Description: Reactor (PRTR) (a.k.a. 309 Building) in the late 1950's. The tanks are described in WIDS Sites 309-TW-1, 309-TW-2, and 309-TW-3. The 309-TW-3 tank typically collected liquid waste from the storage basin overflow and drain system, the Rupture Loop Annex Cell sump, contaminated floor drains, Loadout Facility drains, exhaust fan pit drain, stack and duct drains, and the exhaust air filter drain. Tank 309-TW-2 was used as a backup for 309-TW-3. Tank 309-TW-1 was used as a process holding tank where liquid from the other two tanks was treated or prepared for pumping liquid waste to the 340 Complex. Sometime after the initial installation of the tanks, an ion exchange column was installed between tanks 309-TW-2 and 309-TW-1. The ion exchange column was used to treat liquid from Tanks 309-TW-2 and 309-TW-3 before sending the liquid to the 340 Complex for disposal (contaminated stream). If the contamination was removed by the ion exchange resin processing, it was sent through the 300 Area Retention Process Sewer to the 307 Retention Basins.

Related Sites/ Structures: The site was related to operations at the 309 Building (PRTR - Plutonium Recycle Test Facility), 309 Tank #1 (WIDS Site 309-TW-1), 309 Tank #2 (WIDS Site 309-TW-2), 309 Tank #3 (WIDS Site 309-TW-3), an underground concrete covered valve pit, above and below ground transfer pipelines, an ion exchange vessel, and a control panel.

Waste Type: Soil

Waste Description: The waste is contaminated soil. Potential radioactive contaminants of concern are cesium-137, cobalt-60, and americium-241. Potential hazardous contaminants are barium, cadmium, chromium, lead, and selenium.

The related contaminated structures, e.g., tanks, valve pit and ancillary piping will need to be removed under a decontamination and decommissioning action prior to soil remediation. The tanks, 309-TW-1, 309-TW-2, and 309-TW-3 are separate sites in WIDS.

Code: 300-256	Classification: Accepted
Names: 300-256; 306E Fabrication and Testing Laboratory Releases	Reclassification: Interim Closed Out (11/22/2010)
Type: Unplanned Release	Start Date: 1/1/1956
Status: Inactive	End Date:

Description: The site is contaminated soil under and around the 306E Building. The area around the 306E building is paved and posted as having underground radioactive contamination.

Location: The 306E Building is on the north side of Ginko Street, in the northeast corner of the 300 Area.

Release Description: Without distinguishing between the 306E and 306W Buildings, Gerber, WHC-MR-0388, states the following. Airborne dust and particulate contamination in and near this facility included uranium and thorium, as well as all of the components of the beryllium-Zircaloy-2 brazing material developed for N Reactor fuel elements. Zircaloy-2 was a blend of zirconium alloyed with small amounts of tin, iron, chromium, and nickel. The N Reactor co-extrusion process also required an exterior jacket of copper-silicon alloy. Poor ventilation was a continual problem throughout at least the first fifteen years of 306 Building history. Additionally, multiple fires and leaks occurred over the years in and around the 306 Building, in barrels and waste "load luggers" containing uranium, thorium, heavy metals, and other fuel component scraps. Fires also occurred around and in building equipment, such as centerless grinders, lathes, electric saws, and other machinery. These fires oxidized and volatilized uranium and other wastes; long-lived airborne contamination, which can be recirculated today, settled in building sumps, crevices, and nearby soil. In addition, tools and fabrication work areas within the building often displayed contamination levels of 20,000 to 80,000 counts per minute during the 1950's and 1960's. As recently as 1987, contaminated equipment entered the building from off the Hanford Site, spreading spotty contamination up to 100,000 disintegration's per minute. Gerber

continues, again without distinguishing between 306E and 306W. In addition to airborne and machinery contamination, multiple drain and piping leaks (WIDS Site 300-15) and spills have occurred in the 306 Building over the years. These spills have included chemicals, cleansers, solvents, reagents, oils containing polychlorinated biphenyls (PCBs), and other substances used in fuel fabrication processes. From 1956 to 1967 (and once after 1967), a lime tank and valve pit just north of the east end of the 306 Building (WIDS Site 300-41) intercepted and neutralized nitric acid-bearing chemical wastes before discharge to the process sewer. In 1976, this pit was inspected, along with the process waste sump, sewer manholes, and the inlet box to the process sewer leaching trenches, after several hundred gallons of slightly enriched uranyl nitrate hexahydrate solution was spilled into the sump. The investigation found that much uranium and thorium contamination lies in and beneath the 306 Building floor, slab, pipe trenches, and sewer lines. Specifically, two large deposits - 2.4 meters (8 feet) long by 0.6 meters (2 feet) wide by 15 centimeters (6 inches) thick - of uranium-bearing particulate matter were found in the inlet box, but the accumulated radioactivity levels were determined to be nondangerous (3.6 grams of uranium per liter of sludge). No significant accumulation was found in the lime pit and sewer manholes. In 1975, piping that had been installed to transfer fresh nitric acid from the 333 Building to the 306 Building, and to route used acids in the reverse direction, were partially removed. However, several feet of pipe "spurs" nearest the 306 Building remain in place. These and other pipes, along with pipe trenches, sumps, sewers, and drains can be expected to hold hazardous chemical residues as well as the metal residues listed previously. In 1979, a HEDL Radiological Engineering report stated: "All sewer lines (WIDS Site 300-15) leading from this building are suspect. The lime pit...contain[s] uranium and thorium sludge. Surface and near surface contamination around this building is to be expected."

Process Description: The original 306 Building was completed in 1956 and named the Fuel Element Pilot Plant. The facility was constructed to support the 313 Building operations. It was expanded in 1960 to contain the co-extrusion fabrication processes for N Reactor fuels fabrication. In 1972, the new eastern half was designated as 306E and became the Hanford Engineering Development Laboratory (HEDL) operated by Westinghouse Electric Corporation. The original western portion of the building, was designated as 306W and was allocated to Pacific Northwest Laboratories (PNL).

Related Sites/ Structures: The site is related to the 306E Building, 333 building, 300 Area process sewer, and 300 Area sanitary sewer. The contaminated soil beneath the 306E Building is WIDS Site 300-256 and the contaminated soil beneath the adjacent 306W Metal Fabrication Development Building is documented as WIDS Site Code 300-33.

Waste Type: Soil

Waste Description: The waste is contaminated soil under and around the 306E Building.

Closure Info: 300-33, 300-256 and 300-41 were addressed as a group. The information below documents information for the group of sites.

The Remaining Sites Verification Package (RSVP-2010-058) for 300-33, 300-256, and 300-41 waste sites have documented that these sites have met both the industrial and rural-residential scenario remedial action objectives (RAOs) as established in the Remedial Design Report/Remedial Action Work Plan for the 300 Area (300 Area RDR/RAWP) and the Interim Action Record of Decision for the 300-FF-2 Operable Unit, (300-FF-2 ROD). Verification sampling data, site evaluations, and supporting documentation illustrate that the site has been successfully remediated and that there are no residual hazardous/dangerous materials present above RAOs in the soil. Therefore, the sites are protective of human health, groundwater, and the Columbia River.

The waste sites consisted of the contaminated soil around and under the 306W and 306E Building, the neutralization tank, and valve pit.

Demolition of the 306E, 306W, and 306E-BA facilities, which overlaid these waste sites, was completed between November 2006 and December 2007. Remediation of the combined 300-33, 300-256, and 300-41 waste sites occurred between July 10 and November 9, 2009. The remediation activities included the removal of the neutralization tank, valve pit, soil, and other debris within the footprint of the 306E/W Building including the partial removal and backfill of the 306E Building assembly pit. All debris and excavation materials have been removed to the Environmental Restoration Disposal Facility.

The 300-FF-2 ROD lists the COPCs for the sites using descriptive and non-analyte-specific terms. The 300-FF-2 ROD lists uranium, thorium, heavy metals (lead), and acids as COPCs for the 300-33 waste site. The COPCs listed for the 300-256 waste site are uranium, thorium, heavy metals, chemicals, cleansers, solvents, reagents, and PCBs. The COPCs for the 300-41 waste site are anions. Based on the chemical composition of the items on these lists, a single list of specific analyses was developed to capture the COPCs for the three waste sites.

Verification sampling was performed on May 6, 2010, to support a determination that residual contaminant concentrations at these sites meet the cleanup criteria specified in the 300 Area RDR/RAWP and the Record of Decision for the 300-FF-1 and 300-FF-5 Operable Units. The verification sample results were provided within the 95% upper confidence limit (UCL) calculation in Appendix B of the RSVP and indicate that the remedial action achieved compliance with the RAOs for the sites.

The laboratory-reported verification data results for all constituents were stored in the Environmental Restoration project-specific database prior to archival in the Hanford Environmental Information System and were presented as Attachment 1 of the 95% UCL calculation in Appendix B of the RSVP.

Verification sampling results also indicated that the residual contaminant concentrations achieved do not preclude any future uses (as bounded by the rural-residential scenario) and allow for unrestricted use of shallow-zone soils. Site contamination did not extend into the deep-zone soils; therefore, institutional controls to prevent uncontrolled drilling or excavation into the deep zone are not required.

Code: 300-257	Classification: Accepted
Names: 300-257; 309 Process Sewer to River	Reclassification: None
Type: Process Sewer	Start Date:
Status: Inactive	End Date:
Description: The site underground process sewer piping that was originally connected to the 309 Building's Rupture Loop Holding Tank. The tank was removed in the late 1970's. Gerber states that when the Rupture Loop Holding Tank was removed to a 200 Area burial ground, all the connections to the Radioactive Liquid Waste Sewer (RLWS) were severed and plugged. The area where the Rupture Loop Holding Tank was located is now covered with asphalt and is being used as a parking lot.	

The tank had a set of incoming piping that included a 7.6 centimeter (3 inch) steel process sewer pipeline and a 10.2 centimeter (4 inch) steel vent pipeline. The outgoing piping was more complex in that there were two outgoing pipelines that were interconnected in a valve box. One 7.6 centimeter (3 inch) steel pipe run started at the pump on the center top of the tank and ran to the valve box. This pipeline was for pump discharge and was the means of lowering the tank

level.

The second pipe was a 15 centimeter (6 inch) steel overflow pipe that drained to manhole #3. This pipe exited the tank 22.9 centimeters (9 inches) from the top of the tank.

The valve box (pit) was a 1.8 meter by 1.8 meter (6 foot by 6 foot) mostly below grade concrete box with a gravel bottom. The valve box had a manhole and ladder for direct access to the valves. There were also three grade level openings in the top of the valve box for access to the valves with a gate key. It is unknown if the valve box remains in place. The valve box was located approximately 2.1 meters (7 feet) from the Rupture Loop Holding Tank. It may have been removed at the same time as the tank.

There was one 7.6 centimeter (3 inch) incoming pipeline to the valve box and two 7.6 centimeter (3 inch) exit pipelines. Contaminated waste water was diverted at the valve box to the high level waste pipeline that went to the 340 Complex. Uncontaminated water was sent to the process sewer where it teed into the overflow pipeline. At manhole #3, five pipelines converge and flow into a 1 meter (36 inch) 10 gauge corrugated steel pipeline that flowed to the Columbia River. The five pipelines that enter manhole #3 are all process sewer piping with the following sizes and descriptions: 1) a 15.2 (6 inch) steel pipeline from the Rupture Loop Holding Tank overflow line and the valve box, 2) a 30.5 centimeter (12 inch) vitrified clay pipe coming from the 309 Building, 3) a 30.5 centimeter (12 inch) steel line with a 5.1 centimeter (2 inch) condensate drain above the steel pipeline from the 309 Reactor, 4) a 0.76 meter (2.5 foot) steel pipeline from the Condenser Facility (demolished), and 5) a 15.2 centimeter (6 inch) vitrified clay pipe from the 309 Building. According to DOE/EIS-0113, the streams from the 309 Building included cooling water from air conditioning chillers and floor drains from the south basement service area.

The corrugated steel pipe enters a manhole (overflow structure) at the top of the river bank. The structure is 3.8 meters (12.5 feet) deep with the invert to the structure at 1.9 meters (6.2 feet) from the top of the open grate cover. The pipe exits at a depth of 3.8 meters (12.5 feet) on the opposite side of the structure (going towards the river). No pipeline is visible on the river bank or at the edge of the river. DOE/EIS-0113 shows the top view and the profile of this pipeline. The pipeline from the overflow structure (concrete box) is covered by 3.15 meters by 3.15 meters by 0.9 meters (10 feet by 10 feet by 3 feet) deep riprap. Additional riprap has been placed at the terminus of the pipe. At the pipeline terminus there is a minimum of 1.2 meters (4 feet) of riprap cover over the pipeline. This pipeline was identified as discharge No. 014 309 Building Outfall Structure Columbia River Mile 344.5.

According to Nat Harding (Water Utilities), the corrugated pipe has collapsed (due to deterioration) in some places causing subsidences and has had to be filled with dirt.

Location: The site begins southeast of the location of the 309 Rupture Loop Holding Tank (WIDS Site 300-55), joins other process sewer lines and runs due east to a sump (overflow structure) at the top of the river bank.

Process Description: Liquid waste from the 309 Building (Plutonium Recycle Test Reactor) was routed to the Rupture Loop Holding Tank for sampling. If it was contaminated it was sent to the 340 Complex through a 7.6 centimeter (3 inch) underground pipeline. If the waste was not contaminated, it was diverted to the Columbia River via a 1 meter (3 foot) diameter pipeline to the outfall.

Related Sites/Structures: The site was related to the Rupture Loop Holding Tank (WIDS Site 300-55), a valve box, the Radioactive Liquid Waste Sewer (WIDS Site 300 RLWS), manhole #3 and contributory piping coming into manhole #3, an overflow structure at the east end of the site, and piping that exits into the Columbia River.

Waste Type: Equipment
Waste Description: The waste is a pipeline that carried potentially radioactively contaminated water to the river.

Code: 300-258 **Classification:** Accepted
Names: 300-258; Abandoned Pipe Trench Between 334 Tank Farm and 306E **Reclassification:** Interim Closed Out (10/17/2011)
Type: Trench **Start Date:** 1/1/1960
Status: Inactive **End Date:** 1/1/1975

Description: The northern portion of this waste site was remediated with the 618-1 Burial Ground in 2010. The southern portion was sampled and evaluated. No remediation of the southern portion was required. The site was an abandoned subsurface concrete pipe trench. The top of the pipe trench was level with the ground surface and covered with metal plates that measure approximately 0.9 meters by 0.3 meters (3 feet by 1 foot). The metal plates were posted "Radioactive Material, Internally Contaminated." Between the 306E Building and the fence south of the 333 Building, the trench is surrounded by asphalt. The metal cover plates and concrete walls are constructed to allow vehicle traffic on the north side of the 306E Building to drive over the pipe trench. Between the 333 Building fence and the 334 Tank Farm, the trench is primarily surrounded by gravel. The pipe trench is covered by solid plate over most of its length. However, approximately 10 meters (32.8 feet) at the north end have metal plates with approximately 5 centimeter (2 inch) holes. Pipes are visible through these holes.

Location: The pipe trench ran northwest from the north wall of the 306E Building to the southwest corner of the 334 Tank Farm where it joined the south end of the 300-224 pipe trench.

Process Description: The pipe trench was used to house acid transfer piping from the 334 Tank Farm to the 306E Building chemical processing bay in the northeast corner of this facility. From about 1972 to 1975, waste etch solution may have been transferred from the 306E Building chemical bay to the 333/334 Waste Acid Treatment System.

Related Sites/Structures: The site is associated with the 306E Building chemical processing facilities, the 334 Tank Farm, and the 300-224 pipe trench.

Closure Info: The northern portion of the 300-258 waste site that was addressed in the 618-1 Burial Ground excavation is interim closed out within this document based on the results presented in the Cleanup Verification Package for the 618-1 Burial Ground. The 618-1 Burial Ground excavation occurred from September 17, 2008, to September 10, 2009. Two focused, in-process samples were collected from the southern portion of the pipe trench. After sampling, the southern portion of the pipe trench of soil and debris were removed (August 6, 2009) and sent to the Environmental Restoration Disposal Facility (ERDF).

Code: 300-259 **Classification:** Accepted
Names: 300-259; Contamination Area Surrounding 618-1 Burial Ground **Reclassification:** Interim Closed Out (5/11/2010)
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**

Description: The Contamination Area (CA) was posted with light posts and plastic chain that encompasses the 618-1 Burial Ground. The concrete markers for the burial ground (WIDS Site 618-1) were inside the Contamination Area chain. The Contamination Area and Burial Ground were both covered with gravel. A concrete pipe trench (WIDS Site 300-258) and a concrete storage pad

(WIDS Site 333 LHWSA) were also located inside the Contamination Area.

Location: The Contamination Area (CA) is located in the northeast corner of the 300 Area, north and east of the 618-1 Burial Ground.

**Related Sites/
Structures:** The site is related to the 618-1 burial ground and 300-258.

Waste Type: Misc. Trash and Debris
**Waste
Description:**

Closure Info: In accordance with the Remaining Sites Verification Package, RSVP-2009-059, the verification sampling results supports a reclassification of the 300-259 waste site to Interim Closed Out. The current site conditions have achieved the remedial action objectives (RAOs) and the corresponding remedial action goals (RAGs) as established in the Remedial Design Report/Remedial Action Work Plan for the 300 Area (RDR/RAWP) (DOE-RL-2001-47, Rev. 3) and in the 300-FF-2 Interim Action ROD.

Remediation of the 300-259 waste site was performed from March 18 through May 18, 2009. Approximately 6,600 metric tons (7,300 U.S. short tons) of debris and soil were removed. The soil within the waste site footprint was excavated to a depth of 1 m (3 ft) below ground surface (bgs), and the resulting 3,000 bank cubic meters (4,000 bank cubic yards) of soil was disposed at ERDF. Observations during excavation supported the findings of the geophysical survey that indicated the 300-259 waste site contamination was limited to the surface, as the soil below the gravel added in 1991 appeared undisturbed

The COPCs for the waste site were identified based on the characterization of the contaminated items and soil found at the site, as well as the site location. Uranium was listed in the 300 Area Remedial Action Sampling and Analysis Plan (300 Area SAP) as the sole COPC; however, debris and areas of soil contamination had radiological survey readings for beta/gamma contamination as well, and the site's proximity to the 618-1 Burial Ground made it necessary to include additional analytes. Therefore, the COPCs for verification sampling included radionuclides (evaluated using laboratory analytical methods for gamma-, beta-, and alpha-emitting radionuclides), the expanded analyte list for the inductively coupled plasma metals, and mercury.

Verification sampling was performed on October 19, 2009 (logbook EL-1395-15), to support a determination that residual contaminant concentrations at this site meet the cleanup criteria specified in the RDR/RAWP and the ROD for the 300-FF-1 and 300-FF-5 Operable Units, (EPA 1996). The verification sample results were provided within the 95% upper confidence limit (UCL) calculation in Appendix B of the RSVP and indicated that the remedial action achieved compliance with the RAOs.

The laboratory-reported verification data results for all constituents were stored in the WCH Environmental Restoration project-specific database prior to archival in the Hanford Environmental Information System and were presented as Attachment 1 of the 95% UCL calculation (Appendix B of the RSVP).

Remedial actions were performed to support future industrial land use and to protect groundwater and the Columbia River. Further, the residual contaminant concentrations achieved do not preclude any future uses (as bounded by the rural-residential scenario) and allow for unrestricted use of shallow zone soils (i.e., surface to 4.6 m [15 ft] deep). This site has no deep zone; therefore, no deep zone institutional controls are required.

Code: 300-260 **Classification:** Accepted

Names: 300-260; Contaminated Soil West of 313 Building **Reclassification:** No Action (1/13/2011)

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: The site consists of an area of formerly contaminated soil west of the former 313 Building. The site is no longer radiologically posted. Before reclassification it was surrounded by light posts and a yellow rope, no signs of any kind were present. A small amount of equipment and large wooden boxes are stored inside the roped area.

Location: The site is located inside the 300 Area, north of Ginko Street, north of 303-K and west of the 313 Building.

Closure Info: The sampling data collected in conjunction with excavation at the site, site evaluations, and supporting documentation demonstrate that this site meets the unrestricted (residential) remedial action objectives and goals established in the 300 Area RDR/RAWP (DOE-RL 2009b). Therefore, the 300-260 waste site is recommended for reclassification as a No Action waste site.

In 2001, the Interim Action Record of Decision for the 300-FF-2 Operable Unit, Washington (ROD) (EPA 2001) listed the COPCs for the site as uranium, lead, and barium. The ROD states, "Soil samples from the site exceeded regulatory levels for lead and barium" and "Radioactively contaminated black chunks (suspected to be oxidized uranium) were found in holes during upgrades of the electrical utilities in 1994". Samples taken during excavation of a concrete pad at the 300-260 waste site were collected on June 2 and June 3, 2010. The excavation removed a concrete pad for an electrical vault along with incidental soil. Approximately 1,278 metric tons (1,672 U.S. tons) of material was excavated and disposed of at the Environmental Restoration Disposal Facility.

Code: 300-262 **Classification:** Accepted

Names: 300-262; Contaminated Soil West of South Process Pond **Reclassification:** Closed Out (7/23/2003)

Type: Unplanned Release **Start Date:** 1/1/1943

Status: Inactive **End Date:** 1/1/1975

Description: The site has been remediated and closed out.

Location: The site is located west of the 316-1, South Process Pond, west of the railroad tracks, and approximately 61 meters east of 3713 Building.

Release Description: The contaminated soil was discovered on July 19, 1994 during excavation work to install a new utility pipeline. Excavated soils were contained in accordance with applicable established procedures. The contamination appears to have existed prior to the construction of the railroad spur that runs next to the 316-1, South Process Pond.

Related Sites/Structures: This site was associated with the South Pond (316-1); the Retired Filter Backwash Pond (300-RFBP) and unplanned release (UPR) sites UPR 300-32, UPR-300-33, UPR-300-34, UPR-300-35, UPR-300-36, UPR-300-37, and UPR-300-FF-1.

Waste Type: Soil

Waste Description: The waste is radioactively contaminated soil. The survey report indicates readings up to 15,000 disintegrations per minute (dpm) Beta/Gamma. The contamination is suspected to be scrapings from the 316-1, South Process Pond. Potential contaminants of concern may be the same as those for 316-1, including uranium-238 and cobalt-60. Other contaminants may be copper, chromium, ammonia, and polychlorinated biphenyls (PCBs).

Closure Info: 316-1, 300 RFBP, 300-262, UPR-300-32, UPR-300-33, UPR-300-34, UPR-300-35, UPR-300-36, UPR-300-37 and UPR-300-FF-1 were addressed as a group. The information below documents information for the group of sites.

The site has been remediated and closed out. Approximately 47, 600 square meters (512, 000 sq. ft) of soil was excavated, to a depth of approximately 18 feet below ground surface.

Code: 300-263 **Classification:** Accepted
Names: 300-263; 324 Building Diversion Tank **Reclassification:** None
Type: Catch Tank **Start Date:** 1/1/1969
Status: Inactive **End Date:** 1/1/1969

Description: This is an underground, 77,071-liter (20,360-gallon) cylindrical tank, approximately 36 feet long and 10 feet deep. The top of the tank is approximately 60 inches below ground surface.

Location: The tank is located in the 300 Area and east of 3718G Building.

Process Description: The site is an inactive catch tank. The tank was set up to hold contaminated process solutions that were too hot to send directly to the crib (316-3?) without additional treatment. After the tank was put on line, it was intended to be used as a diversion tank in the event of a radioactive release from the facility (324 Building).

Shortly after the tank was installed, the 340 Complex came on line. At that time, the piping system to the diversion tank in the 324 yard was bypassed and capped. Since that time, the 324 Building has transferred its waste to the 340 Complex. Drawing H-3-28455 shows the isolation of the system and has been visually verified at the caissons.

Related Sites/Structures: Originally, the tank was associated with the 324 Building. There are three supporting caissons (valving, pump and ion exchange).

Waste Type: Equipment

Waste Description: The waste is an inactive tank. Hazardous or radioactive waste was never transferred from the 324 Building to the tank. The tank is isolated and the pipelines are capped.

Sample results, Sample Id S8171-01, indicated cesium-137 to be 509 picocuries per liter (13.9% counting error). Gross Beta was 1,700 picocuries per liter (10% method error).

At the time the site was sampled, there was 15.2 centimeters (6 inches) of rainwater. The water is believed to have come from intrusion because many of the flange bolts were missing. The site is located in a low area where pooling of water can occur. The contamination is believed to be from surface contamination. This site lies in the middle of WIDS Site 316-3, 307 Disposal Trenches.

Code: 300-265 **Classification:** Accepted
Names: 300-265; Pipe Trench Between 324 and 325 Buildings **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:** 1/1/1971
Status: Inactive **End Date:**

Description: The site is a 5 centimeter (2 inch), underground encased stainless-steel waste transfer line encased within a 10 centimeter (4-inch) fiberglass-reinforced epoxy pipe. The pipeline has a downward slope of about 0.5% from the 325 Building to the 324 Building. Inside the pipeline

are two other stainless-steel Schedule 40 pipes, one is 3/8 inch and the other is 3/4 inch. The inner pipes were driven through the 5 centimeter (2 inch) pipe several years after the larger pipe was installed. The route of the pipeline is marked at the ground surface and is totally within the exclusion area to prevent accidental excavation. The depth of the pipeline ranges from 1 to 4 meters (3 to 12 feet) underground. The encasement surrounding the two smaller pipelines was used both for secondary containment and as a route for transfer of the process off-gas for discharge through the 324 Building stack. Before venting through the stack, it flowed into B Cell and was treated with the B Cell ventilation exhaust.

Location: The transfer line runs in an east-west direction, north of the 324, 308 and 325-A buildings, inside the 300 Area.

Process Description: This stainless steel transfer system allowed liquefied High Level Waste (HLW) to be pumped back and forth from the 324 and 325 Buildings for vitrification experiments for spent nuclear fuel waste.

Related Sites/ Structures: This pipeline connects the 324 and 325 Buildings.

Waste Type: Process Effluent

Waste Description: The transfer line carried liquid High Level Waste from spent nuclear fuel processing.

Code: 300-268

Classification: Accepted

Names: 300-268; 3741 Building Foundation; Box Storage Building Foundation; Special Machine Shop

Reclassification: Interim Closed Out

Type: Foundation

Start Date: 1/1/1944

Status: Inactive

End Date: 1/1/1956

Description: The building has been removed. The building site is covered with gravel. There are no visual signs or markers to indicate where the building footprint had been located. The site cannot be precisely located without geophysical scans or excavation. The entire 300 Area is a posted Underground Radioactive Material area. There is no separate radiological posting for this site.

Location: The 3741 Building was east of where the 384 Power Plant and south of the 303-J buildings had been located.

Process Description: The building was used to store and prepare samples of irradiated graphite, flux wires, and uranium from the 305 Test Pile, in cardboard boxes. The word "box" in the name Box Storage Building was derived from these boxes. The building was also used as a Special Machine Shop. It contained lathes, drills, saws and other machinery for cutting and preparing metal samples for analysis.

Waste Type: Demolition and Inert Waste

Waste Description: The contamination related to this building were a result of passive dust from machining irradiated uranium, graphite, and other metallic samples from the 305 Test Pile. The contamination, if remaining, would be associated with any remaining concrete foundation.

Code: 300-269

Classification: Accepted

Names: 300-269; 331-A Virology Laboratory Foundation

Reclassification: None

Type: Foundation

Start Date: 1/1/1972

Status: Active **End Date:** 1/1/1995

Description: The site is a rectangular concrete building foundation. New air conditioner units are installed on the concrete foundation to support the adjacent 331 facility.

Location: The 331-A foundation is located adjacent to the northwest side of the existing 331 Building.

Process Description: The 331-A Building was a roughly T-shaped, one-story, concrete-block building with a sloped wood frame roof. The building was originally used for biological research to investigate radiation effects of animals. The purpose of the research was to investigate radiation damage to tissue from plutonium and fission products. Animals that were contaminated were held in other areas of the 331 complex until their feces showed no significant contamination. In the early 1980s, the facility was converted to a virology laboratory to study bacterial and viral growth in animals. Virology research continued until 1995.

Related Sites/ Structures: The 331-A Building was part of the original 331 Building complex.

Waste Type: Equipment

Waste Description: Residual contamination may be on the pad from past releases at the building.

Code: 300-270 **Classification:** Accepted

Names: 300-270; Unplanned Release at 313 Building **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/2000

Status: Inactive **End Date:** 1/1/2000

Description: The "unplanned release" reported by the Government Accountability Project and sampled by the Washington Departments of Ecology and Health. It was a milky-white flow of water that came out of a pipe located below the loading dock on the east side of the 313 Building. The dock is used by Richland Specialty Extrusions to store cylinders of metal (e.g., aluminum). The pipe drains stormwater from the roof of the 313 Building. The release was on to the surface of the ground, in an area of compacted gravel and soil. This area adjoins a paved parking lot.

Location: The "release" was on the east side of the 313 Building.

Process Description: The source of the stormwater was the roof of the 313 Building, but the reason for the discoloration was not determined. The liquid tested and found to be nonradioactive and nondangerous. The matter was not pursued further.

Related Sites/ Structures: The release of whitish stormwater came from a pipe under the loading dock on the east side of the 313 Building. The pipe drains the roof of the 313 Building, according to the e-mail summarizing the sampling activities.

Waste Type: Soil

Waste Description: The stormwater is nondangerous and nonradioactive. Soil collected from the area near the pipe showed elevated levels of lead. The contaminated soil was not caused by the milky-white liquid. The source of the lead contamination is unknown.

Code: 300-273 **Classification:** Accepted

Names: 300-273; 366 Bunker Pipeline; Fuel Oil Transfer Pipeline **Reclassification:** Interim Closed Out

Type: Product Piping **Start Date:** 1/1/1964

Status: Inactive **End Date:** 1/1/1998

Description: The site is an encased underground pipeline. The encased pipeline contains two 7.6 centimeter (3 inch diameter) stainless steel lines. It is not visually marked on the surface.

Location: The pipeline is located northeast of the 384 Powerhouse, between the 366 Bunker site and the day tanks.

Process Description: The underground pipeline transferred fuel oil from the 366 Fuel Oil Bunkers (300-6) to the underground Fuel Oil Day Tanks (300-223) to run the 384 Powerhouse. The system operated between 1964 and 1998.

Related Sites/Structures: The encased pipeline contains two 7.6 centimeter (3 inch diameter) stainless steel lines. It is associated with WIDS sites 300-6 and 300-223.

Code: 300-274 **Classification:** Accepted

Names: 300-274; Surface Debris **Reclassification:** None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: A field walkdown of the 300-FF-1 Operable Unit was done in July and December of 2004 to identify remaining debris, hazards and potential new waste sites. Miscellaneous surface debris found consisted mostly of transite, wood, asphalt, metal and broken glass.

Location: The 300-FF-1 Operable Unit boundary extends north of the northeast corner of 300 Area to south of the Treated Effluent Disposal Facility (TEDF). It is bounded on the east by the Columbia River. The western edge is irregularly shaped. The majority of the debris was located in the southern portion of the 300-FF-1 Operable Unit, south of the filter backwash ponds.

Process Description: Various forms and sizes of potentially hazardous or dangerous surface debris waste was created during 300 Area construction and operation and during decommissioning and remedial action activities.

Waste Type: Asbestos (non-friable)

Waste Description: Transite pipe, treated wood, insulation and various forms of transite were identified during the Operable Unit walkdown. The debris was determine to be Potential Asbestos Containing Material (PACM).

Code: 300-275 **Classification:** Accepted

Names: 300-275; Potential Landfill on River Edge **Reclassification:** Interim Closed Out (8/13/2009)

Type: Sanitary Landfill **Start Date:**

Status: Inactive **End Date:**

Description: Before remediation the site consisted of seven areas of debris in two regions, a northern and southern one. There were three surface debris areas and four subsurface debris areas.

Location: There were two separate regions of debris. The northern region was approximately 40 meters (131 feet) west of the Columbia River shoreline and 140-meters (459-feet) north of the remediated 300-49, Landfill 1a site. The southern region with one surface debris area and two subsurface areas was located 9 meters (29.5 feet) northeast of 300-49.

Waste Type: Misc. Trash and Debris

Waste**Description:**

The two surface debris areas in the northern region contain sparsely scattered surface debris, including small fragments of potential asbestos containing shingles and concrete. Other sparse, but visible debris includes rusted cans, metal fragments of unknown origin, pieces of insulated electrical cable, and a few pieces of broken glass. The underground debris is of unknown type.

The surface debris area in the southern region includes small fragments of potential asbestos containing shingles, metal fragments, a few small pieces of concrete debris, glass fragments, and porcelain jar fragments. There is also a small segment of stainless steel pipe and a broken graduated cylinder, both likely related to the Hanford laboratory work in the 300 Area. The underground debris is of unknown type. (Logbook EL-1583-5, pp.20-21)

Closure Info:

In accordance with this evaluation, the verification sampling results support a reclassification of the site to Interim Closed Out. The Remaining Sites Verification Package (RSVP-2008-059) has documented that the current site conditions achieve the remedial action objectives (RAOs) and the corresponding remedial action goals (RAGs) established in the Remedial Design Report/Remedial Action Work Plan for the 300 Area (RDR/RAWP) and in the 300-FF-2 Interim Action ROD.

The selected remedy for the site was removal and disposal of surface and subsurface solid debris items that may contain hazardous/dangerous constituents. Surface debris identified at both the northern and southern regions of the site included small fragments of potentially asbestos-containing shingles (transite), metal fragments, concrete pieces, porcelain jar fragments, rusted cans, metal fragments, insulated electrical cable, broken glass, pieces of copper tubing, a broken graduated cylinder, and other trash.

Based on the location and overall composition of the debris in both regions, the entire site was believed to be related to Hanford Site laboratory work in the 300 Area. Handpicking and removal of surface debris from both the northern and southern regions was completed prior to excavation activities. Subsurface debris was excavated and removed from both regions of the site between July 25, 2007, and August 9, 2007. A total of 1,148 bank cubic meters (1,502 bank cubic yards) of material were excavated from the overall site, resulting in approximately 2,754 metric tons (3,036 tons) of material disposed at the Environmental Restoration Disposal Facility (ERDF).

The soil directly below items of surface debris was visually evaluated during removal of the debris. If staining or other evidence of a release of contaminants (e.g., impacted vegetation) to the underlying soil had been observed, the impacted soil would have been removed and verification soil samples collected. None of the soil underlying surface debris collected exhibited evidence of a release of contaminants such as staining or impacted soil.

Because the 300-275 waste site overlapped the pre-excavation boundary of the 300-49 waste site and was assumed to have a similar process history, the entire Contaminants of Potential Concern (COPC) list for the 300-49 waste site as specified in the RDR/RAWP was applied to the site. The COPCs included: cobalt-60, uranium-234, uranium-235, uranium-238, arsenic, lead, thallium, polychlorinated biphenyls (PCBs), benzo(a)pyrene, and chrysene. While not COPCs, antimony, barium, beryllium, boron, cadmium, total chromium, cobalt, copper, manganese, mercury, molybdenum, nickel, selenium, silver, vanadium, and zinc concentrations were also evaluated by performing the expanded inductively coupled plasma metals analytical list. Additional COPCs were identified based on process knowledge and observations made during excavation and remediation. Radiological detections during excavation led to the addition of gross alpha, and gross beta activity. Transite and other suspected asbestos containing materials were identified.

Verification sampling within the excavation areas was conducted on November 20, 2008 (WCH

Logbook EL-1395-14). An evaluation of the resulting data found that the waste removal action achieved compliance with the rural-residential scenario RAOs for the site. A summary of the cleanup evaluation for the soil results against the applicable criteria was presented in Table ES-1 of the RSVP. The results of the verification sampling were used to make reclassification decisions for the site in accordance with the Tri-Party Agreement Handbook Management Procedures, TPA-MP-14 procedure. The laboratory-reported verification data results for all constituents were stored in the WCH Environmental Restoration project-specific database prior to archival in the Hanford Environmental Information System and were presented as Attachment 1 of the 95% UCL calculation in Appendix A of the RSVP.

The results of verification sampling were protective of groundwater and the Columbia River and show that residual contaminant concentrations do not preclude any future uses (as bounded by the rural-residential scenario) and allow for unrestricted use of shallow zone soils (i.e., surface to 4.6 m [15 ft] deep).

