vision.

In general, low vision is defined as having a visual acuity worse than 20/70. Low (or partial) vision also includes dimness of vision, haziness, film over the eye, foggy vision, extreme near-sightedness or far-sightedness, distortion of vision, color distortion or blindness, visual field defects, spots before the eyes, tunnel vision, lack of peripheral vision, abnormal sensitivity to light or glare and night blindness.

People with tunnel vision can see only a small part of the ballot at one time. For these users it is helpful to have letters at the lower end of the font size range in order

3.3 Accessibility requirements

to allow them to see more letters at the same time. Thus, there is a need to provide font sizes at both ends of the range.

People with low vision or color blindness benefit from high contrast and from a selection of color combinations appropriate for their needs. Between 7% and 10% of all men have color vision deficiencies. Certain color combinations in particular cause problems. Therefore, use of color combinations with good contrast is required. Note also the general Requirement 3.2.5 j.

However, some users are very sensitive to very bright displays and cannot use them for long. An overly bright background causes a visual white-out that makes these users unable to distinguish individual letters. Thus, use of non-saturated color options is an advantage for some people.

It is important to note that some of the requirements in 3.2.5 "Perceptual issues" also provide support for voters with certain kinds of vision problems.

- a. An accessible voting station with a color electronic image display SHALL allow the voter to adjust the color saturation throughout the voting session while preserving the current votes. Two options SHALL be available: 1) black text on white background and 2) white text on black background.
- b. Buttons and controls on accessible voting stations SHALL be distinguishable by both shape and color. This applies to buttons and controls implemented either "on-screen" or in hardware. This requirement does not apply to sizeable groups of keys, such as a conventional 4x3 telephone keypad or a full alphabetic keyboard.
- c. The Acc-VS SHALL provide synchronized audio output to convey the same information as that which is displayed on the screen. There SHALL be a means by which the voter can disable either the audio or the video output, resulting in a video-only or audio-only presentation, respectively. The system SHALL allow the voter to switch among the three modes (synchronized audio/video, video-only, or audio-only) throughout the voting session while preserving the current votes.

3.3.3 Blindness

These requirements specify the features of the accessible voting station designed to assist voters who are blind.

- a. The accessible voting station SHALL provide an audio-tactile interface (ATI) that supports the full functionality of the visual ballot interface.
 - i. The ATI of VEBD-A of the accessible voting station SHALL provide the same capabilities to vote and cast a ballot as are provided by its visual interface.
 - ii. The ATI SHALL allow the voter to have any information provided by the voting system repeated.
 - iii. The ATI SHALL allow the voter to pause and resume the audio presentation.
 - iv. The ATI SHALL allow the voter to skip to the next contest or return to previous contests.
 - v. The ATI SHALL allow the voter to skip over the reading of a referendum so as to be able to vote on it immediately.
- b. Voting stations that provide audio presentation of the ballot SHALL do so in a usable way, as detailed in the following sub-requirements.

3.3 Accessibility requirements

- i. The ATI SHALL provide its audio signal through an industry standard connector for private listening using a 3.5mm stereo headphone jack to allow voters to use their own audio assistive devices.
 - ii. When VEBD-A utilizes a telephone style handset or headphone to provide audio information, it SHALL provide a wireless T-Coil coupling for assistive hearing devices so as to provide access to that information for voters with partial hearing. That coupling SHALL achieve at least a category T4 rating as defined by [ANSI01] American National Standard for Methods of Measurement of Compatibility between Wireless Communications Devices and Hearing Aids, ANSI C63.19.
 - iii. A sanitized headphone or handset SHALL be made available to each voter.
 - iv. VEBD-A SHALL set the initial volume for each voting session between 40 and 50 dB SPL.
 - v. The audio system SHALL allow the voter to control the volume throughout the voting session while preserving the current votes. The volume SHALL be adjustable from a minimum of 20dB SPL up to a maximum of 100 dB SPL, in increments no greater than 10 dB.
 - vi. The audio system SHALL be able to reproduce frequencies over the audible speech range of 315 Hz to 10 KHz.
 - vii. The audio presentation for VEBD-A of verbal information should be readily comprehensible by voters who have normal hearing and are proficient in the language. This includes such characteristics as proper enunciation, normal intonation, appropriate rate of speech, and low background noise. Candidate names should be pronounced as the candidate intends.
 - viii. The audio system SHALL allow the voter to control the rate of speech throughout the voting session while preserving the current votes. The range of speeds supported SHALL include 75% to 200% of the nominal rate. Adjusting the rate of speech SHALL not affect the pitch of the voice.
- c. If Acc-VS supports ballot activation for non-blind voters, then it SHALL also provide features that enable voters who are blind to perform this activation.
 - d. If Acc-VS supports ballot submission or vote verification for non-blind voters, then it SHALL also provide features that enable voters who are blind to perform these actions.
 - e. Mechanically operated controls or keys, or any other hardware interface on Acc-VS available to the voter SHALL be tactilely discernible without activating those controls or keys.
 - f. The status of all locking or toggle controls or keys (such as the "shift" key) for Acc-VS SHALL be visually discernible, and also discernible through either touch or sound.

3.3.4 Dexterity

These requirements specify the features of the accessible voting station designed to assist voters who lack fine motor control or use of their hands.

3.3 Accessibility requirements

- a. The accessible voting station SHALL provide a mechanism to enable non-manual input that is functionally equivalent to tactile input. All the functionality of the accessible voting station (e.g., straight party voting, write-in candidates) that is available through the conventional forms of input, such as tactile, SHALL also be available through the non-manual input mechanism.
- b. If Acc-VS supports ballot submission or vote verification for non-disabled voters, then it SHALL also provide features that enable voters who lack fine motor control or the use of their hands to perform these actions.
- c. Keys, controls, and other manual operations on the accessible voting station SHALL be operable with one hand and SHALL not require tight grasping, pinching, or twisting of the wrist. The force required to activate controls and keys SHALL be no greater than 5 lbs. (22.2 N).
- d. The accessible voting station controls SHALL not require direct bodily contact or for the body to be part of any electrical circuit.

3.3.5 Mobility

These requirements specify the features of the accessible voting station designed to assist voters who use mobility aids, including wheelchairs. Many of the requirements of this section are based on the ADA Accessibility Guidelines for Buildings and Facilities (ADAAG).

- a. The accessible voting station SHALL provide a clear floor space of 30 inches minimum by 48 inches minimum for a stationary mobility aid. The clear floor space SHALL be designed for a forward approach or a parallel approach.
- b. When deployed according to the installation instructions provided by the manufacturer, Acc-VS SHALL allow adequate room for an assistant to the voter. This includes clearance for entry to and exit from the area of the voting station.
- c. Labels, displays, controls, keys, audio jacks, and any other part of the accessible voting station necessary for the voter to operate the voting system SHALL be legible and visible to a voter in a wheelchair with normal eyesight (no worse than 20/40, corrected) who is in an appropriate position and orientation with respect to the accessible voting station.

3.3.5.1 Controls within reach

The requirements of this section ensure that the controls, keys, audio jacks and any other part of the accessible voting station necessary for its operation are within easy reach. Note that these requirements have meaningful application mainly to controls in a fixed location. A hand-held tethered control panel is another acceptable way of providing reachable controls.

- a. If the accessible voting station has a forward approach with no forward reach obstruction then the high reach SHALL be 48 inches maximum and the low reach SHALL be 15 inches minimum. See Part 1: Figure 3-1.
- b. If the accessible voting station has a forward approach with a forward reach obstruction, the following sub-requirements SHALL apply. (See Part 1: Figure 3-2).
 - i. The forward obstruction for Acc-VS SHALL be no greater than 25 inches in depth, its top no higher than 34 inches and its bottom surface no lower than 27 inches.

3.3 Accessibility requirements

- ii. If the obstruction for Acc-VS is no more than 20 inches in depth, then the maximum high reach SHALL be 48 inches, otherwise it SHALL be 44 inches.
- iii. Space under the obstruction between the finish floor or ground and 9 inches above the finish floor or ground SHALL be considered toe clearance and SHALL comply with the following provisions for Acc-VS:
 - 1. Toe clearance depth SHALL extend 25 inches maximum under the obstruction;
 - 2. The minimum toe clearance depth under the obstruction SHALL be either 17 inches or the depth required to reach over the obstruction to operate the accessible voting station, whichever is greater; and
 - 3. Toe clearance width SHALL be 30 inches minimum.
- iv. Space under the obstruction between 9 inches and 27 inches above the finish floor or ground SHALL be considered knee clearance and SHALL comply with the following provisions:
 - 1. Knee clearance depth SHALL extend 25 inches maximum under the obstruction at 9 inches above the finish floor or ground;
 - 2. The minimum knee clearance depth at 9 inches above the finish floor or ground SHALL be either 11 inches or 6 inches less than the toe clearance, whichever is greater;
 - 3. Between 9 inches and 27 inches above the finish floor or ground, the knee clearance depth SHALL be permitted to reduce at a rate of 1 inch in depth for each 6 inches in height. (It follows that the minimum knee clearance at 27 inches above the finish floor or ground SHALL be 3 inches less than the minimum knee clearance at 9 inches above the floor.); and
 - 4. Knee clearance width SHALL be 30 inches minimum.
- c. If the accessible voting station has a parallel approach with no side reach obstruction then the maximum high reach SHALL be 48 inches and the minimum low reach SHALL be 15 inches. See Part 1: Figure 3-3.
- d. If the accessible voting station has a parallel approach with a side reach obstruction, the following sub-requirements SHALL apply. See Figure 3-1.
 - i. The side obstruction for Acc-VS SHALL be no greater than 24 inches in depth and its top no higher than 34 inches.
 - ii. If the obstruction is no more than 10 inches in depth, then the maximum high reach SHALL be 48 inches, otherwise it SHALL be 46 inches.

3.3 Accessibility requirements

Figure 3-1 Unobstructed reach measurements

Dimensions shown in inches above the line, SI units (in millimeters) below the line

<p>Figure 1: Unobstructed forward reach</p>	<p>Figure 2: Obstructed forward reach (a) for an obstruction depth of up to 20 inches (b) for an obstruction depth of up to 25 inches</p>
<p>Figure 3: Unobstructed side reach with an allowable obstruction less than 10 inches deep</p>	<p>Figure 4: Obstructed side reach (a) for an obstruction depth of up to 10 inches (b) for an obstruction depth of up to 24 inches</p>

3.3.6 Hearing

These requirements specify the features of the accessible voting station designed to assist voters with hearing disabilities.

- a. The accessible voting station SHALL incorporate the features listed under Requirement 3.3.3-C for voting systems that provide audio presentation of the ballot.
- b. If the accessible voting system provides sound cues as a method to alert the voter, the tone SHALL be accompanied by a visual cue, unless the station is in audio-only mode.
- c. No voting device SHALL cause electromagnetic interference with assistive hearing devices that would substantially degrade the performance of those devices. The voting device, measured as if it were a wireless device, SHALL achieve at least a category T4 rating as defined by [ANSI01] American National Standard for Methods of Measurement of Compatibility between Wireless Communications Devices and Hearing Aids, ANSI C63.19.

3.3.7 Cognition

These requirements specify the features of the accessible voting station designed to assist voters with cognitive disabilities.

- a. The accessible voting station should provide support to voters with cognitive disabilities.

3.3.8 English proficiency

These requirements specify the features of the accessible voting station designed to assist voters who lack proficiency in reading English.

- a. For voters who lack proficiency in reading English, Acc-VS SHALL provide an audio interface for instructions and ballots as described in 3.3.3 b.

Section 4: Software

4.1 Selection of Programming Languages

4.1.1 Acceptable Programming Language Constructs

Application logic SHALL be produced in a high-level programming language that has all of the following control constructs:

- a. Sequence;
- b. Loop with exit condition (e.g., for, while, and/or do-loops);
- c. If/Then/Else conditional;
- d. Case conditional; and
- e. Block-structured exception handling (e.g., try/throw/catch).

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.2 Selection of General Coding Conventions

4.2.1 Acceptable Coding Conventions

Application logic SHALL adhere to (or be based on) a published, credible set of coding rules, conventions or standards (herein simply called "coding conventions") that enhance the workmanship, security, integrity, testability, and maintainability of applications.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.2.1.1 Published

Coding conventions SHALL be considered published if they appear in publicly available media.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.2.1.2 Credible

Coding conventions SHALL be considered credible if at least two different organizations independently decided to adopt them and made active use of them at some time within the three years before conformity assessment was first sought.

Test Method: *Inspection*

Test Entity: Manufacturer

4.3 Software Modularity and Programming

4.3.1.1 Modularity

Application logic SHALL be designed in a modular fashion.

4.3.1.2 Module testability

Each module SHALL have a specific function that can be tested and verified independently from the remainder of the code.

Test Method: Inspection

Test Entity: Manufacturer

4.3.1.3 Module size and identification

Modules SHALL be small and easily identifiable.

Test Method: Inspection

Test Entity: Manufacturer

4.4 Structured Programming

4.4.1 Exception Handling

4.4.1.1 Exception handling

Application logic SHALL handle exceptions using block-structured exception handling constructs.

Test Method: Inspection

Test Entity: Manufacturer

4.4.1.2 Legacy library units must be wrapped

If application logic makes use of any COTS or third-party logic callable units that do not throw exceptions when exceptional conditions occur, those callable units SHALL be wrapped in callable units that check for the relevant error conditions and translate them into exceptions, and the remainder of application logic SHALL use only the wrapped version.

Test Method: Inspection

Test Entity: Manufacturer

4.4.2 Unstructured Control Flow is Prohibited

Application logic SHALL contain no unstructured control constructs.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.4.2.1 Branching

Arbitrary branches (a.k.a. GoTos) SHALL NOT be allowed.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.4.2.2 Intentional exceptions

Exceptions SHALL only be used for abnormal conditions. Exceptions SHALL NOT be used to redirect the flow of control in normal ("non-exceptional") conditions.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.4.2.3 Unstructured exception handling

Unstructured exception handling (e.g., On Error GoTo, setjmp/longjmp) SHALL NOT be allowed.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.4.2.4 Separation of code and data

Application logic SHALL NOT compile or interpret configuration data or other input data as a programming language.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.5 Comments

4.5.1 Header Comments

Application logic modules SHALL include header comments that provide at least the following information for each callable unit (e.g., function, method, operation, subroutine, procedure.):

- a. The purpose of the unit and how it works (if not obvious);

- b. A description of input parameters, outputs and return values, exceptions thrown, and side-effects; and
- c. Any protocols that must be observed (e.g., unit calling sequences).

