

Realizing a Clean Energy Future

**World Renewable Energy
Forum 2012**

Dr. Dan E. Arvizu

Laboratory Director

Energy Context

National Energy Imperatives

U.S. Energy Production and Consumption (2010)

U.S. Energy Production (2010): 74.9 Quadrillion Btu

U.S. Non-Hydro Renewable Energy Production: 5.2 Quadrillion Btu

U.S. Energy Consumption (2010): 98.0 Quadrillion Btu

U.S. Non-Hydro Renewable Energy Consumption: 5.7 Quadrillion Btu

Source: EIA; full references are provided starting on p. 123.

Note: Because hydropower is considered a conventional source of energy, it is accounted for separate from other new renewable sources of energy. Energy consumption is higher than energy production due to oil imports.

Shares of renewable energy sources in total global primary energy supply is still small

Source: IPCC Special Report Renewable Energy Sources (SRREN)

Renewable energy costs are still higher than existing energy prices, but in various settings renewable energy is getting competitive

Ranges of global technical potentials of renewable energy sources is enormous

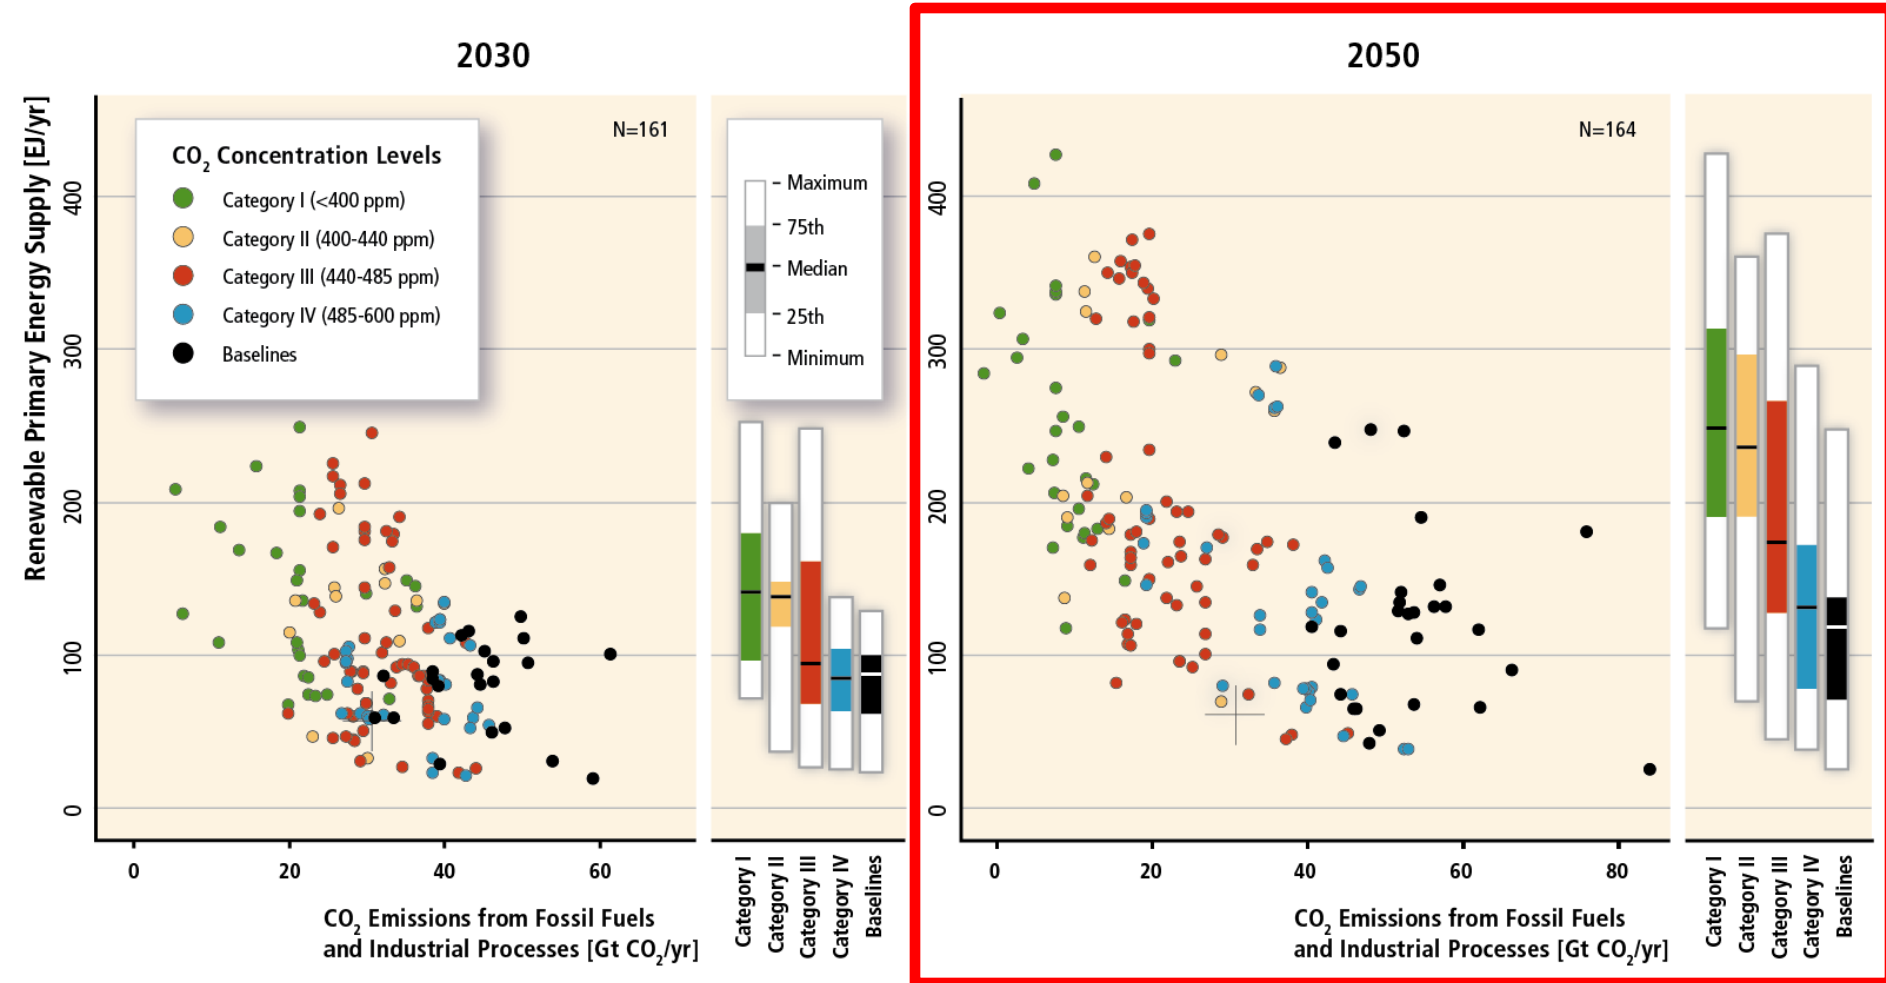

Range of Estimates of Global Technical Potentials

Max (in EJ/yr)	1109	52	331	580	312	500	49837
Min (in EJ/yr)	118	50	7	85	10	50	1575

Source: IPCC Special Report Renewable Energy Sources (SRREN)

Global renewable energy primary energy supply from 164 long-term scenarios versus fossil and industrial CO₂ emissions. Modeling suggests many outcomes.