Code:	300-276	Classification:	Accepted
Names:	300-276; 3607 Sanitary Sewer System; 3607 Sanitary System Miscellaneous Components; 3707; 300 Area Sanitary Sewer Disposal System	Reclassification:	Interim Closed Out (12/8/2011)
Type:	Sanitary Sewer	Start Date:	1/1/1943
Status:	Inactive	End Date:	1/1/1996
Description:	The site consisted of the components of the original septic system, which processed sanitary effluent from the 300 Area Sanitary Sewer System (300 SSS) piping. The site includes the surface and subsurface sewer system components of manhole SS6, the influent diversion box, the effluent diversion box, the sludge pumping equipment, the sludge pit, the system's original septic tank, the system's original tile field, a retention basin and the measuring weir/diversion trenches.		
Location:	The components of 300-276 are located in the northeast section of 300 Area, east of the 333 building.		
Release Description:	WHC-MR-088 states the Sanitary Sewer System may have received undocumented contamination via cross contamination from other waste systems and from connections to change houses, lunchrooms, restrooms and First Aide stations populated by contaminated workers. A 1948 Health Instrument division report stated significant increases of uranium were found in the 300 Area sanitary water due to seepage from the process waste ponds. A 1991 radiological survey of the septic tank sludge pump displayed readings of 25,000 counts per minute.		
Process Description:	The original, gravity flow 300 Area Sanitary Sewer System operated from 1944 through 1996. In 1996, the ground disposal portion of the system was replaced with a pressurized system and routed to the City of Richland sewer system. This WIDS site is the pre-1996 sewer system, downstream of Manhole SS6.		
	The original sanitary sewer system (1943) consisted of one septic tank that received effluent via manhole SS6 and a tile field. In 1951, two more septic tanks, two diversion boxes, and a sludge pit and pumping system were added. The tile field was replaced by two large leaching trenches. (WIDS site 300-52 represents the two 1951 septic tanks and two leaching trenches) More improvements were made in 1960. A chlorination station was added in 1972.		
Related Sites/ Structures:	This site is associated with 300-52 and 300 SSS.		

Waste Type: Equipment
Waste Description: The equipment (diversion boxes, pumps, tanks) associated with the Sanitary Sewer System is potentially chemically and radioactively contaminated. WHC-MR-0388 states that a 1991 radiation survey of the septic tank sludge pump and pipes had readings of 25,000 counts per minute.

Waste Type: Sanitary Sewage
Waste Description: The Sanitary Sewer System is potentially contains radioactive and chemical contaminants.

Closure Info: The demolition of the three septic tanks, associated equipment, and the liquid chlorine bottle storage facility foundation, as well as loadout of demolished debris and soil, began on November 8, 2010, and was completed February 3, 2011. Debris from the demolition and excavation of the septic system included concrete, rebar, piping, valves, sand (used for tank fills), and residual sludge.

Excavation at the 300-276 waste site resulted in a total of approximately 2,228 bank cubic meters (2,914 bank cubic yards) of contaminated soil and debris. All material was direct loaded for disposal at the Environmental Restoration Disposal Facility (ERDF). A post-excavation radiological survey for gamma activity was conducted following the completion of remedial action to confirm that no radiological contamination was present. No elevated gamma activity was detected.

Code:	303-M SA	Classification:	Accepted
Names:	303-M SA; 303-M Storage Area; 303-M Building Storage Area	Reclassification:	Interim Closed Out (6/29/2010)
Type:	Storage	Start Date:	1/1/1983
Status:	Inactive	End Date:	1/1/1987

Description: The 303-M-Storage Area was an inactive, curbed, concrete pad adjacent to the west side of the 303-M Uranium Oxide Facility (UOF). The concrete surface was painted with a heavy gray paint as a fixative. Several "fixed radioactive contamination" signs were on the surface. The area was used for storage of pyrophoric uranium and Zircaloy-2 chips and fines awaiting treatment in the 303-M UOF. The metal turnings were stored underwater in 114-L (30-gal) metal drums. The drums of fines were stored in a spaced array defined by painted yellow circles on the pad.

Location: The unit is 21 feet (6.4 meters) east of the 333-N Building and enclosed within a 6-inch high concrete curb adjacent to the west wall of the 303-M Uranium Oxide Facility.

Process Description: The storage area was used to store drums of uranium and zircaloy-2 chips and fines, prior to oxidation in the 303-M Uranium Oxide Facility. Lift trucks with barrel clamps were used to transport the drums of uranium metal turnings from the 333-N Fuels Fabrication Building to a designated storage spot (a solid yellow circle painted on) the storage pad. Water levels in the drums were maintained within six inches of the top of the drum, well above the level of the fines in the drum. Barrel clamps were used to pick up a drum and take it into the 303-M Uranium Oxide Facility for processing.

Related Sites/Structures: Structures associated with this unit include the 333-N Building, the 303-M Building, the remnants of the 303-L Building, and the 618-1 Burial Ground.

Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: The area was used for storage of pyrophoric uranium and zirconium fines awaiting treatment in the 303-M Oxidation Facility. The metal turnings were stored under water in 30 gallon metal

drums. The drums of uranium fines were stored in a spaced array defined by painted yellow circles on the pad. An estimated 127 tons (115,300 kilograms) of uranium were treated during the 303-M Facilities operation from 1983 to 1987.

Closure Info: 618-1, 618-1:1, 618-1:2, 300-110, 303-M SA, 303-M UOF and 333 ESHWSA were addressed as a group. The information below documents information for the group of sites.

The 618-1 Burial Ground, two subsites, three consolidated sites and four co-located sites were remediated as a group. This group included WIDS sitecodes 618-1, 618-1:1, 618-1:2, 333 LHWSA, UPR-300-13, UPR-300-14, 300-110, 303-M SA, 303-M UOF and 333 ESHWSA. Parts of waste sites 300-15, 300-259 and UPR-300-17 were also remediated along with 618-1. Several facilities were built over the top of portions of the 618-1 Burial Ground after it ceased to operate. These facilities were demolished and their debris taken to the Environmental Restoration Disposal Facility (ERDF) prior to the start of the burial ground remediation project.

Cleanup Verification Package CVP-2010-00001 demonstrates that remedial action at the site has achieved the Remedial Action Objectives and corresponding Remedial Action Goals established for the industrial land-use scenario in the Record of Decision (EPA 2001), the Explanation of Significant Differences for the 300-FF-2 Operable Unit (EPA 2004), and the RDR/RAWP(DOE-RL-2001-47, Rev 3).

Field remediation activities were performed between September 17, 2008 and September 10, 2009, in accordance with the RDR/RAWP. Approximately 47,332 metric tons (52,160 US tons) of soil and debris was excavated and disposed of at Environmental Restoration Disposal Facility (ERDF). No excavated soil was used as clean, uncontaminated backfill.

Excavated material consisted mostly of contaminated soil, metal pipe, crucibles, laboratory glassware, and empty metal containers. Twenty metal drums containing personal protective equipment were removed from the trenches. Several bottles containing liquid and/or powder were also removed.

Some land disposal restricted (LDR) materials like lead solids contaminated with barium and chromium, were identified among the debris. The LDR material was segregated from the bulk soil and non-LDR debris for disposal. The bulk soil and non-LDR debris was sorted and segregated in the burial trenches. After sorting, the remaining bulk soil debris stockpiles were sampled to ensure that the material was in compliance with land disposal restrictions. The released stockpiled material was transported to ERDF for disposal. Land disposal restricted materials that had been segregated for treatment were transported to ERDF under a separate waste profile.

Following remediation and field screening of the 618-1 Burial Ground, verification sampling was conducted on January 26 and 27, 2010. Contaminants of Potential Concern for the statistical samples included cesium-137, uranium-233/234, uranium-235, uranium-238, barium, beryllium, chromium (total), copper, lead, lithium, mercury, molybdenum, nickel, silver, uranium (total metal), zinc, PCBs, chloride, fluoride, nitrate, nitrite, and sulfate. Arsenic, antimony, boron, cadmium, cobalt, manganese, selenium, and vanadium were evaluated for the expanded inductively coupled plasma metals analytical list.

The remaining soil at the 618-1 site has been sampled, analyzed, and evaluated. Results indicate that the site supports future land uses that can be represented (or bounded) by the industrial land-use scenario and poses no threat to groundwater or the Columbia River. Institutional controls are required to prevent drilling or excavation into the deep zone.

Code: 303-M UOF

Classification: Accepted

Names: 303-M UOF; 303-M Uranium Oxide Facility **Reclassification:** Interim Closed Out (6/29/2010)
Type: Process Unit/Plant **Start Date:** 1/1/1983
Status: Inactive **End Date:**

Description: The site was a reinforced concrete structure containing a highbay area and a one-story extension on the north side of the building (Figures 7, 8, and 9). The 303-M SA is located on the west side of the building. The building was used to oxidize pyrophoric uranium metal turnings and chips and Zircaloy-2 fines generated during fuel fabrication machining operations in the 333 Building. During the 4 years that it was operational (1983 to 1987), the 303-M UOF converted 115 metric tons of uranium scrap into oxide form. The 303-M Building was demolished in March 2006, and the debris was shipped to the ERDF as described in Facility Status Change Form D4-300-008

Location: The unit is located in the north central 300 Area, east of the 333 Building.

Process Description: The facility was used to oxidize pyrophoric uranium metal turnings and chips and zircalloy-2 fines generated during fuel fabrication machining operations in the 333 Building. The metal turnings were received in 30 gallon drums filled with water for fire prevention. The metal turnings were removed, screened, hand fed into a shredder/chopper, and small bags of metallic fines were placed inside a burner chamber for oxidation.

Related Sites/ Structures: Structures related to the 303-M Building include the 303-M Storage Area (WIDS Site Code 303-M SA), the 333 Building, the 618-1 Burial Ground, and the remnants of the 303-L Building.

Waste Type: Chemicals

Waste Description: The oxidation process feed material was pyrophoric uranium and zircalloy-2 fines. Approximately 127 tons (115,300 kilograms) of material was oxidized during operations. Waste currently at the facility may include residual radiological and chemical contamination in the process equipment, on surfaces, and in the process sewer.

Closure Info: 618-1, 618-1:1, 618-1:2, 300-110, 303-M SA, 303-M UOF and 333 ESHWSA were addressed as a group. The information below documents information for the group of sites.

The 618-1 Burial Ground, two subsites, three consolidated sites and four co-located sites were remediated as a group. This group included WIDS sitecodes 618-1, 618-1:1, 618-1:2, 333 LHWSA, UPR-300-13, UPR-300-14, 300-110, 303-M SA, 303-M UOF and 333 ESHWSA. Parts of waste sites 300-15, 300-259 and UPR-300-17 were also remediated along with 618-1. Several facilities were built over the top of portions of the 618-1 Burial Ground after it ceased to operate. These facilities were demolished and their debris taken to the Environmental Restoration Disposal Facility (ERDF) prior to the start of the burial ground remediation project.

Cleanup Verification Package CVP-2010-00001 demonstrates that remedial action at the site has achieved the Remedial Action Objectives and corresponding Remedial Action Goals established for the industrial land-use scenario in the Record of Decision (EPA 2001), the Explanation of Significant Differences for the 300-FF-2 Operable Unit (EPA 2004), and the RDR/RAWP(DOE-RL-2001-47, Rev 3).

Field remediation activities were performed between September 17, 2008 and September 10, 2009, in accordance with the RDR/RAWP. Approximately 47,332 metric tons (52,160 US tons) of soil and debris was excavated and disposed of at Environmental Restoration Disposal Facility (ERDF). No excavated soil was used as clean, uncontaminated backfill.

Excavated material consisted mostly of contaminated soil, metal pipe, crucibles, laboratory glassware, and empty metal containers. Twenty metal drums containing personal protective equipment were removed from the trenches. Several bottles containing liquid and/or powder

were also removed.

Some land disposal restricted (LDR) materials like lead solids contaminated with barium and chromium, were identified among the debris. The LDR material was segregated from the bulk soil and non-LDR debris for disposal. The bulk soil and non-LDR debris was sorted and segregated in the burial trenches. After sorting, the remaining bulk soil debris stockpiles were sampled to ensure that the material was in compliance with land disposal restrictions. The released stockpiled material was transported to ERDF for disposal. Land disposal restricted materials that had been segregated for treatment were transported to ERDF under a separate waste profile.

Following remediation and field screening of the 618-1 Burial Ground, verification sampling was conducted on January 26 and 27, 2010. Contaminants of Potential Concern for the statistical samples included cesium-137, uranium-233/234, uranium-235, uranium-238, barium, beryllium, chromium (total), copper, lead, lithium, mercury, molybdenum, nickel, silver, uranium (total metal), zinc, PCBs, chloride, fluoride, nitrate, nitrite, and sulfate. Arsenic, antimony, boron, cadmium, cobalt, manganese, selenium, and vanadium were evaluated for the expanded inductively coupled plasma metals analytical list.

The remaining soil at the 618-1 site has been sampled, analyzed, and evaluated. Results indicate that the site supports future land uses that can be represented (or bounded) by the industrial land-use scenario and poses no threat to groundwater or the Columbia River. Institutional controls are required to prevent drilling or excavation into the deep zone.

Code:	311 MT1	Classification:	Accepted
Names:	311 MT1; 311 Tank Farm Underground Methanol Tank #1; 311-1; 311 Methanol Tank 1	Reclassification:	Closed Out (2/12/1999)
Type:	Storage Tank	Start Date:	1/1/1955
Status:	Inactive	End Date:	1/1/1971
Description:	The former site has been backfilled and is covered with gravel. Prior to removal, the site consisted of a horizontal, flat-ended cylindrical tank.		
Location:	The site is northwest of 303-G and northeast of 303-F.		
Process Description:	The unit is no longer active and has been removed. While in service the unit stored pure methanol used as a final rinse to remove water from aluminum end caps and cans in the "triple dip" and "lead dip" fuel fabrication processes.		
Related Sites/Structures:	Structures associated with the tank include the other 311 Methanol Tank (WIDS Site 311 MT2), the 313 Methanol Tank (WIDS Site 313 MT), transfer piping, and the 313 Building. WIDS Site 300-40 (Corrosion of Vitrified Clay Sewer Pipe) is located to the west of the site.		
Waste Type:	Chemicals		
Waste Description:	The unit contained an aqueous solution of methanol. Methanol was used as a drying agent for the aluminum cleaning process. The methanol was pumped from the tank in 1971. The tank was removed in 1989.		
Closure Info:	The tank was removed August 30, 1989. This tank and two others (WIDS Sites 311 MT2 and 313 MT) were taken to the Nonradioactive Dangerous Waste Landfill (WIDS Site NRDWL) for storage.		

The tank impressions from all three tanks were surveyed with a photo ionization organic vapor detector (HNU Model P1-101). There were no readings. Narrow holes were bored into the

sand at suspicious locations. There were no readings. There was no stained soil. Samples (random) were collected at four locations around the tank. The excavation was backfilled on the completion of the tank removal.

Review of the results of soil tests from 311 MT1, 311 MT2, and 313 MT indicates that none of the tanks have leaked.

Institutional control (IC) information has been revised as directed by the U. S. DOE letter, 05-AMRC-0078, 1/4/05, following a review of the Institutional Controls (ICs) in the WIDS. Some 300 Area sites, including this one, were closed out before CVP documents were in use, and close-out information was documented in waste site reclassification forms. No ICs were identified for these sites at the time of closeout, however the DOE determined that further evaluation of ICs would be needed before making a final decision on the appropriate ICs to implement. Until a final Record of Decision is approved for this site, tentative ICs based on the remedial action and location for this and similar sites in the DOE letter have been determined judgmentally.

Code:	311 MT2	Classification:	Accepted
Names:	311 MT2; 311 Tank Farm Underground Methanol Tank #2; 311-2; 311 Methanol Tank 2	Reclassification:	Closed Out (2/12/1999)
Type:	Storage Tank	Start Date:	1/1/1955
Status:	Inactive	End Date:	1/1/1971
Description:	The former site has been backfilled and is covered with gravel. Prior to removal, the site consisted of a horizontal, flat-ended cylindrical tank.		
Location:	The unit is located northwest of 303-G and northeast of 303-F.		
Process Description:	The unit is no longer active and has been removed. While in service the unit stored used methanol solution generated in the 313 fuel fabrication/final rinse processes, until the solution was de-watered in the still. The de-watered methanol was then added to the 311 Methanol Tank (WIDS Site 311 MT1).		
Related Sites/ Structures:	Structures associated with the tank include the other 311 Methanol Tank (WIDS Site 311 MT1), the 313 Methanol Tank (WIDS Site 313 MT), transfer piping, and the 313 Building. WIDS Site 300-40 (Corrosion of Vitrified Clay Sewer Pipe) is located to the west of the site.		
Waste Type:	Chemicals		
Waste Description:	The unit contained an aqueous solution of methanol. Methanol was used as a drying agent for the aluminum cleaning process. The methanol was removed from the tank in 1971. The tank was removed in 1989.		
Closure Info:	The tank was removed August 30, 1989. This tank and two others (WIDS Sites 311 MT1 and 313 MT) were taken to the Nonradioactive Dangerous Waste Landfill (WIDS Site NRDWL) for storage.		

The tank impressions from all three tanks were surveyed with a photo ionization organic vapor detector (HNU Model P1-101). There were no readings. Narrow holes were bored into the sand at suspicious locations. There were no readings. There was no stained soil. Samples (random) were collected at four locations around the tank. The excavation was backfilled on the completion of the tank removal.

Review of the results of soil tests from 311 MT1, 311 MT2, and 313 MT indicates that none of the tanks have leaked.

Institutional control (IC) information has been revised as directed by the U. S. DOE letter, 05-AMRC-0078, 1/4/05, following a review of the Institutional Controls (ICs) in the WIDS. Some 300 Area sites, including this one, were closed out before CVP documents were in use, and close-out information was documented in waste site reclassification forms. No ICs were identified for these sites at the time of closeout, however the DOE determined that further evaluation of ICs would be needed before making a final decision on the appropriate ICs to implement. Until a final Record of Decision is approved for this site, tentative ICs based on the remedial action and location for this and similar sites in the DOE letter have been determined judgmentally.

Code: 313 ESSP **Classification:** Accepted

Names: 313 ESSP; 313 Building East Site Storage Pad; 313 East Side Storage Pad **Reclassification:** None

Type: Storage **Start Date:**

Status: Inactive **End Date:**

Description: The 313 East Side Storage Pad is a large concrete pad with an asphalt ramp that connects the pad to Ginko street. No wastes of any kind are currently stored at the site. The Waste Acid Treatment System pipe trench (WIDS Site 300-224) passes east-west through the site and is posted as internally contaminated with radioactive material. Two areas of the pad, located adjacent to the east wall near the southern end of the 313 building have been painted gray. Signs are placed at the base of the walls, just above the painted areas that read "Fixed Contamination - Contamination Under Grey Paint on Ground".

Location: The unit is adjacent to the south eastern side of the 313 Building. The unit extends from the 313 Building to approximately 15 meters (50 feet) from the railroad tracks east of the 313 Building and south to the north side of Ginko Street.

Process Description: Previously the site staged radiological waste from 313 Building operations and, during fuel fabrication operations, staged mixed waste from the 313 Centrifuge and uranium waste from the 313 Filter Press. The unit was also used to stage raw materials received by rail cars.

Related Sites/ Structures: Structures associated with the unit include the 313 Buildings, the 303 Buildings, the Waste Acid Treatment System pipe trench (WIDS Site 300-224), and the railroad tracks along the east side of the pad.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: The area was used to stage mixed waste including byproduct waste materials from the fuels fabrication process and neutralized solids from the 313 Recovery Operations process.

Code: 313 MT **Classification:** Accepted

Names: 313 MT; 313 Building Underground Methanol Storage Tank; 313 Methanol Tank **Reclassification:** Closed Out (2/12/1999)

Type: Storage Tank **Start Date:** 1/1/1955

Status: Inactive **End Date:** 1/1/1971

Description: The 313 Methanol Tank was removed in 1989. The excavation was backfilled and the floor was patched with concrete. Prior to removal the site consisted of a steel cylindrical tank lying horizontally. The tank was below the floor of the 313 Building.

Location: The tank was located below the floor in the southeast portion of the 313 Building.

Release: No releases have been identified.

Release**Description:**

Process Description: Prior to removal, the tank was used as an emergency dump tank. In case of a fire in the 313 Building, the methanol from the dehydration tanks could be released to the underground tank. The tank was never used for an emergency dump.

Related Sites/ Structures: Structures associated with the tank include the 311 Methanol Tank 1 (WIDS Site 311 MT1), the 311 Methanol Tank 2 (WIDS Site 311 MT2), transfer piping, and the 313 Building.

Waste Type: Chemicals

Waste Description: From 1971 to 1987 the tank contained an aqueous methanol solution. The tank was removed in 1989. The tank never received an emergency methanol dump.

Closure Info: The tank was removed August 30, 1989. This tank and two others (WIDS Sites 311 MT2 and 311 MT2) were taken to the Nonradioactive Dangerous Waste Landfill (WIDS Site NRDWL) for storage.

The tank impressions from all three tanks were surveyed with a photo ionization organic vapor detector (HNU Model P1-101). There were no readings. Narrow holes were bored into the sand at suspicious locations. There were no readings. There was no stained soil. Samples (random) were collected at four locations around the tank. The excavation was backfilled on the completion of the tank removal.

Review of the results of soil tests from 311 MT1, 311 MT2, and 313 MT indicates that none of the tanks have leaked.

Institutional control (IC) information has been revised as directed by the U. S. DOE letter, 05-AMRC-0078, 1/4/05, following a review of the Institutional Controls (ICs) in the WIDS. Some 300 Area sites, including this one, were closed out before CVP documents were in use, and close-out information was documented in waste site reclassification forms. No ICs were identified for these sites at the time of closeout, however the DOE determined that further evaluation of ICs would be needed before making a final decision on the appropriate ICs to implement. Until a final Record of Decision is approved for this site, tentative ICs based on the remedial action and location for this and similar sites in the DOE letter have been determined judgmentally.

Code: 316-3	Classification: Accepted
Names: 316-3; Process Water Trenches; 307 Disposal Trenches	Reclassification: None
Type: Trench	Start Date: 1/1/1953
Status: Inactive	End Date: 1/1/1963

Description: The trenches were backfilled in 1965 and are no longer visible. A large portion of the location has been paved and fenced. The site consisted of two trenches, each 180 meters (600 feet) long, 9.1 meters (30 feet) wide at the east end, tapering to 3.0 meters (10 feet) wide at the west end. The depth varied from 3.7 meters (12 feet) to 8.2 meters (27 feet). The trenches ran in an east and west direction, approximately 6.1 meters (20 feet) apart. Each contained a 13 centimeter (5 inch) vitrified clay pipe that ran the entire length of the unit.

Location: The trenches were located east of 300 Area, southeast of the 340 Facility.

Process Description: From 1953 to 1963, effluent below discharge limits was released from the 307 Retention Basins and discharged to these trenches. Effluent above discharge limits was transported to the 200 Area for disposal.

Related Sites/ Structures: The trenches are associated with the 340 Complex. Facilities that discharged to the 307 trenches via the retention basins, included 324, 325, 326, 327, 329, and the 308 buildings.

Waste Type: Process Effluent

Waste Description: The site received wastes from the 300 Area Laboratory expansion facilities (329 Biophysics Laboratory, 327 Radiometallurgy Building, 324 Radiochemistry Building, 326 Pile Technology Building, and 329 Mechanical Development Building). The wastes first went through the 307 Retention Basin. Retention Basin waste below discharge limits was released to the trenches from 1953 to 1963. The trenches were excavated in 1963, and the contaminated soil was taken to 300 North (618-10) Burial Ground. The trenches were backfilled with process pond scrapings and fly ash in 1965.

In 1987 the west end of the 316-3 (near the 3727 building) was used to test a grout liquid waste solidification process. A 6.1 meter by 6.1 meter by 3.0 meter (20 foot by 20 foot by 9 foot) deep section of the trenches was excavated, and contaminated material (probably backfill from the south process pond) was encountered. Activities measured were as high as 378 picocuries per gram beta and 234 picocuries per gram alpha.

Code: 316-4 **Classification:** Accepted

Names: 316-4; 316-N-1; 321 Cribs; 616-4; 300 North Cribs **Reclassification:** None

Type: Crib **Start Date:** 1/1/1948

Status: Inactive **End Date:** 1/1/1956

Description: The crib structures were removed in 2004. The crib consisted of two bottomless tanks, buried 3 meters (10 feet) below grade, resting on gravel strata. A waste influent line extended from 0.6 meters (2 feet) above the bottom of one of the tanks and continued, at an angle, to grade level. A vent riser extended from the top of the tank to 2.4 meters (8 feet) above grade. The tanks were 0.6 meters (2 feet) apart, with a stainless steel overflow pipe connecting them just below the top of each tank. (see H-3-5305) The area was marked with AC-540 markers marked "Crib 316-4". A 1995 Geophysical Investigation survey concurs the tanks had concrete footings and sat on a bed of gravel. It also states the tanks are believed to be 8 ft in diameter, 7 ft tall, with the tops of the tanks being located approximately 10 ft below the surface.

The crib excavation was backfilled in 2005 with 4221 meters of clean dirt.

Location: The site is located northwest of the 300 Area, approximately 45 meters (150 feet) southeast of the 618-10 (300 North) Burial Ground .

Release Description: A cumulative total of 895 kgs (1974 pounds) of uranium was discharged into the cribs as U-bearing organic wastes from the 321 Building from 1948 through June 23, 1954

Process Description: The site received hexone-bearing uranium wastes and limited amounts of other uranium-bearing wastes from the 321 Building. Calculations up to and including July 1955 indicated liquid wastes containing a total of 550 kg (1,230 lbs) of uranium had been discharged to this site. Additional documentation has been found indicating 12,040 L (3,182 gal) of liquid organic waste was being shipped to the 300 North Cribs in 1962.

Related Sites/ Structures: The cribs are constructed with a 3-inch SCH 40 vent riser, a stainless Steel inlet pipe, 5.5 meters (18 ft long); Two Stainless Steel tank covers, and a concrete support foundation surrounding the outside bottom of the tanks. An overflow line, connects the two tanks.

Waste Type: Process Effluent

Waste Description: wastes from the 321 Building. Calculations up to and including July 1955 indicated liquid wastes containing a total of 550 kilograms (1,230 pounds) of uranium had been discharged to this site. Additional documentation has been found indicating 12,040 liters (3,182 gallons) of liquid organic waste was being shipped to the 300 North Cribs in 1962.

Code: 331 LSLDF **Classification:** Accepted
Names: 331 LSLDF; 331 Life Sciences Laboratory Drainfield; 331 LSL Drain Field **Reclassification:** No Action (10/16/2008)
Type: Drain/Tile Field **Start Date:** 1/1/1970
Status: Inactive **End Date:** 1/1/1974

Description: The 331 LSLDF waste site is a septic system consisting of a diversion chamber, two (dual-chambered) septic tanks, a distribution box, and a drain field connected to the 331 complex. The 331 LSLDF septic system was operational from 1970 to 1974, at which time the sanitary sewer connections were rerouted to the 300 Area Sanitary Sewer. The 331 LSLDF septic system was fully isolated and abandoned in place in 1974. The waste line has been capped west of the septic tanks. The drainfield is marked with a single sign at the site center.

Location: The unit is located southeast of the 331 Building.

Process Description: The septic system was designed to receive sanitary wastewater associated with animal studies from the 331-A and 331-B Buildings for discharge into the soil column. However, field observations and testing suggest this system did not receive any discharges. It is probable that all of the animal study discharges were routed to the 331 Life Sciences Laboratory Trenches 1 and 2 (331 LSLT1 and 331 LSLT2), the 331 LSLT1 Animal Waste Pit, the 300 Area Sanitary Sewer, or transported to the 100 Area. The animal studies involved the use of radioisotopes, and the animal waste was segregated on the basis of radiological activity. Solid animal waste exceeding 200 pCi/g specific activity was transported to the 100 F Area trenches. Other solid animal waste (less than 200 pCi/g specific activity) was allowed to flush into the 331 waste system(s). The 331 Building, located in the Hanford Site's 300 Area, was constructed in 1970. The largest portion is a three story facility, consisting of laboratories on the first and third floors. The first floor laboratory area initially contained a multi-room, inhalation toxicology, and exposure suite. The third floor laboratories included small animal facilities, and related animal physiology and inhalation toxicology laboratories, low-level and high-level radiochemistry laboratories, as well as tissue culture, virology, histology, hematology, biochemistry, histochemistry, pathology, and microbial physiology laboratories. Two smaller ancillary structures, 331-A and 331-B, made up another segment of the 331 Building. The 331-A Building is detached and located on the northwest side of the 331 Building and contained 15 pen areas for large animals (e.g., swine). The 331-B Building, connected to the west and southwest portion of the 331 Building, is a one-story concrete block structure with long, narrow, animal runs. The run area originally contained 110 concrete living units for dogs. The north section was comprised of an animal clinic, hospital, food preparation room, and change room. An equipment room and a metabolism room were located at the south end of the animal runs. The dog runs were built as a wing adjacent to 331-B. It also contained dog habitat areas. A semi-high bay building, 331-D, was erected southeast of the 331 Building in 1974. The 331-D Building was to serve as an Animal Waste Treatment Facility. It contained a 94,625 liters per day (25,000 gallons per day) capacity waste treatment plant, which was designed to chemically treat, mechanically flocculate, settle, and gravity filter animal wastes. A sludge dryer also was installed to heat and dry 54.4 kilograms per hour (120 pounds per hour) of sewage sludge product from the treatment facility.

Related Sites/ Structures: The drainfield is associated with the 331 Life Sciences Laboratory.

Waste Type: Animal Waste

Waste Description: The unit may have received animal waste from the 331 Buildings prior to construction of the 331-D Treatment Facility. Since most of the animal studies involved the use of radio isotopes, animal waste was segregated on the bases of activity. Solid animal waste, exceeding 200 picocuries per gram specific activity, was transported to the 100-F Area trenches on a regular basis. All other solid animal waste (less than 200 picocuries per gram specific activity) was allowed to flush into the 331 waste system. However, specific cases of contamination have occurred at the 331 complex. In January 1975, between 25 and 2,500 microcuries of plutonium-238 from contaminated soil used in a botanical experiment was washed into the process sewer. This material may have ended up in the 331 Life Science Laboratory Drainfield (LSLDF).

The constituents of concern listed below reflects those which could potentially still be present in the subsurface at the 331 Building WIDS sites. During the course of identifying the constituents of concern no evidence of any waste containing PCBs was discovered during a records review. A walkthrough of the facility did not reveal the presence of any PCB containing equipment with the exception of possible PCB laden light ballast. All transformers were of the dry design. Therefore, PCBs are not listed among the constituents of concern. These contaminants are americium-241, curium-244, neptunium-237, plutonium-238, plutonium-239, uranium-232, uranium-233, cadmium, chromium, lead, uranium (total).

Waste Type: Sanitary Sewage

Waste Description: The unit received sanitary wastewater from the 331-A and 331-B Buildings for discharge into the soil column.

Closure Info: In accordance with the Remaining Sites Verification Package (RSVP-2008-020), the confirmatory sampling results support a reclassification of the 331 Life Sciences Laboratory Drain Field (LSLDF) waste site to "No Action" based on attainment of industrial land use remedial action objectives (RAOs) and the corresponding remedial action goals (RAGs) established in the Remedial Design Report/Remedial Action Work Plan for the 300 Area (RDR) and the Interim Action Record of Decision for the 300-FF-2 Operable Unit, Hanford Site, (ROD), and the 300 Area Remedial Action Sampling and Analysis Plan (SAP).

This septic system was designed to receive sanitary wastewater associated with animal studies from the 331-A and 331-B Buildings for discharge into the soil column. However, field observations and testing suggest this system did not receive any discharges. Similar to the septic tanks, all of the drain field laterals were found to be clean, almost new in appearance. Sediments within the laterals were only sparingly available, and the little that could be collected (from the fifth and sixth laterals in the northern trench and the sixth lateral in the southern trench) had to be combined to achieve a sufficient sample size for fixed laboratory analysis.

During the RSVP evaluation field radiological surveys were performed to evaluate the presence of radioisotopes from the animal studies. No radiological activity was detected in the field or in the samples analyzed at the laboratories. The sample results do indicate detections for 29 COPCs. It is probable that all of the animal study discharges were routed to the 331 Life Sciences Laboratory Trenches 1 and 2 (331 LSLT1 and 331 LSLT2), the 331 LSLT1 Animal Waste Pit, the 300 Area Sanitary Sewer, or transported to the 100 Area

The Work Instruction for Confirmatory Sampling of the 331 Life Sciences Laboratory Drain Field (LSLDF) was developed to determine if contamination was present in the drain field. Confirmatory sampling of the drain field and of the soil around the distribution box was performed in April 2007. Similar to the septic tanks, all of the drain field laterals were found to be unexpectedly clean, and almost new in appearance. Sediments within the laterals were only sparingly available, and the little that could be collected from each lateral was combined to achieve a sufficient sample size for fixed laboratory analysis.

The COPCs for the site were identified based on existing historical information for the site. The

COPC list provided in the 300-FF-2 ROD includes americium-241, curium-244, neptunium-237, plutonium-238, plutonium-239, uranium-232, uranium-233, cadmium, chromium, lead, and total uranium. Historical information for the Hanford Site shows that there are no likely sources of the uranium-232 isotope; therefore, uranium-232 was eliminated as a COPC. Based on further evaluation of wastes potentially discharged to the septic system, pesticides, PCBs, mercury, inorganic anions (including nitrate and nitrite), semivolatile organic compounds, and gamma-emitting radionuclides were added as COPCs.

Because inductively coupled plasma (ICP) analysis was planned for cadmium, chromium, and lead, the expanded list of ICP metals was also added to the analytical list in the analytical results data package. These additional COPCs include arsenic, antimony, barium, beryllium, boron, cobalt, copper, manganese, molybdenum, nickel, selenium, silver, vanadium, and zinc.

Confirmatory sampling results were also compared to the unrestricted (residential) land use RAGs, which determined that in addition to the previously mentioned 19 COPCs exceeding soil RAGs for groundwater and/or river protection aroclor-1254 and dieldren concentrations exceed the unrestricted direct exposure RAGs. However, the overall volume of material within the 331 LSLDF containing these constituents was determined to be minimal. Aroclor-1254 is likely the result of oils or mastics used to seal various components of the septic system during construction of the septic system. Therefore, it may be appropriate to consider the waste site for residential (unrestricted) land use; this should be considered as part of the final remedial investigation/feasibility study and land use determinations for the 300 Area.

The analytical data results were shown to meet the cleanup objectives for industrial direct exposure, groundwater protection, and river protection as required in the ROD and the SAP. Accordingly, a reclassification to No Action is supported for the waste site. This site does not have a deep zone or any conditions that would warrant institutional controls for industrial land use.

Code:	331 LSLT1	Classification:	Accepted
Names:	331 LSLT1; 331 Life Sciences Laboratory Trench #1; 331 LSL Trench 1	Reclassification:	None
Type:	Trench	Start Date:	1/1/1966
Status:	Inactive	End Date:	1/1/1969
Description:	The trench is currently marked with a single sign at the site centerline and surrounded with Underground Radioactive Material signs. The 331 Life Sciences Laboratory Trench 1 (LSLT1) is an abandoned leaching trench that has been backfilled. The site was a rectangular excavation. The site includes connecting waste transfer lines.		
Location:	The unit was located underneath or near the east end of the 331 Building. The north leaching trench has been arbitrarily designated as the 331 LSLT1 unit. The site is located just north of the 331 LSLT2.		
Process Description:	The 331 Leaching Trenches disposed of sanitary and animal wastes to the soil column. Sanitary waste flowed from the 331-B Septic Tank and animal waste flowed from the animal waste unloading pit, entered Diversion Chamber No. 1, and was subsequently discharged to the leaching trenches.		
Related Sites/Structures:	The structures associated with this site include the 331 LSLT2 trench immediately to the south, the No. 1 and No. 2 Diversion Chambers, the animal waste unloading pit, the 331-B Sanitary Septic Tank, the 331-B (and possibly 331-A) Building, and the waste transfer lines. Other associated structures are the 331 Life Sciences Laboratory Drain Field and the 331-D Animal Waste Treatment Facility.		

Waste Type: Sanitary Sewage
Waste Description: The unit received sanitary wastewater.