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.6 Executable Code and Data Integrity

4.6.1 Code Coherency

Application logic SHALL conform to the following sub-requirements:

- a. Self-modifying code SHALL NOT be allowed;
- b. Application logic SHALL be free of race conditions, deadlocks, livelocks, and resource starvation;
- c. If compiled code is used, it SHALL only be compiled using a COTS compiler; and
- d. If interpreted code is used, it SHALL only be run under a specific, identified version of a COTS runtime interpreter.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.6.2 Prevent Tampering With Code

Programmed devices SHALL defend against replacement or modification of executable or interpreted code.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.6.3 Prevent Tampering With Data

The voting system SHALL prevent access to or manipulation of configuration data, vote data, or audit records.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.7 Error Checking

4.7.1 Detect Garbage Input

4.7.1.1 Validity check

Programmed devices SHALL check information inputs for completeness and validity.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.7.1.2 Defend against garbage input

Programmed devices SHALL ensure that incomplete or invalid inputs do not lead to irreversible error.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.7.2 Mandatory Internal Error Checking

4.7.2.1 Error checking

Application logic that is vulnerable to the following types of errors SHALL check for these errors at run time and respond defensively (as specified by Requirement 4.7.2.8) when they occur:

- Out-of-bounds accesses of arrays or strings (includes buffers used to move data);
- Stack overflow errors;
- CPU-level exceptions such as address and bus errors, dividing by zero, and the like;
- Variables that are not appropriately handled when out of expected boundaries;
- Numeric overflows; and
- Known programming language specific vulnerabilities.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.7.2.2 Range checking of indices

If the application logic uses arrays, vectors, character sequences, strings or any analogous data structures, and the programming language does not provide automatic run-time range checking of the indices, the indices SHALL be ranged-checked on every access.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.7.2.3 Stack overflows

If stack overflow does not automatically result in an exception, the application logic SHALL explicitly check for and prevent stack overflow.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.7.2.4 CPU traps

The application logic SHALL implement such handlers as are needed to detect and respond to CPU-level exceptions including address and bus errors and dividing by zero.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.7.2.5 Garbage input parameters

All scalar or enumerated type parameters whose valid ranges as used in a callable unit (e.g., function, method, operation, subroutine, procedure.) do not cover the entire ranges of their declared data types SHALL be range-checked on entry to the unit.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.7.2.6 Numeric overflows

If the programming language does not provide automatic run-time detection of numeric overflow, all arithmetic operations that could potentially overflow the relevant data type SHALL be checked for overflow.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.7.2.7 Nullify freed pointers

If pointers are used, any pointer variables that remain within scope after the memory they point to is deallocated SHALL be set to null or marked as invalid (pursuant to the idiom of the programming language used) after the memory they point to is deallocated.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.7.2.8 React to errors detected

The detection of any of the errors enumerated in Requirement 4.7.2.1 SHALL be treated as a complete failure of the callable unit in which the error was detected. An appropriate exception SHALL be thrown and control SHALL pass out of the unit forthwith.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.7.2.9 Do not disable error checks

Error checks detailed in Requirement 4.7.2.1 SHALL remain active in production code.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.7.2.10 Roles authorized to respond to errors

Exceptions resulting from failed error checks or CPU-level exceptions SHALL require intervention by an election official or administrator before voting can continue.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.7.2.11 Election integrity monitoring

The voting system SHALL proactively detect or prevent basic violations of election integrity (e.g., stuffing of the ballot box or the accumulation of negative votes) and alert an election official or administrator if such violations they occur.

Test Method: *Inspection*

Test Entity: *Manufacturer*

4.8 Recovery

4.8.1 Voting System Device Failure

4.8.1.1 Resuming normal operations

All voting systems SHALL be capable of resuming normal operations following the correction of a failure in any device.

Test Method: *Functional*

Test Entity: *Manufacturer*

4.8.1.2 Failures not compromise voting or audit data

Exceptions and system recovery SHALL be handled in a manner that protects the integrity of all recorded votes and audit log information.

Test Method: *Functional*

Test Entity: *Manufacturer*

4.8.1.3 Device survive component failure

All vote capture device SHALL be capable of resuming normal operation following the correction of a failure in any component (e.g., memory, CPU, printer) provided that catastrophic electrical or mechanical damage has not occurred.

Test Method: *Functional*

Test Entity: *Manufacturer*

4.8.2 Controlled Recovery

Error conditions SHALL be corrected in a controlled fashion so that voting system status may be restored to the initial state existing before the error occurred.

Test Method: *Functional*

Test Entity: *Manufacturer*

4.8.2.1 Nested error conditions

Nested error conditions that are corrected without reset, restart, reboot, or shutdown of the vote capture device SHALL be corrected in a controlled sequence so that voting system status may be restored to the initial state existing before the first error occurred.

Test Method: *Functional*

Test Entity: *Manufacturer*

4.8.2.2 Reset CPU error states

CPU-level exceptions that are corrected without reset, restart, reboot, or shutdown of the vote capture device SHALL be handled in a manner that restores the CPU to a normal state and allows the voting system to log the event and recover as with a software-level exception.

Test Method: *Functional*

Test Entity: *Manufacturer*

4.8.3 Restore Device to Checkpoints

When recovering from non-catastrophic failure or from any error or malfunction that is within the operator's ability to correct, the voting system SHALL restore the device to

the operating condition existing immediately prior to the error or failure, without loss or corruption of voting data previously stored in the device.

Test Method: *Functional*

Test Entity: *Manufacturer*

4.9 Source Code Review

In the source code review, the accredited test lab shall look at programming completeness, consistency, correctness, modifiability, structure, modularity and construction.

4.9.1 Workmanship

Although these requirements are scoped to application logic, in some cases the test lab may need to inspect border logic and third-party logic to assess conformity.

4.9.1.1 Review source versus manufacturer specifications

The test lab SHALL assess the extent to which the application logic adheres to the specifications made in its design documentation.

Test Method: *Inspection*

Test Entity: *VSTL*

4.9.1.2 Review source versus coding conventions

The test lab SHALL assess the extent to which the application logic adheres to the published, credible coding conventions chosen by the manufacturer.

Test Method: *Inspection*

Test Entity: *VSTL*

4.9.1.3 Review source versus workmanship requirements

The test lab SHALL assess the extent to which the application logic adheres to the requirements of Section 4 Software.

Test Method: *Inspection*

Test Entity: *VSTL*

4.9.1.4 Efficacy of built-in self-tests

The test lab SHALL verify the efficacy of built-in measurement, self-test, and diagnostic capabilities.

Test Method: *Inspection*

Test Entity: *VSTL*

4.9.2 Security

4.9.2.1 Security control source code review

The test lab SHALL analyze the source code of the security controls to assess whether they function correctly and cannot be bypassed.

Test Method: *Inspection*

Test Entity: *VSTL*

Section 5: Security

5.1 Access Control

This section states requirements for the identification of authorized system users, processes and devices and the authentication or verification of those identities as a prerequisite to granting access to system processes and data. It also includes requirements to limit and control access to critical system components to protect system and data integrity, availability, confidentiality, and accountability.

This section applies to all entities attempting to physically enter voting system facilities or to request services or data from the voting system.

5.1.1 Separation of Duties

5.1.1.1 Definition of roles

The voting system SHALL allow the definition of personnel roles with segregated duties and responsibilities on critical processes to prevent a single person from compromising the integrity of the system.

Test Method: *Functional*

Test Entity: *VSTL*

5.1.1.2 Access to election data

The voting system SHALL ensure that only authorized roles, groups, or individuals have access to election data.

Test Method: *Functional*

Test Entity: *VSTL*

5.1.1.3 Separation of duties

The voting system SHALL require at least two persons from a predefined group for validating the election configuration information, accessing the cast vote records, and starting the tabulation process.

Test Method: *Functional*

Test Entity: *VSTL*

5.1.2 Voting System Access

The voting system SHALL provide access control mechanisms designed to permit authorized access and to prevent unauthorized access to the system.

5.1.2.1 Identity verification

The voting system SHALL identify and authenticate each person to whom access is granted, and the specific functions and data to which each person holds authorized access.

Test Method: *Functional*

Test Entity: *VSTL*

5.1.2.2 Access control configuration

The voting system SHALL allow the administrator group or role to configure permissions and functionality for each identity, group or role to include account and group/role creation, modification, and deletion.

Test Method: *Functional*

Test Entity: *VSTL*

5.1.2.3 Default access control configuration

The voting system's default access control permissions SHALL implement the least privileged role or group needed.

Test Method: *Functional*

Test Entity: *VSTL*

5.1.2.4 Escalation prevention

The voting system SHALL prevent a lower-privilege process from modifying a higher-privilege process.

Test Method: *Functional*

Test Entity: *VSTL*

5.1.2.5 Operating system privileged account restriction

The voting system SHALL NOT require its execution as an operating system privileged account and SHALL NOT require the use of an operating system privileged account for its operation.

Test Method: *Functional*

Test Entity: *VSTL*

5.1.2.6 Logging of account

The voting system SHALL log the identification of all personnel accessing or attempting to access the voting system to the system event log.

Test Method: *Functional*

Test Entity: *VSTL*

5.1.2.7 Monitoring voting system access

The SHALL provide tools for monitoring access to the system. These tools SHALL provide specific users real time display of persons accessing the system as well as reports from logs.

Test Method: *Functional*

Test Entity: *VSTL*

5.1.2.8 Login failures

The vote capture devices at the kiosk locations and the central server SHALL have the capability to restrict access to the voting system after a preset number of login failures.

- a. The lockout threshold SHALL be configurable by appropriate administrators/operators.
- b. The voting system SHALL log the event.
- c. The voting system SHALL immediately send a notification to appropriate administrators/operators of the event.
- d. The voting system SHALL provide a mechanism for the appropriate administrators/operators to reactivate the account after appropriate confirmation.

Test Method: *Functional*

Test Entity: *VSTL*

5.1.2.9 Account lockout logging

The voting system SHALL log a notification when any account has been locked out.

Test Method: *Functional*

Test Entity: *VSTL*

5.1.2.10 Session time-out

Authenticated sessions on critical processes SHALL have an inactivity time-out control that will require personnel re-authentication when reached. This time-out SHALL be implemented for administration and monitor consoles on all voting system devices.

Test Method: *Functional*

Test Entity: *VSTL*

5.1.2.11 Screen lock

Authenticated sessions on critical processes SHALL have a screen-lock functionality that can be manually invoked.

Test Method: Functional

Test Entity: VSTL

5.2 Identification and Authentication

Authentication mechanisms and their associated strength may vary from one voting system capability and architecture to another but all must meet the minimum requirement to maintain integrity and trust. It is important to consider a range of roles individuals may assume when operating different components in the voting system and each may require different authentication mechanisms.

The requirements described in this section vary from role to role. For instance, a kiosk worker will have different identification and authentication characteristics than a voter. Also, for selected critical functions there may be cases where split knowledge or dual authorization is necessary to ensure security. This is especially relevant for critical cryptographic key management functions.

5.2.1 Authentication

5.2.1.1 Strength of authentication

Authentication mechanisms supported by the voting system SHALL support authentication strength of at least 1/1,000,000.

Test Method: Functional

Test Entity: VSTL

5.2.1.2 Minimum authentication methods

The voting system SHALL authenticate users per the minimum authentication methods outlined below.

Test Method: Functional

Test Entity: VSTL

Table 5-1 Roles

GROUP OR ROLE	MINIMUM AUTHENTICATION STRENGTH
Election Judge	Two factor
Kiosk Worker	One factor
Voter	Not required

5.2 Identification and Authentication

Election Official	Two factor
Administrator	Two-factor
Application or Process	Digital signature 112 bits of security ¹

5.2.1.3 Multiple authentication mechanisms

The voting system SHALL provide multiple authentication methods to support multi-factor authentication.

Test Method: *Functional*

Test Entity: *VSTL*

5.2.1.4 Secure storage of authentication data

When private or secret authentication data is stored by the voting system, it SHALL be protected to ensure that the confidentiality and integrity of the data are not violated.

Test Method: *Functional*

Test Entity: *VSTL*

5.2.1.5 Password reset

The voting system SHALL provide a mechanism to reset a password if it is forgotten, in accordance with the system access/security policy.

Test Method: *Functional*

Test Entity: *VSTL*

5.2.1.6 Password strength configuration

The voting system SHALL allow the administrator group or role to specify password strength for all accounts including minimum password length, use of capitalized letters, use of numeric characters, and use of non-alphanumeric characters per NIST 800-63 Electronic Authentication Guideline Standards.

Test Method: *Functional*

Test Entity: *VSTL*

5.2.1.7 Password history configuration

The voting system SHALL enforce password histories and allow the administrator to configure the history length when passwords are stored by the system.

¹ NIST Special Publication 800-57

Test Method: *Functional*

Test Entity: *VSTL*

5.2.1.8 Account information password restriction

The voting system SHALL ensure that the user name is not used in the password.

Test Method: *Functional*

Test Entity: *VSTL*

5.2.1.9 Automated password expiration

The voting system SHALL provide a means to automatically expire passwords.

Test Method: *Functional*

Test Entity: *VSTL*

5.2.1.10 Device authentication

The voting system servers and vote capture devices SHALL identify and authenticate one another using NIST - approved cryptographic authentication methods at the 112 bits of security.

Test Method: *Functional*

Test Entity: *VSTL*

5.2.1.11 Network authentication

Remote voting location site Virtual Private Network (VPN) connections (i.e., vote capture devices) to voting servers SHALL be authenticated using strong mutual cryptographic authentication at the 112 bits of security.

Test Method: *Functional*

Test Entity: *VSTL*

5.2.1.12 Message authentication

Message authentication SHALL be used for applications to protect the integrity of the message content using a schema with 112 bits of security.

Test Method: *Functional*

Test Entity: *VSTL*

5.2.1.13 Message authentication mechanisms

IPsec, SSL, or TLS and MAC mechanisms SHALL all be configured to be compliant with FIPS 140-2 using approved algorithm suites and protocols.

