Product information, including uses/applications and source(s) of imports:

The subject product is an ion-exchange resin developed to provide the industry with a solid form of the chelating agent ethylenediamine tetraacetic acid (EDTA). This provides the user with the capability to process liquid through an immobilized bed of ion-exchange resin for the removal of unwanted metal cations (positively charged ions) such as copper, lead, zinc, cadmium, cobalt, nickel, and other environmentally deleterious metallic species. The product is used by electronic circuit printing/wiring board manufacturers, chemical and electroplaters, as well as a broad array of industries which generate waste treatment streams containing these metal ions. This resin is unique in that it reduces unwanted cations to part-per-billion levels in mediums with high concentrations of competing, but relatively benign, ions. It is imported from France, Germany, the United Kingdom, and China.