Waste Type: Animal Waste
Waste Description: The unit received liquid animal waste from the animal waste pit. Since most of the animal studies involved the use of radio isotopes, animal waste was segregated on the bases of activity. Solid animal waste, exceeding 200 picocuries per gram specific activity, was transported to the 100-F Area trenches on a regular basis. All other solid animal waste (less than 200 picocuries per gram specific activity) was allowed to flush into the 331 waste system. However, specific cases of contamination have occurred at the 331 complex.

The constituents of concern reflect those contaminants which could potentially still be present in the subsurface at the 331 Building WIDS sites. These include americium-241, curium-244, neptunium-237, plutonium-238, plutonium-239, uranium-232, uranium-233, cadmium, chromium, lead, uranium (total). During a records review to identify the constituents of concern, no evidence of any waste containing PCBs was discovered. A walkthrough of the facility did not reveal the presence of any PCB containing equipment with the exception of possible PCB laden light ballasts. All transformers were of the dry design. Code: 331 LSLT2	Classification: Accepted
Names: 331 LSLT2; 331 Life Sciences Laboratory Trench #2; 331 LSL Trench 2	Reclassification: None
Type: Trench	Start Date: 1/1/1966
Status: Inactive	End Date: 1/1/1974

Description: The trench is currently marked with a single sign at the site centerline and surrounded with Underground Radioactive Material signs. The 331 LSLT2 is an abandoned leaching trench that has been backfilled. The site was a rectangular excavation. The site includes connecting waste transfer lines.

Location: The unit was located underneath or near the east end of the 331 Building. The south leaching trench has been arbitrarily designated as the 331 LSLT2 Unit. The site is located just south of the 331 LSLT1.

Process Description: The 331 Leaching Trenches disposed of sanitary and animal wastes to the soil column. Sanitary waste flowed from the 331-B Septic Tank and animal waste flowed from the animal waste unloading pit, entered Diversion Chamber No. 1, and was subsequently discharged to the leaching trenches.

Related Sites/Structures: The structures associated with this site include the LSLT1, the No. 1 and No. 2 Diversion Chambers, the animal waste unloading pit, the 331-B Sanitary Septic Tank, the 331-B (and possibly 331-A) Buildings, and the waste transfer lines. Other associated structures are the 331 Life Sciences Laboratory Drain Field and the 331-D Animal Waste Treatment Facility.

Waste Type: Animal Waste
Waste Description: The unit received liquid animal waste from the animal waste pit. Animal wastes were the most prominent wastes, in terms of volume, generated by the 331 complex. Originally, liquid animal wastes from the complex including washdowns from the "hog and dog runs" were disposed to a large, unlined pit, east of the 331-D Building. Sewers carrying animal waste from the 331 complex were also connected to this pit.

Since most of the animal studies involved the use of radio isotopes, animal waste was segregated on the bases of activity. Solid animal waste, exceeding 200 picocuries per gram specific activity, was transported to the 100-F Area trenches on a regular basis. All other solid animal waste (less than 200 picocuries per gram specific activity) was allowed to flush into the 331 waste system. However, specific cases of contamination have occurred at the 331 complex.

The constituents of concern reflect those contaminants which could potentially still be present in the subsurface at the 331 Building WIDS sites. These include americium-241, curium-244, neptunium-237, plutonium-238, plutonium-239, uranium-232, uranium-233, cadmium, chromium, lead, uranium (total). During a records review to identify the constituents of concern, no evidence of any waste containing PCBs was discovered. A walkthrough of the facility did not reveal the presence of any PCB containing equipment with the exception of possible PCB laden light ballasts. All transformers were of the dry design. Therefore, PCBs are not listed among the constituents of concern.

Waste Type: Sanitary Sewage
Waste Description: The unit received sanitary wastewater. In 1974, the clean (non-radioactive) animal sewage was connected to the regular 300 Area Sanitary Sewer System.

Code: 333 ESHWSA **Classification:** Accepted
Names: 333 ESHWSA; 333 Building East Side **Reclassification:** Interim Closed Out (6/29/2010)
 Hazardous Waste Storage Area; 333 East Side
 HWSA
Type: Storage **Start Date:** 1/1/1964
Status: Inactive **End Date:**
Description: The 333 East Side Hazardous Waste Storage Area is part of the asphalt paved area near the northeast corner of the 333 Building, within the building fence line. No barrels of hazardous waste are stored here anymore, only miscellaneous non-hazardous materials. Currently, several large trash dumpsters are at this location.
Location: The unit is located northeast of the 333 Building, in the northern part of the 300 Area.
Process Description: The unit provided temporary storage for miscellaneous hazardous wastes.
Related Sites/Structures: The unit is associated with the 333 Building Operations. This site was located adjacent to the 618-1 Burial Ground.
Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: The area contained small quantities of miscellaneous waste oils, cutting lubricants, chemicals, and solvents stored in containers. In previous years, the area was used for miscellaneous radioactive and hazardous waste storage. Currently this area is used only to store miscellaneous non-hazardous solid building waste.
Closure Info: 618-1, 618-1:1, 618-1:2, 300-110, 303-M SA, 303-M UOF and 333 ESHWSA were addressed as a group. The information below documents information for the group of sites.

The 618-1 Burial Ground, two subsites, three consolidated sites and four co-located sites were remediated as a group. This group included WIDS sitecodes 618-1, 618-1:1, 618-1:2, 333 LHWSA, UPR-300-13, UPR-300-14, 300-110, 303-M SA, 303-M UOF and 333 ESHWSA. Parts of waste sites 300-15, 300-259 and UPR-300-17 were also remediated along with 618-1. Several facilities were built over the top of portions of the 618-1 Burial Ground after it ceased to operate. These facilities were demolished and their debris taken to the Environmental Restoration Disposal Facility (ERDF) prior to the start of the burial ground remediation project.

Cleanup Verification Package CVP-2010-00001 demonstrates that remedial action at the site has achieved the Remedial Action Objectives and corresponding Remedial Action Goals established for the industrial land-use scenario in the Record of Decision (EPA 2001), the Explanation of Significant Differences for the 300-FF-2 Operable Unit (EPA 2004), and the RDR/RAWP(DOE-RL-2001-47, Rev 3).

Field remediation activities were performed between September 17, 2008 and September 10, 2009, in accordance with the RDR/RAWP. Approximately 47,332 metric tons (52,160 US tons) of soil and debris was excavated and disposed of at Environmental Restoration Disposal Facility (ERDF). No excavated soil was used as clean, uncontaminated backfill.

Excavated material consisted mostly of contaminated soil, metal pipe, crucibles, laboratory glassware, and empty metal containers. Twenty metal drums containing personal protective equipment were removed from the trenches. Several bottles containing liquid and/or powder were also removed.

Some land disposal restricted (LDR) materials like lead solids contaminated with barium and chromium, were identified among the debris. The LDR material was segregated from the bulk soil and non-LDR debris for disposal. The bulk soil and non-LDR debris was sorted and segregated in the burial trenches. After sorting, the remaining bulk soil debris stockpiles were sampled to ensure that the material was in compliance with land disposal restrictions. The released stockpiled material was transported to ERDF for disposal. Land disposal restricted materials that had been segregated for treatment were transported to ERDF under a separate waste profile.

Following remediation and field screening of the 618-1 Burial Ground, verification sampling was conducted on January 26 and 27, 2010. Contaminants of Potential Concern for the statistical samples included cesium-137, uranium-233/234, uranium-235, uranium-238, barium, beryllium, chromium (total), copper, lead, lithium, mercury, molybdenum, nickel, silver, uranium (total metal), zinc, PCBs, chloride, fluoride, nitrate, nitrite, and sulfate. Arsenic, antimony, boron, cadmium, cobalt, manganese, selenium, and vanadium were evaluated for the expanded inductively coupled plasma metals analytical list.

The remaining soil at the 618-1 site has been sampled, analyzed, and evaluated. Results indicate that the site supports future land uses that can be represented (or bounded) by the industrial land-use scenario and poses no threat to groundwater or the Columbia River. Institutional controls are required to prevent drilling or excavation into the deep zone.

Type:	Storage Tank	Start Date:	1/1/1953
Status:	Active	End Date:	
Description:	The 340 Complex is located on the east side of the 300 Area. The 340 Complex consists of buildings 340, 340-A, 340-B, 3707-F, and two office trailers. Other 340 complex systems include the 307 Retention Basins, two tanks in an underground vault, six aboveground tanks in 340A, underground transfer pipes, load-out and decontamination equipment, and instrumentation. Prior to 1963, the 340 Complex also included the 316-3 trenches, which disposed of retention process waste that met release criteria.		

The 340 Building and Annex includes a control room, decontamination area, mechanical

equipment room, change and rest rooms, truck load-out facilities, and an operator's office. The process water, vacuum, and compressed dry-air subsystems are contained within these structures. The 340 Vault is directly east of the 340 building, and is a below-grade concrete basin, with large concrete cover-blocks. The Vault contains two 57,000-liter (15,000-gallon) tanks once used for primary RLWS storage. The 340-A building lies east of the vault, and houses six 30,000-liter (8,000-gallon) above ground tanks for auxiliary RLWS storage. The tanks are vented through the Vault filter system. 304-B building is divided into east and west sections. The east section was used for RLWS load-outs by rail to the 200 Areas. The west section is used for radioactive solid waste storage and for housing the east side ventilation system. 3707-F building houses the retention process sewer sampling equipment and controls. MO-741 is the health physics technicians' office and survey station. MO-036 is a double-wide trailer that provides offices for engineering, radiation control, and operations personnel.

- Location:** The 340 Complex is located inside 300 Area, east of California Street and north of the 3728 building.
- Process Description:** The 340 facility was completed in 1953 along with the initial Radioactive Liquid Waste Sewer (RLWS) piping system, the 307 Basins and the Retention Process Sewer (RPS) piping system. These systems represented an attempt to deal with radioactive effluents from several new laboratories in a modern, controlled manner. The 340/307 system was fed by pipelines from the 325, 326, 327, and 329 Buildings (and later the 308 and 325 Buildings) in a system known as the Retention Process Sewer(RPS) or the Diversion Waste System. Liquid process wastes that had the potential to be contaminated were disposed to the RPS and routed to the 307 Basins for sampling. If radioactivity was not detected above release limits, these wastes were disposed to the 307 Trenches. If levels proved to be above release limits, the effluents were pumped into the 340 Building RLWS tanks.
- The 340 Complex received and sampled the 300 Area radioactive liquid waste. Waste routed by the RLWS was accumulated and stored in two underground tanks. The waste was stored for less than 90 days. It was transferred to the 200 Areas by rail car for storage and disposal. Retention process sewer waste is collected at the 340 complex in the 307 retention basins, sampled, and discharged to the process sewer. Waste exceeding discharge criteria is held for transport to the 200 Areas.
- Related Sites/ Structures:** The 340 Complex received radioactive liquid waste from the 300 Area laboratory buildings via the 300 Area Radioactive Liquid Waste Sewer. The buildings discharging waste to the sewer include the 324, 325, 326, 327, and 329 buildings. Retention process sewer waste is generated by 324, 325, 326, 327, and the 329 buildings and discharge to the 307 Retention Basins, located in the 340 Complex.
- Unplanned releases associated with this facility are UPR-300-1, UPR-300-2, and UPR-300-11.
- Waste Type:** Soil
- Waste Description:** Several spills and leaks over the operational history of the 340 Complex have contributed radionuclides (such as Cesium and Strontium) and chemical waste to the soil column.
- Waste Type:** Process Effluent
- Waste Description:** The 340 Complex receives liquid effluent from 300 Area laboratories via the 300 Area Radioactive Liquid Waste Sewer and the Retention Process Sewer. The sewer effluent was collected in the 340 underground vault tanks and the 307 Retention Basins. Waste may also include organic and inorganic laboratory chemicals, acids, bases, and decontamination solutions.

Code: 400-37

Classification: Accepted

Names: 400-37; Fuel Oil Tank South of 4732-B

Reclassification: None

Closure Info: surface debris, including a section of irrigation pipe and valving which was found just north of the oil stained area. On June 20, 1995, sampling and removal of oil-stained soil was initiated. Field screening and laboratory analytical results indicated that the excavated soils were contaminated with PCBs at levels up to 55 parts per million (ppm) and TPH levels up to 350 parts per million. No other contaminants were detected above natural background levels.

Institutional control (IC) information has been revised as directed by the U. S. DOE letter, 05-AMRC-0078, 1/4/05, following a review of the Institutional Controls (ICs) in the WIDS. Some 300 Area sites, including this one, were closed out before CVP documents were in use, and close-out information was documented in waste site reclassification forms. No ICs were identified for these sites at the time of closeout, however the DOE determined that further evaluation of ICs would be needed before making a final decision on the appropriate ICs to implement. Until a final Record of Decision is approved for this site, tentative ICs based on the remedial action and location for this and similar sites in the DOE letter have been determined judgmentally.

Code: 600-47	Classification: Accepted
Names: 600-47; Dumping Area North of 300-FF-1	Reclassification: Interim Closed Out (8/25/2005)
Type: Dumping Area	Start Date:
Status: Inactive	End Date:

Description: The site has been remediated and interim closed out. This site consisted of several areas of debris and Underground Radioactive Material Areas.

Location: This site was located north of the 300 Area above the bank of the Columbia River west of Johnson Island.

Related Sites/ Structures: The 600-210 Outfall Structure and pipeline are also located in this area.

Waste Type: Misc. Trash and Debris

Waste Description: Debris found at the site includes concrete, brick, cinder block, glass, stainless steel, steel millings/filings, plastic, tar roofing paper, wire, pipe, bottles, sheet metal, screen, clay pipe, irrigation pipe, etc. Concreted soils were found during test diggings, burned wood was found on top of the rise. A "Danger Area" sign was located on the ground just north of the rise. A photo of the area from 1950 shows soil disturbance in the area.

Closure Info: The cleanup verification package, 2005-00005, documented that the site has been remediated in accordance with the Record of Decision for the 300-FF-2 Operable Unit (ROD), as modified by the Explanation of Significant Differences for the 300-FF-2 Operable Unit Interim Record of Decision (ESD). Remedial action objectives and goals established for the site in the ROD and ESD are reflected in the Remedial Design Report/Remedial Action Work Plan for the 300 Area (RDR/RAWP).

The contaminated excavation materials were disposed at the Environmental Restoration Disposal Facility (ERDF) in the 200 Area of the Hanford Site, and the site was backfilled with clean soil to the average adjacent grade elevation. Cleanup objectives were based on the 300 Area unrestricted land-use scenario established by the ESD. Excavation was driven by remedial action objectives for direct exposure, protection of groundwater, and protection of the Columbia River.

The area within and around the 600-47 waste site was considered culturally sensitive based on proximity to the river, historical location of the pre-Hanford Fruitvale community, and discovery of an archaeological site in 1993 during the Treated Effluent Disposal Facility outfall installation. Some of the debris at the site may have pre-dated Hanford Site operations.

Final cleanup verification samples were collected on May 25, 2005. The site contaminants of concern (COCs) identified in the 300 Area Sampling and Analysis Plan (300 Area SAP), included: uranium, arsenic, barium, beryllium, cadmium, chromium and lead. The verification samples (J036X2 through J036X7) were submitted to offsite laboratories for analysis using approved U.S. Environmental Protection Agency analytical methods as required per the 300 Area SAP. Verification samples were composed of a composite of four soil aliquots collected from random locations within decision subunits (excluding the quality assurance/quality control samples).

The remedial action objectives and corresponding RAGs established for unrestricted land use in the ROD, the ESD, and the RDR/RAWP have been achieved as documented in the CVP. The contaminated materials from the site were excavated and disposed at ERDF. The remaining soils at this site have been sampled, analyzed, and modeled. The analytical and modeling results indicated that residual concentrations in the shallow zone will support future land uses that can be represented (or bounded) by an unrestricted land-use scenario and that residual concentrations throughout this site pose no threat to groundwater or the Columbia River. No deep zone institutional controls were required. The 600-47 site has been verified to be remediated in accordance with the ROD and ESD and may be backfilled.

Code:	600-63	Classification:	Accepted
Names:	600-63; Buried Waste Test Facility; Recharge Study Site; Vadose Zone Field Study - 300 North; VZFS300N; 300-N Lysimeter Area	Reclassification:	None
Type:	Experiment/Test Site	Start Date:	1/1/1984
Status:	Active	End Date:	1/1/1994
Description:	The site is enclosed within a chain link fence with barbed wire top and a locked gate. The fenced area is posted with "Restricted Area - Contact PNL Radiological Office" and "Underground Radioactive Material" signs. Outside the fence there is a considerable amount of debris. Two large wooden cabinets, pallets, piping and a fire extinguisher were noted.		
Location:	The unit is located southeast of 400 Area, just west of Route 4 South. It is southeast of the 618-10 Burial ground.		
Process Description:	The Buried Waste Test Facility is located in the northeast corner of the fenced area. A solar panel, some metal scaffolds and a concrete cover are visible. In 1998, the west side of the site had a large amount of blown-in tumbleweeds collected along the fence. The tumbleweeds had been removed before the 1999 site visit. The BWTF was established in 1978 to investigate recharge and radionuclide migration in Hanford soil. Six drainage lysimeters (7.6 meters deep) and two weighing lysimeters (1.5 meters deep) were installed. A trace amount of Co-60 was mixed in one centimeter of soil and placed 60 centimeters below the surface of two of the drainage lysimeters. Trace amounts of tritium was placed in two other lysimeters. The migration of the contaminants was monitored. The columns were sampled in 1990. No tritium or cobalt was found at the 180 centimeter level using hand-held instruments and field level screens.		
Related Sites/ Structures:	The site is associated with 600-259.		
Waste Type:	Soil		
Waste Description:	A trace amount of Co-60 was mixed in one centimeter of soil and placed 60 centimeters below the surface of two of the drainage lysimeters. Trace amounts of tritium were placed in two other lysimeters. The migration of the contaminants was monitored.		

Code: 600-243 **Classification:** Accepted
Names: 600-243; Bioremediation Pad Inside Gravel Pit #6; Oil Contaminated Soil; Petroleum Contaminated Soil Bioremediation Pad; Pit 6 **Reclassification:** Interim Closed Out (11/7/2008)
Type: Surface Impoundment **Start Date:**
Status: Inactive **End Date:**

Description: The site is a treatment facility for petroleum contaminated soil. It is rectangular shaped, 48.5 meters (159 feet) long by 38.7 meters (127 feet) wide. A 0.9 meters (3 foot) berm surrounds the site. The site is lined with heavy black plastic. The contaminated soil has visible rust stains and pieces of clear plastic mixed into the soil. Tumbleweeds and cheatgrass are growing on the surface. No petroleum odors were observed at the site. The site is posted Keep Out - Petroleum Contaminated Soil - For Entry Contact 376-7053 and WIDS Site 600-243.

Location: The site is located approximately 300 m (984 ft) west of the 300 Area and south of a dead end dirt road that heads west from Route 4 South. The site boundaries as identified in the remedial action design drawing are: 1) (E) 593130.19, (N) 116110.00 Washington State Plane 2) (E) 593125.56, (N) 116156.22 3) (E) 593181.25, (N) 116158.01 4) (E) 593179.63, (N) 116118.95

Process Description: The site was used as a bioremediation pad for petroleum-contaminated soils. The soil originated from remediation activities performed in 1994 as part of the L-044 Project. The project generated contaminated soils during the removal of underground storage tanks at the 300 Area Fire Station (300-5) and in the 1100 Area. Petroleum tanks removed from these areas during the L-044 project included those that stored gasoline, diesel and waste oil. Moisture and nutrients were periodically added to the site to facilitate bioremediation of the hydrocarbons. Eight samples were collected in 1995 and analyzed for gasoline, diesel, and heavy oils. Eleven samples were collected in 2001 and analyzed for diesel and heavy oils. The results indicated that the soil still exceeded Model Toxics Control Act (MTCA) 1996 Method A cleanup levels for soil (200 mg/kg TPH based on protection of groundwater). Motor oil range hydrocarbons were detected as high as 3700 mg/kg. Diesel range hydrocarbons were not detected.

Related Sites/ Structures: The bioremediation pad is located within the original boundaries of Gravel Pit #6 (site code 600-244).

Waste Type: Soil

Waste Description: The waste is petroleum contaminated soil from Project LO-44, Underground Storage Tank Removals. The contaminants of potential concern (COPCs) for the 600-243 waste site were petroleum hydrocarbons in the diesel and motor oil ranges, benzo(k)fluoranthene, chrysene, fluoranthene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, PCBs, and lead.

Closure Info: The Remaining Sites Verification Package (RSVP-2007-033) demonstrates that the 600-243 petroleum-contaminated soil bioremediation pad meets the objectives for interim closure as established in the Remedial Design Report/Remedial Action Work Plan for the 300 Area (RDR/RAWP) and the Interim Action Record of Decision for the 300-FF-2 Operable Unit, (ROD).

Remedial action at the waste site was performed in August 2007. The contaminated soil and liner were removed during excavation, resulting in disposal of approximately 2,134 bank cubic meters (BCM) (2,791 bank cubic yards [BCY]) of contaminated materials to the Environmental Restoration Disposal Facility.

A comparison against ecological risk screening levels was made for the site contaminants of

concern and other constituents. Screening levels were exceeded for antimony, barium, boron, cadmium, copper, lead, manganese, selenium, vanadium, and zinc. Exceedance of screening values does not necessarily indicate the existence of risk to ecological receptors. Because concentrations of antimony, manganese, and vanadium are below Hanford Site background levels, it is believed that the presence of these constituents does not pose a risk to ecological receptors. The remaining metals that exceed ecological risk screening levels are due to coal ash, which is ubiquitous in the general area of the 600-243 waste site. The bioremediation pad had been placed directly on coal ash, and the verification sample results reflect the composition of the coal ash. A more complete quantitative ecological risk assessment will be presented in the baseline risk assessment for the river corridor portion of the Hanford Site and will be used to support the final closeout decision for this site.

Verification sampling was performed in October 2007 to collect data to determine if the remedial action goals had been met. The contaminants of potential concern (COPCs) for verification sampling included petroleum hydrocarbons in the diesel and motor oil ranges, benzo(k)fluoranthene, chrysene, fluoranthene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, polychlorinated biphenyls, and lead. The coal ash that had originally been underneath the waste site was exposed after remediation. This material affected the verification sampling results for the waste site as the ash contains multiple metals. While a limited sampling of surrounding coal ash was undertaken, a full evaluation of the coal ash underlying and surrounding the waste is outside the scope of this remaining sites verification package. Radiological field surveys were performed to ensure that radiological contamination was not present at the waste site.

These results show that residual soil concentrations support future land uses that can be represented (or bounded) by a rural residential scenario. The results also demonstrate that residual contaminant concentrations support unrestricted future use of shallow zone soil (i.e., surface to 4.6 m [15 ft]) and contaminant levels remaining in the soil are protective of groundwater and the Columbia River. This site does not have a deep zone; therefore, no deep zone institutional controls are required.

Statistical sampling to verify the completeness of remediation was performed and analytical results for the decision unit were shown to meet the cleanup objectives for direct exposure,

Code: 600-259	Classification: Accepted
Names: 600-259; Grout Waste Test Lysimeter; Inactive Lysimeter Site East End; Special Waste Form Lysimeter	Reclassification: Interim Closed Out (2/6/2006)
Type: Experiment/Test Site	Start Date: 1/1/1984
Status: Inactive	End Date: 1/1/1994
Description: The entire site has been remediated and interim closed out.	
The site consisted of The Grout Waste Test Facility (subsite 1) which was exhumed in 1994 and Special Waste Form lysimeter (subsite 2).	
Location:	The unit was located southeast of 400 Area, just west of Route 4 South. It was southeast of the 618-10 Burial ground.
Release Description:	On January 25, 1991, it was concluded that the lysimeter may have been damaged during backfilling causing a reportable quantity of effluent to leak into the soil. It was estimated that over a 3 year period, as much as 300 liters of contaminated liquid may have leaked. It was noted that one of the Grout Waste Test Facility lysimeter caissons (B1) was not collecting recharge water. The caisson was not exhumed to determine the cause, but it was speculated that

the weld at the bottom of the caisson had been compromised when it was filled with gravel. It was decided that the buried caisson had probably leaked into the underlying sediments, contaminating them with radioactive materials. The release was estimated to have occurred over a 3 year period. The maximum concentration of contaminants in the sediments was estimated to be $6E-05$ microcuries/milliliter to $1.3E-04$ microcuries/milliliter of Technetium-99. When the Grout Lysimeter Facility was removed in September 1994, extensive sampling was conducted for all constituents identified in the caissons. Background samples were collected and compared to the sample results. It was concluded that no radiological constituents had leaked from either caisson during the lysimeter test. Although there was clear evidence that the B1 Lysimeter did have a large seam weld crack at the bottom, the leak contained only atmospheric moisture. No final report was issued for the sample analysis due to lack of funding.

Process Description: The lysimeters were designed to test the leaching and migration rates of grout solidified low level radioactive waste. Routine monitoring and leachate collection activities were conducted until January 1989.

Related Sites/ Structures: The site was associated with 600-63 and a 1991 Occurrence Report indicating an unplanned release to the soil may have occurred (RL--PNNL-PNLBOPER-1991-0018) at the Grout Waste Test Facility.

Waste Type: Soil

Waste Description: The Special Waste Form lysimeter contained masonry cement, Portland cement and vinyl ester styrene waste forms spiked with Mn-54, Co-60, Cs-134 and Cs-137. The waste forms were placed into the lysimeters at various depths. The leachate was collected and disposed of. The research was completed in 1992. The lysimeters were capped in 1995 to prevent any further water intrusion. The leachate was drained for the last time by PNNL in 1996.

Waste Type: Soil

Waste Description: The Grout Waste Lysimeter caissons (A-1 and B-1) contained layers of waste, containing small amounts of both radioactive and non-radioactive tracer agents embedded into grout material. The waste layers were separated by layers of soil. The lysimeter caissons were buried below ground. The radioactive tracers used in this test were primarily Co-60 (up to 330 Ci/L) and lesser amounts of Cobalt-58, Iron-59, Chromium-51 and Manganese-54.

Closure Info: The Cleanup Verification Package for the 600-259 Waste Site (CVP-2005-00008), demonstrated that the waste site was remediated in accordance with the Record of Decision for the 300-FF-2 Operable Unit, Hanford Site (ROD), as modified by the Explanation of Significant Differences for the 300-FF-2 Operable Unit Interim Record of Decision (ESD). Remedial action of both subsites has achieved the remedial action objectives (RAOs) and remedial action goals (RAGs) established in the Remedial Design Report/Remedial Action Work Plan for the 300 Area (RDR/RAWP).

Preliminary waste site contaminants of potential concern were identified in the 300 Area Remedial Action Sampling and Analysis Plan (SAP) and included: cesium-134, cesium-137, cobalt-60, manganese-54, technetium-99, tritium. Cleanup verification samples, including QA/QC samples, were collected and analyzed for the established contaminants of concern on 8/23/05 through 9/21/05. HEIS Verification sample numbers, J03WM5 through J03WM9 and J10738 through J10742, were listed in appendix A of the CVP.

Remedial action was conducted from September 2004 to July 2005. Excavation of the site included the removal of all caisson structures and radioactive waste forms. Overburden material was segregated and stockpiled for possible use as backfill material pending the results of verification sampling. No anomalies were identified within the bulk soil and debris during remedial activities, and no indications of liquid waste migration beyond the caisson units were observed.

Approximately 950 metric tons (1,050 U.S. tons) of contaminated material was removed and disposed of at the ERDF. The remaining soil was sampled, analyzed, and evaluated. Results indicated that the site supports future land uses that can be represented (or bounded) by an unrestricted land-use scenario and that residual concentrations throughout this site pose no threat to groundwater or the Columbia River.

The 600-259 (subsites 1 and 2), waste site has been verified to be remediated in accordance with the ROD and the ESD and may be backfilled. This site has no deep zone; therefore no institutional controls are required.

This Site has the Following SubSites:

Code: 600-259:1

Names: 600-259:1; Grout Waste Test Facility Lysimeter

Code: 600-259:2

Names: 600-259:2; Grout Lysimeter Site; Special Waste Form Lysimeter

Code: 600-259:1

Classification: Accepted

Names: 600-259:1; Grout Waste Test Facility Lysimeter

Reclassification: Interim Closed Out (2/6/2006)

Type: Experiment/Test Site

Start Date:

Status: Inactive

End Date:

Description: The lysimeters were exhumed in September 1994. The Grout Waste Test Facility consisted of four large lysimeters designed to test the leaching and migration rates of grout solidified low level radioactive waste. The four caissons were placed vertically in the ground, forming a square. The four lysimeters were designated as A1, A2, B1 and B2. A2 and B2 were never used. Lysimeter A1 contained phosphate/sulfate waste and B1 contained Cladding Removal Waste. Twenty four radioactive waste forms were placed on each lysimeter. The waste forms were placed in layers, separated by soil and gravel. Routine monitoring and leachate collection activities were conducted until January 1989.

The 600-259 (subsites 1 and 2), waste site has been verified to be remediated in accordance with the ROD and the ESD and may be backfilled. This site has no deep zone; therefore no institutional controls are required.

Location: The unit is located southeast of 400 Area, just west of Route 4 South. It is southeast of the 618-10 Burial ground, and adjacent to 600-63.

Process Description: The lysimeters were designed to test the leaching and migration rates of grout solidified low level radioactive waste. Routine monitoring and leachate collection activities were conducted until January 1989.

The SubSite is Part Of:

Code: 600-259

Names: 600-259; Grout Waste Test Lysimeter; Inactive Lysimeter Site East End; Special Waste Form Lysimeter

Code: 600-259:2

Classification: Accepted

Names: 600-259:2; Grout Lysimeter Site; Special Waste Form Lysimeter

Reclassification: Interim Closed Out (2/6/2006)

Type: Experiment/Test Site

Start Date:

Status: Inactive**End Date:**

Description: In 1999, programmatic responsibility for the lysimeter site was split between PNNL and ERC. PNNL retained responsibility for the active Buried Waste Lysimeter (see 600-63). The inactive Grout Waste Lysimeter facility and the Special Waste Form lysimeter were transitioned to the Environmental Restoration Contractor. A chain link fence had been previously added to physically separate the active portion of the site from the inactive portion.

The Special Waste-Form Lysimeter was constructed in the summer of 1983 and consisted of ten soil filled caissons [1.83 meters (6 feet) in diameter by 3.05 meters (10 feet) deep] placed concentrically around a central access caisson that measured 3.65 meters (in diameter, 3.65 meters deep). Each lysimeter is equipped with a gravity drain attached to the central caisson for leachate collection. The central caisson also provides access to the ten lysimeters through horizontal sample ports. A 15 centimeter diameter monitoring well is installed adjacent to each lysimeter caisson to allow for downwell gamma scanning and neutron probe measurements of the caissons. Each of the ten lysimeter caissons contains one waste-form sample that is in direct contact with the soil. Samples of commercial reactor waste was obtained and solidified in cement, bitumen or vinyl-ester styrene to create a waste form. Information was collected regarding the amount and types of contaminants that leached into the soil over time. Test data was collected between 1984 and 1992.

The 600-259 (subsites 1 and 2), waste site has been verified to be remediated in accordance with the ROD and the ESD and may be backfilled. This site has no deep zone; therefore no institutional controls are required.

Location: The unit is located southeast of 400 Area, just west of Route 4 South. It is southeast of the 618-10 Burial ground, and adjacent to 600-63.

Process Description: Samples of commercial reactor waste were obtained and solidified in cement, bitumen or vinyl-ester styrene to create a waste form. Information was collected regarding the amount and types of contaminants that leached into the soil over time. Test data were collected between 1984 and 1992.

The SubSite is Part Of:

Code: 600-259

Names: 600-259; Grout Waste Test Lysimeter; Inactive Lysimeter Site East End; Special Waste Form Lysimeter

Code: 600-290

Classification: Accepted

Names: 600-290; Contaminated Concrete Foundation West of 618-13; Pad and Loading Dock Near 618-13; 300 West Storage Area

Reclassification: None

Type: Foundation

Start Date: 1/1/1947

Status: Inactive

End Date: 1/1/1950

Description: The site consists of two subsites. Subsite 1 included a contaminated foundation and loading dock. The foundation and loading dock were remediated in 2009. Prior to remediation, the concrete pad had been posted as a radiological fixed contamination area. Subsite 2 includes the rest of the site boundary and is know as the 300 West Storage Area.

Location: The concrete foundation had been located due west of 300 Area, at the end of a gravel road. It is approximately 730 meters (0.45 miles) west of Stevens Drive.

Process Description: The 300 Area was constructed between June 1943 and January 1945. At that time, the area

surrounding the 600-290 waste site was inconspicuous except for a dirt road that ran along the north side of the gravel pit. A 1948 aerial photograph (IDMS-N2139826) shows a disturbed tear drop shaped area similar to the present condition. Two structures are visible in the photograph. One is at the center of the tear drop shape and the other borders the dirt road on the north side. The structure to the north is surrounded by a square feature resembling a fence. WHC-MR-0388 states that a 500 gallon Columbian stainless steel tank and several agitators, used by Du Pont in the early 321 Building bismuth phosphate tests, was buried in 1947 west of 300 Area. The area west of 300 Area was later used to bury solvent waste from 321 Building. The burial site (618-9) is known as the "300 West Burial Ground" and the "Dry West Burial Site No. 9". Dried hexone from solvent extraction studies in the 321 Building was placed in black iron drums and moved to a fenced storage area near the desert dry chemical storage hut in March 1950 (HW-17410). The 321 Building sustained significant damage from a hexone explosion on January 23, 1949 (HW-13812). The facility management would have been particularly sensitive to the dangers of hexone following the explosion. The location of this remote area was ideal for storing dangerous materials, away from buildings and personnel. In October 1950 all hexone from the 321 Building tanks was removed to provide room for the less-flammable Shell Deodorized Spray Base Solvent. The hexone was dried and stored in black metal drums for use in subsequent Redox studies (HW-15843 and HW-19325). Top soil from the 303 Area was removed in 1950 and piled approximately one-half to three quarters of a mile northwest of the 300 Area, and covered with two feet of clean soil. Total activity buried here is not known. The 618-13 soil mound of covered contaminated material has been posted as a radiation zone (HW-39076). This waste site, is visible in aerial photographs as early as April 30, 1951 (350-NEG). Contaminated soil was reportedly found inside the 300 Area, on October 23, 1950, during construction of the new Instrument Division Building. The new building was being located between the existing Instrument Shop and the Metal Fabrication Plant (313 Building). The activities involved excavating the earth around two existing tile pipe lines (one sanitary and one liquid process waste line from the Metal Fabrication Plant). The incident report (DDTS-Generated-3822) speculated that the contaminated soil was from a wooden French Drain or crib installed on this site in 1944 to temporarily receive wastes from experimental autoclaves. The soil had a maximum dosage-rate of 50 mrep/hr (HW-19325). Facility personnel, in 1971, identified the soil mound (618-13) as the location that received soil from the excavation near the 313 Building (in 1952) (Richmond 1971). The evidence from aerial photographs and historical documents appears to indicate that the soil mound was constructed shortly after October 23, 1950. The facility personnel, in 1971, also described the earth mound as having been constructed to serve as a blast shield for any explosions which might result from solvent storage in the [300-W] Equipment Storage Yard. The 1951 training manual for the 321 Building identified one of the related facilities as the "300 West Area Storage for chemicals and solvents" (HW-19791). Aerial photography from this period shows only one location (near the mound) fitting this description. An aerial photograph (2406-PHOTO), dated December 1, 1953, has features that resemble objects contained in a fenced area north of the soil mound. This is the same location where a square feature resembling a fence was observed in a 1948 aerial photograph (IDMS number N2139826). It appears that the dry chemical storage was located just north of the 600-290 waste site, near the location of the 300 West Burial Ground (618-9). The 300 West Burial Ground was constructed in June 1954 when about 18,927 liters (5,000 gallons) of solvent waste from the 321 Building, contained in 208 liter (55 gallon) drums, was buried and covered with about 1.2 meters (4 feet) of clean soil (HW-39076). The burial ground is also described in document WHC-MR-0388. This report states that nearly 100 drums that had been generated in 1949 to 1950. The drums were stored on an outdoor pad for nearly 5 years. The drums were later placed in the 300 West Burial Ground (sitecode 618-9). The fence that surrounded the soil mound (618-13) is visible in a May 15, 1956 aerial photograph (3746-PHOTO). Two large structures are also visible in the photograph that resemble huts. The area (fence, roads, storage buildings and earth barricade) is depicted in drawing M-3600 sheet 46, originally drawn in 1958. The mound, fence, hutments and various objects inside the fence are also visible in aerial photographs taken in 1962 and 1968 (29033 and 48300-20-CN). The fenced area is identified in the 1975 Final Environmental Statement (ERDA-1538) as a

"Contaminated Equipment Storage Area". This report states that all of the equipment had been removed and that the ground was slightly contaminated. The purpose of the concrete pad and loading dock was described in the 300-FF-2 Operable Unit Technical Baseline Report (Reference: Appendix A of BHI-00012, Letter from Keene, A. R., 02/03/1961, "Burial of Solid Wastes in the Vicinity of the 300 Area"). The report states that the pad and dock were used for the storage of depleted solvents that were subsequently buried in the nearby 618-9 burial ground. The soil mound, and the pad and loading dock, was all that remained by 1976 (aerial photograph 74962-11CN). The fence, hutments and fenced in objects had all been removed.