Source: SRREN SPM, Figure SPM.9

Many expect electricity demand to grow faster than renewable energy generation

The Outlook for Energy: A View to 2030 31

MIT's *Future of Natural Gas* Study

Source: EPPA, MIT

A Profound Transformation is Required

Today's Energy System

- Dependent on non-domestic sources
- Subject to price volatility
- Increasingly vulnerable energy delivery systems
- 2/3 of source energy is wasted
- Significant carbon emissions
- Role of electricity increasing

Sustainable Energy System

- Carbon neutral
- Efficient
- Diverse supply options
- Sustainable use of natural resources
- Creates economic development
- Accessible, affordable and secure

TRANSFORMATION

Energy Sector Challenges

Percent Sales Invested in R&D

Life Cycles

National Strategies Driving
Energy Market

RE Sector Capacities Vary by Region

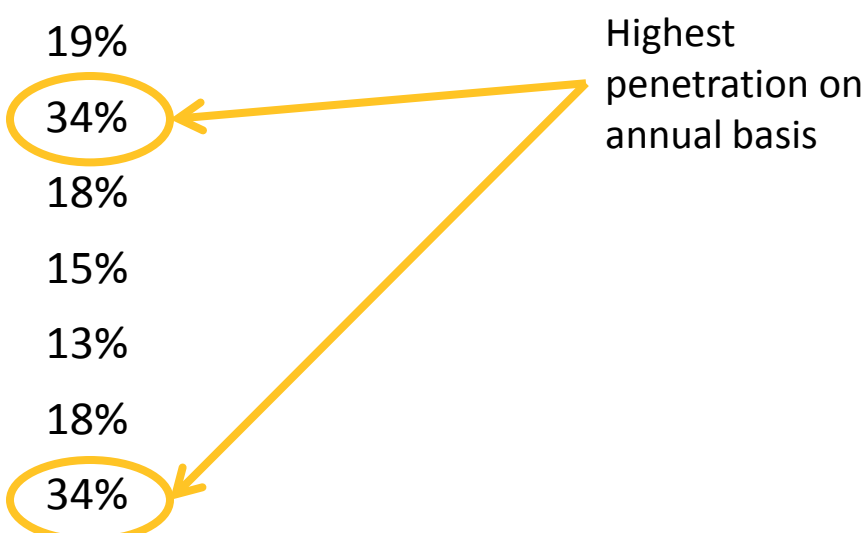

Source: REN21 (2011)

RE has achieved varying degrees of penetration

Country	% Renewable Generation (2010)
Australia	8%
China	19%
Denmark	34%
Germany	18%
India	15%
Ireland	13%
Mexico	18%
Spain	34%
Thailand	8%
United Kingdom	7%
United States	11%

Highest penetration on annual basis

Renewable Share of Total Generation by State Up Across the United States

Non-Hydroelectric renewable share of total net generation by state

Source: U.S. Energy Information Administration, Form EIA-923, [Power Plant Operations Report](#).

