

NEAR MISS CRANE HOISTING INCIDENT

A non injury incident occurred while hoisting a bucket of muck during the construction of a shaft with five men working below. Bolts on the crane hoist drum, designed to prevent free spooling sheared off. The loaded bucket dropped and landed on the shaft coping.

Best Practices

- **NEVER** modify crane hoists without manufacturer approval
- **NEVER** disable hoist safety features
- **Ensure** cranes are examined daily for defects
- **Properly** maintain equipment
- **Don't** exceed weight limits
- **Properly** train equipment operators
