

Addendum to ORNL-6907 [1]
August 2002

Therese K. Stovall

In 2002, the data files used by the interactive ZIP-Code computer program were updated to reflect current fuel prices, insulation costs, postal zip-code changes, and anticipated future fuel prices.[2] The algorithms remained unchanged. The following tables can be used as direct replacements for those contained in The Supporting Documentation for the 1997 Revision to the DOE Insulation Fact Sheet.[1] The recommended insulation levels shown in Tables 8-11 of ORNL-6907 were not revised at this time.

The moisture guidance found in the Internet versions of the Insulation Fact Sheet was expanded and updated using the best available research results in this field.[3] This topic has been the subject of intense study the last few years due to increased awareness of moisture problems that often accompany tight well-insulated homes.

The insulation prices were revised by examining the change in insulation prices between the Means CostWorks 2002 and the R. S. Means prices published in 1996.[4,5] These escalation factors were then applied to the prices shown in Table 7 of ORNL-6907 to produce the replacement table included here.[1] The insulation cost multiplier was previously a state-wide value and was included in Appendix E of the original Supporting Documentation.[1] In this update, the state-wide values have been replaced by a cost multiplier for each zip-code area, now shown in Appendix A[4]

Residential electric power and home heating oil prices were taken from references 6 and 7. Propane prices have been varying over a wide range, so an average of prices from May 2001 to April 2002 was used.[7] Natural gas prices have also been more volatile recently, so an average of prices from December 2000 to November 2001 was used.[8]

Appendix A: Climate and Cost Information Used in The Zip Computer Program, Revised 2002.

The data values shown in this table include the 3-digit zip code (i.e., the first three digits of a five digit postal zip code), the fuel escalation region, the state number, which is used to reference energy prices, and insulation cost adjustment factors. Climate values for heating (HDD_k = heating degree days divided by 1000, base 65°F) and cooling (CDH_k = cooling degree hours divided by 1000, base 74°F) are also shown.[9] The insulation cost factors are normalized to a national average of 1.0.[4]

Appendix F. Residential Energy Price Escalation Factors, Revised 2002.

Four regional energy price escalation tables are shown in this appendix. (The regional assignments for each zip code are shown in Appendix A.) These factors were taken from Ref. 10.