Test Method: *Functional*

Test Entity: VSTL

5.3 Cryptography

Cryptography serves several purposes in voting systems. They include:

Confidentiality: where necessary the confidentiality of voting records can be provided by encryption;

Authentication: data and programs can be authenticated by a digital signature or message authentication codes (MAC), or by comparison of the cryptographic hashes of programs or data with the reliably known hash values of the program or data. If the program or data are altered, then that alteration is detected when the signature or MAC is verified, or the hash on the data or program is compared to the known hash value.

Typically the programs loaded on voting systems and the ballot definitions used by voting systems are verified by the systems, while systems apply digital signatures to authenticate the critical audit data that they output. For remote connections cryptographic user authentication mechanism SHALL be based on strong authentication methods; and

Random number generation: random numbers are used for several purposes including the creation of cryptographic keys for cryptographic algorithms and methods to provide the services listed above, and as identifiers for voting records that can be used to identify or correlate the records without providing any information that could identify the voter.

5.3.1 General Cryptography Requirements

5.3.1.1 Cryptographic functionality

All cryptographic functionality SHALL be implemented using NIST-approved cryptographic algorithms/schemas, or use published and credible cryptographic algorithms/schemas/protocols.

Test Method: Inspection

Test Entity: VSTL

5.3.1.2 Required security strength

Cryptographic algorithms and schemas SHALL be implemented with a security strength equivalent to at least 112 bits of security to protect sensitive voting information and election records.

Test Method: Inspection

Test Entity: VSTL

5.3.1.3 Use NIST-approved cryptography for communications

Cryptography used to protect information in-transit over public telecommunication networks SHALL use NIST-approved algorithms and cipher suites. In addition the implementations of these algorithms SHALL be NIST-approved (Cryptographic Algorithm Validation Program).

Test Method: *Function*

Test Entity: *VSTL*

5.3.2 Key Management

The following requirements apply to voting systems that generate cryptographic keys internally.

5.3.2.1 Key generation methods

Cryptographic keys generated by the voting system SHALL use a NIST-approved key generation method, or a published and credible key generation method.

Test Method: *Inspection*

Test Entity: *VSTL*

5.3.2.2 Security of key generation methods

Compromising the security of the key generation method (e.g., guessing the seed value to initialize the deterministic random number generator (RNG)) SHALL require as least as many operations as determining the value of the generated key.

Test Method: *Inspection*

Test Entity: *VSTL*

5.3.2.3 Seed values

If a seed key is entered during the key generation process, entry of the key SHALL meet the key entry requirements in 5.3.3.1. If intermediate key generation values are output from the cryptographic module, the values SHALL be output either in encrypted form or under split knowledge procedures.

Test Method: *Inspection*

Test Entity: *VSTL*

5.3.2.4 Use NIST-approved key generation methods for communications

Cryptographic keys used to protect information in-transit over public telecommunication networks SHALL use NIST-approved key generation methods. If the approved key generation method requires input from a random number generator, then an approved (FIPS 140-2) random number generator SHALL be used.

Test Method: *Inspection*

Test Entity: *VSTL*

5.3.2.5 Random number generator health tests

Random number generators used to generate cryptographic keys SHALL implement one or more health tests that provide assurance that the random number generator continues to operate as intended (e.g., the entropy source is not stuck).

Test Method: *Inspection*

Test Entity: *VSTL*

5.3.3 Key Establishment

Key establishment may be performed by automated methods (e.g., use of a public key algorithm), manual methods (use of a manually transported key loading device), or a combination of automated and manual methods.

5.3.3.1 Key entry and output

Secret and private keys established using automated methods SHALL be entered into and output from a voting system in encrypted form. Secret and private keys established using manual methods may be entered into or output from a system in plaintext form.

Test Method: *Inspection*

Test Entity: *VSTL*

5.3.4 Key Handling

5.3.4.1 Key storage

Cryptographic keys stored within the voting system SHALL NOT be stored in plaintext. Keys stored outside the voting system SHALL be protected from disclosure or modification.

Test Method: *Inspection*

Test Entity: *VSTL*

5.3.4.2 Key zeroization

The voting system SHALL provide methods to zeroize all plaintext secret and private cryptographic keys within the system.

Test Method: *Functional*

Test Entity: *VSTL*

5.3.4.3 Support for rekeying

The voting system SHALL support the capability to reset cryptographic keys to new values.

Test Method: *Functional*

Test Entity: VSTL

5.4 Voting System Integrity Management

This section addresses the secure deployment and operation of the voting system, including the protection of removable media and protection against malicious software.

5.4.1 Protecting the Integrity of the Voting System

5.4.1.1 Cast vote integrity; transmission

The integrity and authenticity of each individual cast vote SHALL be protected from any tampering or modification during transmission.

Test Method: Functional

Test Entity: VSTL

5.4.1.2 Cast vote integrity; storage

The integrity and authenticity of each individual cast vote SHALL be preserved by means of a digital signature during storage.

Test Method: Functional

Test Entity: VSTL

5.4.1.3 Cast vote storage

Cast vote data SHALL NOT be permanently stored on the vote capture device.

Test Method: Functional

Test Entity: VSTL

5.4.1.4 Electronic ballot box integrity

The integrity and authenticity of the electronic ballot box SHALL be protected by means of a digital signature.

Test Method: Functional

Test Entity: VSTL

5.4.1.5 Malware detection

The voting system SHALL use malware detection software to protect against known malware that targets the operating system, services, and applications.

Test Method: Inspection

Test Entity: VSTL

5.4.1.6 Updating malware detection

The voting system SHALL provide a mechanism for updating malware detection signatures.

Test Method: *Inspection*

Test Entity: *VSTL*

5.4.1.7 Validating software on kiosk voting devices

The voting system SHALL provide the capability for kiosk workers to validate the software used on the vote capture devices as part of the daily initiation of kiosk operations.

Test Method: *Inspection*

Test Entity: *VSTL*

5.5 Communications Security

This section provides requirements for communications security. These requirements address ensuring the integrity of transmitted information and protecting the voting system from external communications-based threats.

5.5.1 Data Transmission Integrity

5.5.1.1 Data integrity protection

Voting systems that transmit data over communications links SHALL provide integrity protection for data in transit through the generation of integrity data (digital signatures and/or message authentication codes) for outbound traffic and verification of the integrity data for inbound traffic.

Test Method: *Functional*

Test Entity: *VSTL*

5.5.1.2 TLS/SSL

Voting systems SHALL use at a minimum TLS 1.0, SSL 3.1 or equivalent protocols, including all updates to both protocols and implementations as of the date of the submission (e.g., RFC 5746 for TLS 1.0).

Test Method: *Functional*

Test Entity: *VSTL*

5.5.1.3 Virtual private networks (VPN)

Voting systems deploying VPNs SHALL configure them to only allow FIPS-compliant cryptographic algorithms and cipher suites.

Test Method: *Functional*

Test Entity: *VSTL*

5.5.1.4 Unique system identifier

Each communicating device SHALL have a unique system identifier.

Test Method: *Inspection*

Test Entity: *VSTL*

5.5.1.5 Mutual authentication required

Each device SHALL mutually strongly authenticate using the system identifier before additional network data packets are processed.

Test Method: *Functional*

Test Entity: *VSTL*

5.5.1.6 Secrecy of ballot data

Data transmission SHALL preserve the secrecy of voters' ballot selections and SHALL prevent the violation of ballot secrecy and integrity.

Test Method: *Functional*

Test Entity: *VSTL*

5.5.2 External Threats

Voting systems SHALL implement protections against external threats to which the system may be susceptible.

Test Method: *Functional*

Test Entity: *VSTL*

5.5.2.1 Disabling network interfaces

Voting system components SHALL have the ability to enable or disable physical network interfaces.

Test Method: *Functional*

Test Entity: *VSTL*

5.5.2.2 Minimizing interfaces

The number of active ports and associated network services and protocols SHALL be restricted to the minimum required for the voting system to function.

Test Method: *Inspection/Vulnerability*

Test Entity: VSTL

5.5.2.3 Prevention of attacks and security non-compliance

The voting system SHALL block all network connections that are not over a mutually authenticated channel.

Test Method: *Functional/Vulnerability*

Test Entity: VSTL

5.6 Logging

5.6.1 Log Management

5.6.1.1 Default settings

The voting system SHALL implement default settings for secure log management activities, including log generation, transmission, storage, analysis, and disposal.

Test Method: *Inspection*

Test Entity: VSTL

5.6.1.2 Log access

Logs SHALL only be accessible to authorized roles.

Test Method: *Functional*

Test Entity: VSTL

5.6.1.3 Log access

The voting system SHALL restrict log access to append-only for privileged logging processes and read-only for authorized roles.

Test Method: *Functional*

Test Entity: VSTL

5.6.1.4 Logging events

The voting system SHALL log logging failures, log clearing, and log rotation.

Test Method: *Functional*

Test Entity: VSTL

5.6.1.5 Log format

The voting system SHALL store log data in a publicly documented format, such as XML, or include a utility to export log data into a publicly documented format.

Test Method: *Inspection*

Test Entity: *VSTL*

5.6.1.6 Log separation

The voting system SHALL ensure that each jurisdiction's event logs and each component's logs are separable from each other.

Test Method: *Functional*

Test Entity: *VSTL*

5.6.1.7 Log review

The voting system SHALL include an application or program to view, analyze, and search event logs.

Test Method: *Functional*

Test Entity: *VSTL*

5.6.1.8 Log preservation

All logs SHALL be preserved in a useable manner prior to voting system decommissioning.

Test Method: *Inspection*

Test Entity: *VSTL*

5.6.1.9 Voter privacy

Logs SHALL NOT contain any data that could violate the privacy of the voter's identity.

Test Method: *Functional*

Test Entity: *VSTL*

5.6.1.10 Timekeeping format

Timekeeping mechanisms SHALL generate time and date values, including hours, minutes, and seconds.

Test Method: *Functional*

Test Entity: *VSTL*

5.6.1.11 Timekeeping precision

The precision of the timekeeping mechanism SHALL be able to distinguish and properly order all log events.

Test Method: *Inspection*

Test Entity: *VSTL*

5.6.1.12 System clock security

Only the system administrator SHALL be permitted to set the system clock.

Test Method: *Functional*

Test Entity: *VSTL*

5.6.2 Communications Logging

5.6.2.1 General

All communications actions SHALL be logged.

Test Method: *Inspection*

Test Entity: *VSTL*

5.6.2.2 Log content

The communications log SHALL contain at least the following entries:

- Times when the communications are activated and deactivated;
- Services accessed;
- Identification of the device which data was transmitted to or received from;
- Identification of authorized entity; and
- Successful and unsuccessful attempts to access communications or services.

Test Method: *Functional*

Test Entity: *VSTL*

5.6.3 System Event Logging

This section describes requirements for the voting system to perform event logging for system maintenance troubleshooting, recording the history of system activity, and detecting unauthorized or malicious activity. The operating system, and/or applications software may perform the actual event logging. There may be multiple logs in use for any system component.

5.6.3.1 Event log format

The voting system SHALL log the following data for each event:

- a. System ID;
- b. Unique event ID and/or type;

5.6 Logging

- c. Timestamp;
- d. Success or failure of event, if applicable;
- e. User ID triggering the event, if applicable; and
- f. Jurisdiction, if applicable.

Test Method: *Inspection*

Test Entity: *VSTL*

5.6.3.2 Critical events

All critical events SHALL be recorded in the system event log.

Test Method: *Functional*

Test Entity: *VSTL*

5.6.3.3 System events

At a minimum the voting system SHALL log the events described in the table below.

Test Method: *Inspection*

Test Entity: *VSTL*

Table 5-2 System Events

SYSTEM EVENT	DESCRIPTION
GENERAL SYSTEM FUNCTIONS	
Error and exception messages	Includes but not limited to: <ul style="list-style-type: none">• The source and disposition of system interrupts resulting in entry into exception handling routines.• Messages generated by exception handlers.• The identification code and number of occurrences for each hardware and software error or failure.• Notification of physical violations of security.• Other exception events such as power failures, failure of critical hardware components, data transmission errors or other types of operating anomalies.• All faults and the recovery actions taken.• Error and exception messages such as ordinary timer system interrupts and normal I/O system interrupts do not need to be logged.
Critical system status messages	Critical system status messages other than information messages displayed by the device during the course of normal operations. Includes but not limited to:

5.6 Logging

SYSTEM EVENT	DESCRIPTION
	<ul style="list-style-type: none"> Diagnostic and status messages upon startup. The “zero totals” check conducted before starting the voting period.
Non-critical status messages	Non-critical status messages that are generated by the data quality monitor or by software and hardware condition monitors.
Events that require election official intervention	Events that require election official intervention, so that each election official access can be monitored and access sequence can be constructed.
Shutdown and restarts	Both normal and abnormal shutdowns and restarts.
Changes to system configuration settings	Configuration settings include but are not limited to registry keys, kernel settings, logging settings, and other system configuration settings.
Integrity checks for executables, configuration files, data, and logs	Integrity checks that may indicate possible tampering with files and data.
The addition and deletion of files	Files added or deleted from the system.
System readiness results	Includes but not limited to: <ul style="list-style-type: none"> System pass or fail of hardware and software test for system readiness. Identification of the software release, identification of the election to be processed, kiosk locations, and the results of the software and hardware diagnostic tests. Pass or fail of ballot style compatibility and integrity test. Pass or fail of system test data removal.
Removable media events	Removable media that is inserted into or removed from the system.
Backup and restore	Successful and failed attempts to perform backups and restores.
Authentication related events	Includes but not limited to: <ul style="list-style-type: none"> Login/logoff events (both successful and failed attempts). Account lockout events. Password changes.
Access control related events	Includes but not limited to: <ul style="list-style-type: none"> Use of privileges. Attempts to exceed privileges. All access attempts to application and underlying system resources. Changes to the access control configuration of the system.
User account and role (or groups) management activity	Includes but not limited to: <ul style="list-style-type: none"> Addition and deletion of user accounts and roles. User account and role suspension and reactivation.