Notes: Non-hydroelectric renewables include generation from wind, solar, geothermal, and other renewable sources such as wood and wood wastes, municipal solid wastes, landfill gas, etc. Data for 2011 are preliminary.

Specific Implementation Challenges

- **Legal, market, and institutional barriers—Increasing power system flexibility needed to integrate variable RE (e.g., through larger balancing areas, new market rules) may require significant ecosystem-wide changes**
- **Coordination—Due to the involvement of multiple agencies and jurisdictions, developing and implementing a shared vision could be challenging**
- **Public support—The public may not understand or support actions necessary to integrate renewables**
- **Customizing solutions—There is no one-size-fits-all solution to integrating variable renewables; countries need to determine the most appropriate combination of approaches**

High-Penetration Renewables

The image shows the cover of a report titled "Renewable Electricity Futures: Exploration of up to 80% renewable electricity penetration in the United States". The cover features logos for NREL, MIT, Pacific Northwest National Laboratory, and Renewable Energy Consulting Services, Inc. Below the logos is a horizontal strip of four images: a red truck, a person pointing at a screen, a wind turbine, and several glass beakers with yellow liquid. The title and authors' names are listed in the center, and the event details are at the bottom. A small disclaimer at the very bottom states: "NREL is a national laboratory of the U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, operated by the Alliance for Sustainable Energy, LLC."

World Renewable Energy Forum
Denver, Colorado
May 17, 2012

NREL is a national laboratory of the U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, operated by the Alliance for Sustainable Energy, LLC.

New study to be presented and discussed in WREF Thursday panel session

All regions of the country could contribute substantial renewable electricity supply in 2050

Innovation, Integration, & Adoption

Reducing Investment Risk

- Enable basic and applied clean energy technology innovation
- Accelerate technology market introduction and adoption
- Integrate technology at scale
- Encourage collaboration in unique research and testing “partnering” facilities
- Provide analysis and expertise to inform decisions

Status of the Technologies

Multiple Promising PV Technologies

20x-100x

500x

$\text{Cu(In,Ga)Se}_2 \sim 1\text{-}2 \text{ }\mu\text{m}$

c-Si $\sim 180 \text{ }\mu\text{m}$

Wind Technology Innovation

- Modular large components – blades, drivetrains, and tall towers
- Advanced drivetrain power conversion systems – superconducting direct drive generators
- Flexible, ultra-large rotors and systems
- Active controls for structural load reduction, improved wind plant performance, and grid-friendly operation
- Floating offshore wind turbines
- Airborne wind power systems

Biofuels Innovation

New conversion technologies are being developed, offering the possibility of revolutionary, high volume methods for producing biofuel hydrocarbon fuels for our trucks, trains, ships, and aircraft . . .

Biological Conversion

Chemical Catalytic Conversion

Pyrolysis/Bio-Oil Pathways

Heterotrophic Algae Conversion

Hybrid Conversion Technologies

Transportation Innovation

Portfolio of technologies leading to 54.5 mpg

Degree of electrification
(power electronics & energy storage)

Start/stop

Regenerative braking

Low rolling resistance tires

Electric infrastructure

Electric powered steering

Light weighting

8 speed transmissions

Turbocharging, direct fuel injection, advanced combustion

Variable cylinder mgmt

Improved aerodynamics

Diesel powered & or Alternative Fuels, H2

Buildings Innovation

High Performance Buildings

BIPV Products & PV-T Array

Compressorless Cooling

Electrochromic Windows

Polymer Solar Water Heaters

Computerized optimization & simulation Tools

Efficiency/Integration Innovation

Buildings

- Whole building systems integration
- Computerized building energy optimization tools
- Advanced HVAC (Heating Ventilating and air conditioning)
- Cost effective ultra energy efficient retrofits

Grid Integration

Interconnection Standards

- IEEE Standards Development
- Standards Testing and Validation

Smart-Grid Data Hub

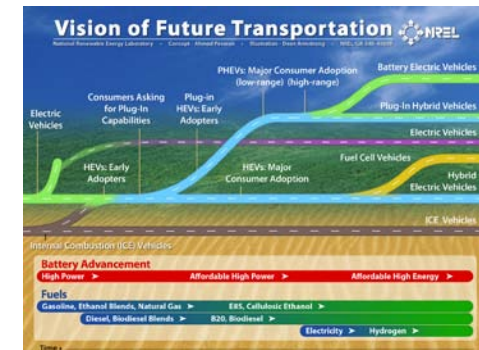

RE Grid Integration

- Power Electronics for Interconnection monitoring and control
- Grid-to-vehicle interface

Advanced Vehicles

- Fuels utilization
- Component technologies
- Electric vehicle-to-grid interface

To achieve a clean energy vision, we must...

- Invest in innovation
- Invent the future we desire
- Improve access to capital
- Partner on a global scale