Related Sites/ Structures: The concrete foundation is associated with the excavated 618-9 burial ground, the 618-13 soil mound and the 321 building.

Waste Type: Chemical Release

Waste Description: The waste is the remains of the concrete pad (apron), the loading dock and surrounding soil.

The loading dock was obviously stained with rust colored and yellow staining. Contaminants of potential concern may include uranium and nitric acid (uranyl nitrate). Volatile organic compounds (including hexone), semi-volatile organic compounds, polychlorinated biphenyls, chlorinated hydrocarbons, and lead.

Five areas of fixed radiological contamination were identified during a radiological survey on 5/1/2006 (RSR-300PS-06-0808).

This Site has the Following SubSites:

Code: 600-290:1

Names: 600-290:1; Contaminated Concrete Foundation West of 618-13; Pad and Loading Dock Near 618-13

Code: 600-290:2

Names: 600-290:2; 300 West Storage Area

Code: 600-290:1

Classification: Accepted

Names: 600-290:1; Contaminated Concrete Foundation West of 618-13; Pad and Loading Dock Near 618-13

Reclassification: Interim Closed Out (11/12/2009)

Type: Foundation

Start Date:

Status: Inactive

End Date:

Description: A gravel road lead to the concrete pad on the north side of the soil mound, where a truck could back up on the pad to the loading dock and offload drums of waste. Circular rust colored patterns, in the shape of 308 liter (55 gallon) drums, suggest that drums were once stored on the loading dock. The foundation and loading dock were remediated in 2009. Prior to remediation, the concrete pad had been posted as a radiological fixed contamination area.

Closure Info: 618-13 and 600-290:1 were addressed as a group. The information below documents information for the group of sites.

The concrete pad and loading dock were remediated in 2009. Field remediation of the 618-13 Burial Ground and the 600-290:1 concrete pad and loading dock occurred between January 5 and February 2, 2009. The activity removed the soil mound, concrete pad, and loading dock. Cleanup Verification Package CVP-2009-00005 demonstrates that remedial action at the 618-13 Burial Ground and the collocated 600-290:1 Pad and Loading Dock Near 618-13 has achieved the remedial action objectives (RAOs) and corresponding remedial action goals (RAOs) established for the unrestricted landuse scenario in the Interim Action Record of Decision (EPA 2001), the Explanation of Significant Differences for the 300-FF-2 Operable

Unit (EPA 2004), and the Remedial Design/Remedial Action Work Plan for the 300 Area (DOE/RL 2009b).

The contaminated materials from the site have been excavated and disposed at ERDF. The remaining soil at the 618-13 and 600-290:1 sites have been sampled, analyzed, and evaluated. Results indicate that the site supports future land uses that can be represented (or bounded) by the residential land-use scenario and poses no threat to groundwater or the Columbia River.

Both 618-13 and 600-290:1 waste sites are closed to shallow zone criteria and, therefore, do not require any institutional controls.

The SubSite is Part Of:

Code: 600-290

Names: 600-290; Contaminated Concrete Foundation West of 618-13; Pad and Loading Dock Near 618-13; 300 West Storage Area

Code: 600-290:2

Classification: Accepted

Names: 600-290:2; 300 West Storage Area

Reclassification: None

Type: Foundation

Start Date:

Status: Inactive

End Date:

Description: The subsite includes the remaining area covered by the WIDS boundary. The majority of the area was enclosed by a fence and was used for storage of contaminated equipment. A portion of the site extends north of the fence where anomalies were visible in an old aerial photograph.

The SubSite is Part Of:

Code: 600-290

Names: 600-290; Contaminated Concrete Foundation West of 618-13; Pad and Loading Dock Near 618-13; 300 West Storage Area

Code: 618-1

Classification: Accepted

Names: 618-1; Solid Waste Burial Ground No. 1; 300 Area Burial Ground No. 1; 318-1

Reclassification: Interim Closed Out (6/29/2010)

Type: Burial Ground

Start Date: 1/1/1945

Status: Inactive

End Date: 1/1/1951

Description: This burial ground was excavated and remediated in 2008 and 2009.

Drawing H-3-1172 shows the Burial Ground consisted of at least two trenches running north-south, that measure 5 meters (16 feet) wide by 61 meters (200 feet) long and are 2.4 meters (8 feet) deep. The south end of the burial ground contained a series of pits that are estimated to be 6.1 meters (20 feet) deep and possibly two shorter, east-west trenches. The burial ground had been marked with yellow, concrete AC-540 markers and radiation area chain on three sides. Five other Buried Radioactive Material medallions, inserted flush with the asphalt pavement along the east side of the 333 Building, marked the western extent of the burial ground. In 1998, the burial ground was located within a larger area posted as a Contamination Area.

Over time, multiple facilities and portions of operational support structures were placed on top of the backfilled burial ground footprint. The 303-M Building was built over a portion of the original burial ground.

This site has two subsites, 618-1:1, the 333 ESHTSSA (333 East Side Heat Treat Salt Storage

Area), and 618-1:2, the Limestone Neutralization Pit, WATS Trench Neutralization Pit. Other, co-located waste sites that have been consolidated into the burial ground waste site include UPR-300-13 (Acid Neutralization Tank Leak East of the 333 Building), UPR-300-14 (Acid Leak at the 334 Tank Farm) and 333 LHWSA (333 Laydown Hazardous Waste Storage Area).

Location: The site was located in the northeast corner of the 300 Area, adjacent to the east side of the 333 Building.

Process Description: The burial ground received waste from early 300 Area facility operations, including the 305 Reactor, 3706 Laboratory and the 3741 Building. Conflicting operational dates have been cited in various documentation. HW-39076 states the operational dates of 618-1 were 1945 through 1951, when it was replaced by 618-2. Historical photograph (Negative number 2406) is dated December 1953. The 618-1 Burial Ground appears to be backfilled and inactive in this aerial photograph. The 618-2 Burial Ground is also visible in this photograph and indicates multiple burial trenches are open and active. Other documents and letters indicate the end date for this burial ground as 1956 or 1957.

Related Sites/ Structures: The burial ground is associated with early 300 Area facility operations. Several facilities had been constructed over the top of portions of the burial ground. The 303-M facility was built over the top of the north end of the west trench (Burial Trench 1). The 334 building, the 334-A building, and the 334 Waste Acid Tanks (above ground tank farm) were also placed over portions of the west side of the burial ground. WIDS SubSites 618-1:1, 333 ESHTSSA and 618-1:2, Limestone Neutralization Pit are also associated with the site since they were physically located on or immediately adjacent to the burial ground. The burial ground is associated with acid releases, WIDS Site UPR-300-13 and WIDS Site UPR-300-14, and two storage areas, 333 LHWSA and 333 ESHTSSA (see the consolidated sites under the Regulatory tab). The 333 ESHTSSA is designated as subsite 618-1:1. The Limestone Neutralization Pit is designated as subsite 618-1:2. WIDS Site 300-259 (Contaminated Soil East of 618-1 Burial Ground) surrounded 618-1 Burial Ground.

Waste Type: Misc. Trash and Debris

Waste Description: 618-1 was estimated to contain large quantities of uranium (~16 tons [14,500 kilograms]) from the fuel fabrication activities and small quantities of plutonium and fission products from laboratory operations. Specific items include contaminated gloves, miscellaneous equipment, bronze crucibles, and solid laboratory waste. A 1946 report states that lead sink traps from the 321 laboratory were removed and taken to the burial ground. Radiological readings on the sink traps indicated 6,000 d/m alpha and 15 mr/hr beta/gamma. A monthly report from August 1946 mentions the burial of a bronze crucible that read 170 millireps/hour (179 millirads/hour) and 5.5 mr/hr (millirads/hour) at a distance of 10.2 centimeters (4 inches). UPR-300-13 contributed process acid that included 4,432 pounds (2,012 kilograms) of nitrate, 447 pounds (202.9 kilograms) of copper, and 3 pounds (1.4 kilograms) of uranium.

During the burial ground remediation, in 2008 and 2009, items found in the burial ground included metal drums, iron and bronze crucibles, metal boxes, glass laboratory flasks and bottles. Some of the bottles contained unknown liquids and powders. One drum was labeled Poison Waste. Some drums were leaking oily liquid.

Waste Type: Chemical Release

Waste Description: Additional waste from unplanned releases (WIDS Site UPR-300-13) from facilities that were constructed over the burial ground would have contributed additional chemicals to the soil column as a liquid release. Sample results showed that 2015 kilograms (4432 pounds) of nitric acid, 44 kilograms (96 pounds) of fluoride, 217 kilograms (477 pounds) of copper and 1.4 kilograms (3 pounds) equivalent to 0.0005 curies of uranium were lost to the ground. 870 kilograms (1910 pounds) of caustic was added to the leaking tank and allowed to leak into the soil to neutralize the acid that had escaped into the ground. The leak rate of the tank was 582.9 liters (154 gallons) per hour.

A release on July 18, 1975 (WIDS Site UPR-300-14) of 4,540 liters (1,200 gallons) of 93% sulfuric acid solution from the 334 Tank Farm drained to a limestone pit (WIDS Site 300-246). Since the pit had an open bottom and was located over the 618-1 Burial Ground, the release drained to the burial ground.

- Waste Type:** Chemicals
- Waste Description:** WIDS Site 333 ESHTSSA stored above ground containers of solidified heat-treat salt waste from the fuels fabrication facility. The waste consisted of sodium chloride, potassium chloride, sodium nitrite, sodium nitrate, and potassium nitrate. Approximately, thirty to fifty 208 liter (55 gallon) drums accumulated each year (1964-1987).
- Closure Info:** 618-1, 618-1:1, 618-1:2, 300-110, 303-M SA, 303-M UOF and 333 ESHWSA were addressed as a group. The information below documents information for the group of sites.

The 618-1 Burial Ground, two subsites, three consolidated sites and four co-located sites were remediated as a group. This group included WIDS sitecodes 618-1, 618-1:1, 618-1:2, 333 LHWSA, UPR-300-13, UPR-300-14, 300-110, 303-M SA, 303-M UOF and 333 ESHWSA. Parts of waste sites 300-15, 300-259 and UPR-300-17 were also remediated along with 618-1. Several facilities were built over the top of portions of the 618-1 Burial Ground after it ceased to operate. These facilities were demolished and their debris taken to the Environmental Restoration Disposal Facility (ERDF) prior to the start of the burial ground remediation project.

Cleanup Verification Package CVP-2010-00001 demonstrates that remedial action at the site has achieved the Remedial Action Objectives and corresponding Remedial Action Goals established for the industrial land-use scenario in the Record of Decision (EPA 2001), the Explanation of Significant Differences for the 300-FF-2 Operable Unit (EPA 2004), and the RDR/RAWP(DOE-RL-2001-47, Rev 3).

Field remediation activities were performed between September 17, 2008 and September 10, 2009, in accordance with the RDR/RAWP. Approximately 47,332 metric tons (52,160 US tons) of soil and debris was excavated and disposed of at Environmental Restoration Disposal Facility (ERDF). No excavated soil was used as clean, uncontaminated backfill.

Excavated material consisted mostly of contaminated soil, metal pipe, crucibles, laboratory glassware, and empty metal containers. Twenty metal drums containing personal protective equipment were removed from the trenches. Several bottles containing liquid and/or powder were also removed.

Some land disposal restricted (LDR) materials like lead solids contaminated with barium and chromium, were identified among the debris. The LDR material was segregated from the bulk soil and non-LDR debris for disposal. The bulk soil and non-LDR debris was sorted and segregated in the burial trenches. After sorting, the remaining bulk soil debris stockpiles were sampled to ensure that the material was in compliance with land disposal restrictions. The released stockpiled material was transported to ERDF for disposal. Land disposal restricted materials that had been segregated for treatment were transported to ERDF under a separate waste profile.

Following remediation and field screening of the 618-1 Burial Ground, verification sampling was conducted on January 26 and 27, 2010. Contaminants of Potential Concern for the statistical samples included cesium-137, uranium-233/234, uranium-235, uranium-238, barium, beryllium, chromium (total), copper, lead, lithium, mercury, molybdenum, nickel, silver, uranium (total metal), zinc, PCBs, chloride, fluoride, nitrate, nitrite, and sulfate. Arsenic, antimony, boron, cadmium, cobalt, manganese, selenium, and vanadium were evaluated for the expanded inductively coupled plasma metals analytical list.

The remaining soil at the 618-1 site has been sampled, analyzed, and evaluated. Results indicate that the site supports future land uses that can be represented (or bounded) by the industrial land-use scenario and poses no threat to groundwater or the Columbia River. Institutional controls are required to prevent drilling or excavation into the deep zone.

The Following Sites Were Consolidated With This Site:

Code: 333 ESHTSSA

Names: 333 ESHTSSA; 333 East Side Heat Treat Salt Storage Area

Code: 333 LHWSA

Names: 333 LHWSA; 333 Laydown Hazardous Waste Storage Area; 333 Laydown HWSA

Code: UPR-300-13

Names: UPR-300-13; Acid Neutralization Tank Leak East of 333 Building; UN-300-13

Code: UPR-300-14

Names: UPR-300-14; Acid Leak at 334 Tank Farm; UN-300-14

This Site has the Following SubSites:

Code: 618-1:1

Names: 618-1:1; 333 East Side Heat Treat Salt Storage Area; 333 ESHTSSA

Code: 618-1:2

Names: 618-1:2; Limestone Neutralization Pit; WATS Trench Neutralization Pit; 300-246

Code: 618-1:1

Classification: Accepted

Names: 618-1:1; 333 East Side Heat Treat Salt Storage Area; 333 ESHTSSA

Reclassification: Interim Closed Out (6/29/2010)

Type: Burial Ground

Start Date:

Status: Inactive

End Date:

Description: This area has been remediated and reclassified to Interim Closed Out with the 618-1 Burial Ground. The 333 ESHTSSA was an inactive storage area. The unit included various locations inside the 333 Building fence where heat-treat salts were stored. The heat-treat salts were stored on the paved area near the southeast corner of the building or in the adjacent area located over a portion of the 618-1 Burial Ground. Several areas of the asphalt pavement have been painted over and posted fixed radiological contamination (see WIDS Site UPR-300-17). The area stored containers of solidified heat-treat salt waste from the fuels fabrication facility. The waste consisted of sodium chloride, potassium chloride, sodium nitrite, sodium nitrate, and potassium nitrate. Approximately, thirty to fifty 208 liter (55 gallon) drums accumulated each year (1964-1987).

The SubSite is Part Of:

Code: 618-1

Names: 618-1; Solid Waste Burial Ground No. 1; 300 Area Burial Ground No. 1; 318-1

Code: 618-1:2

Classification: Accepted

Names: 618-1:2; Limestone Neutralization Pit; WATS Trench Neutralization Pit; 300-246

Reclassification: Interim Closed Out (6/29/2010)

Type: Burial Ground

Start Date:

Status: Inactive

End Date:

Description: The neutralization pit has been remediated and reclassified as Interim Closed Out with the 618-

1 Burial Ground. The centerline of the Pit was 26.8 meters (88 feet) south of the centerline of the 333 Building East Pipe Trench, aligned with where the pipe trench exited the east wall of the 333 Building. (see H-3-18520). The upper wooden covers for the Limestone Neutralization Pit had been removed and the pit had been backfilled with soil. It was no longer visible at the surface. The concrete pipe trench branch to the pit was visible prior to remediation (see photos). The drain line from the concrete pipe trench to the pit was sealed and the neutralization pit shut down in 1975, following a large acid spill (WIDS Site UPR-300-14). This incident caused concern for the groundwater. The original pit was constructed of a 0.46 meter (1.5 foot) deep bed of limestone with 7.6 centimeter (3 inch) rock on top of a 0.3 meter (1 foot) deep bed of washed gravel. The top of the limestone bed was 15.2 centimeters (6 inches) above grade and 1.2 meters (4 feet) above the surface of the limestone bed. The Limestone Neutralization Pit received drainage from the WATS pipe trench and the 334 Tank Farm sump trench. The pit was filled with limestone rocks used to neutralize acidic aqueous solutions draining from the pipe trench. The pit had an open top to allow the addition of limestone rocks as needed. It was open at the bottom to drain to the soil column. The soil column effected part of the of the 618-1 Burial Ground, located beneath the neutralization pit. The 334 Tank Farm had four elevated tanks, two for storing concentrated nitric acid, one to store concentrated sulfuric acid, and one tank to store waste etch acid. A sump trench beneath the elevated acid tanks collected leaks from tanks, valves, and piping. The acid transfer lines from the 334 Tank Farm to the 333 Building were installed in the Pipe Trench. Rainwater collected in the sump trenches and the pipe trench drained to the pit.

The SubSite is Part Of:

Code: 618-1

Names: 618-1; Solid Waste Burial Ground No. 1; 300 Area Burial Ground No. 1; 318-1

Code: 618-2

Classification: Accepted

Names: 618-2; Solid Waste Burial Ground No. 2; 318-2

Reclassification: Interim Closed Out (12/28/2006)

Type: Burial Ground

Start Date: 1/1/1951

Status: Inactive

End Date: 1/1/1954

Description: The site has been remediated and interim closed out. The burial ground contained three or four trenches running east-west. The largest trench was 54 meters (175 feet) long and 18 meters (60 feet) wide.

Location: The unit was located north of the 333 Building, on the north side of the 300 Area Exclusion Area.

Process Description: The site received solid waste from the 300 Area operations. This included waste from the 325 and 327 laboratory facilities, which began operations in 1953. A 1995 Ground Penetrating Radar survey found the northern most trench to be 49 meters (160 feet) long and 9 meters (30 feet) wide. The southern most trench was 55 meters (180 feet) long and 15 meters (50 feet) wide. The center trench was 54 meters (175 feet) long and 18 meters (60 feet) wide. The discrepancy of whether there were three or four trenches could be due to the fact that the geometry of the middle trench was broken into two pieces at the east end.

Waste Type: Equipment

Waste Description: The unit was used for disposal of uranium-contaminated equipment and materials, plutonium, and fission products. The uranium waste was typically solid metallic uranium oxides in the form of metal cuttings from Reactor Fuel Fabrication facilities in the 300 Area. The plutonium and fission products came from 300 Area laboratory facilities, that began to operate in 1953. The burial ground may also contain tin from the triple dip canning process and lead from the lead dip process.

In December 2004, during remedial excavation of this burial ground, a combination lock safe was unearthed. A plutonium contaminated cup, a one gallon jug containing liquid waste, a 250 milliliter flask and several metal cans were found inside the safe.

Closure Info: The cleanup verification package (CVP), CVP-2006-00010, has documented that remedial action objectives (RAOs) and remedial action goals (RAGs) for the site have been achieved as established for the industrial land-use scenario in the Interim Action Record of Decision for the 300-FF-2 Operable Unit, Hanford Site, (ROD), as modified by the Explanation of Significant Differences for the 300-FF-2 Operable Unit Interim Record of Decision (ESD), and the Remedial Design Report/Remedial Action Work Plan for the 300 Area (RDR/RAWP).

Remedial action activities at the waste site initially began in November 2004 and were completed in August 2006. Excavation and load-out operations were suspended from December 2004 to December 2005, due to the discovery of higher than anticipated levels of plutonium-contaminated waste. Remediation involved excavation and removal of buried waste and contaminated soil. In-process radiological field screening was conducted during the site remedial actions to guide the excavation and quickly assess the presence and level of contamination. The radiological survey results indicated the presence of isotopes of uranium and plutonium, as well as cesium-137.

The buried waste consisted primarily of a wide variety of laboratory and construction-type debris. Excavation activities found no indication of bulk liquid waste disposal at this waste site. During the initial excavation phase, contaminated soil and debris were excavated from the burial ground and transported to a designated "stockpile" area for sorting and sampling. This staging pile area supported the 618-2, 618-3, and 618-8 Burial Ground excavations as documented in the CVP-2006-00010.

Excavated material consisted of contaminated soil and a wide variety of miscellaneous debris. Some Land Disposal Restriction (LDR) materials, (primarily lead solids) were identified among the debris and were subsequently segregated from the bulk soil and non-LDR debris, then designated for separate load-out as LDR material. After receipt of sample results confirming compliance with LDR restrictions, the stockpile material was loaded into ERDF containers and transported to ERDF for disposal. LDR materials that had been segregated for treatment were subsequently loaded-out and transported to ERDF under a separate waste profile.

Preliminary waste site contaminants of potential concern (COPCs) were identified in the 300 Area Remedial Action Sampling and Analysis Plan (SAP). Following excavation of the site, final contaminants of concern COCs were identified in the Closeout Plan for the 618-2 Burial Ground.

Final cleanup verification samples were collected on September 6 and 7, 2006, to confirm acceptability of residual contaminant concentrations in the soil. The COCs listed included: barium, cadmium, chromium, lead, tin, selenium, uranium (total), tritium (H-3), cobalt-60, nickel-63, strontium-90, cesium-137, europium-152, europium-154, europium-155, plutonium-238, plutonium-239/240, plutonium-241, americium-241, uranium-233/234, uranium-235, uranium-238, and uranium (total).

Verification sampling events involved four decision units including a shallow zone, deep zone, overburden soil stockpile, and staging pile/decontamination pad footprint. Because the staging pile/decontamination pad supported the 618-2, 618-3, and 618-8 Burial Ground excavations, arsenic and silver were added as COPCs for staging pile/decontamination pad only. The site consisted of both a shallow and a deep zone decision unit.

The cleanup verification sample analytical data results were stored in the Environmental

Restoration database prior to archiving in the Hanford Environmental Information System. The data was also summarized in Appendix B of the CVP-2006-00010. The total excavated depth was approximately 6 meters (19.7 feet), with the shallow zone consisting of the excavation sidewalls to a depth of 4.6 meters (15 feet) and the deep zone consisting of the excavation sidewalls below 4.6 meters (15 feet) together with the floor of the excavation.

This cleanup verification package also demonstrated that the combined waste staging pile and decontamination pad area for the 618-2, 618-3, and 618-8 Burial Grounds do not preclude any future uses, as bounded by the rural-residential scenario, and provided for in the ESD and the RDR/RAWP and allow unrestricted use of shallow zone soils within this area. In consideration of this and because the waste staging pile area has no deep zone, no institutional controls are required at the waste staging pile location.

The remaining soil at the site has also been sampled, analyzed, and evaluated. Results indicated that the site supports future land uses that can be represented (or bounded) by the industrial land-use scenario and poses no threat to groundwater or the Columbia River. Institutional controls were required to prevent drilling or excavation into the deep zone. The waste site was verified to be remediated in accordance with the ROD and the ESD and may be backfilled.

Code:	618-3	Classification:	Accepted
Names:	618-3; Burial Ground #3; Dry Waste Burial Ground No. 3; Solid Waste Burial Ground No. 3; 318-3	Reclassification:	Interim Closed Out (9/5/2006)
Type:	Burial Ground	Start Date:	1/1/1954
Status:	Inactive	End Date:	1/1/1955
Description:	The site has been remediated and interim closed. Prior to remediation the site was fenced and posted with Underground Radioactive Material signs. The original surface dimensions were 107 meters (350 feet) long by 50 meters (165 feet) wide. An extension to the north end of the burial ground appeared on Drawings H-6-933 and H-6-939, lengthening the site by 15 meters (50 feet). A 1995 Ground Penetrating Radar survey indicated that this burial ground was dominated by one continuous north-south trending trench. Within the interpreted trench boundary, areas of debris were readily identified continuously covering an area of about 335 feet by 90 feet.		
Location:	The site was located north of the 300 Area Exclusion Fence, adjacent to and west of the 618-2 Burial Ground.		
Process Description:	This disposal site was first used in the summer of 1954. It received mostly contaminated waste from the remodeling of the 313, 303-J and 303-K Buildings and the construction of the 311 Facility.		
Waste Type:	Demolition and Inert Waste		
Waste Description:	The site consisted of uranium-contaminated waste, primarily building materials from the remodeling of the 313 Building. It may have also contained waste from the 303-J and K upgrades. In 1986, the volume of contaminated soil was estimated to be 12,549 cubic meters (443,160 cubic feet), with 12,643 cubic meters (446,480 cubic feet) of overburden.		
Closure Info:	The cleanup verification package (CVP) has documented that the waste site was remediated in accordance with the Interim Action Record of Decision for the 300-FF-2 Operable Unit, (ROD) (EPA 2001), as modified by the Explanation of Significant Differences for the 300-FF-2 Operable Unit Interim Record of Decision (ESD) (EPA 2004). Remedial action objectives (RAOs) and remedial action goals (RAGs) for this site were documented in the ROD and the Remedial Design Report/Remedial Action Work Plan for the 300 Area (RDR/RAWP).		

The Remedial Action Sampling and Analysis Plan (SAP) identified preliminary contaminants of potential concern (COPCs) in the 300 Area and contaminants of concern COCs for the waste site were identified in the Closeout Plan for the 618-3 Burial Ground. They included: uranium-233/234, uranium-235, uranium-238, uranium (Total), arsenic, barium, cadmium, chromium, lead, selenium, silver and uranium.

Soil cleanup levels were established in the ROD based on a limited ecological risk assessment. A comparison against ecological risk screening levels, although not required by the ROD, has been made for the site COCs. Screening values were not exceeded for the COCs for this site, with the exception of selenium and the total uranium detected in the biased sample results. Exceedance of screening values did not necessarily indicate the existence of risk to ecological receptors. It was believed that the presence of selenium at this site does not pose a risk to ecological receptors because concentrations of selenium were within the range of natural site background.

For the exceedance of uranium, the biased samples were taken from below the biologically active zone (a maximum depth of 2.7 meters [8.9 feet]) per Table 2-2 of the 100 Area Burial Grounds Focused Feasibility Study. As such, these concentrations of uranium will not be accessible to ecological receptors. A baseline risk assessment for the river corridor portion of the Hanford Site began in 2004, which includes a more complete quantitative ecological risk assessment. That baseline risk assessment will be used as part of the final ROD for these sites.

Remedial action activities at the waste site were conducted from September 9, 2004, to October 28, 2004. Remediation activities were conducted in accordance with the RDR/RAWP. Remediation involved excavation and removal of buried waste and contaminated soil to the extent required to satisfy the RAOs and corresponding RAGs. In-process radiological field screening was conducted during the site remedial actions. Field screening was used to guide the excavation to quickly assess the presence and level of contamination. The radiological survey results were consistent with the presence of uranium, at relatively low concentrations. There was no indication of additional radioactive contamination beyond the low levels of uranium.

The buried waste consisted primarily of a wide variety of construction-type debris. Excavation activities found no indication of bulk liquid waste disposal at this waste site. Land disposal restriction materials, primarily consisting of lead solids, were identified and separated from the bulk soil and debris during excavation and sorting operations. Sorting and sampling of the excavated soil and debris was performed in a designated staging pile area. This staging pile area supported the 618-2, 618-3, and 618-8 Burial Ground excavations and will be closed out with the 618-2 waste site. No overburden piles were created during the waste site excavation. All excavated materials were disposed at ERDF. A total of approximately 30,878 metric tons (34,037 U.S. tons) of material was removed and disposed at ERDF.

Final cleanup verification sampling was conducted on January 31, 2006, to confirm acceptability of residual contaminant concentrations in the soil. Based on the overall footprint of the area and depth of excavation, the site was classified as one shallow zone decision unit. The final verification samples were submitted to offsite laboratories for analysis using approved U.S. Environmental Protection Agency (EPA) analytical methods as required per the SAP.

The cleanup verification package has demonstrated that remedial action at the waste site has achieved the RAOs and corresponding RAGs established for the industrial land-use scenario in the ROD, the ESD, and the RDR/RAWP. The remaining soil at the site has been sampled, analyzed, and evaluated. Results indicate that the site supports future land uses that can be represented (or bounded) by the industrial land-use scenario and poses no threat to groundwater or the Columbia River. The waste site was verified to be remediated in accordance with the ROD and the ESD. This site has no deep zone; therefore, no institutional controls are required.

Code: 618-5	Classification: Accepted
Names: 618-5; Burial Ground No. 5; Regulated Burning Ground; 318-5	Reclassification: Interim Closed Out (7/12/2004)
Type: Burial Ground	Start Date: 1/1/1945
Status: Inactive	End Date: 1/1/1962
Description: The site has been remediated and interim closed out.	
Location: The unit was located north of the 300 Area. It was north of the remediated 316-2 Pond and east of the 316-5 Process Trenches. The site was approximately 1.6 kilometers (1 mile) north of the Richland City limits.	
Process Description: The site received 300 Area waste from 1945 through 1962. The site was one large (single) pit. It was also used as a burn pit.	
Waste Type: Misc. Trash and Debris	
Waste Description: HW-39076 states the area was a burning trench as well as a storage area for aluminum silicate containing 17% uranium and bronze crucibles with radiation levels up to 200 mr/hr. The site was used for the disposal of uranium-bearing trash. Characterization test pits dug in 1992 encountered radiologically contaminated lead bricks, steel pipes, wood fragments and other garbage. Asbestos was found in Test Pit 2.	
Closure Info: Remedial action objectives and goals for the 618-5 Burial Ground were established by the U.S. Environmental Protection Agency and the U.S. Department of Energy, Richland Operations Office, in concurrence with the Washington State Department of Ecology. These goals and objectives were based on industrial land use and are documented in the Record of Decision for the 300-FF-2 Operable Unit (ROD).	

Excavation operations were driven by remedial action objectives for removal of the burial ground contents as well as direct exposure limits, protection of groundwater, and protection of the Columbia River. For the respective points of compliance, remedial action goals were established in the ROD and the Remedial Design Report/Remedial Action Work Plan for the 300 Area.

The COCs for the site were developed from historical information, process knowledge, and/or available characterization data as presented in the RDR/RAWP. Arsenic, cadmium, chromium, lead, and uranium were identified as the contaminants of concern (COCs) for statistical verification sampling based on the type and quantity of waste material encountered during excavation operations. Cleanup verification samples were collected and analyzed for the established COCs. The sample numbers and results are listed in Appendix A of CVP-2003-00021, the results have not been loaded into HEIS as of 8/16/04. Evaluation of verification sample results for the site indicated that all remedial action objectives and goals for direct exposure, protection of groundwater, and protection of the Columbia River have been met for industrial land use.

At the completion of field operations in 2003, the total excavation was approximately 8,110 meters squared (87,300 square feet) in area with a maximum depth of approximately 7.5 meters (24.6 feet) below the surrounding grade. Approximately 46,300 metric tons (50,930 tons) of bulk soil and debris were excavated from the site, put into adjacent staging pile areas, and subsequently transported to the Environmental Restoration Disposal Facility for disposal. Overburden material and excavated soil identified as potentially clean was stockpiled (below cleanup level soil stockpile) at the site for subsequent use as backfill material.

Historical information documenting operation of the 618-5 Burial Ground as a burn pit was consistent with the type and condition of waste observed during the excavation process. In addition to the major waste streams encountered, smaller quantities of asbestos, wood debris, intact bottles, dried paint, tar, and other items were unearthed in discrete areas of the burial ground. A detailed listing of waste unearthed from the burial ground and managed as no bulk material was maintained in the 300 Area project files (i.e., waste tracking sheet).

The CVP demonstrated that remedial action has achieved the cleanup objectives established in the ROD. Residual soil has been sampled, analyzed, and modeled. Results indicated that the site supports future land uses that can be represented (or bounded) by the industrial land-use scenario and poses no threat to groundwater or the Columbia River. Consequently, the 618-5 Burial Ground is verified to be remediated in accordance with the ROD and may be backfilled.

Because residual soil concentrations indicated that cleanup levels for more stringent land uses may have been achieved for the 618-5 Burial Ground, a supplemental evaluation was performed against the unrestricted land-use cleanup objectives established in the 300-FF-2 ESD. Results of the evaluation demonstrated that remedial actions at the site have achieved all of the objectives for unrestricted land uses. Consequently, no institutional controls are required at the site

Code:	618-7	Classification:	Accepted
Names:	618-7; Burial Ground #7; Solid Waste Burial Ground No. 7; 318-7	Reclassification:	Interim Closed Out (1/7/2009)
Type:	Burial Ground	Start Date:	1/1/1960
Status:	Inactive	End Date:	1/1/1973
Description:	The site has been remediated and backfilled with clean soil to adjacent grade elevations. The burial ground consisted of 2 east-west oriented trenches and one V-shaped pit. Before remediation, the burial ground was a vegetation-covered area, with patches of cobbles, surrounded by wooden poles and an 2.4 meter (8 foot) wire fence. A locked gate was located on the east side of the fenced area and was posted with Underground Radioactive Material signs.		
Location:	The site was located northwest of the 300 Area, west of Stevens Drive. It was 9 meters (29.5 feet) north of the Vitrification Test Site (site code 300 VTS).		
Process Description:	Most of the waste in this burial ground originated from the 313 and 333 buildings (operated by Douglas United Nuclear- DUN). Some waste was generated by the JA Jones, Battelle Northwest and Westinghouse companies, located in the 300 Area. Between 1962 and 1973, hundreds of drums of zircaloy chips (slightly contaminated with Beryllium) were disposed at this burial ground. The zircaloy chips are waste from the process of machining the ends of zircaloy clad fuel elements. They vary in size, but are generally 0.14 millimeters (4 to 5 mils) thick and 0.6 centimeters (0.25 inches) wide. The chips may be contaminated with beryllium and uranium. The material was considered to be pyrophoric and was placed in 114 liter (30 gallon) iron drums, filled with water. No records were kept to identify the exact quantities and locations of these drums. The practice was discontinued in June, 1973.		
Waste Type:	Equipment		
Waste Description:	Materials buried at this site were primarily from the 321, 313, 333, 3722 and 3732 Buildings. Miscellaneous contaminated equipment and hundreds of 114 liter (30 gallon) drums of zircaloy chips contaminated with moderate amounts of beryllium and uranium were buried in the trenches from 1960 to 1973. Since the zircaloy was considered pyrophoric, the drums were filled with water to avoid spontaneous combustion. It is highly possible the water has leaked out of the drums. It has been suggested the waste remain undisturbed to avoid oxidation. An		

explosive hazard may be present. Other low-level material, slightly contaminated with uranium and thorium, was also buried in the trenches. A 1972 memo states that from January through August 1972, 91 cubic meters (3024 cubic feet) of waste contaminated with uranium was placed in Burial Ground 7. It also states that during that same period, 55 cubic meters (1848 cubic feet) of thoria contaminated waste, 25 cubic meters (848 cubic feet) of thorium oxide and 30 cubic meters (1000 cubic feet) of non-radioactive beryllium contaminated waste was placed in Burial Ground 7.

Closure Info: The cleanup verification package (CVP) documents that remedial action at the 618-7 Burial Ground has achieved the remedial action objectives (RAOs) and corresponding remedial action goals (RAGs) as established for the unrestricted land-use scenario in the Interim Action Record of Decision for the 300-FF-2 Operable Unit, Hanford Site, Benton County, Washington, U.S. Environmental Protection Agency, Region 10, (ROD), the Explanation of Significant Differences for the 300-FF-2 Operable Unit Interim Record of Decision, U.S. Environmental Protection Agency, Region 10ESD (EPA 2004), and the Remedial Design Report/Remedial Action Work Plan for the 300 Area (RDR/RAWP).

Remedial action activities at the 618-7 Burial Ground began January 4, 2008, and were completed on November 15, 2008. Remediation activities were conducted in accordance with the RDR/RAWP and involved excavation and removal of buried waste and contaminated soil to the extent required to satisfy the RAOs and corresponding RAGs. In-process radiological field screening was conducted during the site remedial actions to guide the excavation and quickly assess the presence and level of contamination.

Waste encountered during excavation of the trenches was consistent with the types of material anticipated based on its reported use for disposal of contaminated equipment from the 300 Area Facilities and "hundreds" of drums of Zircaloy chips. A total of 117 drums containing Zircaloy and water-soluble oil were removed. Because these drums contained PCBs and other contaminants, they were sent to an off-site treatment facility.