5.7 Incident Response

SYSTEM EVENT	DESCRIPTION
	<ul style="list-style-type: none">Changes to account or role security attributes such as password length, access levels, login restrictions, permissions.Administrator account and role password resets.
Installation, upgrading, patching, or modification of software or firmware	Logging for installation, upgrading, patching, or modification of software or firmware include logging what was installed, upgraded, or modified as well as a cryptographic hash or other secure identifier of the old and new versions of the data.
Changes to configuration settings	Includes but not limited to: <ul style="list-style-type: none">Changes to critical function settings. At a minimum critical function settings include location of ballot definition file, contents of the ballot definition file, vote reporting, location of logs, and system configuration settings.Changes to settings including but not limited to enabling and disabling services.Starting and stopping processes.
Abnormal process exits	All abnormal process exits.
Successful and failed database connection attempts (if a database is utilized).	All database connection attempts.
Changes to cryptographic keys	At a minimum critical cryptographic settings include key addition, key removal, and re-keying.
Voting events	Includes: <ul style="list-style-type: none">Opening and closing the voting period.Casting a vote.Success or failure of log and election results exportation.

5.7 Incident Response

5.7.1 Incident Response Support

5.7.1.1 Critical events

Manufacturers SHALL document what types of system operations or security events (e.g., failure of critical component, detection of malicious code, unauthorized access to restricted data) are classified as critical.

Test Method: *Inspection*

Test Entity: *VSTL*

5.7.1.2 Critical event alarm

An alarm that notifies appropriate personnel SHALL be generated on the vote capture device, system server, or tabulation device, depending upon which device has the error, if a critical event is detected.

Test Method: *Functional*

Test Entity: *VSTL*

5.8 Physical and Environmental Security

5.8.1 Physical Access

5.8.1.1 Unauthorized physical access requirement

Any unauthorized physical access SHALL leave physical evidence that an unauthorized event has taken place.

Test Method: *Inspection*

Test Entity: *VSTL*

5.8.2 Physical Ports and Access Points

5.8.2.1 Non-essential ports

The voting system SHALL disable physical ports and access points that are not essential to voting operations, testing, and auditing.

Test Method: *Inspection*

Test Entity: *VSTL*

5.8.3 Physical Port Protection

5.8.3.1 Physical port shutdown requirement

If a physical connection between the vote capture device and a component is broken, the affected vote capture device port SHALL be automatically disabled.

Test Method: *Inspection*

Test Entity: *VSTL*

5.8.3.2 Physical component alarm requirement

The voting system SHALL produce a visual alarm if a connected component is physically disconnected.

Test Method: *Inspection*

Test Entity: *VSTL*

5.8.3.3 Physical component event log requirement

An event log entry that identifies the name of the affected device SHALL be generated if a vote capture device component is disconnected.

Test Method: *Inspection*

Test Entity: *VSTL*

5.8.3.4 Physical port enablement requirement

Disabled ports SHALL only be re-enabled by authorized administrators.

Test Method: *Inspection*

Test Entity: *VSTL*

5.8.3.5 Physical port restriction requirement

Vote capture devices SHALL be designed with the capability to restrict physical access to voting device ports that accommodate removable media with the exception of ports used to activate a voting session.

Test Method: *Inspection*

Test Entity: *VSTL*

5.8.3.6 Physical port tamper evidence requirement

Vote capture devices SHALL be designed to give a physical indication of tampering or unauthorized access to ports and all other access points, if used as described in the manufacturer's documentation.

Test Method: *Inspection*

Test Entity: *VSTL*

5.8.3.7 Physical port disabling capability requirement

Vote capture devices SHALL be designed such that physical ports can be manually disabled by an authorized administrator.

Test Method: *Inspection*

Test Entity: *VSTL*

5.8.4 Door Cover and Panel Security

5.8.4.1 Access points security requirement

Access points such as covers and panels SHALL be secured by locks or tamper evident or tamper resistant countermeasures and SHALL be implemented so that

kiosk workers can monitor access to vote capture device components through these points.

Test Method: *Inspection*

Test Entity: *VSTL*

5.8.5 Secure Paper Record Receptacle

5.8.5.1 Secure paper record container requirement

If the voting system provides paper record containers then they SHALL be designed such that any unauthorized physical access results in physical evidence that an unauthorized event has taken place.

Test Method: *Inspection*

Test Entity: *VSTL*

5.8.6 Secure Physical Lock and Key

5.8.6.1 Secure physical lock access requirement

Voting equipment SHALL be designed with countermeasures that provide physical indication that unauthorized attempts have been made to access locks installed for security purposes.

Test Method: *Inspection*

Test Entity: *VSTL*

5.8.6.2 Secure locking system key requirement

Manufacturers SHALL provide locking systems for securing vote capture devices that can make use of keys that are unique to each owner.

Test Method: *Inspection*

Test Entity: *VSTL*

5.8.7 Media Protection

These requirements apply to all media, both paper and digital, that contain personal privacy related data or other protected or sensitive types of information.

5.8.7.1 Kiosk site protection

The voting system SHALL meet the following requirements:

- a. All paper records (including rejected ones) printed at the kiosk locations SHALL be deposited in a secure container;

- b. Vote capture device hardware, software and sensitive information (e.g., electoral roll) SHALL be physically protected to prevent unauthorized modification or disclosure; and
- c. Vote capture device hardware components, peripherals and removable media SHALL be identified and registered by means of a unique serial number or other identifier.

Test Method: *Inspection*

Test Entity: *VSTL*

5.9 Penetration Resistance

5.9.1 Resistance to Penetration Attempts

5.9.1.1 Resistant to attempts

The voting system SHALL be resistant to attempts to penetrate the system by any remote unauthorized entity.

Test Method: *Functional*

Test Entity: *VSTL*

5.9.1.2 System information disclosure

The voting system SHALL be configured to minimize ports, responses and information disclosure about the system while still providing appropriate functionality.

Test Method: *Functional*

Test Entity: *VSTL*

5.9.1.3 System access

The voting system SHALL provide no access, information or services to unauthorized entities.

Test Method: *Functional*

Test Entity: *VSTL*

5.9.1.4 Interfaces

All interfaces SHALL be penetration resistant including TCP/IP, wireless, and modems from any point in the system.

Test Method: *Functional*

Test Entity: *VSTL*

5.9.1.5 Documentation

The configuration and setup to attain penetration resistance SHALL be clearly and completely documented.

Test Method: *Functional*

Test Entity: *VSTL*

5.9.2 Penetration Resistance Test and Evaluation

5.9.2.1 Scope

The scope of penetration testing SHALL include all the voting system components. The scope of penetration testing includes but is not limited to the following:

- System server;
- Vote capture devices;
- Tabulation device;
- All items setup and configured per Technical Data Package (TDP) recommendations;
- Local wired and wireless networks; and
- Internet connections.

Test Method: *Penetration*

Test Entity: *VSTL*

5.9.2.2 Test environment

Penetration testing SHALL be conducted on a voting system set up in a controlled lab environment. Setup and configuration SHALL be conducted in accordance with the TDP, and SHALL replicate the real world environment in which the voting system will be used.

Test Method: *Penetration*

Test Entity: *VSTL*

5.9.2.3 White box testing

The penetration testing team SHALL conduct white box testing using manufacturer supplied documentation and voting system architecture information.

Documentation includes the TDP and user documentation. The testing team SHALL have access to any relevant information regarding the voting system configuration. This includes, but is not limited to, network layout and Internet Protocol addresses for system devices and components. The testing team SHALL be provided any source code included in the TDP.

Test Method: *Penetration*

Test Entity: *VSTL*

5.9.2.4 Focus and priorities

Penetration testing seeks out vulnerabilities in the voting system that might be used to change the outcome of an election, interfere with voter ability to cast ballots, ballot counting, or compromise ballot secrecy. The penetration testing team SHALL prioritize testing efforts based on the following:

- a. Threat scenarios for the voting system under investigation;
- b. Remote attacks SHALL be prioritized over in-person attacks;
- c. Attacks with a large impact SHALL be prioritized over attacks with a more narrow impact; and
- d. Attacks that can change the outcome of an election SHALL be prioritized over attacks that compromise ballot secrecy or cause non-selective denial of service.

Test Method: *Penetration*

Test Entity: *VSTL*

Section 6: Quality Assurance

6.1 General Requirements

At a minimum, this program SHALL:

- a. Include procedures for specifying, procuring, inspecting, accepting, and controlling parts and raw materials of the requisite quality;
- b. Require the documentation of the software development process;
- c. Require the documentation of the hardware specification and selection process;
- d. Identify and enforce all requirements for:
 - i. In-process inspection and testing that the manufacturer deems necessary to ensure proper fabrication and assembly of hardware
 - ii. Installation and operation of software and firmware
- e. Include plans and procedures for post-production environmental screening and acceptance testing; and
- f. Include a procedure for maintaining all data and records required to document and verify the quality inspections and tests.

Test Method: *Inspection*

Test Entity: *Manufacturer*

6.2 Components from Third Parties

A manufacturer who does not manufacture all the components of its voting system, but instead procures components as standard commercial items for assembly and integration into a voting system, SHALL verify that the supplier manufacturers follow documented quality assurance procedures that are at least as stringent as those used internally by the voting system manufacturer.

Test Method: *Inspection*

Test Entity: *Manufacturer*

6.3 Responsibility for Tests

Manufacturer SHALL be responsible for performing all quality assurance tests, acquiring and documenting test data, and providing test reports for examination by the VSTL as part of the national certification process. These reports SHALL also be provided to the purchaser upon request.

Test Method: *Inspection*

Test Entity: *Manufacturer*

6.4 Parts and Materials, Special Tests, and Examinations

In order to ensure that voting system parts and materials function properly, manufacturers SHALL:

- a. Select parts and materials to be used in voting systems and components according to their suitability for the intended application. Suitability may be determined by similarity of this application to existing standard practice or by means of special tests;
- b. Design special tests, if needed, to evaluate the part or material under conditions accurately simulating the actual voting system operating environment; and
- c. Maintain the resulting test data as part of the quality assurance program documentation.

Test Method: *Inspection*

Test Entity: *Manufacturer*

6.5 Quality Conformance Inspections

The manufacturer performs conformance inspections to ensure the overall quality of the voting system and components delivered to the VSTL for national certification testing and to the jurisdiction for implementation. To meet the conformance inspection requirements the manufacturer SHALL:

- a. Inspect and test each voting system or component to verify that it meets all inspection and test requirements for the voting system; and
- b. Deliver a record of tests or a certificate of satisfactory completion with each voting system or component.

Test Method: *Inspection*

Test Entity: *Manufacturer*

Section 7: Configuration Management

7.1 Scope

7.1.1 Configuration Management Requirements

The configuration management documentation provided for manufacturer registration SHALL be sufficient for pilot projects.

Test Method: *Inspection*

Test Entity: *EAC*

7.1.2 Audit of Configuration Management Documentation

The manufacturer SHALL provide the following documentation to the EAC for review. This documentation will be audited during the registration review which will be conducted during the pilot testing period. The items which the EAC will audit are the following:

- a. Application of configuration management requirements;
- b. Configuration management policy;
- c. Configuration identification;
- d. Baseline, promotion, and demotion procedures;
- e. Configuration control procedures;
- f. Release process;
- g. Configuration audits; and
- h. Configuration management resources.

Test Method: *Inspection*

Test Entity: *EAC*

7.2 Configuration Identification

Configuration identification is the process of identifying, naming, and acquiring configuration items. Configuration identification encompasses all voting system components.

7.2.1 Classification and Naming Configuration Items

Manufacturers SHALL describe the procedures and conventions used to classify configuration items into categories and subcategories, uniquely number or otherwise identify configuration items and name configuration items.

Test Method: *Inspection*

Test Entity: *Manufacturer*

7.2.2 Versioning Conventions

When a voting system component is part of a higher level system element such as a subsystem, the manufacturer SHALL describe the conventions used to:

- a. Identify the specific versions of individual configuration items and sets of items that are incorporated in higher level system elements such as subsystems;
- b. Uniquely number or otherwise identify versions; and
- c. Name versions.

Test Method: *Inspection*

Test Entity: *Manufacturer*

7.3 Baseline and Promotion Procedures

Manufacturers SHALL establish formal procedures and conventions for establishing and providing a complete description of the procedures and related conventions used to:

- a. Establish a particular instance of a component as the starting baseline;
- b. Promote subsequent instances of a component to baseline status as development progresses through to completion of the initial completed version released to the VSTL for testing; and
- c. Promote subsequent instances of a component to baseline status as the component is maintained throughout its life cycle until system retirement (i.e., the system is no longer sold or maintained by the manufacturer).

Test Method: *Inspection*

Test Entity: *Manufacturer*

7.4 Configuration Control Procedures

Configuration control is the process of approving and implementing changes to a configuration item to prevent unauthorized additions, changes or deletions. The manufacturer SHALL establish such procedures and related conventions, providing a complete description of those procedures used to:

- a. Develop and maintain internally developed items;

- b. Acquire and maintain third-party items;
- c. Resolve internally identified defects for items regardless of their origin; and
- d. Resolve externally identified and reported defects (i.e., by customers and VSTLs).

Test Method: *Inspection*

Test Entity: *Manufacturer*

7.5 Configuration Audits

7.5.1 Physical Configuration Audit (PCA)

For the PCA, a manufacturer SHALL provide:

- a. Identification of all items that are to be a part of the pilot release;
- b. Specification of compiler (or choice of compilers) to be used to generate voting system executable programs;
- c. Identification of all hardware that interfaces with the software;
- d. Configuration baseline data for all hardware that is unique to the voting system;
- e. Copies of all software documentation intended for distribution to users, including program listings, specifications, operations manual, voter manual, and maintenance manual;
- f. Identification of any changes between the physical configuration of the voting system submitted for the PCA and that submitted for the Functional Configuration Audit (FCA), with a certification that any differences do not degrade the functional characteristics; and
- g. Complete descriptions of its procedures and related conventions used to support this audit by
 - i. Establishing a configuration baseline of the software and hardware to be tested; and
 - ii. Confirming whether the voting system documentation matches the corresponding system components.

Test Method: *Inspection*

Test Entity: *VSTL*

7.5.2 Functional Configuration Audit (FCA)

The Functional Configuration Audit is conducted by the VSTL to verify that the voting system performs all the functions described in the system documentation.

Manufacturers SHALL:

- a. Completely describe its procedures and related conventions used to support this audit for all voting system components; and
- b. Provide the following information to support this audit:

7.5 Configuration Audits

- c. Copies of all procedures used for module or unit testing, integration testing, and system testing;
- d. Copies of all test cases generated for each module and integration test, and sample ballot formats or other test cases used for system tests; and
- e. Records of all tests performed by the procedures listed above, including error corrections and retests.

