

The text of the sixth paragraph in **HASQARD** Volume 2, Revision 3, Section 4.2.4 is revised to say:

“Custody seals shall be used to verify that sample integrity has been maintained during transport. The field custodian shall seal the cap of the individual sample container so that any tampering is easy to detect. In lieu of using a custody seal directly applied to sample containers, the sample container may be placed inside a secondary container that is sealed with a custody seal. Custody tape shall be selected that is not removable from the shipping container without breaking the seal. Samples shall be shipped in insulated containers with either synthetic ice or ice packed in plastic bags when samples require cooling to  $4\pm 2^{\circ}\text{C}$ .”