Approximately 18,140 metric tons (20,000 US tons) of aluminum turnings and solids contained lead above land disposal restriction (LDR) levels and required solidification prior to disposal at ERDF. Aluminum turnings and aluminum rods from approximately 200 drums were mixed with soil and sent to ERDF. The contaminated vermiculite was also mixed with soil for disposal at ERDF. The bottles recovered from the 3 trenches (approximately 200) were emptied and the bottles were disposed at ERDF. The contents of the bottles were sent to an analytical laboratory for characterization prior to disposal.

All excavated materials were disposed at the ERDF with the exception of the radiologically contaminated oil and the Zircaloy which were sent for treatment and/or disposal at an approved facility.

The COCs/COPCs were based on site history, process knowledge, available characterization data, and visual observations during excavation. The initial list of COCs/COPCs for the 618-7 Burial Ground was identified in Appendix A, Table A-2, of the RDR/RAWP and in Appendix A, Table A-1, of the 300 Area Remedial Action Sampling and Analysis Plan (SAP). Observations of the type and quantity of material removed from the site and associated characterization sampling performed during the excavation process were used to develop an expanded list of COCs/COPCs for the verification sampling that included uranium-233/234, uranium-235, uranium-238, thorium-232, cesium-137, europium-152, europium-154, europium-155, lead, chromium, and beryllium. While not considered COCs/COPCs, arsenic, antimony, barium, boron, cadmium, cobalt, copper, manganese, molybdenum, nickel, selenium, silver, vanadium, and zinc were also evaluated by requesting the expanded inductively coupled plasma (ICP) metals analytical list.

Specific COCs/COPCs polycyclic aromatic hydrocarbons (PAHs), TPH, polychlorinated biphenyls (PCBs), and semivolatile organic compounds were included for focused samples at locations where drums of used oil were found. Ethylene glycol was added as a COPC for the focused sample collected at the location of the large tanks containing ethylene glycol in cooling coils, and pH was added as a COPC for the focused sample at the location of the tank containing sodium hydroxide found in the thoria trench.

Verification sampling was conducted between September and November 2008. The sampling covered a total of four decision units including the main trench, main trench expansion, thoria trench, and the drum handling area footprint. The main trench included both the north and middle trenches of the burial ground while the thoria trench covered only the south trench. The trenches were excavated to a depth of approximately 6 m (20 ft) but are considered shallow zone decision units for site closeout.

A main trench expansion sample area was added after an additional waste area was discovered on the southeast boundary of the main trench. Although located in the main trench, this area was considered as a separate decision unit as additional removal enlarged the boundary of the excavation. The final boundary of the expansion included a previously sampled area of the main trench. Both the previously sampled area and the newly excavated area were resampled as the main trench expansion decision unit. The four decision units and their respective required number of verification samples were presented in the Shallow Zones Sampling Plan in Appendix C of the CVP.

The contaminated materials from the site have been excavated and most have been disposed of at ERDF or at an approved disposal facility. A small amount of containerized waste is currently under contract for disposal at an approved facility. The remaining soil at the site has been sampled, analyzed, and evaluated. Results indicated that the site supports future land uses that can be represented (or bounded) by the residential land-use scenario and poses no threat to groundwater or the Columbia River. The entire site is closed to shallow zone criteria and, therefore, does not require any institutional controls.

Code: 618-8	Classification: Accepted
Names: 618-8; Early Solid Waste Burial Ground; Solid Waste Burial Ground No. 8; 318-8	Reclassification: Interim Closed Out (8/7/2006)
Type: Burial Ground	Start Date: 1/1/1944
Status: Inactive	End Date: 1/1/1954
Description:	The site has been remediated and interim closed. The site originally consisted of a solid waste burial ground. Later, when a parking lot was constructed over the majority of the site the radiation monuments were cut down to grade. Medallions embedded in the asphalt then marked the location of the burial ground. The original footprint of the burial ground was expanded to the north in 1980. This area was delineated by post and chain. The site was posted as Underground Radioactive Material.
Location:	The site was located north of the 300 Area, beneath a portion of the 300 Area North Parking Lot (in the vicinity of Washington State Plane coordinates E 593820, N 116410) and an extended area north of the parking lot.
Waste Type: Construction Debris	
Waste Description:	The site is assumed to have been used for the disposal of uranium-contaminated solid waste from fuel fabrication facilities.
Closure Info:	The cleanup verification package (CVP) 2006-00006 documents that the waste site has been remediated in accordance with the Interim Action Record of Decision for the 300-FF-2

Operable Unit, (ROD) (EPA 2001) and has met the remedial action objectives (RAOs) and remedial action goals (RAGs) for this site for interim closure as established in the Remedial Design Report/Remedial Action Work Plan for the 300 Area (RDR/RAWP).

The waste site COCs (arsenic, barium, cadmium, chromium, lead, selenium, silver, uranium (total), uranium-233/234, uranium 235, and uranium-238) were identified in the 300 Area Remedial Action Sampling and Analysis Plan (SAP) and the Closeout Plan for the 618-8 Burial Ground.

Remedial action activities began on November 1, 2004, and were completed on November 8, 2004. Remediation involved excavation and staging of clean overburden material and removal of contaminated soil to the extent required to satisfy the RAOs and corresponding RAGs. Excavated material consisted of soil and a wide variety of construction-type debris. Load-out of the 618-8 stockpiled excavated material was completed on September 13, 2005. Approximately 6,462 metric tons (7,125 U.S. tons) of material from the site was removed and disposed at the ERDF.

Final cleanup verification sampling was conducted on January 31, 2006. The verification samples were submitted to offsite laboratories for analysis using approved U.S. Environmental Protection Agency analytical methods as required per the SAP. The analytical data are stored in the Environmental Restoration database prior to being transferred to the Hanford Environmental Information System and are summarized in Appendix A of the CVP-2006-00006.

Geophysical, ground-penetrating radar (GPR) surveys were performed in 1987 and additional characterization in 2002. These GPR surveys identified two distinct areas containing substantial amounts of buried waste in the areas located north of the parking lot (inside the area previously delineated by the "post and chain" boundaries). The GPR surveys could not identify a traditional trench configuration or evidence of buried waste under the area delineated by the medallions in the parking lot. Subsequent test excavations and trenching performed at the parking lot area did not expose any evidence of buried waste or debris in that area. A total of eight soil samples were collected from soil removed during the trenching and test excavations. These samples were analyzed for Resource Conservation and Recovery Act of 1976 metals and a wide range of radionuclides. Analytical results showed all results were either undetected or detected below lookup values. As a result, the area under the parking lot was not excavated further.

Site excavation and waste disposal are complete, and the exposed surfaces have been sampled and analyzed to verify attainment of the remedial action goals. Results of the sampling, laboratory analyses, and data evaluations for the site indicated that all remedial action objectives and goals for direct exposure, protection of groundwater, and protection of the Columbia River have been met for industrial land use.

Because residual soil concentrations indicated that cleanup levels for more stringent land uses may have been achieved for the site, a supplemental evaluation was performed against unrestricted land-use cleanup objectives established in the Explanation of Significant Differences for the 300-FF-2 Operable Unit Record of Decision. Results of the evaluation have demonstrated that residual contaminant concentrations do not preclude any future uses (as bounded by the rural-residential scenario) and allow for unrestricted use of shallow zone soils [i.e., surface to 4.6 meters (15 feet) deep]. In consideration of this and because the site has no deep zone, no institutional controls are required at the waste site.

Code: 618-9

Classification: Accepted

Names: 618-9; Dry Waste Burial Site No. 9; 300 West Burial Ground; 318-9

Reclassification: Closed Out (10/7/1998)

achieved the remedial action objectives (RAOs) and corresponding remedial action goals (RAOs) established for the unrestricted land use scenario in the Interim Action Record of Decision (EPA 2001), the Explanation of Significant Differences for the 300-FF-2 Operable Unit (EPA 2004), and the Remedial Design/Remedial Action Work Plan for the 300 Area (DOE/RL 2009b).

The contaminated materials from the site have been excavated and disposed at ERDF. The remaining soil at the 618-13 and 600-290:1 sites have been sampled, analyzed, and evaluated. Results indicate that the site supports future land uses that can be represented (or bounded) by the residential land-use scenario and poses no threat to groundwater or the Columbia River.

Both 618-13 and 600-290:1 waste sites are closed to shallow zone criteria and, therefore, do not require any institutional controls.

Code:	UPR-300-1	Classification:	Accepted
Names:	UPR-300-1; 307-340 Waste Line Leak; 316-1A; UN-300-1	Reclassification:	None
Type:	Unplanned Release	Start Date:	1/1/1969
Status:	Inactive	End Date:	1/1/1969
Description:	The site was a release to the soil in the area between the 307 Retention Basins and the 340 Building. There is no readily apparent sign of subsurface contamination beneath the gravel covered area.		
Location:	UPR-300-1 occurred in the soil between the 307 Retention Basins and the 340 Building in the 300 Area.		
Release Description:	A long-duration leak was discovered in the cast iron transfer line between the 307 Retention Basins and the 340 Vault. On December 9, 1969, operators experienced difficulty transferring retention waste from the 307 Basins to the 340 Vault. The next day the pump was tried again and it continued to work at reduced output. Eventually the pump was stopped when water appeared at ground surface between the basins and the 340 building. After stopping the pump, the area of the flooding was excavated and the bottom half of the Retention Basin transfer line adjacent to the junction of the transfer line with the Radioactive Liquid Waste Sewer (RLWS) line was found to be severely corroded. The corroded section of carbon steel pipe discharged approximately 900 curies of short-lived radionuclides (including 10 curies each of strontium-90 and cesium-137) to the soil column over a period as long as a year. Investigation suggested that the cause of the corrosion was RLWS waste backing up into the section of transfer line near the junction.		
Process Description:	The 307 Retention Basins are fed by the Retention Process Sewer (RPS) and discharge to the Process Sewer. In the event that effluent in the 307 Retention Basins does not meet release criteria for the process sewer, the waste is transferred to the 340 Tank vault for storage until it can be transported to the 200 Area Tank Farms.		
Related Sites/Structures:	UPR-300-1 was associated with the 340 Building/307 Retention Basins transfer line, and the Radioactive Liquid Waste Sewer (RLWS). Well 399-3-8 is also associated with this site. This well was drilled through the middle of the contamination to determine if the plume had reached groundwater in 1970. Review of the site shows that this well has been "missing" for some time. Numerous drawing searches have been performed, aerial photographs have been reviewed, a geophysical study was performed, and site personnel have been interviewed in attempts to locate and determine what happened to the well. The presumed location of the well coincides with the location of RLWS valve box number 8. Construction of valve box		

number 8 took place in 1970, the last date of well sampling. It is possible that construction activities disturbed the well. Thus, it is possible that the well casing was cut off below grade, or completely removed.

Waste Type: Process Effluent

Waste Description: The waste discharged to the soil column consisted of process effluent contaminated by transuranic fission products including 900 curies of short-lived radionuclides (mainly promethium-147) and 10 curies each of strontium-90 and cesium-137.

Code: UPR-300-2

Classification: Accepted

Names: UPR-300-2; Releases at the 340 Facility; UN-300-2; UN-316-2

Reclassification: None

Type: Unplanned Release

Start Date: 1/1/1954

Status: Inactive

End Date:

Description: The site appears to be multiple releases from ongoing decontamination and waste handling activities starting in January 1954.

Location: UPR-300-2 affected the soil within 3 to 6 meters (10 to 20 feet) of the north, east, and south walls of the 340 Building.

Release Description: Several leaks have occurred that contributed significant amounts of radioactivity to the soil around 340 Building. Soil contamination that extends several feet down adjacent to the 340 Building south wall suggests that the sump (truck tanker loadout) overflowed during the tanker truck era. Strontium-90 has been identified in the soil. The short-lived radionuclides are gone, and the ground surface is stabilized. However, contamination is known to extend several feet into the soil. In the same vicinity, a drain was exposed to allow the draining of tanker trucks for maintenance on the tanker valves. Minor leakage occurred around the drain pipe. This area is also covered and stabilized, but contamination is known to extend several feet into the soil.

A major leak on a retention waste line was discovered December 9, 1969 (See WIDS Site UPR-300-1). The last known ground contamination found in the same area occurred during the V-659 project on October 31, 1977. A leaking tee on the 15.2 centimeter (6 inch) radioactive liquid waste line had gone undetected until the line was uncovered (See WIDS Site UPR-300-11). Known contamination is also present on the north side of the vault. The most affected area is near the northwest corner of the vault (near the control room). A HEPA filter in the vault exhaust system was located there, and condensation from the vault atmosphere collected in the filter enclosure and dripped on the ground. The condition was corrected with the V-677 project, and the surface soil was removed. A potential for low level nuisance contamination is present in the yard, especially downwind (east-northeast) of known problem areas. A systematic search was made for this contamination in 1979, and none was found. Soil samples were taken and surface surveys were made.

Process Description: The 340 facility was completed in 1953 along with the initial Radioactive Liquid Waste Sewer (RLWS) piping system, the 307 Basins and the Retention Process Sewer (RPS) piping system. These systems represented an attempt to deal with radioactive effluents from several new laboratories in a modern, controlled manner. The 340/307 system was fed by pipelines from the 325, 326, 327, and 329 Buildings (and later the 308 and 325 Buildings) in a system known as the Retention Process Sewer(RPS) or the Diversion Waste System. Liquid process wastes that had the potential to be contaminated were disposed to the RPS and routed to the 307 Basins for sampling. If radioactivity was not detected above release limits, these wastes were disposed to the 307 Trenches. If levels proved to be above release limits, the effluents were pumped into the 340 Building RLWS tanks.

Related Sites/ Structures: UPR-300-2 is associated with 340 Building processes.

Waste Type: Process Effluent

Waste Description: 10 millicuries of cesium-137 is provided in the original source document and is designated as an estimate only. It is unknown if this was related to a single event or all events over the time period (1954 to date).

Code: UPR-300-4

Classification: Accepted

Names: UPR-300-4; Contaminated Soil Beneath the 321 Building; UN-300-4

Reclassification: None

Type: Unplanned Release

Start Date: 1/1/1945

Status: Inactive

End Date: 1/1/1955

Description: The site is the soil beneath and south of the 321 Building. The site represents a number of releases that occurred from 1945 to 1988. This time period covers the development of the REDOX, PUREX processes, and numerous other pilot operations. No specific occurrence reports have been identified. The true extent of the soil contamination is unknown. However, an area approximately 30.5 meters by 30.5 meters by 6.1 meters deep (100 feet by 100 feet by 20 feet deep) is an estimation of the extent of the contamination.

Location: UPR-300-4 is located beneath and south of the 321 Building.

Release Description: Uranium contamination has been associated with the canyon and basement shop areas from the beginning. General contamination of the canyon walls, decks, and ground areas around the building is associated with separation plant pilot operations that were set up and tested in the canyon area. Best records indicate that PUREX pilot plant operations utilized uranyl nitrate/thorium solutions. This accounts for significant detectable uranium contamination etched into the concrete of the canyon walls and on cranes, decks, and overhead areas. Modification of the facility over the years required cleaning and painting to contain the activity. However, drilling or otherwise breaching most surface area will release residual uranium/thorium contamination. Rumors of the use of small quantities of plutonium in the early operations has not been substantiated. There are no analytical data to support these statements. More recent history (radiation surveys) indicates that contamination in and around 321 and 321-A (323 Building) is significant and extensive. Excavation inside the canyon area for the HEDL (FFTF) Hydraulic Core Mock-UP (HCM) uncovered higher concentrations of uranium waste than had been previously reported. A yellow substance (presumably uranyl nitrate) that measured 20 millirad per hour extended 4.6 - 6.1 meters (15 - 20 feet) under the canyon floor and beyond. Cleanup stopped at the depth needed for the HCM. Excavation south of the building has also uncovered significant quantities of uranium contamination (25 millirad per hour) covered over with 0.9 - 1.2 meters (3 - 4 feet) of backfill. A manhole between 321 and 321-A (323 Building) read approximately 75 millirad per hour. Specific contamination events in the 321 Building included a large explosion of a hexone/nitric acid mixture on January 23, 1949. The explosion occurred in E-Cell when a spark from an electric motor being used to test a turbine pump bearing arced through the air and touched off the mixture. The actual volume was only about 20 gallons of liquid in a 55 gallon drum. The explosion spread uranium powder and solution throughout the canyon and lifted the roof because there were no blow-out panels in the building. Ceilings and floors cracked, but the hard concrete walls did not. The aqueous makeup room in the north portion of the building and the back/south dock that held building process solutions were severely jarred by the event, and some chemicals and process solutions splattered and spilled. An entire drum of uranyl nitrate hexahydrate flew through the air on the back dock, spilling its contents. The cleanup consisted of large and repeated water flushings that spread the contamination to surrounding soils and to the Process Ponds. Other contamination events in the 321 Building included an explosion and resultant fire in dissolver

vessel A-5, in A-Cell in May 1957. The vessel contained enriched (0.95% uranium-235) uranyl nitrate solution. In January 1962, a concentrator experienced overpressurization and sprayed uranyl nitrate hexahydrate as far as the roof of 3706 Building. A release of iodine-131 both within the building and out of the stack occurred during a chlorine gas-scrubbing experiment in 1964. There were many smaller leaks and contamination incidents in addition to these more serious events. A 1988 exterior contamination survey of the 321 Building found several areas of fixed contamination, including flaking exterior paint chips reading 150,000 disintegrations per minute beta/gamma and 25,000 disintegrations per minute alpha, attributed to "pre PUREX R&D radiological chemical separation operations." To control this contamination, the structure was painted in 1990. Loose, smearable contamination was found during a routine survey of the building's interior in 1991, again attributed to "residual" remains from past operations.

Process Description: Originally, the 321 Canyon, administration offices, and shops provided support for the 300 Area Laboratory programs dedicated solely to production reactor fuel development. The facility was supported by the analytical control laboratories (3706 Building). Over time, the mission of the facility changed to support other test activities and operations. The 323 Building was originally 321-A and provided feed storage in below grade tanks and lay down space and storage above grade. Four stainless steel tanks, approximately 14.6 meters long by 3.05 meters in diameter (48 feet long by 10 feet in diameter) located under the 323 Building contain uranium/thorium sludge. The tanks are filled with water to reduce corrosion of the tanks. Total quantities of radionuclides and tank volumes are unknown. Reference Drawing H-75032 has details on tank locations, size and elevation. An access door is located in the northeast corner of 323 under a stairwell. Building 323 also contains a shielded cell used for stress analysis of various irradiated fuel cladding materials. Stringent contamination control measures were applied for specimens prepared in 327 Building and transferred to 323. No significant problems have been associated with shielded cell. However, the exhaust duct, primary HEPA filter and downstream exhaust fans and filter plenum located on the south side of 323 have a potential for low level mixed fission product and activation product contamination.

Related Sites/ Structures: This site is associated with the 321 Building and possibly 323 (321-A) Building. Five miscellaneous streams are documented around the 321 Building in the "Inventory of Miscellaneous Streams", Revision 3. These sites are identified in WIDS as site codes 300-81 through 300-84 and 300-92.

Waste Type: Process Effluent

Waste Description: Wastes and contamination in and around the 321 Building are very extensive. They include all of the components of the many chemical processes tested in this facility over the years and result from both waste management practices and from unplanned contamination events and accidents. Components of the bismuth phosphate process included many acids (nitric, phosphoric, hydrofluoric, oxalic, and others), bismuth nitrate, sodium dichromate, potassium permanganate, calcium, lanthanum and sodium fluorides, ammonium fluosilicate, peroxide, sodium hydroxide, and other substances. Components of the REDOX process and its development include methyl isobutyl ketone (hexone), aluminum nitrate, ammonium nitrate, many acids (including nitric, sulfuric, oxalic, and others), ferrosulfamate, sodium hydroxide, mercury, resins and other substances.

Components of the Metal Recovery process and the PUREX process were quite similar to each other and included tri-butyl phosphate, normal paraffin hydrocarbon, acids (including nitric, oxalic, and others), ammonium fluoride, ammonium nitrate and other substances. The RECUPLEX process used tri-butyl phosphate, carbon tetrachloride, many acids (including nitric, oxalic, hydrofluoric, and others), sodium fluoride, sodium hydroxide, and other substances. All of these chemicals became waste constituents, along with trace isotopes of plutonium, uranium, thorium, strontium, cesium, aluminum, iron, copper, and zinc. Additionally, cell and equipment decontamination reagents, cleansers, and drying materials,

including carbon tetrachloride, trichlorethylene, acetone, A-butanone, and many commercial products, became a part of the 321 waste stream.

Because the 321 Building was a pilot plant, the Building's mission changed a number of times. These mission changes altered the potential contaminants that may have contributed to the soil contamination. Listed below are some of the mission changes and potential contaminants.

When the original hot laboratory facilities in the A and B Cells of T Plant had been disassembled to make room for a radioactive lanthanum production mission, some of the testing with higher activity radiochemical solutions was initiated in the 321 Building. These tests continued until 'C' Plant (Hot Semi-Works) was constructed in the 200 East Area in 1949.

Subsequent defense production expansions from 1950 to 1955 generated the development of the Uranium Plant Metal Recovery process, the PUREX process, and the reclamation of uranium and plutonium by extraction (RECUPLX) process. Pilot scale developmental testing using low activity solutions for all of these processes was conducted in the 321 Building. Reduction-oxidation process improvement trials, including mercury-catalyzed dissolving studies, also were conducted during this period.

Beginning in the late 1950's, in response to orders from the National Aeronautics and Space Administration (NASA) and from hospitals and medical laboratories and research centers, chemists embarked on the development of several pioneering methods of extracting high-heat isotopes from high level nuclear waste. Among the most prominent isotopes extracted were strontium-90, cesium-137, cerium-144, promethium-147, and neptunium-237. At one time in the 1960's, Hanford was the only producer in the world of promethium-147, a rare earth extract that was used in the development of the artificial heart. Extraction of these isotopes was accomplished by ion exchange, solvent extraction, carrier precipitation, and other means. Many of the pilot scale development tests for these extractions were conducted using tracer level waste solutions. During the 1950's and 1960's, several attempts were made to produce uranium-233 from thorium. These processes used chemical separation of various forms of thorium target fuel elements (powders, pellets, wafers, with many oxide blends) after irradiation.

A general cleanup of the building during 1946 to 1947 revealed radioactive material in lead sink traps of cold areas and maximum readings of 50,000 disintegrations per minute in other building locations. During January and February of 1947, a total of nearly 800 micrograms of plutonium was flushed from the inside of process lines and tanks in the 321 Building. Late that year, a large disposal of uranyl nitrate hexahydrate solution to the 300 Area Process Pond spiked radioactivity readings in that pond so high that a decision was made to build the special 321 Cribs to contain uranium bearing 321 Building solutions. By April 1948, 321 Building operations had discharged 238 pounds of uranium to the 300 Area Process Pond. Early that year, building modifications revealed plutonium contamination in the concrete of sampling boxes in cold areas of the canyon, and readings up to 45,000 disintegrations per minute (alpha) were discovered in sludge inside tank 1-AU.

Solid radioactive and chemical wastes from the 321 Building were buried in all of the various burial grounds used in the 300 Area (with the possible exception of 618-9). Nitrous oxide fumes from bismuth phosphate process tests and fission gases including iodine-131 from all separations processes tests escaped from the 321 Building stack.

The Following Sites Were Consolidated With This Site:

Code: 300-81

Names: 300-81; 321 Building Steam Condensate; Miscellaneous Stream #370

Code: 300-82

Names: 300-82; 321 Building Steam Condensate; Miscellaneous Stream #371

draped over the waste line. Smears of the area showed that alpha contamination was also present. At a depth of approximately 7.6 meters (25 feet), contamination spread laterally in an interface between the undisturbed soil and backfill.

Process Description: While in service, the Retired Radioactive Liquid Waste Sewer (RRLWS) system transferred liquid waste from laboratories and facilities in the 300 Area to the 340 Complex for sampling and disposal.

Related Sites/ Structures: UPR-300-11 is associated with a flanged "tee" connecting the east and west legs of the Retired Radioactive Liquid Waste Sewer (RRLWS) to the 340 Facility. Analysis of the contamination below the "tee" suggested the effluent was derived from 325-A building processes.

Waste Type: Process Effluent

Waste Description: Soil samples collected near the broken pipe were analyzed and yielded concentrations of 0.2 strontium-90, 0.24 europium-155, 0.09 cerium-144, 0.0017 plutonium-239 and 240, and 0.014 americium-241 and plutonium-238 (all microcuries per cubic centimeter). Approximately 1 curie of contamination was left in place.

Code: UPR-300-12 **Classification:** Accepted

Names: UPR-300-12; Contaminated Soil Beneath the 325 Building; UN-300-12 **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1979

Status: Inactive **End Date:** 1/1/1979

Description: The site was an unplanned release to the soil under the floor on the east side of the 325-A Building.

Location: UPR-300-12 occurred in the basement floor of the 325-A Building. The waste migrated through cracks in the floor to the soil beneath the building.

Release Description: On January 8, 1979, a Pacific Northwest Laboratory (PNL) supervisor located in the 325-A building notified the Westinghouse 340 facility supervisor that approximately 15,140 liters (4,000 gallons) of contaminated liquid needed to be transferred from tank WT-1. Shortly before 1600 hours, the transfer began utilizing a steam jet pump. The jet pump had ran all night and was still operating the next morning. The liquid level on tank WT-1 located indicated decrease approximately 15,140 liters (4,000 gallons) had been transferred. However, the 340 facility reported they had not received the liquid waste. An investigation of the Radioactive Liquid Waste System line-up revealed that an isolation valve on the discharge line, outside the building, was shut, thus precluding discharge of the water to the storage and retention tanks at the 340 Building. The valve was opened and a rush of water was heard. However, the 340 facility storage tank revealed only a negligible amount of water. The 325-A Building was examined for the presence of waste water. Water was noticed on the floor of Room 50-A. No other unexplained volumes of water could be found in 325-A Building. The discharge stop valve for 325-A Building was opened and residual water in the combined drain line allowed to gravity drain to the 340 Building waste storage complex. Tank levels were rechecked and verified that approximately 11,355 liters (3,000 gallons) of low level radioactive water could not be accounted for. A test was initiated in Room 50-A that wetted the floor with 265 liters (70 gallons) clean water. It was estimated that over 189.25 liters (50 gallons) flowed into the confluence of the wall and floor, primarily along the northern and eastern walls. It was the consensus of opinion from all interested parties that the subject water flowed down the drain line, through the sump pump discharge line, into the sump and thence to the floor where it exited through existing cracks to the soil. The floor of Room 50-A in the 325 Building was core drilled to obtain a sample of the earth below the floor. The earth was analyzed to determine if

radionuclides present in the soil matched the material that was transferred from the 325-A Building on January 8 and 9, 1979.

Process Description: The 325 Radiochemistry Building was built to safely house and handle multi-curie level chemical development work with high activity substances. The High-Level Radiochemistry addition, with its three larger hot cells, housed several pioneering "isotope campaigns??. A number of new techniques developed in the 325 Building separated or fractionized specific isotopes from high-level waste by ion exchange, carrier precipitation, solvent extraction, and various combinations of these and other methods. In addition, studies that were part of a Nuclear Waste Vitrification Project took place in the Hot Cells from 1977 to 1980.

Related Sites/ Structures: UPR-300-12 was associated with the WT-1 Tank, 325 Sump Tank, 325 Overflow Tank, Room 50-A in the 325-A Building and the 340 Complex.

Waste Type: Process Effluent

Waste Description: The site received radioactive rinse water overflow containing nitrate ions, promethium-147, fission products, and transuranic nuclides. The total activity in the rinse water was estimated to be 70 Curies, of which 95% was promethium-147. The rinse water contained nitrate ions, promethium-147, fission products, and transuranic radionuclides. Nitrate ions, but no radionuclides, were detected in samples taken from a nearby groundwater monitoring well. PNL (Occurrence Report #79-2) reports that coring through the cement floor of Room 50-A and sampling of the soils below was completed on January 26, 1979.

Code: UPR-300-17

Classification: Accepted

Names: UPR-300-17; Metal Shavings Fire; UN-300-17

Reclassification: Interim Closed Out (6/28/2010)

Type: Unplanned Release

Start Date: 1/1/1979

Status: Inactive

End Date: 1/1/1979

Description: The release site was the asphalt area at the southeast corner of Building 333. The site is not marked or labeled in the field, and its location is not apparent. The site falls within a "Radiologically Controlled Area" that surrounds the 333 Building on its north, south and east sides. The asphalt and concrete at the southeast corner of 333 are painted gray and labeled "Fixed Contamination Area." The unpainted asphalt east of the "Fixed Contamination Area" is old and cracked. There is no clear indication where the asphalt was replaced in 1979. East of the unpainted asphalt area, there is a fire hydrant and an automatic sprinkler valve surrounded by gravel and broken asphalt and concrete. Even further east, there is an expanse of gravel. East/northeast of the southeast corner, there is a large "Contamination Area." An approximately 0.6 meter (24 inch) diameter metal manhole is located in the "Fixed Contamination Area." It is unlabeled except for a "Confined Space" sign. In the asphalt area east of the "Fixed Contamination Area," there is an approximately 0.4 meter (16 inch) diameter drain with a metal grate and an approximately 0.6 meter (24 inch) diameter metal manhole with perforations. The 0.4 meter (16 inch) drain is labeled "Radioactive Material, Internally Contaminated." The 0.6 meter (24 inch) metal manhole is labeled "Sewer" and "Danger, Limited Access/Confined Space."

Location: UPR-300-17 was confined to the asphalt area at the southeast corner of Building 333.

Release Description: The release occurred on September 2, 1979, when a garbage can containing oily rags and other waste material caught fire. Rain caused metal shavings, which were believed to be uranium, in the can to ignite. The can was inside a plastic-lined wooden burial box, which also caught on fire. Smoke from the fire contaminated a propane tank located about 3.0 meters (10 feet) away to 500 counts per minute, a forklift about the same distance away to 700 counts per minute, and a 15.2 meter (50 foot) piece of fire hose to 1500 counts per minute. The ground about 0.6

meters (2 feet) from the wooden burial box was contaminated to 15,000 counts per minute for approximately 1.2 meters (4 feet). Contamination was limited to the ground around the wooden burial box, with a radius of approximately 3 meters (10 feet).

Related Sites/ Structures: The site was adjacent to the 618-1 Burial Ground.

Waste Type: Chemicals

Waste Description: The waste consisted oily rags and other waste material, including what was believed to be uranium shavings.

Closure Info: The Remaining Sites Verification Package, (RSVP-2010-014), has documented that the site has achieved the remedial action objectives and the corresponding remedial action goals established in the Remedial Design Report/Remedial Action Work Plan for the 300 Area and the Interim Action Record of Decision for the 300-FF-2 Operable Unit (EPA 2001). Verification sampling results have supported a reclassification of the waste site to Interim Closed Out.

Remediation of the waste site was performed from May 5 through May 11, 2009. Approximately 445 metric tons (490 US short tons) of concrete, asphalt, and soil were removed. The soil within the waste site footprint was excavated to a depth of 1 m (3 ft) below ground surface, and the resulting 195 bank cubic meters 255 bank cubic yards of soil was disposed at the Environmental Restoration Disposal Facility.

The COPCs for the site were identified based on the site location and types of material that caught fire, causing the release that occurred on September 2, 1979 at the site. Uranium was listed in the 300 Area Remedial Action Sampling and Analysis Plan (SAP) as the sole COPC; however, based on the site's proximity to the 333 Building and further site evaluation, the COPCs for verification sampling included radionuclides that evaluated using laboratory analytical methods for gamma-, beta-, and alpha-emitting radionuclides; polycyclic aromatic hydrocarbons (PAH); the expanded analyte list for the inductively coupled plasma (ICP) metals; total petroleum hydrocarbons (TPH); and PCBs.

On July 27, 2009, radiological field screening for beta and gamma activity was conducted following the site remedial action to confirm that waste site excavation was complete.

The excavation was performed to remove the fixed contamination area composed of painted or unpainted asphalt and concrete. Also, the excavation for the 618-1 waste site remediation extended into and below the eastern portion of the WIDS boundary for the UPR-300-17 waste site. The area excavated as part of the 618-1 waste site is therefore excluded from the UPR-300-17 waste site remediation scope and was closed out as part of the 618-1 waste site scope CVP-2010-00001.

The results of verification sampling show that residual contaminant concentrations have met human health direct exposure cleanup levels for industrial land use in the shallow zone soils (i.e., surface to 4.6 m [15 ft] deep). The results also demonstrate that residual contaminant concentrations are protective of groundwater and the Columbia River. The waste site does not have a deep zone or residual contaminant concentrations that would require any institutional controls to prevent uncontrolled drilling or excavation.

Code: UPR-300-38	Classification: Accepted
Names: UPR-300-38; 313 Slab; Demolished 313 Building Foundation; Soil Contamination Beneath the 313 Building	Reclassification: None

Type: Unplanned Release**Start Date:****Status:** Inactive**End Date:**

Description: The 313 building was demolished in 2004 and the foundation/slab was left in place. The site consists of the contaminated soil beneath the 313 Building, as well as the foundation. The contamination resulted from multiple unplanned release events. The full extent of contamination will not be determined until the 313 Building foundation has been removed. Note: WIDS Site UPR-300-38 associated with this area. All of the RCRA/CERCLA releases identified for the soils in this area will be addressed as part of UPR-300-38. Also see WIDS Site UPR-300-44 which involved a leak in a section of the process sewer line that was detected in January 1985. This leak in the process sewer line downstream from the 313 URO could have allowed uranium-bearing waste spills to have reached the ground beneath the process sewer. Also see WIDS Site UPR-300-45, a waste transfer line leak to the pipe trench between the 313 URO and the 303-F Building. Because the pipe trench bottom has holes in it, this site leaked to the soil column.

Location: The soil contamination is beneath the southern half of the 313 Building. The 313 Building is located at the north end of the main 300 Area (within the security fence). It is located north of Ginko Street, east of the 303K, 305, and 314 Buildings, and west of the 3712 and 3720 Buildings.

Release Description: Unplanned release site UPR-300-38 represents the area of soil contamination beneath the southern half of the 313 Building. Because of a general failure of the process sewer line beneath the building, any discharges into the process sewer may have contributed to the contamination.

In the early 1970's, during floor repairs in the 313 Building, liquid was observed flowing over the acid brickwork installed beneath the concrete floor. The liquid was collected and processed through the uranium recovery operation. Some of the subfloor was removed and replaced. According to site personnel, the pipe trench (which runs east to west) and the filter press were lined with stainless steel after the spill. The sump in this trench which leads to the process sewer has been grouted.

Related Sites/Structures: The contamination is associated with releases from the 313 Uranium Recovery Operations (WIDS Site 313 URO) and the 300 Area Waste Acid Treatment System (300 WATS).

Waste Type: Chemicals

Waste Description: Materials released to the soil beneath the building may have included uranium-bearing acid (nitric and sulfuric acid with uranium in solution), neutralized acid waste (typically sodium fluoride, sodium nitrate, sodium dichromate, and sodium sulfate in solution with precipitates of uranium, chromium, copper and zirconium), etch acids (nitric, hydrofluoric, sulfuric, and chromic acids), tetrachloroethene (perchloroethylene), sodium hydroxide solutions, and contaminated water.

The Following Sites Were Consolidated With This Site:

Code: UPR-300-44

Names: UPR-300-44; Uranium Bearing Waste Etch-Acid Spill; 313 Building; UN-300-44

Code: UPR-300-39

Classification: Accepted

Names: UPR-300-39; Sodium Hydroxide Leak at 311 Tank Farm; UN-300-39

Reclassification: None

Type: Unplanned Release

Start Date: 1/1/1954

Status: Inactive

End Date: 1/1/1954

Description: The release site was to the soil adjacent to the caustic storage tanks in the 311 Tank Farm. The

two sodium hydroxide (NaOH) tanks are currently labeled "Empty." The location and extent of the release is not discernible in the field. The ground around the two tanks is covered by a concrete containment, that is surrounded by more concrete and gravel. The concrete containment is not marked or labeled in any way to warn about excavating in the area.

Location: UPR-300-39 occurred in the soil adjacent to the caustic storage tanks in the 311 Tank Farm, which is located between the 303-F and 303-G Buildings.