Test Method: *Functional / Inspection*

Test Entity: *VSTL*

Section 8: Technical Data Package

8.1 Scope

This section contains a description of manufacturer documentation relating to the voting system that must be submitted with the system as a precondition of conformity assessment. These items are necessary to define the product and its method of operation; to provide technical and test data supporting the manufacturer's claims of the system's functional capabilities and performance levels; and to document instructions and procedures governing system operation and field maintenance. Any other items relevant to the system evaluation, such as media, materials, source code, object code, and sample output report formats, must be submitted along with this documentation.

This documentation is used by the VSTL in constructing the test plan. Testing of systems submitted by manufacturers that consistently adhere to particularly strong and well-documented quality assurance and configuration management practices will generally be more efficient than for systems developed and maintained using less rigorous or less well-documented practices.

Both formal documentation and notes of the manufacturer's system development process must be submitted for conformity assessment. Documentation describing the system development process permits assessment of the manufacturer's systematic efforts to develop and test the system and correct defects. Inspection of this process also enables the design of a more precise test plan. The VSTL must design and conduct the appropriate tests to cover all elements of the system and to ensure conformance with all system requirements.

8.1.1 Content and Format

The content of the Technical Data Package (TDP) is intended to provide clear, complete descriptions of the following information about the voting system:

- Overall system design, including subsystems, modules and the interfaces among them;
- Specific functional capabilities provided by the system;
- Performance and design specifications;
- Design constraints, applicable standards, and compatibility requirements;
- Personnel, equipment, and facility requirements for system operation, maintenance, and logistical support;
- Manufacturer practices for assuring system quality during the system's development and subsequent maintenance; and
- Manufacturer practices for managing the configuration of the system during development and for modifications to the system throughout its life cycle.

8.1.1.1 Required content for initial conformity assessment

8.1.1.1.1 Identify full system configuration

Manufacturers SHALL submit to the VSTL documentation necessary for the identification of the full system configuration submitted for evaluation and for the development of an appropriate test plan by the VSTL.

Test Method: Inspection

Test Entity: Manufacturer

8.1.1.1.2 Required content for pilot certification

Manufacturers SHALL provide a list of all documents submitted controlling the design, construction, operation, and maintenance of the voting system. At minimum, the TDP SHALL contain the following documentation:

- Implementation statement;
- Voting system user documentation (See Section 9 Voting Equipment User Documentation);
- System hardware specification;
- Application logic design and specification;
- System security specification;
- System test specification;
- Configuration for testing; and
- Training documentation.

Test Method: Inspection

Test Entity: Manufacturer

8.1.1.2 Format

The requirements for formatting the TDP are general in nature; specific format details are of the manufacturer's choosing.

8.1.1.2.1 Table of contents and abstracts

The TDP SHALL include a detailed table of contents for the required documents, an abstract of each document, and a listing of each of the informational sections and appendices presented.

Test Method: Inspection

Test Entity: Manufacturer

8.1.1.2.2 Cross-index

A cross-index SHALL be provided indicating the portions of the documents that are responsive to the documentation requirements enumerated in section 8.1.1.1.2.

Test Method: Inspection

Test Entity: Manufacturer

8.1.2 Protection of Proprietary Information

8.1.2.1 Identify proprietary data

Manufacturers SHALL identify all documents, or portions of documents, containing proprietary information that is not releasable to the public.

Test Method: Inspection

Test Entity: Manufacturer

8.2 Implementation Statement

8.2.1 TDP Implementation Statement

The TDP SHALL include an implementation statement.

Test Method: Inspection

Test Entity: Manufacturer

8.3 System Hardware Specification

8.3.1 System Hardware Specification Scope

Manufacturers SHALL expand on the system overview included in the user documentation by providing detailed specifications of the hardware components of the voting system, including specifications of hardware used to support the telecommunications capabilities of the voting system, if applicable.

Test Method: Inspection

Test Entity: Manufacturer

8.3.2 System Hardware Characteristics

8.3.2.1 Description of hardware characteristics

Manufacturers SHALL provide a detailed discussion of the characteristics of the system, indicating how the hardware meets individual requirements defined in this document, including:

- a. Performance characteristics: Basic system performance attributes and operational scenarios that describe the manner in which system functions are invoked, describe environmental capabilities, describe life expectancy, and describe any other essential aspects of system performance;

- b. Physical characteristics: Suitability for intended use, requirements for security criteria, and vulnerability to adverse environmental factors;
- c. Reliability: System and component reliability stated in terms of the system's operating functions, and identification of items that require special handling or operation to sustain system reliability; and
- d. Environmental conditions: Ability of the system to withstand natural environments, and operational constraints in normal and test environments, including all requirements and restrictions regarding electrical service, telecommunications services, environmental protection, and any additional facilities or resources required to install and operate the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.3.3 Design and Construction

8.3.3.1 System configuration

Manufacturers SHALL provide sufficient data, or references to data, to identify unequivocally the details of the system configuration submitted for testing.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.3.3.2 Photographs for hardware validation

Manufacturers SHALL provide photographs of the exterior and interior of devices included in the system to identify the hardware of the system configuration submitted for testing.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.3.3.3 List of materials

Manufacturers SHALL provide a list of materials and components used in the system and a description of their assembly into major system components and the system as a whole.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.3.3.4 Design and construction miscellany

Text and diagrams SHALL be provided that describe:

- a. Materials, processes, and parts used in the system, their assembly, and the configuration control measures to ensure compliance with the system specification;

- b. Electromagnetic environment generated by the system; and
- c. Operator and voter safety considerations and any constraints on system operations or the use environment.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.3.4 Hardwired Logic

8.3.4.1 Hardwired and mechanical implementations of logic

For each non-COTS hardware component (e.g., an application-specific integrated circuit or a manufacturer-specific integration of smaller components), manufacturers SHALL provide complete design and logic specifications, such as Computer Aided Design and Hardware Description Language files.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.3.4.2 Logic specifications for PLDs, FPGAs and PICs

For each Programmable Logic Device (PLD), Field-Programmable Gate Array (FPGA), or Peripheral Interface Controller (PIC) that is programmed with non-COTS logic, manufacturers SHALL provide complete logic specifications, such as Hardware Description Language files or source code.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4 Application Logic Design and Specification

8.4.1 Application Logic Design and Specification

Manufacturers SHALL expand on the system overview included in the user documentation by providing detailed specifications of the application logic components of the system, including those used to support the telecommunications capabilities of the system, if applicable.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.2 Purpose and Scope

8.4.2.1 Application logic functions

Manufacturers SHALL describe the function or functions that are performed by the application logic comprising the system, including that used to support the telecommunications capabilities of the system, if applicable.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.3 Applicable Documents

8.4.3.1 Documents controlling application logic development

Manufacturers SHALL list all documents controlling the development of application logic and its specifications.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.4 Application Logic Overview

8.4.4.1 Application logic overview

Manufacturers SHALL provide an overview of the application logic.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.4.2 Application logic architecture

The overview SHALL include a description of the architecture, the design objectives, and the logic structure and algorithms used to accomplish those objectives.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.4.3 Application logic design

The overview SHALL include the general design, operational considerations, and constraints influencing the design.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.4.4 Application logic overview miscellany

The overview SHALL include the following additional information for each separate software package:

- a. Package identification;
- b. General description;
- c. Requirements satisfied by the package;
- d. Identification of interfaces with other packages that provide data to, or receive data from, the package; and
- e. Concept of execution for the package.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.5 Application Logic Standards and Conventions

8.4.5.1 Application logic standards and conventions

Manufacturers SHALL provide information on application logic standards and conventions developed internally by the manufacturer as well as published industry standards that have been applied by the manufacturer.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.5.2 Application logic standards and conventions, checklist

Manufacturers SHALL provide information that addresses the following standards and conventions related to application logic:

- a. Development methodology;
- b. Design standards, including internal manufacturer procedures;
- c. Specification standards, including internal manufacturer procedures;
- d. Coding conventions, including internal manufacturer procedures;
- e. Testing and verification standards, including internal manufacturer procedures, that can assist in determining the correctness of the logic; and
- f. Quality assurance standards or other documents that can be used to examine and test the application logic. These documents include standards for logic diagrams, program documentation, test planning, and test data acquisition and reporting.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.5.3 Justify coding conventions

Manufacturers SHALL furnish evidence that the selected coding conventions are "published" and "credible" as specified in section 4.3.1.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.6 Application Logic Operating Environment

8.4.6.1 Application logic operating environment

Manufacturers SHALL describe or make reference to all operating environment factors that influence the design of application logic.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.7 Hardware Environment and Constraints

8.4.7.1 Hardware environment and constraints

Manufacturers SHALL identify and describe the hardware characteristics that influence the design of the application logic, such as:

- a. Logic and arithmetic capability of the processor;
- b. Memory read-write characteristics;
- c. External memory device characteristics;
- d. Peripheral device interface hardware;
- e. Data input/output device protocols; and
- f. Operator controls, indicators, and displays.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.8 Application Logic Environment

8.4.8.1 Operating system

Manufacturers SHALL identify the operating system and the specific version thereof, or else clarify how the application logic operates without an operating system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.8.2 Compilers and assemblers

For systems containing compiled or assembled application logic, manufacturers SHALL identify the COTS compilers or assemblers used in the generation of executable code, and the specific versions thereof.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.8.3 Interpreters

For systems containing interpreted application logic, manufacturers SHALL specify the COTS runtime interpreter that SHALL be used to run this code, and the specific version thereof.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.9 Application Logic Functional Specification

8.4.9.1 Application logic functional specification

Manufacturers SHALL provide a description of the operating modes of the system and of application logic capabilities to perform specific functions.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.10 Functions and Operating Modes

8.4.10.1 Functions and operating modes

Manufacturers SHALL describe all application logic functions and operating modes of the system, such as ballot preparation, election programming, preparation for opening the voting period, recording votes and/or counting ballots, closing the voting period, and generating reports.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.10.2 Functions and operating modes detail

For each application logic function or operating mode, manufacturers SHALL provide:

- a. A definition of the inputs to the function or mode (with characteristics, limits, tolerances or acceptable ranges, as applicable);
- b. An explanation of how the inputs are processed; and

- c. A definition of the outputs produced (again, with characteristics, limits, tolerances, or acceptable ranges, as applicable).

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.11 Application Logic Integrity Features

8.4.11.1 Application logic integrity features

Manufacturers SHALL describe the application logic's capabilities or methods for detecting or handling:

- a. Exception conditions;
- b. System failures;
- c. Data input/output errors;
- d. Error logging for audit record generation;
- e. Production of statistical ballot data;
- f. Data quality assessment; and
- g. Security monitoring and control.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.12 Programming Specifications

8.4.12.1 Programming specifications

Manufacturers SHALL provide in this section an overview of the application logic's design, its structure, and implementation algorithms and detailed specifications for individual modules.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.13 Programming Specifications Overview

The programming specifications overview SHALL document the architecture of the application logic.

8.4.13.1 Programming specifications overview, diagrams

This overview SHALL include such items as Unified Modeling Language diagrams, data flow diagrams, and/or other graphical techniques that facilitate understanding of the programming specifications.

Test Method: *Inspection*

Test Entity: Manufacturer

8.4.13.2 Internal functioning of individual modules

This section SHALL be prepared to facilitate understanding of the internal functioning of the individual modules.

Test Method: Inspection

Test Entity: Manufacturer

8.4.13.3 Programming specifications overview, content

Implementation of the functions SHALL be described in terms of the architecture, algorithms, and data structures.

Test Method: Inspection

Test Entity: Manufacturer

8.4.14 Programming Specifications Details

8.4.14.1 Programming specifications details

The programming specifications SHALL describe individual application logic modules and their component units, if applicable.

Test Method: Inspection

Test Entity: Manufacturer

8.4.14.2 Module and callable unit documentation

For each application logic module and callable unit, manufacturers SHALL document:

- a. Significant module and unit design decisions, if any, such as algorithms used;
- b. Any constraints, limitations, or unusual features in the design of the module or callable unit; and
- c. A description of its inputs, outputs, and other data elements as applicable with respect to communication over system interfaces. (See section 8.4.16 Interfaces.)

Test Method: Inspection

Test Entity: Manufacturer

8.4.14.3 Mixed-language software

If an application logic module is written in a programming language other than that generally used within the system, the specification for the module SHALL indicate the programming language used and the reason for the difference.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.14.4 References for foreign programming languages

If a module contains embedded border logic commands for an external library or package (e.g., menu selections in a database management system for defining forms and reports, on-line queries for database access and manipulation, input to a graphical user interface builder for automated code generation, commands to the operating system, or shell scripts), the specification for the module SHALL contain a reference to user manuals or other documents that explain them.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.14.5 Source code

For each callable unit (e.g., function, method, operation, subroutine, procedure) in application logic, border logic, and third-party logic, manufacturers SHALL supply the source code.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.14.6 Inductive assertions

For each callable unit (e.g., function, method, operation, subroutine, procedure) in core logic, manufacturers SHALL specify:

- a. Preconditions and postconditions of the callable unit, including any assumptions about capacities and limits within which the system is expected to operate; and
- b. A sound argument (preferably, but not necessarily, a formal proof) that the preconditions and postconditions of the callable unit accurately represent its behavior, assuming that the preconditions and postconditions of any invoked units are similarly accurate.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.14.7 High-level constraints

Manufacturers SHALL specify a sound argument (preferably, but not necessarily, a formal proof) that the core logic as a whole satisfies each of the constraints for all cases within the aforementioned capacities and limits, assuming that the preconditions and postconditions of callable units accurately characterize their behaviors.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.14.8 Safety of concurrency

Manufacturers SHALL specify a sound argument (preferably, but not necessarily, a formal proof) that application logic is free of race conditions, deadlocks, livelocks, and resource starvation.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.15 System Database

8.4.15.1 System database

Manufacturers SHALL identify and provide a diagram and narrative description of the system's databases and any external files used for data input or output.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.15.2 Database design levels

For each database or external file, manufacturers SHALL specify the number of levels of design and the names of those levels (e.g., conceptual, internal, logical, and physical).

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.15.3 Database design conventions

For each database or external file, the manufacturer SHALL specify any design conventions and standards (which may be incorporated by reference) needed to understand the design.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.15.4 Data models

For each database or external file, manufacturers SHALL identify and describe all logical entities and relationships and how these are implemented physically (e.g., tables, files).

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.15.5 Schemata

Manufacturers SHALL document the details of table, record or file contents (as applicable), individual data elements and their specifications, including:

- a. Names/identifiers;
- b. Data type (e.g., alphanumeric, integer);
- c. Size and format (such as length and punctuation of a character string);
- d. Units of measurement (e.g., meters, seconds)
- e. Range or enumeration of possible values (e.g., 0–99)
- f. Accuracy (how correct) and precision (number of significant digits);
- g. Priority, timing, frequency, volume, sequencing, and other constraints, such as whether the data element may be updated and whether business rules apply;
- h. Security and privacy constraints; and
- i. Sources (setting/sending entities) and recipients (using/receiving entities).

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.15.6 External file maintenance and security

For external files, manufacturers SHALL document the procedures for file maintenance, management of access privileges, and security.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.16 Interfaces

8.4.16.1 Description of interfaces

Using a combination of text and diagrams, manufacturers SHALL identify and provide a complete description of all major internal and external interfaces.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.17 Interface Identification

8.4.17.1 Interface identification details

For each interface identified in the system overview, manufacturers SHALL:

- a. Provide a unique identifier assigned to the interface;
- b. Identify the interfacing entities (e.g., systems, configuration items, users) by name, number, version, and documentation references, as applicable; and
- c. Identify which entities have fixed interface characteristics (and therefore impose interface requirements on interfacing entities) and which are being

developed or modified (thus having interface requirements imposed upon them).

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.18 Interface Description

8.4.18.1 Interface types

For each interface identified in the system overview, manufacturers SHALL describe the type of interface (e.g., real-time data transfer, data storage-and-retrieval) to be implemented.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.18.2 Interface signatures

For each interface identified in the system overview, manufacturers SHALL describe characteristics of individual data elements that the interfacing entity (ies) will provide, store, send, access, receive, etc., such as:

- a. Names/identifiers;
- b. Data type (e.g., alphanumeric, integer);
- c. Size and format (such as length and punctuation of a character string);
- d. Units of measurement (e.g., meters, seconds);
- e. Range or enumeration of possible values (e.g., 0–99);
- f. Accuracy (how correct) and precision (number of significant digits);
- g. Priority, timing, frequency, volume, sequencing, and other constraints, such as whether the data element may be updated and whether business rules apply;
- h. Security and privacy constraints; and
- i. Sources (setting/sending entities) and recipients (using/receiving entities).

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.18.3 Interface protocols

For each interface identified in the system overview, manufacturers SHALL describe characteristics of communication methods that the interfacing entity (ies) will use for the interface, such as:

- a. Communication links/bands/frequencies/media and their characteristics;
- b. Message formatting;
- c. Flow control (e.g., sequence numbering and buffer allocation);

- d. Data transfer rate, whether periodic/aperiodic, and interval between transfers;
- e. Routing, addressing, and naming conventions;
- f. Transmission services, including priority and grade; and
- g. Safety/security/privacy considerations, such as encryption, user authentication, compartmentalization, and auditing.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.18.4 Protocol details

For each interface identified in the system overview, manufacturers SHALL describe characteristics of protocols the interfacing entity (ies) will use for the interface, such as:

- a. Priority/layer of the protocol;
- b. Packeting, including fragmentation and reassembly, routing, and addressing;
- c. Legality checks, error control, and recovery procedures;
- d. Synchronization, including connection establishment, maintenance, termination; and
- e. Status, identification, and any other reporting features.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.18.5 Characteristics of interfaces

For each interface identified in the system overview, manufacturers SHALL describe any other pertinent characteristics, such as physical compatibility of the interfacing entity (ies) (e.g., dimensions, tolerances, loads, voltages, plug compatibility).

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.4.19 Appendices

Manufacturers SHALL provide descriptive material and data supplementing the various sections of the body of the logic specifications. The content and arrangement of appendices are at the discretion of the manufacturer. Topics recommended for amplification or treatments in appendix form include:

- Glossary: A listing and brief definition of all module names and variable names, with reference to their locations in the logic structure. Abbreviations, acronyms, and terms should be included, if they are either uncommon in data processing and software development or are used with an unorthodox meaning;

- References: A list of references to all related manufacturer documents, data, standards, and technical sources used in logic development and testing; and
- Program Analysis: The results of logic configuration analysis, algorithm analysis and selection, timing studies, and hardware interface studies that are reflected in the final logic design and coding.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5 System Security Specification

This section defines the security documentation requirements for systems. These recommendations apply to the full scope of system functionality, including functionality for defining the ballot and other pre-voting functions, as well as functions for casting and storing votes, vote reporting, system logging, and maintenance of the system. User documentation includes all public information that is provided to end users. The Technical Data Package (TDP) includes the user documentation along with proprietary information that is viewed only by the VSTL.

8.5.1 General

8.5.1.1 Overall security

Manufacturers SHALL document in the TDP all aspects of system design, development, and proper usage that are relevant to system security. This includes, but is not limited to the following:

- System security objectives;
- All hardware and software security mechanisms;
- All cryptographic algorithms, protocols and schemes that are used;
- Development procedures employed to ensure absence of malicious code;
- Initialization, usage, and maintenance procedures necessary to secure operation;
- All attacks the system is designed to resist or detect; and
- Any security vulnerabilities known to the manufacturer.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.1.2 High level security

Manufacturers SHALL provide at a minimum the high-level documents listed in Table 8-1 as part of the TDP.

Test Method: *Inspection*

Test Entity: *Manufacturer*

Table 8-1 High level system documentation

DOCUMENT	DESCRIPTION
Security Threats Controls	This document identifies the threats the system protects against and the implemented security controls on the system and system components.
Security Architecture	This document provides an architecture level description of how the security requirements are met, and SHALL include the various authentication, access control, audit, confidentiality, integrity, and availability requirements.
Interface Specification	This document describes external interfaces (programmatic, human, and network) provided by each of the components of the system.
Design Specification	This document provides a high-level design of each system component.
Development Environment Specification	This document provides descriptions of the physical, personnel, procedural, and technical security of the development environment including configuration management, tools used, coding standards used, software engineering model used, and description of developer and independent testing.
Security Testing and Vulnerability Analysis Documentation	This document describes security tests performed to identify vulnerabilities and the results of the testing. This also includes testing performed as part of software development, such as unit, module, and subsystem testing.

8.5.2 Access Control

8.5.2.1 General user

Manufacturers SHALL provide user documentation of access control capabilities of the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.2.2 General access control technical specification

Manufacturers SHALL provide descriptions and specifications of all access control mechanisms of the system including management capabilities of authentication, authorization, and passwords.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.2.3 Unauthorized access technical specification

Manufacturers SHALL provide descriptions and specifications of methods to prevent unauthorized access to the access control mechanisms of the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.2.4 Access control dependent system mechanisms

Manufacturers SHALL provide descriptions and specifications of all system mechanisms that are dependent upon, support, and interface with access controls.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.2.5 Voting operations and roles

Manufacturers SHALL provide a list of all of the operations possible on the voting system and list the default roles that have permission to perform each such operation.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.2.6 Critical event escalation

Manufacturers SHALL document a prioritized critical event escalation list of appropriate personnel to be notified.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.3 System Event Logging

8.5.3.1 General

Manufacturers SHALL provide documentation of event logging capabilities of the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.4 Software Installation

8.5.4.1 Software list

Manufacturers SHALL provide a list of all software related to the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.4.2 Software information

Manufacturers SHALL provide, at a minimum, the following information for each piece of software related to the system:

- Software product name;
- Software version number;
- Software manufacturer name;
- Software manufacturer contact information;
- Type of software (application logic, border logic, third party logic, COTS software, or installation software);
- List of software documentation;
- Component identifier(s) (such as filename(s)) of the software; and
- Type of software component (executable code, source code, or data).

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.4.3 Software location information

Manufacturers SHALL provide the location (such as full path name or memory address) and storage device (such as type and part number of storage device) where each piece of software is installed on programmed devices of the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.4.4 Software functionality for programmed devices

Manufacturers SHALL document the functionality provided to the system by the software installed on programmed devices.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.4.5 Software dependencies and interaction

Manufacturers SHALL map the dependencies and interactions between software installed on programmed devices.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.4.6 Build environment software and hardware

Manufacturers SHALL provide a list of all software and hardware required to assemble the build environment used to create system software executable code including application logic, border logic, and third party logic.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.4.7 Build environment assembly procedures

Manufacturers SHALL document the procedures to assemble the build environment(s) used to create system software executable code including application logic, border logic, and third party logic.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.4.8 System software build procedures

Manufacturers SHALL document the procedures used to build the system software executable code including application logic, border logic, and third party logic.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.5 Physical Security

8.5.5.1 Unauthorized physical access

Manufacturers SHALL provide a list of all system components to which access must be restricted and a description of the function of each such component.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.5.2 Physical port and access point

Manufacturers SHALL provide a listing of all ports and access points.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.5.3 Physical lock use

For each lock, manufacturers SHALL document whether the lock was installed to secure an access point.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.5.4 Power usage

Manufacturer SHALL provide a list of all physical security countermeasures that require power supplies.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.5.5 Physical security

Manufacturer SHALL document the design and implementation of all physical security controls for the system and its components.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.6 System Integrity Management

8.5.6.1 Binaries per system

Manufacturers SHALL provide a list of the binaries that are required to be executed on the system devices.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.7 Setup Inspection

8.5.7.1 Software integrity verification

Manufacturers SHALL provide a technical specification of how the integrity of software installed on programmed devices of the system is verified.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.7.2 Software integrity verification technique software non-modification

Manufacturers SHALL provide documentation of software integrity verification techniques that prevent the modification of software installed on programmed devices of the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.7.3 Register and variable value inspection

Manufacturers SHALL provide a technical specification of how the inspection of all the system registers and variables is implemented by the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.7.4 Backup power inspection

Manufacturers SHALL provide a technical specification of how the inspection of the remaining charge of the backup power sources is implemented by the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.7.5 Cabling connectivity inspection

Manufacturers SHALL provide a technical specification of how the inspection of the connectivity of cabling attached is implemented by the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.7.6 Communications operational status inspection

Manufacturers SHALL provide a technical specification of how the inspection of the operational status of the communications capability is implemented by the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.7.7 Communications on/off inspection

Manufacturers SHALL provide a technical specification of how the inspection of the on/off status of the communications capability is implemented by the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.7.8 Consumable inspection

Manufacturers SHALL provide a technical specification of how the inspection of the remaining amount of each consumable is implemented by the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.7.9 Calibration of voting device components inspection

Manufacturers SHALL provide a technical specification of how the inspection of the calibration for each component is implemented by the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.5.7.10 Calibration of voting device components adjustment

Manufacturers SHALL provide a technical specification of how the adjustment to the calibration of each component is implemented by the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.6 Test Specifications

Manufacturers SHALL provide test specifications for:

- a. Development test specifications; and
- b. System test specifications.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.6.1 Development Test Specifications

8.6.1.1 Development test specifications

Manufacturers SHALL describe the plans, procedures, and data used during development and system integration to verify system logic correctness, data quality, and security. This description SHALL include:

- a. Test identification and design, including test structure, test sequence or progression, and test conditions;
- b. Standard test procedures, including any assumptions or constraints;
- c. Special purpose test procedures including any assumptions or constraints;
- d. Test data, including the data source, whether it is real or simulated, and how test data are controlled;
- e. Expected test results; and
- f. Criteria for evaluating test results.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.6.2 System Test Specifications

8.6.2.1 Specifications for verification and validation of system performance

Manufacturers SHALL provide specifications for verification and validation of overall system performance. These specifications SHALL cover:

- a. Control and data input/output;
- b. Processing accuracy;
- c. Data quality assessment and maintenance;
- d. Ballot interpretation logic;
- e. Exception handling;
- f. Security;
- g. Production of audit trails and statistical data;
- h. Expected test results; and
- i. Criteria for evaluating test results.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.6.2.2 Demonstrate fitness for purpose

The specifications SHALL identify procedures for assessing and demonstrating the suitability of the system for election use.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.7 Configuration for Testing

8.7.1 Configuration Description

Configuration of hardware and software, both operating systems and applications, is critical to proper system functioning. Correct test design and sufficient test execution must account for the intended and proper configuration of all system components. If the system can be set up in both conforming and nonconforming configurations, the configuration actions necessary to obtain conforming behavior must be specified.

8.7.1.1 Hardware set-up

Manufacturers SHALL provide instructions and photographs illustrating the proper set up of the system hardware.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.7.1.2 Provide answers to installation prompts

Manufacturers SHALL provide a record of all user selections that must be made during software/firmware installation for the system to meet the requirements of the UOCAVA Pilot Testing Requirements.

Test Method: *Inspection*

Test Entity: *Manufacturer*

8.7.1.3 Configuration data

Manufacturers SHALL submit all configuration data needed to set up and operate the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

Section 9: System Users Manual

9.1 Scope

This section contains requirements on the content of the documentation that manufacturers supply to jurisdictions that use their systems. In this context, "user" refers to election officials, others in the jurisdictions who implement systems, and VSTLs. The user documentation is also included in the TDP provided to the VSTL.

It is not the intent of these requirements to prescribe an outline for user documentation. Manufacturers are encouraged to innovate in the quality and clarity of their user documentation. The intent of these requirements is to ensure that certain information that is of interest to end users and VSTLs will be included within the user documentation. To expedite the VSTL review, manufacturers SHALL provide the VSTL with a short index that relates the corresponding sections of the user documentation to the specific requirements in this document.