Release Description: An unplanned release occurred in the 311 Tank Farm when one of two 37,850 liter (10,000 gallon) sodium hydroxide tanks leaked. A 50 percent sodium hydroxide solution contaminated soil around the tanks.

Process Description: The 311 Building and Tank Farm were constructed to distill methanol for re-use. They operated until 1971 when the last single-pass reactor closed at the Hanford Site. The 311 Building and 311 Tank Farm wastes consisted of chemical spills and leaks (primarily methanol, trichloroethylene and perchloroethylene).

Related Sites/ Structures: UPR-300-39 was associated with the caustic storage tanks in the 311 Tank Farm.

Waste Type: Chemicals

Waste Description: The waste consisted of caustic solution containing 50 percent sodium hydroxide solution.

Code: UPR-300-40 **Classification:** Accepted

Names: UPR-300-40; Acid Release at the 303-F Pipe Trench; UN-300-31; UN-300-40; UPR-300-31 **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1974

Status: Inactive **End Date:** 1/1/1974

Description: The release site was to the soil between the 311 Tank Farm and the 303-F Building.

Location: UPR-300-40 occurred in the soil between the 311 Tank Farm and the 303-F Building.

Release Description: In October 1974, broken drain connections between the pipe trench, the 303-F Building, and the process sewer were discovered. The bottom of the trench was severely eroded, indicating that a spill had occurred. The trench floor is still contaminated. The total volume of spilled material is unknown; however, evidence of uranium contamination in the soil has been found.

Process Description: The 303-F and 303-K Buildings were upgraded in 1954 as part of the project 313 Building expansion and the construction of the 311 Tank Farm. The 303-F Building served as a chemical makeup facility for the solutions (mostly acids) used in the aluminum cleaning, stripping, and anodizing processes performed in the 313 Building. In 1973, it became the pumping facility for the 300 Area Waste Acid Treatment System (WATS) operations. The waste acids treated in the WATS operation included nitric, sulfuric, hydrofluoric, and chromic-nitric-sulfuric acids bearing uranium, Zircaloy-2 components, copper, beryllium, and other fuel fabrication materials.

Related Sites/ Structures: UPR-300-40 was associated with the drain connections between the 303-F Building and the process sewer.

Waste Type: Chemicals

Waste Description: The waste consisted of uranium-bearing acid waste containing nitric and sulfuric acid with uranium in solution and chromic acids with copper and zinc in solution.

Code: UPR-300-41 **Classification:** Accepted

Names: UPR-300-41; 300 Area #340 Building
Phosphoric Acid Spill; UN-300-41 **Reclassification:** Closed Out (2/24/1999)

Type: Unplanned Release **Start Date:** 1/1/1986

Status: Inactive **End Date:** 1/1/1986

Description: The release involved asphalt and soil in the 340 Complex yard. Facility personnel do not know the exact location of the spill.

Location: UPR-300-41 occurred approximately 4.6 meters (15 feet) west of the 340 Building.

Release Description: Three drums allegedly containing nitric acid were received from Battelle for use in a charcoal filter efficiency test on April 17, 1986. On June 3, 1986, one of the drums was found to have failed. Approximately 113.6 liters (30 gallons) of liquid had contaminated part of an asphalt pad and an area of soil next to the pad. The drum was labeled "Sulfuric Acid." The initial clean up involved using sodium bicarbonate and water to neutralize the acid. The spill area did not respond to the clean up method so a sample of the spilled liquid was analyzed. The results indicated the spilled material was phosphoric acid, with high concentrations of chromium, manganese, iron, and nickel in solution.

Related Sites/ Structures: UPR-300-41 was associated with an asphalt pad west of the 340 Building.

Waste Type: Chemicals

Waste Description: A detailed analysis on a sample taken from the leaking drum showed the released liquid consisted of phosphoric acid containing 14,000 parts per million chromium, 1,900 parts per million manganese, 1,700 parts per million iron, and 400 parts per million nickel.

Closure Info: The spilled material was neutralized, absorbed and packed into drums. Contaminated soils were excavated and placed in drums for disposal. The asphalt pad was cleaned. Cleanup was judged to be complete when the concentration of chromium in soil samples was less than 5 parts per million.

Institutional control (IC) information has been revised as directed by the U. S. DOE letter, 05-AMRC-0078, 1/4/05, following a review of the Institutional Controls (ICs) in the WIDS. Some 300 Area sites, including this one, were closed out before CVP documents were in use, and close-out information was documented in waste site reclassification forms. No ICs were identified for these sites at the time of closeout, however the DOE determined that further evaluation of ICs would be needed before making a final decision on the appropriate ICs to implement. Until a final Record of Decision is approved for this site, tentative ICs based on the remedial action and location for this and similar sites in the DOE letter have been determined judgmentally.

Code: UPR-300-42 **Classification:** Accepted

Names: UPR-300-42; 300 Area Powerhouse Fuel Oil
Spill; UN-300-42 **Reclassification:** Interim Closed Out

Type: Unplanned Release **Start Date:** 1/1/1983

Status: Inactive **End Date:** 1/1/1983

Description: This release is not visible. The release was an overflow of Number 6 fuel oil onto the ground adjacent to the Number 2 Day Tank, an underground storage tank. The surface area around the day tanks was paved with asphalt. During the demolition of the below-grade structures associated with the 384 Building in 2009-2010, shallow dark, stained soil was encountered near

Names: UPR-300-46; Contamination North of 333 Building **Reclassification:** Interim Closed Out (8/20/2010)

Type: Unplanned Release **Start Date:** 1/1/1989

Status: Inactive **End Date:** 1/1/1989

Description: The release site was a layer of radioactively contaminated soil found during a pipe trench excavation. There is currently no visual evidence of the release. The area is not marked or posted. The gravel east of the telephone pole along the north perimeter fence appears to be slightly newer than other gravel in the vicinity.

Location: The release site was an area of soil inside the 333 building fence. It occurred east of a telephone pole at the north end of the 333 facility property.

Release Description: On June 21, 1989, radioactively contaminated soil was discovered while excavating a pipe trench north of the 333 Building. The contamination appeared to be confined to a narrow band of soil approximately 2.5 to 5 centimeters (1 to 2 inches) thick.

Related Sites/ Structures: UPR-300-46 was associated with the 333 Building and a french drain known as Miscellaneous Stream #455 (See WIDS Site 300-109).

Waste Type: Process Effluent

Waste Description: The contaminated soil was analyzed, and it was determined that the soil did not contain any significant quantities of hazardous chemicals. The truck load of contaminated soil was disposed of as low-level waste. The contamination was likely caused by a spill of Uranyl Nitrate.

Closure Info: CG 300-109 and UPR-300-46 were addressed as a group. The information below documents information for the group of sites.

The Cleanup Verification Package (CVP-2010-00004) has documented that the 300-109, 333 Building Stormwater Runoff waste site and UPR-300-46, Contamination North of 333 Building waste site have met the rural-residential scenario remedial action objectives (RAOs) established in the Remedial Design Report/Remedial Action Work Plan for the 300 Area (RDR/RAWP) and the Interim Action Record of Decision for the 300-FF-2 Operable Unit, (ROD) (EPA 2001). The evaluation shows that the sites have been successfully remediated and that there are no residual hazardous/dangerous materials present above the RAOs in the soil. Therefore, the 300-109 and UPR-300-46 waste sites are protective of human health, groundwater, and the Columbia River.

Remediation of the 300-109 waste site was performed from April 28 through April 29, 2009. The soil and asphalt within the waste site footprint were excavated to an average depth of 2.6 m (8.5 ft) bgs, with a maximum depth of 3.7 m (12 ft) bgs at the location of the drain. The resulting 325 BCM (425 BCY) of soil was disposed at ERDF. The french drain and associated vitrified clay pipe was found and removed during the remediation. The PVC pipe noted in documentation from the 1990s was not found during remediation.

The Contaminants of Potential Concern (COPCs) for the UPR-300-46 and 300-109 waste sites were identified using historical information for the 333 Building storm water system and the contamination associated with the UPR-300-46 spill. The COPCs associated with the 333 Building and the UPR-300-46 spill include uranium-234, uranium-235, uranium-236, uranium-238, technetium-99, and thorium-232. In addition and in consideration of the storm drain receiving runoff from roofs and pavement surfaces, inductively coupled plasma (ICP) metals, PAH, and PCBs were included as COPCs.

Verification sampling for the UPR-300-46 and 300-109 waste sites was performed on January 6, 2010, to support a determination that residual contaminant concentrations at these sites meet the cleanup criteria specified in the RDR/RAWP and the 300-FF-2 ROD. The complete

laboratory results were stored in the Environmental Restoration (ENRE) project-specific database prior to submitting to the Hanford Environmental Information System (HEIS) for archiving and are provided in Appendix B of the RSVP.

This report demonstrates that the 300-109, 333 Building Stormwater Runoff and UPR-300-46, Contamination North of 333 Building sites have met the rural-residential scenario RAOs established in the RDR/RAWP and the ROD. The evaluation shows that the sites have been successfully remediated and that there are no residual hazardous/dangerous materials present above the RAOs in the soil. Therefore, the 300-109 and UPR-300-46 waste sites are protective of human health, groundwater, and the Columbia River.

Code: UPR-300-48 **Classification:** Accepted

Names: UPR-300-48; 325 Building Basement Topsy Pit **Reclassification:** None

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:** 1/1/1991

Description: The site is radioactively contaminated soil that occurred as a result of a release through a crack in the process sewer drain pipe elbow.

Location: The site is located underneath the 325 Building foundation in room 30 under a process sewer drain elbow.

Release Description: On October 23, 1991, during the confirmation of the 325 Building sewer system configuration, a potential problem with one of the drain lines was discovered. As a precaution, residual material at the bottom of the sump was analyzed. This analysis showed the presence of mercury (700 parts per million) in the sample. The presence of mercury in the sump was believed to be a result of prior, not current, building operations. Further analysis of the sewer line discovered an elbow in a feeder line to the main line had deteriorated and allowed liquids to leak to soil under the basement floor. Soil samples were taken and analyzed.

Related Sites/Structures: The site is associated with the Process Sewer.

Waste Type: Soil

Waste Description: The site received radioactive liquid from a leak in the process sewer drain pipe. The site was discovered during dye testing of drains during development of the Facility Effluent Monitoring Plan development for the 325 Building. The contamination may have resulted from routine releases and accumulated in the soil under the crack.

Samples of the soil under the drain were analyzed for gross radioactivity and for hazardous metals by TCLP. Radioactivity up to 1700 disintegrations per minute alpha was detected. The TCLP results were below regulatory limits.

Code: UPR-600-22 **Classification:** Accepted

Names: UPR-600-22; WPPSS Windrow Site; 600-21 **Reclassification:** None

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: The site consists of a series of small parallel berms, which are approximately 0.6 meters (2 feet), 0.9 meters (3 feet) wide and 91 meters (100 yards) long. The berms are arranged to form a triangle approximately 137 meters (150 yards) by 91 meters (100 yards) long. Perimeter berms are approximately 1.2 meters (4 feet) tall.

Location: adjacent to the north fence of the 618-11 Burial Ground.

Release Description: The area was contaminated prior to 1972 with particulate fallout from burial activities in the 618-11 Burial Grounds. UPR-600-9 occurred on April 14, 1967 and indicates a fan-shaped area (approximately 230 meters [250 yards] long and 91 meters [100 yards] wide) was contaminated during a routine cask unloading operation. The contaminated area outside the fence was turned over with bulldozer to bury the contamination.

Related Sites/ Structures: The site is associated with UPR-600-9 and 618-11.

Waste Type: Soil

Waste Description: The area was contaminated prior to 1972 with particulate fallout from burial activities in the 618-11 Burial Grounds. The contaminated area was covered by scraping the affected ground into windrows. On October 24, 1972, a backhoe was used to cut across each windrow at a spacing of every 15 meters (50 feet) to a depth of 15 centimeters (6 inches) below ground level. Radiological surveys were made of all soils removed and of the walls of each cut. No beta, gamma, or alpha radioactivity was detected above the normal background of 100 counts/minute.

1100-EM-1

Code: 1100-1 **Classification:** Accepted

Names: 1100-1; 1171 Building Sandpit Spills; Battery Acid Pit; UPR-1100-1 **Reclassification:** Deleted From NPL (9/30/1996)

Type: Depression/Pit (nonspecific) **Start Date:** 1/1/1954

Status: Inactive **End Date:** 1/1/1977

Description: This site has been cleaned up under the 1100 Area Record of Decision. The 1100-1 Battery Acid Pit was an unlined, sand-filled pit excavated in native soil. The site is not visible at the surface. The pit was backfilled to grade when it was withdrawn from service.

Location: The unit is located below grade, northwest of the 1176 Building.

Process Description: The unit was used to dispose of battery acid from vehicle maintenance activities. Information suggests that the unit may have been used to dispose of waste oil, waste antifreeze, and spent solvents.

Related Sites/ Structures: The unit was associated with the 1100 Area Maintenance and Service Operations.

Waste Type: Chemicals

Waste Description: Historical documents record an estimated 15,000 gallons (57,000 liters) of battery acid wastes may have been disposed of between 1954 and 1977. Other substances including antifreeze and solvents may have also been disposed of at the site. The sand lining was removed and deposited in an undisclosed location when the sand became saturated. New sand was then added to the pit for further acid disposal.

Code: 1100-2 **Classification:** Accepted

Names: 1100-2; Paint and Solvent Pit; UPR-1100-2 **Reclassification:** Deleted From NPL (9/30/1996)

Type: Depression/Pit (nonspecific) **Start Date:** 1/1/1954

Status: Inactive **End Date:** 1/1/1985

Location: The unit is located along a railroad spur north of the 1171 Building.

Process Description: The pit served as a disposal site for construction debris. Paints, solvents, and thinners have been reportedly disposed of at this location.

Related Sites/ Structures: The unit is associated with the 1100 Area maintenance and construction operations. The pit is also known as Gravel Pit #2 (site code 1100-14)

Waste Type: Chemicals

Waste Description: Paint, solvents, and thinners may have been disposed of in this location.

Waste Type: Construction Debris

Waste Description: The site received construction debris from Hanford Site demolition activities. Principal components of the waste included concrete rubble, asphalt, and wood debris.

Code: 1100-3 **Classification:** Accepted

Names: 1100-3; Antifreeze and Degreaser Pit; Antifreeze **Reclassification:** Deleted From NPL (9/30/1996)

Pit; UPR-1100-3

Type: Depression/Pit (nonspecific) **Start Date:** 1/1/1979

Status: Inactive **End Date:** 1/1/1985

Description: The site was originally a gravel pit used as a source of backfill material. This contaminated soils have been cleaned up under the 1100 Area Record of Decision. The site currently appears as a shallow roughly circular depression.

Location: The unit is located north of 1171 Building and west of the Hanford Rail Line inside Gravel Pit #3 (Site Code 1100-15)

Process Description: The site was used to dispose of waste construction material. Prior to use as a disposal site, the unit was a sand and gravel pit known as Pit #3 (Site Code 1100-15).

Related Sites/ Structures: The waste is related to Hanford construction activities and 1171 Building Operations. The site is associated with Hanford Gravel Pit #3

Waste Type: Construction Debris

Waste Description: Construction waste material including roofing and concrete rubble was disposed of at this site.

Waste Type: Chemicals

Waste Description: Ethylene glycol, degreasing solvents and wash water from engine cleaning may have been disposed of at this site although it is not documented.

Code: 1100-4 **Classification:** Accepted

Names: 1100-4; 1171 Building Spills; Antifreeze Tank Site; UN-1100-4; UPR-1100-4 **Reclassification:** Deleted From NPL (9/30/1996)

Type: Storage Tank **Start Date:** 1/1/1976

Status: Inactive **End Date:** 1/1/1986

Description: This site was cleaned up under the 1100 Area Record of Decision. This site is the former location of a steel underground storage tank.

Location: The unit was located below grade under the northern section of the 1171 Building.

Process Description: The unit temporarily stored waste antifreeze from vehicle maintenance activities. Because there were no risks identified with this site, no further action is required.

Related Sites/ Structures: The was associated with the 1171 Building vehicle maintenance activities.

Waste Type: Chemicals

Waste Description: The unit stored waste antifreeze until removal in 1986. Recent investigations have found metals contamination and slight ethylene glycol contamination.

Code: 1100-11 **Classification:** Accepted

Names: 1100-11; Ephemeral Pool **Reclassification:** Deleted From NPL (9/30/1996)

Type: Pond **Start Date:**

Status: Inactive **End Date:** 1/1/1995

Description: The site has been regraded to a smooth, uniform surface. The Ephemeral Pool site was a long,

narrow depression designed to act as a drainage collection point for precipitation runoff flowing from the 1171 parking area. The north and south boundaries of the site were not distinct because the depression gradually rose toward both the north and south to near the elevation of the surrounding land. Settlement and/or poor grading of the depression floor resulted in the formation of a series of linked pools after rainfall events that temporarily held a portion of the collected moisture within the drainage way until it evaporated or infiltrated into the ground. A pervious gravel lining encouraged infiltration of the collected runoff into the vadose zone beneath this site.

Location: The Ephemeral Pool was located west of the 1171 parking area, near the U.S. Government Railroad lines.

Related Sites/ Structures: The site is associated with the 1171 parking area.

Waste Type: Chemicals

Waste Description: Before cleanup, soil sampling indicated the presence of PCB's (Aroclor 1260) at concentrations ranging from 300 to 42,000 micrograms per kilogram.

Waste Type: Stormwater Runoff

Waste Description: The site was designed to receive stormwater runoff from the adjacent 1171 Building parking area.

Code: HRD

Classification: Accepted

Names: HRD; ITT Waste Disposal Landfill; Gravel Pit 4; Gravel Pit 5; Horn Rapid Landfill (HRL); Horn Rapids Disposal

Reclassification: Deleted From NPL (9/30/1996)

Type: Sanitary Landfill

Start Date:

Status: Inactive

End Date:

Description: This site has been cleaned up based on the 1100 Area Record of Decision. This site consists of an inactive landfill that has been capped with clean soil (asbestos cap) and revegetated. A security fence surrounds the site.

Location: This site is located on the north side of Horn Rapids Roads, west of the intersection of Horn Rapid Road and Stevens Drive.

Process Description: From the late 1940's to the 1970's this site operated as an uncontrolled landfill. This solid waste facility was used primarily for the disposal of office and construction waste, asbestos, sewage sludge, fly ash, and reportedly, numerous drums of unidentified organic liquids. Classified documents were also incinerated at a burn cage located at the northern edge of the landfill.

Waste Type: Oil

Waste Description: Hydraulic oil contaminated with polychlorinated biphenyls was disposed at the site.

Waste Type: Misc. Trash and Debris

Waste Description: Automotive debris was found in all areas of the landfill. Stainless steel lathe shavings were found in the central portion of the landfill. Miscellaneous trash including paint containers was also found at the site.

Waste Type: Construction Debris

Waste Description: Various types of construction debris were found at the site.

Process Description: The site was used for the isolated, unauthorized disposal of liquid waste.

Related Sites/ Structures: adjacent to Gravel Pit #1

Waste Type: Abandoned Chemicals

Waste Description: The site consists of dark-colored, oily residue, and soil. The material includes metal, organic, and pesticide contaminants. Bis(2-ethylhexyl)phthalate (BEHP) and chlordane were identified. BEHP is a probable human carcinogen.

Closure Info: Fifteen soil samples were collected during the Phase I, 1100 Area Investigation. Contaminants identified included lead, potassium, zinc, alpha-chlordane, gamma-chlordane, 4,4'-DDE, bis(2-ethylhexyl)phthalate (BEHP), heptachlor, 3-hexanone, di-n-octylphthalate and 1,1,1-trichloroethane. In Phase II, fourteen soil gas probes were installed to depths ranging from 0.46 meters (1.5 feet) to 1.22 meters (4 feet). No contaminants were identified in the soil gas samples. The remedial action chosen was to excavate 90 cubic yards of contaminated soil. The soil was removed on February 14, 1995 and transported to a permitted, offsite incinerator (Aragonite, Utah). After incineration, the residuals were disposed of in that facility's ash disposal landfill.

1100-EM-2

Code: 700 WST **Classification:** Accepted

Names: 700 WST; 703-1; 700 Area Underground Waste Solvent Tank; 700 Area Waste Solvent Tank **Reclassification:** Deleted From NPL (9/30/1996)

Type: Storage Tank **Start Date:**

Status: Inactive **End Date:** 1/1/1989

Description: Prior to removal, the site consisted of an underground steel storage tank. The tank was pulled and examined. There was a thick crust of soil over much of the tank bottom that prevented a detailed observation of the tank. However, there were no obvious holes. The tank was empty.

Location: This site was located east of the 703 Building approximately 30.5 centimeters (12 inches) from the foundation. The long axis of the tank was north-south. The top of the tank was approximately 45.7 centimeters (18 inches) below grade.

Release Description: When the tank was excavated (but still in place), the odor of solvent was obvious, and the soil was stained dark in places. Readings of the excavation with an HNU model F1 101 10.2 Electron Volt lamp (photo ionization organic vapor detector) showed breathing zone of 3 parts per million, varying from 0-4 parts per million with occasional spikes greater than 7 parts per million. The narrow space beneath the tank read greater than 20 parts per million. HNU readings less than 2.5 centimeters (1 inch) from the soil surface seemed to indicate greater contamination near the south end of the tank impression (after pulling the tank).

Waste Type: Chemicals

Waste Description: The unit contained combustible solution of aliphatic hydrocarbons with 162 parts per million of 1,1,1-trichloroethane.

Closure Info: Witnesses present during excavation reported surface contamination above the tank. Contaminated surface soil was disposed of in five 208 liter (55 gallon) drums by Operations Support Services (OSS) during excavation. Drum contents were sampled by OSS personnel and samples were analyzed under the authority of OSS. The drums and the tank were removed from the site by OSS personnel. The following soil samples were collected: FB-101, FB-102, FB-103, FB-104. Soil was removed from the south end of the tank impression using a backhoe and non-decontaminated shovels. HNU readings approximately 1.2 meters (4 feet) from the trench bottom showed 4-7 parts per million. Soil was shoveled into a plastic bucket from approximately 38 centimeters (15 inches) below where the tank bottom had been. Samples were removed from the center of the bucket. These samples were: FB-105, FB-106, FB-107, FB-108 (equipment blank).

Code: 1100 BSUHR **Classification:** Accepted

Names: 1100 BSUHR; 1100 Area Bus Shop Underground Hoist Rams **Reclassification:** Deleted From NPL (9/30/1996)

Type: Storage Tank **Start Date:** 1/1/1953

Status: Inactive **End Date:**

Description: This site was cleaned up under the 1100 Area Record of Decision. The 1100 BSUHR Site consists of four single manifold, triple tank hoists. Each is related to the 1171 Building Maintenance activities.

Location: The units are located within the 1171 Building Bus Shops.

Process Description: The storage tanks hold hydraulic oil for the operation of the hoists.

Related Sites/ Structures: The site is associated with the 1171 Building Maintenance activities.

Waste Type: Oil
Waste Description: The units contain non-PCB hydraulic oil.

Code: 1100 HWSA	Classification: Accepted
Names: 1100 HWSA; 1100 Area Hazardous Waste Storage Area; 1100 Area HWSA	Reclassification: Deleted From NPL (9/30/1996)
Type: Storage Pad (<90 day)	Start Date: 1/1/1985
Status: Inactive	End Date: 1/1/1990

Description: The site consists of a fenced gravel pad that is used to store waste containers.

Location: The site was located north of the 1100 Area Building.

Process Description: The unit was used to stage hazardous waste for periods less than 90 days.

Related Sites/ Structures: The unit was associated with 1171 Building operations.

Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: The waste staged at the site included: used oil, antifreeze, degreasers, acids, and paint-related wastes.

Code: 1100 UOT4	Classification: Accepted
Names: 1100 UOT4; 1171-4; 1100 Area Underground Used Oil Tank (Tank #4); 1100 Area Used Oil Tank 4	Reclassification: Deleted From NPL (9/30/1996)
Type: Storage Tank	Start Date: 1/1/1953
Status: Inactive	End Date: 1/1/1995

Description: The 1100 UOT4 Site was an unlined, underground steel tank. The tank was removed.

Location: The unit was located below the Light Maintenance Shop in the 1171 Building.

Process Description: The tank provided temporary storage for used oil prior to shipment off site for recycling.

Related Sites/ Structures: The tank was associated to the 1171 Building Maintenance.

Waste Type: Oil
Waste Description: The unit received used oil designated for recycling.

Code: 1100 UOT5	Classification: Accepted
Names: 1100 UOT5; 1171-5; 1100 Area Underground Used Oil Tank (Tank #5); 1100 Area Used Oil Tank 5	Reclassification: Deleted From NPL (9/30/1996)

Description:

Code: 1100 USPT3 **Classification:** Accepted
Names: 1100 USPT3; 1171-3; 1100 Area Underground **Reclassification:** Deleted From NPL (9/30/1996)
Steam Pad Tank 3
Type: Storage Tank **Start Date:** 1/1/1984
Status: Inactive **End Date:** 1/1/1995
Description: The 110 USPT3 Site was a fiberglass-reinforced plastic tank. The tank has been removed.
Location: The unit was located near the northwest corner of the 1171 Building.
Process Description: The tank stored wastewater from steam cleaning activities.
Related Sites/ Structures: The unit was associated with the 1171 Building Steam Cleaning Facilities.
Waste Type: Water
Waste Description: The unit received oily water from washing heavy equipment.

Code: 1100-8 **Classification:** Accepted
Names: 1100-8; 1171 Hoist Oil Leak **Reclassification:** Deleted From NPL (9/30/1996)
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**
Description: The DB-1-N hoist in the 1171 building is currently used for vehicle maintenance. The hoist has been repaired and the oil that leaked from the hoist into the soil has been removed.
Release Description: Oil leaked from the ram and containment pan of the DB-1-N hoist in the 1171 Building into the soil.
Process Description: Vehicle maintenance hoist.
Related Sites/ Structures: 1171 building
Waste Type: Oil
Waste Description: Industrial Oil, UNOCAL UNAX AW 32, MSDS #12615 (HEHF)
Reported Date: November 11, 1994

1100-EM-3

Code: 3000 JYHWSA **Classification:** Accepted

Names: 3000 JYHWSA; Hazardous Waste Storage Area (Jones Yard); 3000 Area Jones Yard Hazardous Waste Storage Area; 3000 Area Jones Yard HWSA **Reclassification:** Deleted From NPL (9/30/1996)

Type: Storage Pad (<90 day) **Start Date:** 1/1/1965

Status: Inactive **End Date:**

Description: The site consisted of a hazardous waste storage area.

Location: The hazardous waste staging area was located south of the 1226 Building in the southeast corner of the fenced area of the 3000 Area.

Process Description: The unit was used to stage hazardous waste for periods of less than 90 days.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: A maximum of 200 55-gallon (208-liter) drums of nonregulated oils were stored in this area, along with 14 55-gallon (208-liter) drums of antifreeze and paint-reacted materials.

Code: 3000 UUOT **Classification:** Accepted

Names: 3000 UUOT; 3000-12; 3000 Area Underground Used Oil Tank **Reclassification:** Deleted From NPL (9/30/1996)

Type: Storage Tank **Start Date:** 1/1/1983

Status: Inactive **End Date:** 1/1/1993

Description: This was the site of a underground storage tank. The tank has been exhumed, and the site remediated.

Location: The site is located just southeast of the 1226 Building on the west side of the 1226 Loading Dock.

Process Description: The site was used for storage of used oil and lubricants for recycling. The materials were generated by vehicle maintenance activities in the 1226 Building.

Waste Type: Oil

Waste Description: At the time the tank was exhumed, it contained some oil sludge.

Code: 3000/1208 HWSA **Classification:** Accepted

Names: 3000/1208 HWSA; Hazardous Waste Storage Area (1208); 3000 Area 1208 Building Hazardous Waste Storage Area; 3000 Area 1208 HWSA **Reclassification:** Deleted From NPL (9/30/1996)

Type: Storage Pad (<90 day) **Start Date:** 1/1/1967

Status: Inactive **End Date:** 1/1/1995

Description: The site consists of a concrete pad that was used to store waste containers.

Location: The hazardous waste staging area was located at the northeast corner of the 1208 Building Shop

in the 3000 Area.

Process Description: The unit was used to stage hazardous waste for periods less than 90 days.

Related Sites/ Structures: The hazardous waste staging area was associated with the 1208 Building Paint Shop.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: Typical wastes contained in the staging area included paints and solvents. The unit received approximately 300 gallons (1,140 liters) per year.

Code: 3000/1226 HWSA **Classification:** Accepted
Names: 3000/1226 HWSA; Hazardous Waste Storage Area (1226); 3000 Area 1226 Building Hazardous Waste Storage Area; 3000 Area 1226 HWSA **Reclassification:** Deleted From NPL (9/30/1996)

Type: Storage Pad (<90 day) **Start Date:** 1/1/1954

Status: Inactive **End Date:** 1/1/1995

Description: The site was a concrete pad that was used to store waste containers.

Location: The hazardous waste staging area was located at the 1226 Building Automotive Shop.

Process Description: The unit was used to stage hazardous waste for less than 90 days.

Related Sites/ Structures: The hazardous waste staging area was associated with the 1226 Building.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: Typical wastes contained in the staging area included oils, solvents, antifreeze, and degreasers in 55-gallon (208-liter) drums. The unit received approximately 300 gallons (1,140 liters) per year.

Code: 3000/1234 **Classification:** Accepted
Names: 3000/1234; 1234 Building Storage Yard; 1234 Laydown Yard; 3000 Area 1234 Storage Yard **Reclassification:** Deleted From NPL (9/30/1996)

Type: Storage **Start Date:**

Status: Inactive **End Date:** 1/1/1995

Description: This site is an open area surrounded by a fence. Access was controlled by a single locked gate. This site was used for the storage of raw and structural materials. The Simulated High-Level Waste Treatment and Storage (SHLWST) sites were located within this site. The SHLWST was a permitted Treatment, Storage, and Disposal (TSD) unit that was clean closed.

Location: This site is located just southwest of the intersection of Stone Street and "W" Avenue.

Related Sites/ Structures: This site was associated with the Simulated High-Level Waste Slurry Treatment and Storage (SHLWST).

Waste Type: Equipment

Waste Description: This area was used for storage of raw materials and equipment. Raw materials included grout used in the Simulated High-Level Waste Slurry Treatment/Storage.

Code: 3000/1240 HWSA **Classification:** Accepted

Names: 3000/1240 HWSA; Hazardous Waste Storage Area (1240); 3000 Area 1240 Building **Reclassification:** Deleted From NPL (9/30/1996)
Hazardous Waste Storage Area; 3000 Area 1240 HWSA

Type: Storage Pad (<90 day) **Start Date:** 1/1/1951

Status: Inactive **End Date:** 1/1/1995

Description: The site consisted of a concrete pad that was used to store waste containers. There were two drains in the storage pad that drained to the soil. The pad contained old stains.

Location: The hazardous waste staging area was located at the southeast corner of the 1240 Building in the 3000 Area.

Process Description: The unit was used to stage hazardous waste for periods less than 90 days.

Related Sites/Structures: The hazardous waste staging area was associated with the 1240 Building.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: Typical wastes contained in the staging area include lubricating oils, cutting oils, solvents, and degreasers in 55-gallon (208-liters) drums. The unit receives approximately 200 gallons (760 liters) per year.

Code: UPR-3000-1 **Classification:** Accepted

Names: UPR-3000-1; Release from the Physical Science Laboratory; UN-3000-1 **Reclassification:** Deleted From NPL (9/30/1996)

Type: Unplanned Release **Start Date:** 1/1/1973

Status: Inactive **End Date:** 1/1/1973

Description: The release site was a sink used only for nonradioactive work in Room 1623 of the Physical Science Laboratory Building. A sign was installed by the sink and the whole middle island was designated plainly as a cold region. The whole middle island was marked with floor tape and a bench top tape to plainly segregate the area from the radioactive area.

Location: UPR-3000-1 originated in the sink in Room 1623 of the Physical Science Laboratory Building. The Physical Science Laboratory Building lies west of the Math Building, south of the Engineering Development Laboratory, and northeast of the intersection of Battelle Boulevard and Stevens Drive in the 3000 Area.

Release Description: A technician disposed of 1,650 milliliters of waste cesium-134 solution into a cold drain that empties into the Richland City sewer system.

Related Sites/Structures: UPR-3000-1 was associated with the sink in Room 1623 of the Physical Science Laboratory Building.

Waste Type: Chemicals

Waste Description: The waste consisted of a tracer solution containing 2 microcuries of cesium-134.

1100-IU-1

Code: 600-28 **Classification:** Accepted
Names: 600-28; Rattlesnake Construction Dump **Reclassification:** Deleted From NPL (9/30/1996)
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site consists of numerous low piles of excavated soil, rock, and construction debris. This site has a very irregular slope. Sagebrush and other vegetation are growing on the piles.
Location: This site is located just north of the Nike Missile Launch Site H-52-L at Rattlesnake Mountain.
Waste Type: Asbestos (non-friable)
Waste Description: The waste consists of a small quantity of transite siding and asbestos pipe.
Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: The site contains numerous empty paint cans.

Code: 600-112 **Classification:** Accepted
Names: 600-112; 6652-C Space Science Laboratory Active Septic Tank; 6652-C SSL Active Septic Tank; 6652-C SSLAST **Reclassification:** Deleted From NPL (9/30/1996)
Type: Septic Tank **Start Date:** 1/1/1955
Status: Inactive **End Date:** 1/1/1994
Description: The site consists of a concrete septic tank with two square access lids and a retention tank connected to the outlet of the septic tank. Both structures are underground. There is no visual evidence of a second septic tank or a retention tank. There is a chained area marked with signs stating "Caution, Sanitary Tile Field".
Location: This site is located on the southeast side of the 6652-C Space Science Laboratory Building. This laboratory is located at the top of Rattlesnake Mountain, inside the fenced boundary.
Process Description: This site provided sanitary sewage disposal for the 6652-C Space Science Laboratory. This laboratory was formerly the barricades and bachelor officers quarters for the U. S. Army Nike missile radar site H-52-C. From 1955 to 1960 the U. S. Army used this facility, and from 1967 to 1994 Battelle Northwest used this site.

Related Sites/ Structures: The associated structure is the 6652-C Space Science Laboratory.

Waste Type: Sanitary Sewage
Waste Description: The unit received sanitary wastewater.

Code: 600-113 **Classification:** Accepted
Names: 600-113; 6607-15; 6652-C Space Science Laboratory Inactive Septic Tank; 6652-C SSL Inactive Septic Tank; 6652-C SSLIST **Reclassification:** Deleted From NPL (9/30/1996)

Description: This site consists of a septic tank with a round base and a 72 centimeter access lid, a distribution box covered with a wooden lid, a square diverter box, and the connecting drain field.

Location: This site is located at the Fitzner/Eberhardt Arid Lands Ecology headquarters at the foot of Rattlesnake Mountain, on its east side.

Process Description: From 1955 to 1960 this site provided sanitary sewage disposal for the officers quarters, the barracks, the mess hall, and the administration building at the former U. S. Army Nike Missile Launch Site H-52-L.

Related Sites/Structures: The 6652-I, 6652-J, and 6652-H Buildings at the Arid Lands Ecology Reserve (ALE) headquarters were serviced by this system.

Waste Type: Sanitary Sewage

Waste Description: The unit received sanitary wastewater.

Closure Info: The septic system was abandoned per the requirements of Washington Administrative Code 246-272-1851. All septage inside the tank was removed and the empty tank was filled to eliminate void spaces. Per an agreement with the Washington Department of Health, the septic system lids were left in place.

Code: 600-116	Classification: Accepted
Names: 600-116; Rattlesnake Mountain Nike Missile Base; RMNMB	Reclassification: Deleted From NPL (9/30/1996)
Type: Military Compound	Start Date: 1/1/1955
Status: Inactive	End Date: 1/1/1961

Description: This site consists of a former U. S. Army Nike Missile Base. The base is split into two parts: the radar site is on top of Rattlesnake Mountain and the missile launch area is at the foot of Rattlesnake Mountain on the southeast slope. Some of these facilities were subsequently used by Battelle Northwest.

Location: The site is located at the summit of Rattlesnake Mountain and the toe of the southeast slope.

Process Description: The site is a former NIKE missile base consisting of structures which supported missile launch, control, and maintenance functions, as well as living quarters for base personnel and storage buildings for hazardous substances used in the maintenance of the physical plant and missile operations. As of July 1999, all base facilities had been abandoned with the exception of 6652L, the underground missile bunkers, which were actively being used for an experiment according to a sign outside the door. The large observatory (Dome 1) is also still operating (as of 8/2001) and under the control of a non-profit organization, the Alliance for the Advancement of Science through Astronomy.