9.2 System Overview

9.2.1 User Documentation System Overview

In the system overview, manufacturers SHALL provide information that enables the user to identify the functional and physical components of the system, how the components are structured, and the interfaces between them.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.2.2 System Overview Functional Diagram

The system overview SHALL include a high-level functional diagram of the system that includes all of its components. The diagram SHALL portray how the various components relate and interact.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.2.3 System Description

9.2.3.1 User documentation system description

The system description SHALL include written descriptions, drawings and diagrams that present:

- a. A description of the functional components or subsystems, (e.g., environment, election management and control, vote recording, vote conversion, reporting, and their logical relationships);

- b. A description of the operational environment of the system that provides an overview of the hardware, firmware, software, and communications structure;
- c. A description that explains each system function and how the function is achieved in the design;
- d. Descriptions of the functional and physical interfaces between subsystems and components;
- e. Identification of all COTS products (both hardware and software) included in the system and/or used as part of the system's operation, identifying the name, manufacturer, and version used for each such component;
- f. Communications (network) software;
- g. Interfaces among internal components and interfaces with external systems. For components that interface with other components for which multiple products may be used, the manufacturers SHALL identify file specifications, data objects, or other means used for information exchange, and the public standard used for such file specifications, data objects, or other means; and
- h. Listings of all software and firmware and associated documentation included in the manufacturer's release in the order in which each piece of software or firmware would normally be installed upon system setup and installation.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.2.3.2 Identify software and firmware by origin

The system description SHALL include the identification of all software and firmware items, indicating items that were:

- a. Written in-house;
- b. Written by a subcontractor;
- c. Procured as COTS; and
- d. Procured and modified, including descriptions of the modifications to the software or firmware and to the default configuration options.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.2.3.3 Traceability of procured software

The system description SHALL include a declaration that procured software items were obtained directly from the manufacturer or from a licensed dealer or distributor.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.2.4 System Performance

9.2.4.1 User documentation system performance

Manufacturers SHALL provide system performance information including:

- a. Device capacities and limits that were stated in the implementation statement;
- b. Performance characteristics of each operating mode and function in terms of expected and maximum speed, throughput capacity, maximum volume (maximum number of voting positions and maximum number of ballot styles supported), and processing frequency;
- c. Quality attributes such as reliability, maintainability, availability, usability, and portability;
- d. Provisions for safety, security, voter privacy, ballot secrecy, and continuity of operations; and
- e. Design constraints, applicable standards, and compatibility requirements.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.3 System Functionality Description

9.3.1 User Documentation, System Functionality Description

Manufacturers SHALL provide a listing of the system's functional processing capabilities, encompassing capabilities required by the UOCAVA Pilot Program Testing Requirements, and any additional capabilities provided by the system, with a description of each capability.

- a. Manufacturers SHALL explain, in a manner that is understandable to users, the capabilities of the system declared in the implementation statement;
- b. Additional capabilities (extensions) SHALL be clearly indicated;
- c. Required capabilities that may be bypassed or deactivated during installation or operation by the user SHALL be clearly indicated;
- d. Additional capabilities that function only when activated during installation or operation by the user SHALL be clearly indicated; and
- e. Additional capabilities that normally are active but may be bypassed or deactivated during installation or operation by the user SHALL be clearly indicated.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.4 System Security Specification

9.4.1 Access Control

9.4.1.1 Access control implementation, configuration, and management

Manufacturers SHALL provide user documentation containing guidelines and usage instructions on implementing, configuring, and managing access control capabilities.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.4.1.2 Access control policy

Manufacturers SHALL provide, within the user documentation, the access control policy under which the system was designed to operate.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.4.1.3 Privileged account

Manufacturers SHALL disclose and document information on all privileged accounts included on the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.4.2 System Event Logging

9.4.2.1 System event logging

Manufacturers SHALL provide user documentation that describes system event logging capabilities and usage.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.4.2.2 Log format

Manufacturers SHALL provide fully documented log format information.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.4.3 Ballot Decryption

9.4.3.1 Ballot decryption process

Manufacturers SHALL provide documentation on the proper procedures for the authorized entity to implement ballot decryption while maintaining the security and privacy of the data.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.4.3.2 Ballot decryption key reconstruction

Manufacturers SHALL provide documentation describing the proper procedure for the authorized entity to reconstruct the election private key to decrypt the ballots.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.4.3.3 Ballot decryption key destruction

Manufacturers SHALL document when any cryptographic keys created or used by the system may be destroyed. The documentation SHALL describe how to delete keys securely and irreversibly at the appropriate time.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.4.4 Physical Security

9.4.4.1 Physical security

Manufacturers SHALL provide user documentation explaining the implementation of all physical security controls for the system, including procedures necessary for effective use of countermeasures.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.4.5 Audit

9.4.5.1 Ballot count and vote total auditing

The system's user documentation SHALL fully specify a secure, transparent, workable and accurate process for producing all records necessary to verify the accuracy of the electronic tabulation result.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.5 Software

9.5.1 Software installation

9.5.1.1 Software list

Manufacturers SHALL provide a list of all software to be installed on the programmed devices of the system and installation software used to install the software.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.5.1.2 Software information

Manufacturers SHALL provide at a minimum, the following information for each piece of software to be installed or used to install software on programmed devices of the system: software product name, software version number, software manufacturer name, software manufacturer contact information, type of software (application logic, border logic, third party logic, COTS software, or installation software), list of software documentation, component identifier(s) (such filename(s)) of the software, type of software component (executable code, source code, or data).

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.5.1.3 Software location information

Manufacturers SHALL provide the location (such as full path name or memory address) and storage device (such as type and part number of storage device) where each piece of software is installed on programmed devices of the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.5.1.4 Election specific software identification

Manufacturers SHALL identify election specific software in the user documentation.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.5.1.5 Installation software and hardware

Manufacturers SHALL provide a list of software and hardware required to install software on programmed devices of the system in the user documentation.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.5.1.6 Software installation procedure

Manufacturers SHALL document the software installation procedures used to install software on programmed devices of the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.5.1.7 Compiler installation prohibited

The software installation procedures used to install software on programmed devices of the system SHALL specify that no compilers SHALL be installed on the programmed device.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.5.1.8 Procurement of system software

The software installation procedures SHALL specify that system software SHALL be obtained from the VSTL or approved distribution repositories.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.5.1.9 Erasable storage media preparation

The software installation procedures SHALL specify how previously stored information on erasable storage media is removed before installing software on the media.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.5.1.10 Installation media unalterable storage media

The software installation procedures SHALL specify that unalterable storage media SHALL be used to install software on programmed devices of the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.5.1.11 Software hardening

Manufacturers SHALL provide documentation that describes the hardening procedures for the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6 Setup Inspection

9.6.1 Setup inspection process

Manufacturers SHALL provide a setup inspection process that the system was designed to support.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.1 Minimum properties included in a setup inspection process

A setup inspection process SHALL, at a minimum, include the inspection of system software, storage locations that hold election information that changes during an election, and execution of logic and accuracy testing related to readiness for use in an election.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.2 Setup inspection record generation

The setup inspection process SHALL describe the records that result from performing the setup inspection process.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.3 Installed software identification procedure

Manufacturers SHALL provide the procedures to identify all software installed on programmed devices.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.4 Software integrity verification procedure

Manufacturers SHALL describe the procedures to verify the integrity of software installed on programmed devices of system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.5 Election information value

Manufacturers SHALL provide the values of system storage locations that hold election information that changes during the election, except for the values set to conduct a specific election.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.6 Maximum values of election information storage locations

Manufacturers SHALL provide the maximum values for the storage locations where election information is stored.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.7 Backup power operational range

Manufacturers SHALL provide the nominal operational range for the backup power sources of the voting system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.8 Backup power inspection procedure

Manufacturers SHALL provide the procedures to inspect the remaining charge of the backup power sources of the voting system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.9 Cabling connectivity inspection procedure

Manufacturers SHALL provide the procedures to inspect the connectivity of the cabling attached to the vote capture device.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.10 Communications operational status inspection procedure

Manufacturers SHALL provide the procedures to inspect the operational status of the communications capabilities of the vote capture device.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.11 Communications on/off status inspection procedure

Manufacturers SHALL provide the procedures to inspect the on/off status of the communications capabilities of the vote capture device.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.12 Consumables quantity of vote capture device

Manufacturers SHALL provide a list of consumables associated with the vote capture device, including estimated number of usages per quantity of consumable.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.13 Consumable inspection procedure

Manufacturers SHALL provide the procedures to inspect the remaining amount of each consumable of the vote capture device.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.14 Calibration of vote capture device components nominal range

Manufacturers SHALL provide a list of components associated with the vote capture devices that require calibration and the nominal operating ranges for each component.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.15 Calibration of vote capture device components inspection procedure

Manufacturers SHALL provide the procedures to inspect the calibration of each component.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.16 Calibration of vote capture device components adjustment procedure

Manufacturers SHALL provide the procedures to adjust the calibration of each component.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.6.1.17 Checklist of properties to be inspected

Manufacturers SHALL provide a checklist of other properties of the system to be inspected.

Test Method: *Inspection*

9.7 System Operations Manual

9.7.1 General

9.7.1.1 System operations manual

The system operations manual SHALL provide all information necessary for system set up and use by all personnel who administer and operate the system at the state and/or local election offices and at the kiosk locations, with regard to all system functions and operations identified in Section 9.3 System Functionality Description.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.7.1.2 Support training

The system operations manual SHALL contain all information that is required for the preparation of detailed system operating procedures and for the training of administrators, state and/or local election officials, election judges, and kiosk workers.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.7.2 Introduction

9.7.2.1 Functions

Manufacturers SHALL provide a summary of system operating functions to permit understanding of the system's capabilities and constraints.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.7.2.2 Roles

The roles of operating personnel SHALL be identified and related to the functions of the system.

Test Method: *Inspection*

Test Entity: Manufacturer

9.7.2.3 Conditional actions

Decision criteria and conditional operator functions (such as error and [failure](#) recovery actions) SHALL be described.

Test Method: Inspection

Test Entity: Manufacturer

9.7.2.4 References

Manufacturers SHALL list all reference and supporting documents pertaining to the use of the system during election operations.

Test Method: Inspection

Test Entity: Manufacturer

9.7.3 Operational Environment

9.7.3.1 Operational environment

Manufacturers SHALL describe the system environment and the interfaces between the system and state and/or local election officials, kiosk workers, system administrators, and voters.

Test Method: Inspection

Test Entity: Manufacturer

9.7.3.2 Operational environment; equipment and facility

Manufacturers SHALL identify all facilities, furnishings, fixtures, and utilities that will be required for equipment operations, including equipment that operates at the:

- a. Kiosk locations;
- b. State and/or local election offices; and
- c. Other locations.

Test Method: Inspection

Test Entity: Manufacturer

9.7.3.3 Operational environment; installation

The operations manual SHALL include a statement of all requirements and restrictions regarding environmental protection, electrical service, recommended auxiliary power, telecommunications service, and any other facility or resource required for the proper installation and operation of the system.

Test Method: Inspection

Test Entity: Manufacturer

9.7.4 System Installation and Test Specification

9.7.4.1 Readiness testing

Manufacturers SHALL provide specifications for testing of system installation and readiness.

Test Method: Inspection

Test Entity: Manufacturer

9.7.4.1.1 Readiness test entire system

These specifications SHALL cover testing of all components of the system and all locations of installation (e.g., kiosk locations, state and/or local election offices), and SHALL address all elements of system functionality and operations identified in Section 9.3 System Functionality Description above, including general capabilities and functions specific to particular voting activities.

Test Method: Inspection

Test Entity: Manufacturer

9.7.5 Operational Features

9.7.5.1 Features

Manufacturers SHALL provide documentation of system operating features that includes:

- a. Detailed descriptions of all input, output, control, and display features accessible to the operator or voter;
- b. Examples of simulated interactions to facilitate understanding of the system and its capabilities;
- c. Sample data formats and output reports; and
- d. Illustration and description of all status indicators and information messages.

Test Method: Inspection

Test Entity: Manufacturer

9.7.5.2 Document straight party override algorithms

For systems that support straight party voting, manufacturers SHALL document the available algorithms for counting straight party overrides.

Test Method: Inspection

Test Entity: Manufacturer

9.7.5.3 Document double vote reconciliation algorithms

For systems that support write-in voting, manufacturers SHALL document the available algorithms for reconciling write-in double votes.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.7.6 Operating Procedures

9.7.6.1 Operating procedures

Manufacturers SHALL provide documentation of system operating procedures that:

- a. Provides a detailed description of procedures required to initiate, control, and verify proper system operation;
- b. Enables the operator to assess the correct flow of system functions (as evidenced by system-generated status and information messages);
- c. Enables the administrator to intervene in system operations to recover from an abnormal system state;
- d. Defines and illustrates the procedures and system prompts for situations where operator intervention is required to load, initialize, and start the system;
- e. Defines and illustrates procedures to enable and control the external interface to the system operating environment if supporting hardware and software are involved. Such information also SHALL be provided for the interaction of the system with other data processing systems or data interchange protocols;
- f. Provides administrative procedures and off-line operator duties (if any) if they relate to the initiation or termination of system operations, to the assessment of system status, or to the development of an audit trail;
- g. Supports successful ballot and program installation and control by state and/or local election officials;
- h. Provides a schedule and steps for the software and ballot installation, including a table outlining the key dates, events and deliverables; and
- i. Specifies diagnostic tests that may be employed to identify problems in the system, verify the correction of problems, and isolate and diagnose faults from various system states.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.7.6.2 Printer error recovery guidelines

Manufacturers SHALL provide documentation for procedures to recover from printer errors and faults including procedures for how to cancel a vote suspended during an error.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.7.7 Transportation and Storage

9.7.7.1 Transportation

Manufacturers SHALL include any special instructions for preparing vote capture devices for shipment.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.7.7.2 Storage

Manufacturers SHALL include any special storage instructions for vote capture devices.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.7.7.3 Precautions for removable media

Manufacturers SHALL detail the care and handling precautions necessary for removable media and records.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.7.8 Appendices

Manufacturers SHALL provide descriptive material and data supplementing the various sections in the body of the system operations manual. The content and arrangement of appendices are at the discretion of the manufacturer. Topics required for discussion include:

- Glossary: A listing and brief definition of all terms that may be unfamiliar to persons not trained in either systems or computer operations;
- References: A list of references to all manufacturer documents and to other sources related to operation of the system;
- Detailed Examples: Detailed scenarios that outline correct system responses to faulty operator input; and
- Manufacturer's Recommended Security Procedures: Security procedures that are to be executed by the system operator.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.8 System Maintenance Manual

9.8.1.1 User documentation system maintenance manual

The system maintenance manual SHALL provide information to support election officials, kiosk workers, information systems personnel, or maintenance personnel in the adjustment or removal and replacement of components or modules in the field.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.8.1.2 General contents

Manufacturers SHALL describe service actions recommended to correct malfunctions or problems; personnel and expertise required to repair and maintain the system, equipment, and materials; and facilities needed for proper maintenance.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.8.2 Introduction

9.8.2.1 Equipment overview, maintenance viewpoint

Manufacturers SHALL describe the structure and function of the hardware, firmware and software for election preparation, programming, vote recording, tabulation, and reporting in sufficient detail to provide an overview of the system for maintenance and for identification of faulty hardware or software.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.8.3 Maintenance Procedures

9.8.3.1 Maintenance manual maintenance procedures

Manufacturers SHALL describe preventive and corrective maintenance procedures for hardware, firmware and software.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.8.3.2 Maintenance manual preventive maintenance procedures

Manufacturers SHALL identify and describe:

- a. All required and recommended preventive maintenance tasks, including software and data backup, database performance analysis, and database tuning;
- b. Number and skill levels of personnel required for each task;
- c. Parts, supplies, special maintenance equipment, software tools, or other resources needed for maintenance; and
- d. Any maintenance tasks that must be referred to the manufacturer.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.8.3.3 Corrective maintenance procedures

9.8.3.3.1 Troubleshooting procedures

Manufacturers SHALL provide fault detection, fault isolation, correction procedures, and logic diagrams for all operational abnormalities identified by design analysis and operating experience.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.8.3.3.2 Troubleshooting procedures details

Manufacturers SHALL identify specific procedures to be used in diagnosing and correcting problems in the system hardware, firmware and software. Descriptions SHALL include:

- a. Steps to replace failed or deficient equipment;
- b. Steps to correct deficiencies or faulty operations in software or firmware;
- c. Number and skill levels of personnel needed to accomplish each procedure;
- d. Special maintenance equipment, parts, supplies, or other resources needed to accomplish each procedure; and
- e. Any coordination required with the manufacturer.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.8.4 Maintenance Equipment

9.8.4.1 Special equipment

Manufacturers SHALL identify and describe any special purpose test or maintenance equipment recommended for [fault](#) isolation and diagnostic purposes.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.8.5 Parts and Materials

Manufacturers SHALL provide detailed documentation of parts and materials needed to operate and maintain the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.8.6 Maintenance Facilities and Support

9.8.6.1 Maintenance environment

Manufacturers SHALL identify all facilities, furnishings, fixtures, and utilities that will be required for equipment maintenance.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.8.6.2 Maintenance support and spares

Manufacturers SHALL specify:

- a. Recommended number and locations of spare devices or components to be kept on hand for repair purposes during periods of system operation;
- b. Recommended number and locations of qualified maintenance personnel who need to be available to support repair calls during system operation; and
- c. Organizational affiliation (e.g., jurisdiction, manufacturer) of qualified maintenance personnel.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.8.7 Appendices

Manufacturers SHALL provide descriptive material and data supplementing the various sections in the body of the system maintenance manual. The content and arrangement of appendices are at the discretion of the manufacturer. Topics required for amplification or treatment in an appendix includes:

- Glossary: A listing and brief definition of all terms that may be unfamiliar to persons not trained in either systems or computer maintenance;
- References: A list of references to all manufacturer documents and other sources related to maintenance of the system;
- Detailed Examples: Detailed scenarios that outline correct system responses to faulty operator input; and

- Maintenance and Security Procedures: Technical illustrations and schematic representations of electronic circuits unique to the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.9 Personnel Deployment and Training Requirements

Manufacturers SHALL describe the personnel resources and training required for a jurisdiction to operate and maintain the system for the duration of the pilot project.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.9.1 Personnel

9.9.1.1 Training manual personnel

Manufacturers SHALL specify the number of personnel and skill levels required to perform each of the following functions:

- a. Pre-voting or election preparation functions;
- b. System operations for system functions performed at the kiosk locations;
- c. System operations for system functions performed at the state and/or local election offices;
- d. Preventive maintenance tasks;
- e. Diagnosis of faulty hardware, firmware, or software;
- f. Corrective maintenance tasks; and
- g. Testing to verify the correction of problems.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.9.1.2 User functions versus manufacturer functions

Manufacturers SHALL distinguish which functions may be carried out by user personnel and which must be performed by manufacturer personnel.

Test Method: *Inspection*

Test Entity: *Manufacturer*

9.9.2 Training

9.9.2.1 Training requirements

Manufacturers SHALL provide training materials to instruct system administrators, kiosk workers, and state and/or local election officials on how to set up, configure and operate the system.

Test Method: *Inspection*

Test Entity: *Manufacturer*

Appendix A: Glossary

This section defines selected terms and acronyms used in this document. Readers may be familiar with many of these terms, but the definitions as used herein may differ from those in other contexts.

Terminology for standardization purposes must be sufficiently precise and formal to avoid ambiguity in the interpretation and testing of the requirements. Any term that is not defined here retains its common English usage meaning.

absentee ballot:	A ballot cast from any location not defined as a polling place.
absentee model:	The ballot remains associated with the voter ID until the close of the voting period and is subject to an adjudication process to be accepted for tabulation.
absentee voting:	The process of casting a ballot from any location not defined as a polling place.
accessible voting station:	Voting station specially equipped for individuals with disabilities referred to in HAVA 301 (a)(3)(B).
administrator:	The role responsible for installing, configuring, and managing the technical operations of the system.
alert time:	The amount of time the system will wait for detectable voter activity after issuing an alert before going into an inactive state requiring poll worker intervention.
application logic:	Software, firmware, or hardwired logic from any source that is specific to the system, with the exception of border logic.
audio-tactile interface	Voter interface designed to not require visual reading of a ballot. Audio is used to convey information to the voter and sensitive tactile controls allow the voter to convey information to the voting system.
authenticated session:	Process that requires all users to provide proof of identity.
ballot image:	Human-readable electronic representation of the ballot, including the voter's selections.
ballot measure:	Contest in which the choices are Yes and No.
ballot secrecy:	Not being able to associate the selections of the ballot with the voter who cast it.
ballot style:	Particular set of contests to appear on the ballot for a particular election district, their order, the list of ballot positions for each contest, and the binding of candidate names to ballot positions
ballot:	The official presentation of all of the contests to be decided in a particular election. See also ballot image, cast vote record, and paper record.
baseline configuration:	The exact system configuration tested by the VSTL. It includes all the system components that were tested, including the specific hardware, operating system, application software, and third-party COTS applications.
border logic:	Software, firmware, or hardwired logic that is developed to connect application logic to COTS or third-party logic.

callable unit:	Function, method, operation, subroutine, procedure, or analogous structural unit that appears within a module (of a software program or analogous logical design).
candidate:	Person contending in a contest for office.
cast ballot:	Ballot in which the voter has taken final action in the selection of contest choices and submitted it for tabulation.
cast vote record:	The record of all votes selected by a voter.
common industry format:	Format described in ISO/IEC 25062:2006 "Common Industry Format (CIF) for Usability Test Reports".
completed system response time	The time taken from when the voter performs some detectible action to when the voting system completes its response and settles into a stable state (e.g., finishes "painting" the screen with a new page).
component:	A discrete and identifiable element of hardware or software within a system.
concept of operations:	Description of roles and responsibilities for system administration, operation and use.
configuration data:	Non-executable input to software, firmware, or hardwired logic, not including vote data.
conformity assessment:	Demonstration that specified requirements relating to a product, process, system, person or body are fulfilled.
contest:	A single decision being put before the voters (e.g., the selection of a candidate for office or the response to ballot questions).
core logic:	Subset of application logic that is responsible for vote recording and tabulation.
COTS:	Commercial Off the Shelf
credible methodologies:	Methodologies (e.g., coding conventions, cryptographic algorithms) are considered credible if at least two organizations other than the voting system manufacturer have independently adopted them and made active use of them at some time within the three years before conformity assessment was first sought.
cryptography:	The protection of information by converting the information into an unreadable format.
CVR:	Cast vote record
device:	Functional unit that performs its assigned tasks as an integrated whole.
election definition:	Definition of the contests and questions that will appear on the ballot for a specific election.
election judge:	A member of the canvassing board that adjudicates the acceptance of absentee ballots
election management system:	Set of processing functions and databases within a system that defines, develops and maintains election databases, performs election definitions and setup functions, formats ballots, counts votes, consolidates and reports results, and maintains audit trails
election officials:	The persons responsible for administering and conducting elections.
election title:	The heading on a ballot specifying the name of the election (e.g., General Election, Primary Election).

equivalent configuration:	A system configuration that has been attested to by the manufacturer to perform identically to the baseline configuration.
error rate:	Ratio of the number of errors detected in relation to the volume of data processed:
failure:	Events that result in (a) loss of one or more functions, (b) degradation of performance such that the device is unable to perform its intended function for longer than 10 seconds, (c) automatic reset, restart or reboot of the voting device, operating system or application software, (d) a requirement for an unanticipated intervention by a person in the role of kiosk worker or technician before normal operation can continue, or (e) error messages and/or audit log entries indicating that a failure has occurred.
fault:	Flaw in design or implementation that may result in the qualities or behavior of the system deviating from the qualities or behavior that are specified in the UOCAVA Pilot Program Testing Requirements and/or in manufacturer-provided documentation.
functional:	Functional testing is the determination through operational testing of whether the behavior of a system or device in specific scenarios conforms to requirements. Functional tests are derived by analyzing the requirements and the behaviors that should result from implementing those requirements.
hardwired logic:	Logic implemented through the design of an integrated circuit; the programming of a Programmable Logic Device (PLD), Field-Programmable Gate Array (FPGA), Peripheral Interface Controller (PIC), or similar; the integration of smaller hardware components; or mechanical design (e.g., as in lever machines).
initial system response time	The time taken from when the voter performs some detectible action (such as pressing a button) to when the voting system begins responding in some obvious way (such as an audible response or any change on the screen).
implementation statement:	Statement by a manufacturer indicating the capabilities, features, and optional functions and extensions that have been implemented in a system.
inspection:	Examination of a product design, product, process or installation and determination of its conformity with specific requirements or, on the basis of professional judgment, with general requirements.
kiosk:	A terminal tasked to display information, accepts user input, and transmit information
kiosk workers:	Election workers who staff the remote voting kiosk locations.
manufacturer:	Entity with ownership and control over a system submitted for testing.
module:	Structural unit of software or analogous logical design, typically containing several callable units that are tightly coupled.
paper record identifier:	Unique randomly generated code that links the paper record to the corresponding cast vote record.
paper record receptacle:	A secure unit for storing paper records at kiosk locations.
paper record:	Printed record of ballot selections made by the voter.
programmed device:	Electronic device that includes application logic.
published:	Methodologies (e.g., coding conventions, cryptographic algorithms) are considered published if they appear in publicly available media.
straight party override:	Ability to make an exception to straight party voting in selected races.

straight party voting:	Mechanism that allows voters to cast a single vote to select all candidates on the ballot from a single political party.
tabulation device:	A device used to calculate election results.
third-party logic:	Software, firmware, or hardwired logic that is neither application logic nor COTS; e.g., general-purpose software developed by a third party that is either customized (e.g., ported to a new platform, as is Windows CE) or not widely used, or source code generated by a COTS package.
UOCAVA:	Uniformed and Overseas Citizens Absentee Voting Act
vote capture device:	Device that is used directly by a voter to vote a ballot.
voted ballot:	Ballot that contains all of a voter's selections and has been cast.
voter inactivity time:	The amount of time from when the system completes its response until there is detectable voter activity. In particular, note that audio prompts from the system may take several minutes and that this time does not count as voter inactivity.
voter privacy:	The inability of anyone to observe, or otherwise determine, what selections a voter has made.
voting process:	Entire array of procedures, people, resources, equipment and locations associated with the conduct of elections.
voting session:	Span of time beginning when a ballot is enabled or activated and ending when the ballot is cast.
voting system:	Equipment (including hardware, firmware, and software), materials, and documentation used to define elections and ballot styles, configure voting equipment, identify and validate voting equipment configurations, perform readiness tests, activate ballots, capture votes, count votes, generate reports, transmit election data, archive election data, and audit elections.
VPN:	Virtual Private Network
VSTL:	Voting System Test Laboratory
white-box testing:	Uses an internal perspective of the system to design test cases based on internal structure. White box testing strategy deals with the internal logic and structure of the code.
write-in:	To make a selection of an individual not listed on the ballot.

Appendix C: Accuracy Test Case

Some voting system performance attributes are tested by inducing an event or series of events and the relative or absolute time intervals between repetitions of the event has no significance. Although equivalence between a number of events and a time period can be established when the operating scenarios of a system can be determined with precision, another type of test is required when such equivalence cannot be established. It uses event based failure frequencies to arrive at ACCEPT/REJECT criteria. This test may be performed simultaneously with time-based tests.

For example, the failure of a device is usually dependent on the processing volume that it is required to perform. The elapsed time over which a certain number of actuation cycles occur is, under most circumstances, not important. Another example of such an attribute is the frequency of errors in reading, recording, and processing vote data.

The error frequency, called "ballot position error rate," applies to such functions as the process of detecting the presence or absence of a voting punch or mark, or to the closure of a switch corresponding to the selection of a candidate.

Certification and acceptance test procedures that accommodate event-based failures are, therefore, based on a discrete, rather than a continuous probability distribution. A Probability Ratio Sequential Test using the binomial distribution is recommended. In the case of ballot position error rate, the calculation for a specific device (and the processing function that relies on that device) is based on:

- HO: Desired error rate = 1 in 10,000,000
- H1: Maximum acceptable error rate = 1 in 500,000
- $a = 0.05$
- $b = 0.05$

The minimum error-free sample size to accept for qualification tests is 1,549,703 votes.

The nature of the problem may be illustrated by the following example, using the criteria contained in the VVSG 2005 for system error rate. A target for the desired accuracy is established at a very low error rate. A threshold for the worst error rate that can be accepted is then fixed at a somewhat higher error rate. Next, the decision risk is chosen, that is, the risk that the test results may not be a true indicator of either the system's acceptability or unacceptability. The process is as follows:

- The desired accuracy of the voting system, whatever its true error rate (which may be far better), is established as no more than one error in every ten million characters (including the null character).
- If it can be shown that the system's true error rate does not exceed one in every five hundred thousand votes counted, it will be considered acceptable. This is more than accurate enough to declare the winner correctly in almost every election.
- A decision risk of 5 percent is chosen, to be 95 percent certain that the test data will not indicate that the system is bad when it is good or good when it is bad.

This results in the following decision criteria:

- a. If the system makes one error before counting 26,997 consecutive ballot positions correctly, it will be rejected. The vendor is then required to improve the system.
- b. If the system reads at least 1,549,703 consecutive ballot positions correctly, it will be accepted.
- c. If the system correctly reads more than 26,997 ballot positions but less than 1,549,703 when the first error occurs, the testing will have to be continued until another 1,576,701 consecutive ballot positions are counted without error (a total of 3,126,404 with one error).