Related Sites/Structures: Site Codes 600-112, 600-113, 600-114, and 600-115 are septic tanks associated with this site. Site 600-270 is the Horseshoe Landfill, and site 600-271 is the Nike Missile Base Landfill. The following buildings are found at the site: 6652C (Space Science Laboratory), 6652CSHED (Storage Building), 6652D (Pumphouse), 6651DOME1 (Observatory), 6652DOME2 (Small Observatory), 6652E (Garden Building), 6652G (ALE Field Storage), 6652H (ALE Laboratory I), 6652I (ALE Headquarters), 6652J (ALE Laboratory II), 6652K, 6652L (Underground Missile Bunkers), 6652LP (Rattlesnake Mountain Lower Pumphouse), 6652M (Fallout Laboratory), 6652O (Missile Assembly and Test Building), 6652P (Generator Building), 6652R (Paint Shed/ Flammable Storage Block Shed), and 6652UP (Rattlesnake Mountain Upper Pumphouse). The following buildings were used by PNNL and are recorded as being

contaminated as of 1998: 6652C, Space Science Laboratory on top of Rattlesnake Mt., including 6652D, the Fire System Pumphouse (lead-based paint, PCBs in light fixture ballasts, mercury switches, and asbestos insulation are suspected based on the age of the facility) 6652C-SHED, also on top of Rattlesnake Mt., includes both an upper pumphouse (6652-UP and Lower Pumphouse (6652-LP) (The shed has asbestos siding and shingles). 6652E, the Garden Building (Sealed neutron probes are stored in the building as of 11/6/1998 for field tests). 6652DOME1 This is the observatory on Rattlesnake Mt. (A slight potential exists for lead-based paint and mercury switches). This facility is still (8/2001) operating and under the control of Alliance for the Advancement of Science through Astronomy (AASTA). 6652G, the ALE Field Storage building (The building has asbestos tiles, siding, and insulation, and may have lead-based paint and mercury switches). 6652H and 6652I (Connected buildings; Labs 202, 204, and 206 previously contained radioactively contaminated equipment and ductwork, including HEPA filters these were removed in August 2000. Also reported at the site in the Vulnerability and Legacy report are PCBs, which may be in transformers and ballasts, lead-based paint may have been used for the building, asbestos tile and insulation are present, and mercury may be in switches and thermostats). 6652J (Lead-based paint and lead sheets in the vent lines are possible, mercury is expected in the thermostats, and floor tiles are asbestos). 6652L, the Nike missile bunkers (PCBs are expected in light ballasts, lead is expected in the paint, lead batteries, and in the form of 20 tons of lead bricks, mercury is suspected in light switches, freons are expected in the refrigerant system, and asbestos is in the tiles, insulation, and siding). 6652M, the Fallout laboratory (There is potential for lead-based paint and lead around the vent pipes on the roof).

Waste Type: Ordnance

Waste Description: The site previously contained unexploded ordnance waste, according to DOE/RL-92-67.

Waste Type: Asbestos (friable)

Waste Description: The site contains PCB's from transformers, asbestos in insulation, tiles, and siding, mercury in switches, and lead-based paint and bricks in various buildings.

Closure Info: Prior to intrusive investigations at the two landfills, Horseshoe and Nike Base, geophysical surveys were conducted by Golder to identify areas where wastes were present. Eleven anomalous areas within the 2.8 hectare (6.9 acre) Horseshoe Landfill site and nine anomalous areas within the 1.9 hectare (4.6 acre) Nike Base Landfill were identified. See Sites 600-270 and 600-271.

In 1994, Geophysical investigations were done to identify underground storage tanks (USTs) in the area. Two 7600 liter (2000 gallon) underground fuel storage tanks were identified at buildings 6652-G and 6652-H. These two tanks were removed. The soil beneath the tanks was sampled and found to be clean. 4.6 cubic meters (6 cubic yards) of petroleum contaminated soil was found inside another underground fuel storage tank at 6652-G. This soil was taken to a landfarm in to 100 Area. Other UST's were identified at 6652-H, 6652-I and 6652-J. One abandoned fuel oil UST, with an unknown volume, was found south of 6652-H.

One 22,800 liter (6000 gallon) underground diesel fuel tank was identified near the observatory dome, at 6652-C. This tank was closed in place in 1994.

Type: Valve Pit **Start Date:** 1/1/1974
Status: Inactive **End Date:**

Description: The unit is an underground structure with reinforced concrete walls, floor, and cover blocks.

Location: The valve pit is located inside the 241-A Tank Farm complex, south of tanks 241-A-101 and 241-A-102.

Process Description: The 241-A Tank Farm valve pits were used to route wastes to and from the 242-A Evaporator; 241-AN, 241-AW, 241-AY, and 241-AZ Tank Farms, PUREX and the 244-A DCRT. The 204-AR Facility was connected to 241-A-A, but waste was re-routed to 241-AW-A valve pit in 2003 when line LIQW-702 was tied into line SN-220 . Transfers from 244-A may include cross-site, 244-CR, and B-Plant wastes.

Related Sites/Structures: The unit is associated with 241-A-350, 241-A Tank Farm, 200-E-167-PL, 200-E-210-PL.

Waste Type: Process Effluent

Waste Description: The 241-A Tank Farm valve pits are used to route wastes to and from the 242-A Evaporator; 241-AN, 241-AW, 241-AY, and 241-AZ Tank Farms; PUREX; and the 244-A DCRT. The 204-AR Facility was connected to 241-A-A, but waste was re-routed to 241-AW-A valve pit in 2003 when line LIQW-702 was tied into line SN-220 . Transfers from 244-A may include cross-site, 244-CR, and B-Plant wastes.

Code: 241-A-B **Classification:** Accepted

Names: 241-A-B; 241-A-B Diversion Box; 241-A-B Structural Valve Pit **Reclassification:** None

Type: Valve Pit **Start Date:** 1/1/1974
Status: Inactive **End Date:**

Description: The unit is an underground reinforced concrete structure with walls, a floor, and cover blocks.

Location: The valve pit is located inside the 241-A Tank Farm complex, south of tanks 241-A-101 and 241-A-102.

Process Description: The 241-A Tank Farm valve pits were used to route wastes to and from the 242-A Evaporator; 241-AN, 241-AW, 241-AY, and 241-AZ Tank Farms; PUREX; and the 244-A DCRT. Transfers from 244-A may have included cross-site, 244-CR, and B-Plant wastes.

Related Sites/Structures: This unit is associated with 241-A-350, 241-A Tank Farm, 200-E-167-PL, 200-E-210-PL.

Waste Type: Process Effluent

Waste Description: The 241-A Tank Farm valve pits are used to route wastes to and from the 242-A Evaporator; 241-AN, 241-AW, 241-AY, and 241-AZ Tank Farms; PUREX; and the 244-A DCRT. Transfers from 244-A may include cross-site, 244-CR, and B-Plant wastes.

Code: 241-A-101 **Classification:** Accepted

Names: 241-A-101; 241-A-TK-101 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1956
Status: Inactive **End Date:** 1/1/1980

Description: The unit is carbon-steel lined, with a reinforced concrete shell, dome, and base. The dome is

located below grade for shielding. This is a third-generation tank with an increased operating depth and a flat (instead of dished) bottom.

Location: The 241-A-101 tank is located in the southwestern portion of the 241-A Tank Farm.

Process Description: The tank is used for the storage of mixed waste generated at Hanford.

Waste Type: Storage Tank

Waste Description: Activity in Tank 241-A-101 began when it was filled with PUREX high-level waste and organic wash waste in 1956. Activity ceased when the tank was deactivated in November 1980.

Code: 241-A-102 **Classification:** Accepted

Names: 241-A-102; 241-A-TK-102 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1956

Status: Inactive **End Date:** 1/1/1980

Description: The unit is carbon-steel lined, with a reinforced concrete shell, dome, and base. The dome is located below grade for shielding. This is a third-generation tank with an increased operating depth and a flat (instead of dished) bottom.

Location: The 241-A-102 tank is located in the southwestern portion of the 241-A Tank Farm.

Process Description: The tank is used for the storage of mixed waste generated at Hanford.

Waste Type: Storage Tank

Waste Description: Tank 241-A-102 was filled with PUREX waste in 1956. The tank was declared deactivated in November 1980 and intrusion prevention was completed during 1982. The tank was interim stabilized in August 1989 after most of the supernatant was pumped. The tank waste is classified as double-shell slurry feed.

Code: 241-A-103 **Classification:** Accepted

Names: 241-A-103; 241-A-TK-103 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1956

Status: Inactive **End Date:** 1/1/1980

Description: The unit is carbon-steel lined, with a reinforced concrete shell, dome, and base. The dome is located below grade for shielding. This is a third-generation tank with an increased operating depth and a flat (instead of dished) bottom.

Location: The 241-A-103 tank is located in the southern portion of the 241-A Tank Farm.

Process Description: The tank is used for the storage of mixed waste generated at Hanford.

Waste Type: Storage Tank

Waste Description: Tank 241-A-103 was filled with self-concentrating PUREX waste from 1956 until 1969. Tank 241-A-103 was declared inactive in August 1980.

Code: 241-A-104 **Classification:** Accepted

Names: 241-A-104; 241-A-TK-104 **Reclassification:** None

Code:	241-A-350	Classification:	Accepted
Names:	241-A-350; 241-A-350 Catch Tank; 241-A-350 Drainage Lift Station	Reclassification:	None
Type:	Catch Tank	Start Date:	1/1/1956
Status:	Inactive	End Date:	1/1/2005
Description:	The unit is an underground reinforced concrete pump pit, with a cover block. The pump pit drains any leaks from the pump through the pump pit floor drain to an 800-gallon (3000-liter) stainless steel tank below.		
Location:	The unit is located inside the 241-A Tank Farm fence, southeast of tank 241-A-106.		
Process Description:	The unit is designed to receive drainage from the 241-A-A and 241-A-B valve pits, 241-A service pit, 241-A&B flush pits, 241-A clean out boxes, 241-A-431 ventilation equipment, and out of specification 241-A-207 retention basin solution.		
Related Sites/ Structures:	The unit is associated with 241-A Tank Farm and 241-A-A and 241-A-B diversion boxes and 207-A.		
Waste Type:	Storage Tank		
Waste Description:	This unit contains aging PUREX high-level waste, PUREX acid concentrator waste, organic wash waste, and 241-A-207 Retention Basin solution.		

Code:	241-A-417	Classification:	Accepted
Names:	241-A-417; 241-A-417 Condensate Tank	Reclassification:	None
Type:	Catch Tank	Start Date:	1/1/1959
Status:	Inactive	End Date:	1/1/2005
Description:	This unit is an underground cylindrical concrete vault lined with an all welded steel liner. Two overflow lines near the top of the vault prevent overflow of the tank. Above the tank are two rectangular pits, a pump pit and a valve pit. The floor of both pits slope to drains that empty to the tank.		
Location:	The tank is located inside the 241-A Tank Farm fence, east of the 241-A-702 Building.		
Release Description:	On March 25, 1980, a routine pressure test of the underground F-100 condensate return pipeline from the AX-501 Valve Pit to the 241-A-417 condensate catch tank failed. An April 3, 1980 investigation found a leak at the flange connection. An excavation at the pipeline leak was done. Two barrels of contaminated soil, reading 10,000 counts per minute, was taken to a burial ground. A new gasket was installed.		
Process Description:	This unit collects condensate from the 241-A-401 Condenser House, 241-A-702, and from 241-AZ-154. Condensate may be pumped back to the 241-AX Tank Farms or overflow to the 216-A-24 Crib.		
Related Sites/ Structures:	The unit is associated with 241-A Tank Farm, 241-AX Tank Farm, and the 216-A-24 Crib.		
Waste Type:	Steam Condensate		
Waste Description:	This unit collects condensate for the 241-A-702 process condensate, the 241-A-401 process condensate, and the 241-AZ-154 steam condensate.		

Code: 241-A-431 **Classification:** Accepted
Names: 241-A-431; 241-A-431 Tank Farm Ventilation Building; 241-A-431 Ventilation Building **Reclassification:** None
Type: Process Unit/Plant **Start Date:** 1/1/1955
Status: Inactive **End Date:** 1/1/1969

Description: The unit is a concrete structure, with the lower portion below grade. The unit is divided into two sections. One section houses the ventilation equipment. The other section houses the de-entrainment equipment. The building is 8 meters (25 feet) high, with the lower 4.9 meters (16 feet) below grade.

Location: The unit is located southeast of the 241-A-103 Tank, inside the 241-A Tank Farm fence.

Process Description: This structure is a tank farm ventilation building that provided off gas de-entrainment for the 241-A Tank Farm and also received the 296-A-11 Stack drainage.

Related Sites/ Structures: The building is associated with the 241-A Tank Farm, 216-A-16, 216-A-17, 216-A-23-A and 216-A-23-B French Drains, 216-A-34, 216-A-19, 216-A-20 and the 296-A-11 Stack.

Waste Type: Equipment
Waste Description: The unit contains radioactively contaminated equipment and concrete. It provided off-gas de-entrainment for the 241-A Tank Farm and also received the 296-A-11 Stack drainage.

Code: 241-A-501 **Classification:** Accepted
Names: 241-A-501; 241-A-501 Contact Condenser Valve Pit **Reclassification:** None
Type: Valve Pit **Start Date:**
Status: Inactive **End Date:**

Location: The valve pit is located inside 241-A Tank Farm, west of 241-A-152 diversion box and east of 241-A-106 tank.

Process Description: The 241-A-501 valve pit received raw water and cooling water from the PUREX facility, via the 241-A201 storage tank. The cooling water ran out of the valve pit to the E-411 (EP-241-A-161) and E-412 (EP-241-A-162) contact condensers. The output from the contact condensers went to the 241-A-401 condenser building.

Related Sites/ Structures: The structure is associated with the 216-A-8 crib.

Code: 241-A-702-WS-1 **Classification:** Accepted
Names: 241-A-702-WS-1; 702-A Drain Lines **Reclassification:** None
Type: French Drain **Start Date:** 1/1/1968
Status: Inactive **End Date:** 1/1/1995

Description: The unit is a french drain that received steam condensate from the 241-A-702 Ventilation Building.

Location: The unit is located inside the 241-A Tank Farm fence, west of the 241-A-702 Ventilation Building.

Process The drain is used in association with the 241-A-702 ventilation system. Process steam was used

Description: in steam heaters during normal and reduced operating conditions to raise the temperature of vent gases from the 241-AY and 241-AZ Tanks to prevent wetting of filters. The drain was used in conjunction with a steam trap for the system.

Related Sites/ Structures: The unit is associated with the 241-AY and 241-AZ Tank Farm and the 241-A-702 Ventilation Building.

Waste Type: Steam Condensate

Waste Description: The unit received steam condensate from the 241-A-702 Ventilation Building.

Code: 241-AX-A **Classification:** Accepted

Names: 241-AX-A; 241-AX-A Diversion Box; 241-AX-A Structural Valve Pit; 241-AX-A Valve Pit **Reclassification:** None

Type: Valve Pit **Start Date:** 1/1/1965

Status: Inactive **End Date:**

Description: The unit is an underground reinforced concrete structure with 1 foot (0.31 meter) thick walls and floor.

Location: The 241-AX-A is located inside the 241-AX Tank Farm, southwest of tank 241-AX-104.

Process Description: 241-AX-A direct slurry into tanks or supernate out of tanks by manipulation of the correct valve.

Related Sites/ Structures: This unit is associated with 241-AY-102 and 241-AX Tank Farm. The unit is interconnected with the 241-AX-B Valve Pit, the 241-A-A Pit, the 241-A-B Pit, and the 242-A Evaporator.

Waste Type: Process Effluent

Waste Description: The unit transports waste solutions from processing and decontamination operations. Quantities are variable according to specific plant operation.

Code: 241-AX-B **Classification:** Accepted

Names: 241-AX-B; 241-AX-B Diversion Box; 241-AX-B Structural Valve Pit; 241-AX-B Valve Pit **Reclassification:** None

Type: Valve Pit **Start Date:** 1/1/1965

Status: Inactive **End Date:**

Description: The unit is an underground reinforced concrete structure with 1foot (.31 meters) thick walls and floor.

Location: The 241-AX-B is located inside the 241-AX Tank Farm, southwest of tank 241-AX-104.

Process Description: 241-AX-B directed slurry into tanks or supernate out of tanks by manipulation of the correct valve.

Related Sites/ Structures: The unit is associated with the 241-AY-102 and the 241-AX Tank Farm. The unit is interconnected with the 241-AX-A Valve Pit, the 241-A-A Pit, the 241-A-B Pit, and the 242-A Evaporator.

Waste Type: Process Effluent

Waste Description: The unit transports waste solutions from processing and decontamination operations. Quantities are variable according to specific plant operation.

Code: 241-AX-IX	Classification: Accepted
Names: 241-AX-IX; IMUST; 241-AX Ion Exchanger	Reclassification: None
Type: Storage Tank	Start Date: 1/1/1967
Status: Inactive	End Date: 1/1/1976

Description: The ion exchange system consists of an above ground filter and ion exchange column. The ion exchange column is enclosed in a shielded structure. The ion exchange column sits on top of a 2.4 meter (8 foot) concrete structure.

Location: The 241-AX-IX is located in the southern portion of the 241-AX Tank Farm. It is northeast of the 241-A-417 condensate hold up tank, between the 241-A and 241-AX tank farms.

Process Description: The 241-AX-IX is an ion exchanger comprised of the exchange column and underground piping. The resin column is located inside a shielded structure that is open at the top. It was installed in 1967 and operated from 1973 to 1976 to remove cesium from the 702-A tank vapor condensate, collected in the 241-A-417 tank. Condensate was pumped from 241-A-417 through the filter and into the top of the ion exchange column. The condensate would gravity flow through the column and normally be discharged to the 218-A-8 crib.

Related Sites/ Structures: The system is associated with the 216-A-8 crib.

Waste Type: Equipment

Waste Description: The 241-AX-IX removed cesium from the 702-A tank vapor condensate, collected in the 241-A-417 tank.

Code: 241-AX-101	Classification: Accepted
Names: 241-AX-101; 241-AX-TK-101	Reclassification: None
Type: Single-Shell Tank	Start Date: 1/1/1965
Status: Inactive	End Date: 1/1/1980

Description: The unit is carbon-steel lined, with a reinforced concrete shell, dome, and base. This is a third-generation tank having a flat bottom, and an additional grid of drain slots beneath the steel liner bottom. The dome is below grade for shielding.

Location: The 241-AX-101 tank is located in the northeast corner of the 241-AX Tank Farm.

Process Description: The 241-AX tanks received high level self boiling waste from PUREX operations.

Waste Type: Storage Tank

Waste Description: Double shell slurry feed is waste concentrated just before reacting the sodium aluminate saturation boundary in the evaporator without exceeding the receiver tank composition limit.

Code: 241-AX-102	Classification: Accepted
Names: 241-AX-102; 241-AX-TK-102	Reclassification: None
Type: Single-Shell Tank	Start Date: 1/1/1966
Status: Inactive	End Date: 1/1/1980

Description: The unit is carbon-steel lined, with a reinforced concrete shell, dome, and base. The dome is

below grade for shielding. This is a third-generation tank having a flat bottom, and an additional grid of drain slots beneath the steel liner bottom.

Location: The 241-AX-102 tank is located in the southeast corner of the 241-AX Tank Farm.

Process Description: 241-AX tanks received high-level self boiling waste from PUREX operations.

Waste Type: Storage Tank

Waste Description: This tank received concentrated complexant which is a concentrate product from the evaporation of dilute complexed waste.

Code: 241-AX-103 **Classification:** Accepted

Names: 241-AX-103; 241-AX-TK-103 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1965

Status: Inactive **End Date:** 1/1/1980

Description: The unit is carbon-steel lined, with a reinforced concrete shell, dome, and base. This is a third-generation tank having a flat bottom, and an additional grid of drain slots beneath the steel liner bottom. The dome is below grade for shielding.

Location: The 241-AX-103 tank is located in the northwest corner of the 241-AX Tank Farm.

Process Description: 241-AX tanks received high-level, self-boiling waste from PUREX operations.

Waste Type: Storage Tank

Waste Description: This tank received concentrated complexant which is concentrated product form the evaporation of dilute complexed waste.

Code: 241-AX-104 **Classification:** Accepted

Names: 241-AX-104; 241-AX-TK-104 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1966

Status: Inactive **End Date:** 1/1/1976

Description: The unit is carbon-steel lined, with a reinforced concrete shell, dome, and base. The dome is below grade for shielding. This is a third-generation tank having a flat bottom, and an additional grid of drain slots beneath the steel liner bottom.

Location: The 241-AX-104 tank is located in the southwestern portion of the 241-AX Tank Farm.

Process Description: 241-AX tanks received high level self boiling waste from PUREX operations.

Waste Type: Storage Tank

Waste Description: This tank received non-complexed waste which is a general waste term applied to all Hanford Site non-complexed liquors non-identified as complexed.

Code: 241-AX-152DS **Classification:** Accepted

Names: 241-AX-152DS; 241-AX-152-DS Diverter Station; Line V713; 241-AX-152 Diverter Station **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1965

Process Description: The valve routes and receives tank farm condensate.

Related Sites/ Structures: The unit interconnects AX Tank Farm to the 241-A-417 Pump Pit and Tank.

Waste Type: Storage Tank

Waste Description: The unit receives and routes tank farm condensate.

Code: 241-AY-152 **Classification:** Accepted

Names: 241-AY-152; 241-AY-152 Diverter Station; 241-AY-152 Sluice Transfer Box; Line DR0074 **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1971

Status: Inactive **End Date:** 1/1/1985

Description: The unit is an underground, reinforced concrete structure.

Location: 241-AY-152 is located in the western portion of the 241-AX Tank Farm.

Process Description: This unit is used to transport radioactive waste solutions between storage and process facilities.

Related Sites/ Structures: The unit is associated with the 241-A and the 241-AX single-shell tank farm. The drain line is DR0074.

Waste Type: Process Effluent

Waste Description: This diversion box received PUREX organic wash, PUREX acid, PUREX high level waste and B Plant high level waste. Lead shielding may also be contained inside the diversion box.

Waste Type: Equipment

Waste Description: This diversion box contains lead shielding.

Code: 241-AY-501 **Classification:** Accepted

Names: 241-AY-501; 241-AY-501 Condensate Valve Pit **Reclassification:** None

Type: Valve Pit **Start Date:**

Status: Inactive **End Date:**

Description: The pit is an underground cement structure with cement cover blocks. The valve pit has been isolated and weather sealed.

Location: The valve pit is located inside the 241-AX Tank Farm fence, east of tank 241-AY-101 and west of 241-AX-103..

Process Description: The 241-AY-501 valve pit was used to distribute condensate from the 702-A ventilation system to the 241-AX, 241-AY and 241-AZ tank farms. The condensate collected in the 241-A-417 tank.

Related Sites/ Structures: The site is associated with 241-A-417.

Code: UPR-200-E-115
Names: UPR-200-E-115; Contamination Spread Inside 241-AX; UN-200-E-115
Code: UPR-200-E-119
Names: UPR-200-E-119; Contamination Spread Inside 241-AX; UN-200-E-119

Code: UPR-200-E-126
Names: UPR-200-E-126; 241-A-105 Tank Leak; UN-200-E-126

Code: 200-E-200-PL **Classification:** Accepted
Names: 200-E-200-PL; Lines 801, 802, 806 and 805; Pipelines from 244-AR Vault to 241-AY-152 and 241-A-153 Diversion Boxes **Reclassification:** None
Type: Direct Buried Tank Farm Pipeline **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is four underground, 15 centimeter (6 inch) diameter carbon steel pipelines buried in the same soil trench. The lines split into a "Y" east of the 241-A Tank Farm fence. Lines 802 and 806 divert to 241-AY-152 Diversion Box. Lines 801 and 805 divert to the 241-A-153 Diversion Box.
Location: The pipelines extend from the 244-AR Vault building to the 241-A Tank Farm. The lines cross under Buffalo Ave.
Related Sites/ Structures: The transfer line is associated with 244-AR Vault, 241-A-153 and 241-AY-152.

Code: 2607-EC **Classification:** Accepted
Names: 2607-EC **Reclassification:** None
Type: Septic Tank **Start Date:** 1/1/1963
Status: Inactive **End Date:**
Description: This unit includes a septic tank and dry well.
Location: HNF-SD-LL-SP-001 shows the location of the septic tank in the northeast corner of 241-A tank farm, near the fence.
Related Sites/ Structures: HNF-6612 says the septic tank is associated with 241-AR-271.
Waste Type: Sanitary Sewage
Waste Description: Sanitary wastewater and sewage. In 1995, the estimated rate of waste generation is 0.45 cu m/d.

Code: 2607-ED **Classification:** Accepted
Names: 2607-ED **Reclassification:** None
Type: Septic Tank **Start Date:** 1/1/1980
Status: Inactive **End Date:**
Description: The 2607-ED Septic Tank receives sanitary wastewater and sewage from the 2707-AX Building

and drains to the drain field. The drain field has a capacity of 257 gallons (973 liters) per day.

Location: This unit lies south of the 241-AX-102 tank, inside the tank farm fence.

Process Description: The 2607-ED Septic Tank and associated drain field are designed to accept sanitary sewer effluent from the 2707-AX Building.

Related Sites/ Structures: The 2607-ED Septic Tank is associated with the 2707-AX Building and lies within the AX Tank Farm.

Waste Type: Sanitary Sewage

Waste Description: The 2607-ED Septic Tank receives sanitary wastewater and sewage from the 2707-AX Building at an estimated rate of 10 cubic feet (0.28 cubic meters) per day.

WMA B/BX/BY

Code: 241-B-101 **Classification:** Accepted
Names: 241-B-101; 241-B-TK-101 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1945
Status: Inactive **End Date:** 1/1/1974

Description: The unit is comprised of a carbon steel liner within a reinforced concrete shell, 9 meters (30 feet) high, with a capacity of 2,017,405 liters (533,000 gallons). The bottom is 11.3 meters (37 feet) below grade, and the dome is located below grade for shielding purposes. This type was built to the original single-shell design, having a dished bottom and a 5.2 meters (17 feet) operating depth. The tank is passively ventilated.

Location: The tank is located about 914 meters (3,000 feet) north northeast of the 221-B building.

Release Description: A leak of 30,280 liters (8,000 gallons) occurred prior to or during 1974. The leak estimate of 30,280 liters (8,000 gallons) is an average total from 19 tanks.

Waste Type: Storage Tank

Waste Description: Initially tank B-101 received metal waste in 1945. The tank received and transferred waste via cascade lines from 1945 until 1963. During 1953, B-101 processed feed for U Plant. From 1953 until 1963, the tank contained supernatant containing evaporator bottoms waste from 241-B tanks. During 1957, in-farm scavenged feed was sent to the 244-CR Vault. From 1960 until 1970, B-101 received wastewater. Also, it was found that during 1960 wastewater leaked into the pipe encasement which drained to B-101. During 1963 the tank received PUREX coating waste. B-101 received B Plant high-level waste (Cell 23) from 1969 until 1970. From 1970 until 1973, the tank received B Plant, Cell 23 evaporator bottoms. The tank also received bismuth phosphate metal waste and waste in route to in-tank solidification. Presently, the waste material is classified as non-complexed and has a total waste volume of 427,705 liters (113,000 gallons). Sludge comprises the total 427,705 liters (113,000 gallons). There is no saltcake or pumpable liquid and 6,000 gallons of drainable interstitial liquid remaining. An analysis was conducted on a B-101 sludge sample in February 1976. The sample was found to have a consistency of soft mud and was dark brown. A heat generation rate based on strontium-89, strontium-90, and cesium-137 was calculated to be 0.0201 watts/liter of sludge. The resulting solids remaining in this tank (based on core samples) contain an estimated 4 million Curies of strontium (92,000 BTU/h). The curie content listed is not decayed to a consistent date; therefore, a cumulative total is inappropriate.

Reported Date: April 30, 1996

Code: 241-B-102 **Classification:** Accepted
Names: 241-B-102; 241-B-TK-102 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1945
Status: Inactive **End Date:** 1/1/1978

Description: The unit is comprised of a carbon steel liner within a reinforced concrete shell, 9 meters (30 feet) high, with a capacity of 2,017,405 liters (533,000 gallons). The bottom is 11.3 meters (37 feet) below grade, and the dome is located below grade for shielding purposes. This type was built to the original single-shell design, having a dished bottom and a 5.2 meters (17 feet) operating depth. Tank 241-B-102 is the second tank in a "cascade" connecting it to tanks 241-B-101 and 241-B-103. The tank is passively ventilated.

Location: Tank 241-B-102 is located on the north side of the 200 East Area about 914 meters (3,000 feet)

north northeast of the 221-B building.

Release Description: While pumping supernatant from tank 241-B-102 to tank 241-B-101, tank farm personnel noticed soil discoloration around the 241-B-102 heel pit indicating a leak in the transfer line. Surface soil contamination with readings of 10 R/hr were recorded. The contaminated ground area was immediately covered with asphalt to reduce radionuclide migration. This UPR is reported as UPR-200-E-108.

Waste Type: Storage Tank

Waste Description: Tank 241-B-102 went into service in 1945 by receiving metal waste produced by the bismuth phosphate process. The tank was sluiced in 1953 to remove the metal waste for uranium recovery then filled with a transfer from tank 241-B-105 (the active receiver tank for the 242-B Evaporator). Most of the contents of the tank were sent to tank 241-C-112 in 1957 for ferrocyanide scavenging of the supernate. Later that year the tank received water. The tank stood idle until 1963, when it began to receive cladding waste supernate from other tanks. The tank received a supernatant transfer from 241-B-101 in 1969 and was receiving high level waste from B Plant. Most of this supernate was transferred out of the tank in 1970. The tank received ion-exchange waste (B Plant) which was later transferred in a large supernate transfer in 1971. The tank also received low level waste from B Plant (1972), water waste transfer and pumpable liquids from other single-shell tanks (B-105, 107, and 110) that were being taken out of service (1972-1976). During this time tank 241-B-102 was also transferring supernate to tanks 241-B-103, 241-B-106, and 241-SX-106. The tank also received cladding removal waste supernate from the Plutonium-Uranium Extraction (PUREX) process and supernate from the fission product recovery process at B Plant. The tank also received ion exchange waste and evaporator bottoms from 241-B, -BX, and -C tank farms. Presently, the waste material is classified as non-complexed and has a total waste volume of 121,120 liters (32,000 gallons). Sludge comprises 68,130 liters (18,000 gallons) of the tank contents, saltcake 37,850 liters (10,000 gallons) and there is 15,140 liters (4,000 gallons) of drainable supernatant liquid remaining. The waste level is very low 17.8 centimeters (~7 inches).

Reported Date: April 30, 1996

Code: 241-B-103	Classification: Accepted
Names: 241-B-103; 241-B-TK-103	Reclassification: None
Type: Single-Shell Tank	Start Date: 1/1/1945
Status: Inactive	End Date: 1/1/1977

Description: The unit is a single-shell tank constructed of .3 meter (1 foot) thick reinforced concrete with a 6.4 millimeters (0.25 inch) mild carbon steel liner (ASTM A 283 Grade C) on the bottom and sides and a .38 meter (1.25 foot) thick domed concrete top. The top of the steel liner is 5.5 meters (18 feet) above the bottom of the tank (at the side wall). The tank has a dished bottom, with a maximum depth of 30 centimeters (12 inches) below the side wall of the tank and a 4 foot 1.2 meters (4 feet) radius knuckle. The tank has a 5.2 meters (17 feet) operating depth. The tank is set on a reinforced concrete foundation 11.3 meters (37 feet) below grade. A three-ply cotton fabric waterproofing was applied over the foundation and steel tank. Four coats of primer paint were sprayed on all exposed interior tank surfaces. The tank ceiling dome was covered with three applications of magnesium zincfluorosilicate wash. Lead flashing was used to protect the joint where the steel liner met the concrete dome. Asbestos gaskets were used to seal the manholes in the tank dome. The tank was waterproofed on the sides and top with tar and gunnite. Tank capacity is 2,017,405 liters (533,000 gallons). The tank was covered with approximately 2.2 meters (7.25 feet) of overburden for shielding purposes. Tank 241-B-103 is the third and final tank in a "cascade" connecting to tanks 241-B-101 and 241-B-102. The cascade overflow height is approximately 4.86 meters (192 inches) from the tank bottom (at the

sidewall) and .61 meters (2 feet) below the top of the steel liner. The tank is passively ventilated.

Location: Tank 241-B-103 is located on the north side of the 200 East Area about 3,000 feet (914 m) north northeast of the 221-B building.

Release Description: A leak of 30,280 liters (8,000 gallons) occurred prior to or during 1978. The leak estimate of 30,280 liters (8,000 gallons) is an average total from 19 tanks.

Waste Type: Storage Tank

Waste Description: Tank 241-B-103 went into service in 1945 by receiving waste cascaded from tank 241-B-102 until it was declared full in 1946. The tank was sluiced in 1953 for uranium recovery. From 1954 until 1963 the tank received supernate, evaporator bottoms waste and unknown waste from an unknown source. The tank also received bismuth phosphate metal waste; PUREX coating waste; and supernatant containing ion exchange waste, N Reactor waste, organic wash waste: PNL waste, REDOX high-level waste, coating waste, evaporator bottoms, B Plant low-level waste, decontamination waste, tributyl phosphate waste, and laboratory waste from 241-B, -BX, and -C tank farms. Additional sources of waste are first and second cycle waste from B Plant and in-tank solidification (ITS-1 & ITS-2) evaporator bottoms. Presently, the waste material is classified as non-complexed and has a total waste volume of 59,000 gallons (223,315 L). Sludge is reported to comprise 59,000 gallons (223,315 L) of the tank contents with no saltcake, drainable, or pumpable liquid remaining. However, the Tank Layer Model (Agnew et al. 1994), estimates that the tank contains mostly saltcake 56,000 gallons (211,960 L), with a small amount of metal waste 3,000 gallons (11,355 L). The waste level in the tank is (~14 inches) 35 cm.

Reported Date: May 31, 1996

Code: 241-B-104 **Classification:** Accepted

Names: 241-B-104; 241-B-TK-104 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1946

Status: Inactive **End Date:** 1/1/1972

Description: The single-shell tank is constructed of .3 meters (1 foot) thick reinforced concrete with a 6.4 millimeter (0.25 inch) mild carbon steel liner (ASTM A 283 Grade C) on the bottom sides and a .38 meter (1.25 foot) thick domed concrete top. The top of the steel liner is 5.5 meters (18 feet) above the bottom of the tank (at the side wall). The tank has a dished bottom, with a maximum depth of 30 centimeters (12 inches) below the side wall of the tank and at 1.2 meters (4 foot) radius knuckle. The tank has a 5.2 meters (17 foot) operating depth. The tank is set on a reinforced concrete foundation 11.3 meters (37 feet) below grade. A three-ply cotton fabric waterproofing was applied over the foundation and steel tank. Four coats of primer paint were sprayed on all exposed interior tank surfaces. The tank ceiling dome was covered with three applications of magnesium zincfluorosilicate wash. Lead flashing was used to protect the joint where the steel liner met the concrete dome. Asbestos gaskets were used to seal the manholes in the tank dome. The tank was waterproofed on the sides and top with tar and gunnite. Tank capacity is 2,017,405 liters (533,000 gallons). The tank was covered with approximately 2.2 meters (7.25 feet) of overburden for shielding purposes. The tank is passively ventilated.

Location: Tank 241-B-104 is located on the north side of the 200 East Area about 914 meters (3,000 feet) north northeast of the 221-B building.

Waste Type: Storage Tank

Waste Description: Tank 241-B-104 is equipped to cascade to tank 241-B-105 and is first in the three-tank cascade flow series. The tank received bismuth phosphate first and second-cycle waste; evaporator

bottoms, and supernatant containing evaporator bottoms from the 241-B tanks. Presently, the waste material is classified as non-complexed and has a total waste volume of 371,000 gallons (1,404,235 L). Sludge is reported to comprise 301,000 gallons (1,139,285 L) and saltcake 69,000 (261,165 L). There is 40,000 gallons (151,400 L) pumpable liquid remaining and 47,000 gallons (177,895 L) of drainable liquid remaining. Drainable liquid includes 46,000 gallons (174,110 L) interstitial and 1,000 gallons (3,785 L) of supernatant liquid. The volume of waste converts to a waste level of almost 11 feet (3.4 m). More sample material is needed for full characterization of the waste.

Status: Inactive

End Date: 1/1/1977

Description: The single-shell tank is constructed of .3 meter (1 foot) thick reinforced concrete with a 6.4 millimeters (0.25 inch) mild carbon steel liner (ASTM A 283 Grade C) on the bottom and sides and a .38 meter (1.25 foot) thick domed concrete top. The top of the steel liner is 5.5 meters (18 feet) above the bottom of the tank (at the side wall). The tank has a dished bottom, with a maximum depth of 30 centimeters (12 inches) below the side wall of the tank and a 1.2 meters (4 feet) radius knuckle. The tank has a 5.2 meter (17 feet) operating depth. The tank is set on a reinforced concrete foundation 11.3 meters (37 feet) below grade. A three-ply cotton fabric waterproofing was applied over the foundation and steel tank. Four coats of primer paint were sprayed on all exposed interior tank surfaces. The tank ceiling dome was covered with three applications of magnesium zincfluorosilicate wash. Lead flashing was used to protect the joint where the steel liner met the concrete dome. Asbestos gaskets were used to seal the manholes in the tank dome. The tank was waterproofed on the sides and top with tar and gunnite. Tank capacity is 2,017,405 liters (533,000 gallons). The tank was covered with approximately 2.2 meters (7.25 feet) of overburden for shielding purposes.

Location: Tank 241-B-108 is located on the north side of the 200 East Area about 914 meters (3,000 feet) north northeast of the 221-B building.

Waste Type: Storage Tank

Waste Description: 241-B-108 tank received PUREX coating waste; bismuth phosphate first-cycle waste, and supernatant containing evaporator bottoms and ion exchange waste from the 241-B and -BY tank farms. The tank also received non-complexed waste and 242-B evaporator saltcake waste. Presently, the waste material is classified as non-complexed and has a total waste volume of 94,000 gallons (355,790 L). Sludge is reported to comprise the 94,000 gallons (355,790 L). There is 4,000 gallons (15,140 L) of drainable interstitial liquid remaining and no pumpable liquid remaining. The volume of waste converts to approximately 2.5 feet (.8 m) in the tank.

There have been no samples taken of the tank waste.

Reported Date: May 31, 1996

Code: 241-B-109	Classification: Accepted
Names: 241-B-109; 241-B-TK-109	Reclassification: None

Status: Inactive	End Date: 1/1/1977

Description: The single-shell tank is constructed of .3 meters (1 foot) thick reinforced concrete with a 6.4 millimeter (0.25 inch) mild carbon steel liner (ASTM A 283 Grade C) on the bottom and sides and a .38 meter (1.25 foot) thick domed concrete top. The top of the steel liner is 5.5 meters (18 feet) above the bottom of the tank (at the side wall). The tank has a dished bottom, with a maximum depth of 30 centimeters (12 inches) below the side wall of the tank and a 1.2 meters (4 foot) radius knuckle. The tank has a 5.2 meters (17 foot) operating depth. The tank is set on a reinforced concrete foundation 11.3 meters (37 feet) below grade. A three-ply cotton fabric waterproofing was applied over the foundation and steel tank. Four coats of primer paint were sprayed on all exposed interior tank surfaces. The tank ceiling dome was covered with three applications of magnesium zincfluorosilicate wash. Lead flashing was used to protect the joint where the steel liner met the concrete dome. Asbestos gaskets were used to seal the manholes in the tank dome. The tank was waterproofed on the sides and top with tar and gunnite. Tank capacity is 2,017,405 liters (533,000 gallons). The tank was covered with approximately 2.2 meters (7.25 feet) of overburden for shielding purposes. At present, the tank farm is enclosed by a 1.8 meter (6-foot) high chain link fence. The tanks are marked by yellow riser pipes and the ground surface is covered with gravel.

Location: Tank 241-B-109 is located on the north side of the 200 East Area about 914 meters (3,000 feet) north northeast of the 221-B building.

Waste Type: Storage Tank

Waste Description: 241-B-109 tank received PUREX coating waste; bismuth phosphate first-cycle waste, and supernatant containing evaporator bottoms, and ion exchange waste. The tank also received coating waste from the 241-B, -BY, and -S tank farms, non-complexed waste, waste water, 224-U waste, and 242-B evaporator saltcake waste. Presently, the waste material is classified as non-complexed and has a total waste volume of 127,000 gallons (480,822 L). There is disparity between sources for tank inventories. One source lists sludge for the total waste volume at 8,000 gallons (30,280 L) of drainable interstitial liquid. Another source reports the waste comprises 30,000 gallons (113,550 L) of unknown waste; 13,000 gallons (49,205 L) of sludge; and 84,000 gallons (317,940 L) of saltcake. The volume of waste converts to approximately 3.5 feet (1.1 m) in the tank. There have been no samples taken of the tank waste.

The tanks are marked by yellow riser pipes and the ground surface is covered with gravel.

Location: Tank 241-B-110 is located on the north side of the 200 East Area about 914 meters (3,000 feet) north northeast of the 221-B building.

Release Description: An unplanned release occurred in 1969 when approximately 31,416 liters (8,300 gallons) of waste containing about 4,300 Ci of cesium-137 leaked from tank 241-B-110 contaminating the soil surrounding the tank. The leak volume estimate is based solely on observed liquid level decreases in this tank and is considered to be the most accurate method for estimating leak volumes. This UPR is recorded as UPR-200-E-128.

Waste Type: Storage Tank

Waste Description: 241-B-110 tank received Bismuth phosphate first-cycle waste; bismuth phosphate second-cycle wastes; fission product waste; B Plant high-level waste (waste fractionization); B Plant waste from cells 5 and 6; B Plant flushes; and ion exchange waste; B Plant low-level waste; evaporator bottoms; non-complexed waste; decontamination waste; PUREX high-level waste; in-tank solidification waste; cesium recovery waste; and waste water. The waste material is classified as non-complexed and presently has a total waste volume of 931,001 liters (246,000 gallons). Sludge comprises the total except for 3,785 liters (1,000 gallons) of supernatant liquid. There is 64,345 liters (17,000 gallons) of pumpable liquid remaining. Level adjustments in 1982 and 1985 brought waste level measurements in the tank to current readings. The volume of waste converts to approximately 2.2 meters (7 feet) in the tank. While characterization of the solid contents has been performed, complete analysis of the upper layer must take place to more fully chartacterize this portion of the waste.

The tanks are marked by yellow riser pipes and the ground surface is covered with gravel.

Location: Tank 241-B-111 is located on the north side of the 200 East Area about 914 meters (3,000 feet) north northeast of the 221-B building.

Release Description: A leak of 8,000 gallons (30,280 L) occurred prior to or during 1978. The leak estimate of 30,280 liters (8,000 gallons) is an average total from 19 tanks. Tank B-111 was categorized "questionable integrity" due to the unexplained activity in Dry Wells 20-11-09 and 20-12-06.

Waste Type: Storage Tank

Waste Description: 241-B-111 tank received bismuth phosphate first-cycle waste; bismuth phosphate second-cycle wastes; ion exchange waste (waste fractionization); fission product waste; B Plant waste from cells 5 and 6; evaporator bottoms; non-complexed waste; decontamination waste; PUREX high-level waste; cesium recovery waste; and waste water. The waste material is classified as non-complexed and presently has a total waste volume of 237,000 gallons (897,045 L) comprised of sludge. There is 60,560 liters (16,000 gallons) of pumpable liquid and 83,270 liters (22,000 gallons) of drainable liquid remaining. The volume of waste converts to approximately 2.2 meters (7 feet) in the tank. More sample material is needed for full characterization of tank waste.

The tank is set on a reinforced concrete foundation 37 feet (11.3 m) below grade. A three-ply cotton fabric waterproofing was applied over the foundation and steel tank. Four coats of primer paint were sprayed on all exposed interior tank surfaces. The tank ceiling dome was covered with three applications of magnesium zincfluorosilicate wash. Lead flashing was used to protect the joint where the steel liner met the concrete dome. Asbestos gaskets were used to seal the manholes in the tank dome. The tank was waterproofed on the sides and top with tar and gunnite. Tank capacity is 533,000 gallons (2,017,405 L). The tank was covered with approximately 7.25 feet (2.2 m) of overburden for shielding purposes. At present, the tank farm is enclosed by a 6-foot (1.8 m) high chain link fence. The tanks are marked by yellow riser pipes and the ground surface is covered with gravel.

Location: Tank 241-B-112 is located on the north side of the 200 East Area about 3,000 feet (914 m) north northeast of the 221-B building.

Release Description: A leak of 2,000 gallons (7,570 L) occurred prior to or during 1978. Tank B-112 was categorized "questionable integrity" due to the unexplained activity in Dry Wells 20-12-03 and 20-12-06.

Waste Type: Storage Tank
Waste Description: 241-B-112 tank received bismuth phosphate second-cycle wastes; B Plant low-level waste; fission product waste; ion exchange waste; evaporator bottoms from the 241-B and -BX tanks; non-complexed waste; first cycle waste; decontamination waste; and waste water. The waste material is classified as non-complexed and presently has a total waste volume of 33,000 gallons (124,905 L) comprised of 30,000 gallons (113,550 L) sludge and 3,000 gallons (11,355 L) of drainable supernatant liquid. Another source indicates that the 30,000 gallons (11,355 L) of sludge is composed of 14,000 gallons (52,990 L) of sludge and 16,000 gallons (60,560 L) of salt cake. The volume of waste converts to approximately 1 foot (.3 m) in the tank. Based on analytical results from the 1995 Auger sampling event, the waste in the tank does not appear to present any immediate safety concerns.

Reported Date: May 31, 1996

Code: 241-B-151 **Classification:** Accepted
Names: 241-B-151; 241-B-151 Diversion Box **Reclassification:** None
Type: Diversion Box **Start Date:** 1/1/1945
Status: Inactive **End Date:** 1/1/1984

Description: 241-B-151 Diversion Box is an underground structure constructed of reinforced concrete with a height of approximately 15 feet (4.6 m). Only an approximate 1 foot (.3 m) of this diversion box appears above grade. The outer dimensions are approximately 20 feet (6.1 m) by 9 feet (2.7 m). Wall thickness ranges from about 2 feet (.61 m) for the lower half to a three step progressively thinner thickness to accommodate the three layers of tapered concrete blocks that make up the cover. The cover is made up in sections consisting of fifteen pre-formed concrete blocks. The layers of concrete blocks are arranged in three stacked rows, the bottom row having the shortest length and the top row having the longest length. The tapered ends aid in locating the blocks into place and each block overlaps with the one above and/or below it. Each block is about 20 inches (51 cm) high and range in length from around 6.8 to 8 feet (2 to 2.4 m)

Location: 241-B-151 Diversion Box is located inside 241-B Tank Farm, approximately 66.6 meters (219 feet) south of tank 241-B-110.

Release Description: UPR-200-E-4, UPR-200-E-73.

Process Description: 241-B-151 Diversion Box transferred waste solutions from processing and decontamination operations to the 241-B and 241-BX Tank Farms.

Related Sites/Structures: 241-B-151 Diversion Box is associated with the 241-B-152, 241-B-153 diversion boxes, 241-B Tank Farm, 241-BX Tank Farm and the 241-B-301B catch tank

Waste Type: Process Effluent
Waste Description: This unit was used for transfer of liquid waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. It is estimated that approximately 50 pounds (23 kilograms) of waste lead is also stored in each diversion box.

Code: 241-B-152 **Classification:** Accepted
Names: 241-B-152; 241-B-152 Diversion Box **Reclassification:** None
Type: Diversion Box **Start Date:** 1/1/1945
Status: Inactive **End Date:** 1/1/1984

Description: 241-B-152 Diversion Box is an underground structure constructed of reinforced concrete with a

height of approximately 4.6 meters (15 feet). Approximate 0.3 meters (1 foot) is above grade. The outer dimensions are approximately (8.5 meters (28 feet) by 2.7 meters (9 feet). Wall thickness is progressively thinner to accommodate for three layers of tapered concrete cover blocks. The layers of concrete blocks are arranged in three stacked rows, the bottom row having the shortest length and the top row having the longest length.

Location: The 241-B-152 Diversion Box is located inside the 241-B Tank Farm, approximately 61 meters (200 feet) southwest of tank 241-B-110.

Release Description: UPR-200-E-74 and UPR-200-E-38 occurred at this diversion box.

Process Description: 241-B-152 Diversion Box transferred waste solutions from processing and decontamination operations to the 241-B and 241-BX Tank Farms.

Related Sites/ Structures: 241-B-152 Diversion Box is associated with the 241-B Tank Farm, 241-E-216-PL, 241-B-151, 241-B-153, 241-B-154, 241-B-252, 241-BX-153, and 241-BX-155 diversion boxes and the 241-B-301 Catch Tank.

Waste Type: Process Effluent

Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. It is estimated that approximately 50 pounds (23 kilograms) of waste lead is stored in each diversion box.

Code: 241-B-153 **Classification:** Accepted

Names: 241-B-153; 241-B-153 Diversion Box **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1945

Status: Inactive **End Date:** 1/1/1984

Description: The 241-B-153 Diversion Box is an underground structure constructed of reinforced concrete with a height of approximately 10.4 meters (34 feet). Approximate 0.3 meters (1 foot) is above grade. The outer dimensions are approximately 10.4 meters (34 feet) by 2.7 meters (9 feet). The wall thickness gets progressively thinner to accommodate three layers of tapered concrete cover blocks. The layers of concrete blocks are arranged in three stacked rows.

Location: The 241-B-153 Diversion Box is located inside the 241-B Tank Farm, approximately 23.8 meters (78 feet) south of tank 241-B-110.

Release Description: UPR-200-E-6, UPR-200-E-75 and UPR-200-E-76 are associated with this site.

Process Description: The 241-B-153 Diversion Box transferred waste solutions from processing and decontamination operations to the 241-B and 241-BX Tank Farms.

Related Sites/ Structures: 241-B-153 Diversion Box is associated with the 241-B Tank Farm, 241-B-151 and 241-B-152 diversion boxes and the 241-B-301 Catch Tank.

Waste Type: Process Effluent

Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-B-201 **Classification:** Accepted

Names: 241-B-201; 241-B-TK-201 **Reclassification:** None

Waste Description: Wastes consist of : 224 building wastes (lanthanum fluoride), metal waste, non-complexed waste, and B Plant high-level waste. The waste material is classified as non-complexed and presently has a total waste volume of 102,195 liters (27,000 gallons) comprised of 102,195 liters (27,000 gallons) sludge. There is 11,355 liters (3,000 gallons) of drainable liquid remaining. The volume of waste converts to approximately 3.7 meters (12 feet) depth in the tank.

Reported Date: May 31, 1996

Code: 241-B-203	Classification: Accepted
Names: 241-B-203; 241-B-TK-203	Reclassification: None
Type: Single-Shell Tank	Start Date: 1/1/1951
Status: Inactive	End Date: 1/1/1977

Description: The single-shell tank is the smallest of the tank farm designs with a 20 foot (6.1 m) diameter, a 24.9 foot (7.5 m) operating depth, and a 55,000 gallon (208,175 L) capacity. The tank is constructed of reinforced concrete with a 0.25 inch (6.4 mm) steel liner on the bottom and sides and a 1.58 foot (.48 m) thick domed concrete top. The tank is set on a concrete foundation 37.9 feet (11.5 m) below grade. The tank was covered with approximately 11 feet (3.3 m) of overburden for shielding purposes. At present, the tank farm is enclosed by a 6-foot (1.8 m) high chain link fence. The tanks are marked by yellow riser pipes and the ground surface is covered with gravel.

Location: Tank 241-B-203 is located on the north side of the 200 East Area about 3,000 feet (914 m) north northeast of the 221-B building.

Release Description: Between 1951 and 1977, unplanned release (UPR) occurred when about 300 gallons (1,136 L) of lanthanum fluoride escaped from tank 241-B-203 and contaminated the soil surrounding and beneath the tank. This UPR is recorded as UPR-200-E-130. The leak volume estimate is based solely on observed liquid level decreases in this tank and is considered to be the most accurate method for estimating leak volumes. Operating Limit Deviation Report (OLDR) No. 82-08 was issued in May 1982 because the liquid level exceeded the decrease criterion. Environmental Protection Deviation Report 83-02 was issued in November 1983 because of evidence of liquid level decreases, settling of solids around the tank perimeter, and liner corrosion.

Waste Type: Storage Tank

Waste Description: Wastes consist of : 224 building wastes (lanthanum fluoride), metal waste, and non-complexed waste. The waste material is classified as non-complexed and presently has a total waste volume of 51,000 gallons (193,035 L) comprised of 50,000 gallons (189,250 L) sludge. There is 6,000 gallons (22,710 L) of drainable liquid remaining. The volume of waste converts to approximately just over 21 feet (6.4 m) depth in the tank.

Reported Date: May 31, 1996

Code: 241-B-204	Classification: Accepted
Names: 241-B-204; 241-B-TK-204	Reclassification: None
Type: Single-Shell Tank	Start Date: 1/1/1951
Status: Inactive	End Date: 1/1/1977

Description: The single-shell tank is the smallest of the tank farm designs with a 6.1 meters (20 foot) diameter, a 7.5 meters (24.9 foot) operating depth, and a 208,175 liters (55,000 gallon) capacity. The tank is constructed of reinforced concrete with a 6.4 millimeter (0.25 inch) steel

liner on the bottom and sides and a .48 meters (1.58 foot) thick domed concrete top. The tank is set on a concrete foundation 11.5 meters (37.9 feet) below grade. The tank was covered with approximately 3.3 meters (11 feet) of overburden for shielding purposes. At present, the tank farm is enclosed by a 1.8 meter (6-foot) high chain link fence. The tanks are marked by yellow riser pipes and the ground surface is covered with gravel.

Location: Tank 241-B-204 is located on the north side of the 200 East Area about 914 meters (3,000 feet) north northeast of the 221-B building.

Release Description: Approximately 1,514 liters (400 gallons) leaked from tank 241-B-204 before or during 1984. The leak volume estimate is based solely on observed liquid level decreases in this tank and is considered to be the most accurate method for estimating leak volumes. Environmental Protection Deviation Report 83-02 was issued in November 1983 because of evidence of liquid level decreases, settling of solids around the tank perimeter, and liner corrosion.

Waste Type: Storage Tank

Waste Description: Wastes consist of: 224 building wastes (lanthanum fluoride), metal waste, B Plant flushes, and non-complexed waste. The waste material is classified as non-complexed and presently has a total waste volume of 189,250 liters (50,000 gallons) comprised of 185,465 liters (49,000 gallons) sludge. There is 22,710 liters (6,000 gallons) of drainable liquid remaining. The volume of waste converts to approximately 6.4 meters (21 feet) depth in the tank.

Reported Date: May 31, 1996

Code: 241-B-252	Classification: Accepted
Names: 241-B-252; 241-B-252 Diversion Box	Reclassification: None
Type: Diversion Box	Start Date: 1/1/1945
Status: Inactive	End Date: 1/1/1984

Description: The site is a 0.6 meter (2 foot) thick, reinforced concrete structure, 4.6 meters (15 feet) deep. The outer dimensions are 11 meters (36 feet) long by 2.7 meters (9 feet) wide. There are twenty four 7.6 centimeter (three inch) Hanford type nozzles housed inside. The top of the box is a concrete cover block which usually extends a few inches above grade.

Location: Diversion Box 241-B-252 is located in the northwest corner of the 241-B Tank Farm, east of Baltimore Avenue.

Related Sites/Structures: Diversion Box 241-B-252 interconnects with the following: The 241-B and 241-BY Tank Farms, 241-B-151, 241-B-152, and 241-BX-154 Diversion Boxes, 109-BY Valve Pit, and 241-B-301 Catch Tank.

Waste Type: Process Effluent

Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-B-301	Classification: Accepted
Names: 241-B-301; 241-B-301B; 241-B-301-B Catch Tank; Drain Lines V238 and V312; IMUST; Inactive Miscellaneous Underground Storage Tank	Reclassification: None
Type: Catch Tank	Start Date: 1/1/1945
Status: Inactive	End Date: 1/1/1984

Description: The site is an underground tank, located within the 241-B Tank Farm chin link fence. The tank is surrounded by a steel chain and marked with radiological and IMUST signs. Four yellow risers are visible at the surface.

Location: The 241-B-301 Catch Tank is located on the west side of the 241-B Tank Farm, inside the tank farm fence. It is south of 12th Street and west of Baltimore Ave..

Process Description: The 241-B-301 Catch Tank was designed to collect waste leaks from the 241-B diversion boxes that occurred during transfers.

Related Sites/Structures: The 241-B-301 Catch Tank is connected to the 241-B-151, 241-B-152, 241-B-153, 241-B-154, 241-B-252, 242-B-151 diversion boxes in the 241-B Tank Farm. Lines V312, V238 and V238 are the drain lines from the diversion boxes.

Waste Type: Process Effluent

Waste Description: 1993, the tank was estimated to contain 2230 liters (590 gallons) of supernate and 81648 liters (21,600 gallons) of sludge. Analytical data for tank liquid show moderately basic pH with extremely low levels of fissile materials. Cesium levels are also very low. The radionuclide analyses have been adjusted for 17.4 year radioactive decay (October 1974 to April 1992). From preliminary observations, supernate in this tank would not be In designated as dangerous waste or prove a criticality hazard.

Code: 242-B-151 **Classification:** Accepted

Names: 242-B-151; 242-B Evaporator Building Diversion Box **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1945

Status: Inactive **End Date:** 1/1/1984

Description: Diversion Box 242-B-151 is constructed of reinforced concrete with a height of approximately 4 meters (13 feet). Approximate 0.3 meters (1 foot) of the diversion box concrete cover appears above grade. The outer dimensions are approximately 3.7 meters (12 feet) by 2.4 meters (8 feet). The structure's cover is in sections consisting of three interlocking pre-formed concrete blocks.

Location: Diversion Box 242-B-151 is located inside the 241-B Tank Farm. It is northwest of the 242-B Evaporator building and approximately 16.2 meters (53 feet) south of tanks 241-B-104 and 241-B-107.

Process Description: Diversion boxes and receiving vaults drain to catch tanks or single-shell tanks.

Related Sites/Structures: Diversion Box 242-B-151 connects with the 242-B Evaporator to the 241-B Tank Farm.

Waste Type: Process Effluent

Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. This unit received byproduct cake solution and waste solution from the first decontamination waste cycle from 242-B. This contained ~10% of original fission product, 1% Plutonium, and the remainder of miscellaneous chemicals. the major chemical component was bismuth phosphate. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-BR-152 **Classification:** Accepted

Names:	241-BR-152; 241-BR-152 Diversion Box	Reclassification:	None
Type:	Diversion Box	Start Date:	1/1/1948
Status:	Inactive	End Date:	1/1/1984
Description:	Tank Farm drawings show 241-BR-152 is co-located in a series of three diversion boxes that are joined together. 241-BXR-152 is the center diversion box. 241-BR-152 Diversion Box is on the eastern end and 241-BYR-152 is the most western of the diversion boxes in this group. They are located south of the 241-B-101 tank.		
Location:	Diversion Box 241-BR-152 is located in the southeastern portion of the 241-BY Tank Farm, inside the tank farm fence.		
Process Description:	Diversion boxes and receiving vaults drain to catch tanks or single-shell tanks. Diversion Box 241-BR-152 is constructed of reinforced concrete with walls approximately 3.7 meters (12 feet) high and ranging from .3-.6 m (1-2 feet) thick. The outer dimensions are approximately 12.2 meters (40 feet) by 11 meters (36 feet). The concrete cover is about .3 meters (1 foot) above grade and is made up in sections consisting of thirty interlocking pre-formed concrete blocks. The concrete blocks range in thickness from .37 meters (1.2 feet) to .82 meters (2.7 feet) and are equipped with lifting bails made from approximate 3.43 centimeters (1.35 inch) diameter steel bar. Cranes were used to lift the blocks. The blocks were sealed with a combination of hot sealing compound and a flexcell bituminous fiber expansion joint.		
Related Sites/ Structures:	Diversion Box 241-BR-152 interconnects with the following: 241-BXR-151 Diversion Box, the 241-B Tank Farm, and building 242-B (242-B Evaporator). The transfer line to 241-B Tank Farm is discussed in sitecode 200-E-197-PL.		
Waste Type:	Process Effluent		
Waste Description:	This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. It is estimated that approximately 50 pounds (23 kilograms) of lead shielding may stored in each diversion box.		

Code:	241-BX-101	Classification:	Accepted
Names:	241-BX-101; 241-BX-TK-101	Reclassification:	None
Type:	Single-Shell Tank	Start Date:	1/1/1948
Status:	Inactive	End Date:	1/1/1975
Description:	The 22.9 meter (75 foot) diameter single-shell tank is constructed of .3 meters (1 foot) thick reinforced concrete with a 1 centimeter (0.375 inch) mild carbon steel liner (ASTM A 283 Grade C) on the bottom and sides and a .38 m (1.25 foot) thick domed concrete top. The top of the steel liner is 5.5 meters (18 feet) above the bottom of the tank (at the side wall). The tank has a dished bottom, with a maximum depth of 30 centimeter (12 inches) below the side wall of the tank and a (1.2 m) radius knuckle. The tank has a 16 foot 4.9 meters (4 foot) operating depth. The tank is set on a reinforced concrete foundation about 11.3 meters (37 feet) below grade. A three-ply cotton fabric waterproofing was applied over the foundation and steel tank. Four coats of primer paint were sprayed on all exposed interior tank surfaces. The tank ceiling dome was covered with three applications of magnesium zincfluorosilicate wash. Lead flashing was used to protect the joint where the steel liner met the concrete dome. Asbestos gaskets were used to seal the manholes in the tank dome. The tank was waterproofed on the sides and top with tar and gunnite. Tank capacity is 2,017,405 liters (533,000 gallons). The tank was covered with approximately 2.2 meters (7.25 feet) of overburden for shielding purposes. At present, the tank farm is surrounded by a chain link fence, topped with three strands of barbed wire. The ground surface is covered with gravel and no vegetation is seen.		
Location:	Tank 241-BX-101 is located on the north side of the 200 East Area about 850 meters (2,800		

feet) north of the 221-B (B Plant) building.

Release Description: A leak of 30,280 liters (8,000 gallons) occurred prior to or during 1972. The leak volume estimate is an average of approximately 30,280 liters (8,000 gallons) for 19 tanks.

Waste Type: Storage Tank

Waste Description: 241-B-101 tank received bismuth phosphate metal waste; evaporator bottoms; B Plant low-level waste, ion exchange waste (waste fractionization), and supernatant containing B Plant low-level waste; PUREX organic wash waste, cladding waste, coating waste, #1 acid and concentrator waste, ion exchange waste; REDOX ion exchange waste from 241-BY, -BX, -B, and -C tanks; tributyl phosphate waste; inorganic wash waste; coating waste; uranium recovery waste; complex waste; double-shell slurry feed; evaporator feed; organic wash waste; metal waste; non-complexed waste; waste water; in-tank solidification saltcake; cesium recovery waste. The unit received an inadvertent transfer of ~ 6,813 liters (1,800 gallons) of ARC-359 organic ion exchange resin in early 1972. The waste material is classified as non-complexed and presently has a total waste volume of 162,755 liters (43,000 gallons) comprised of 158,970 liters (42,000 gallons) sludge and 3,785 liters (1,000 gallons) of drainable supernatant liquid. The volume of waste converts to approximately .3 meters (1 foot) in the tank.

Names: 241-BX-102; 241-BX-TK-102	Reclassification: None
Type: Single-Shell Tank	Start Date: 1/1/1948
Status: Inactive	End Date: 1/1/1971

Description: The 22.9 meter (75 foot) diameter single-shell tank is constructed of .3 meters (1 foot) thick reinforced concrete with a 1 centimeter (0.375 inch) mild carbon steel liner (ASTM A 283 Grade C) on the bottom and sides and a .38 m (1.25 foot) thick domed concrete top. The top of the steel liner is 5.5 meters (18 feet) above the bottom of the tank (at the side wall). The tank has a dished bottom, with a maximum depth of 30 centimeters (12 inches) below the side wall of the tank and a 1.2 meters (4 foot) radius knuckle. The tank has a 4.9 meters (16 foot) operating depth. The tank is set on a reinforced concrete foundation about 11.3 meters (37 feet) below grade. A three-ply cotton fabric waterproofing was applied over the foundation and steel tank. Four coats of primer paint were sprayed on all exposed interior tank surfaces. The tank ceiling dome was covered with three applications of magnesium zincfluorosilicate wash. Lead flashing was used to protect the joint where the steel liner met the concrete dome. Asbestos gaskets were used to seal the manholes in the tank dome. The tank was waterproofed on the sides and top with tar and gunnite. Tank capacity is 2,017,405 liters (533,000 gallons). The tank was covered with approximately 2.2 meters (7.25 feet) of overburden for shielding purposes. At present, the tank farm is surrounded by a chain link fence, topped with three strands of barbed wire. The ground surface is covered with gravel and no vegetation is seen.

Location: Tank 241-BX-102 is located on the north side of the 200 East Area about 850 meters (2,800 feet) north of the 221-B (B Plant) building, directly west of the 241-B Tank Farm.

Release Description: The 241-BX-102 tank was overfilled in 1951, causing a large volume of liquid waste to overflow into the soil column. It was estimated that 348,000 liters (91,600 gallons) of tank waste was lost in the 1951 event. Assuming the metal waste stream contained 0.5 pounds of uranium per gallon of liquid waste, approximately 22.5 tons of uranium was released to the soil. A 1971 report identified 264,950 liters (70,000 gallons) was released from this tank prior to or during 1971. Some or all of the found in 1971 can be attributed to the 1951 overflow event.

Waste Type: Storage Tank
Waste Description: 241-BX-102 tank received bismuth phosphate metal waste; diatomaceous earth; supernatant containing tributyl phosphate waste; metal waste; PUREX coating waste; B Plant low level waste; evaporator bottoms from 241-BX, -BY, -B, and -C tanks; organic wash waste; metal waste; non-complexed waste. The waste material is classified as non-complexed and presently has a total waste volume of 363,360 liters (96,000 gallons) comprised of 147,615 liters (39,000 gallons) of unknown waste; 64,345 liters (17,000 gallons) of diatomaceous earth; 151,400 liters (40,000 gallons) of sludge; no pumpable liquid remaining, and 15,140 liters (4,000 gallons) of drainable supernatant liquid. The volume of waste converts to approximately .8 meters (2.5 feet) in the tank.

Location: Tank 241-BX-103 is located on the north side of the 200 East Area about 850 meters (2,800 feet) north of the 221-B (B Plant) building, directly west of the 241-B Tank Farm.

Release Description: The contaminated soil in the vicinity of dry wells 21-03-03, 21-03-05, and 21-03-12 is believed to have been caused by tank overflow and spillage a number of years ago. 113,550 to 340,650 liters (30,000 to 90,000 gallons) of waste spilled on the ground between tank BX-102 and BX-103 in 1951.

Waste Type: Storage Tank
Waste Description: 241-BX-103 tank received bismuth phosphate metal waste; supernatant containing metal waste; tributyl phosphate waste; PUREX coating waste, #1 acid concentrator waste, ion exchange waste, low and high-level waste, and sludge supernatant wastes; organic wash waste; decontamination waste; PNL waste; N Reactor waste; laboratory waste; evaporator feed, evaporator bottoms; REDOX ion exchange waste; non-complexed waste; waste water; B Plant low-level waste from 241-B, -BX, -BY, -C tanks, BXR-002 diversion box, and ER-311 catch tank. The waste material is classified as non-complexed and presently has a total waste volume of 257,380 liters (68,000 gallons) comprised of 234,670 liters (62,000 gallons) of sludge and 22,710 liters (6,000 gallons) of drainable supernatant liquid. There is no pumpable liquid remaining. The volume of waste converts to approximately .5 meters (1.7 feet) in the tank.

The top of the steel liner is 5.5 meters (18 feet) above the bottom of the tank (at the side wall). The tank has a dished bottom, with a maximum depth of 30 centimeters (12 inches) below the side

wall of the tank and a 1.2 meters (4 foot) radius knuckle. The tank has a 4.9 meters (16 foot) operating depth. The tank is set on a reinforced concrete foundation about 11.3 meters (37 feet) below grade. A three-ply cotton fabric waterproofing was applied over the foundation and steel tank. Four coats of primer paint were sprayed on all exposed interior tank surfaces. The tank ceiling dome was covered with three applications of magnesium zincfluorosilicate wash. Lead flashing was used to protect the joint where the steel liner met the concrete dome. Asbestos gaskets were used to seal the manholes in the tank dome. The tank was waterproofed on the sides and top with tar and gunnite. Tank capacity is 2,017,405 liters (533,000 gallons). The tank was covered with approximately 2.2 meters (7.25 feet) of overburden for shielding purposes. At present, the tank farm is surrounded by a chain link fence, topped with three strands of barbed wire. The ground surface is covered with gravel and no vegetation is seen.

Location: Tank 241-BX-105 is located on the north side of the 200 East Area about 850 meters (2,800 feet) north of the 221-B (B Plant) building, directly west of the 241-B Tank Farm.

Waste Type: Storage Tank

Waste Description: 241-BX-105 tank received bismuth phosphate metal waste; PUREX coating waste; ion exchange waste; evaporator bottoms; supernatant containing metal waste; uranium recovery waste; B Plant low-level waste; concentrated reduction and oxidation (REDOX) waste; complexed and non-complexed waste; double-shell slurry feed from 241-BX, -BY, -C, -S, and -SX tanks; tributyl phosphate waste; evaporator feed; waste water. The waste material is classified as non-complexed and presently has a total waste volume of 193,035 liters (51,000 gallons) comprised of 162,755 liters (43,000 gallons) of sludge; 11,355 liters (3,000 gallons) of saltcake; 18,925 liters (5,000 gallons) of supernatant liquid. There remains 41,635 liters (11,000 gallons) drainable liquid and 15,140 liters (4,000 gallons) of pumpable liquid remaining. The volume of waste converts to approximately .3 meters (1 foot) in the tank (WHC-EP-0182-98). It should be noted that recent FIC gauge level readings taken from riser 1 of the tank indicate a waste depth of 24.8 inches (.6 m). Core samples recovered from risers 1 and 8 seem to confirm the waste depth and volume indicated by the FIC gauge (WHC-SD-WM-ER-406, Rev. 0B).

At present, the tank farm is surrounded by a chain link fence, topped with three strands of barbed wire. The ground surface is covered with gravel and no vegetation is seen.

Location: Tank 241-BX-108 is located on the north side of the 200 East Area about 850 meters (2,800 feet) north of the 221-B (B Plant) building, directly west of the 241-B Tank Farm.

Release Description: A leak of about 9,463 liters (2,500 gallons) occurred prior to or during 1974.

Waste Type: Storage Tank

Waste Description: 241-BX-108 tank received bismuth phosphate first-cycle waste; supernatant containing tributyl phosphate waste; PUREX coating waste; B Plant cesium recovery waste; ion exchange waste from 241-BX and -C tanks; non-complexed waste; uranium recovery waste; cladding waste. The waste material is classified as non-complexed and presently has a total waste volume of 98,410 liters (26,000 gallons) comprised of 98,410 liters (26,000 gallons) of sludge. There is 3,785 liters (1,000 gallons) drainable interstitial liquid and no pumpable liquid remaining. The volume of waste converts to about a 10 centimeters (4 inch) depth in the tank.

Code: 241-BX-109	Classification: Accepted
Names: 241-BX-109; 241-BX-TK-109	Reclassification: None
Type: Single-Shell Tank	Start Date: 1/1/1950
Status: Inactive	End Date: 1/1/1974

Description: The 22.9 meters (75 foot) diameter single-shell tank is constructed of .3 meters (1 foot) thick reinforced concrete with a 1 centimeter (0.375 inch) mild carbon steel liner (ASTM A 283 Grade C) on the bottom and sides and a .38 meter (1.25 foot) thick domed concrete top. The top of the steel liner is 5.5 meter (18 feet) above the bottom of the tank (at the side wall). The tank has a dished bottom, with a maximum depth of 30 centimeters (12 inches) below the side wall of the tank and a 1.2 meters (4 foot) radius knuckle. The tank has a 4.9 meters (16 foot) operating depth. The tank is set on a reinforced concrete foundation about 11.3 meters (37 feet) below grade. A three-ply cotton fabric waterproofing was applied over the foundation and steel tank. Four coats of primer paint were sprayed on all exposed interior tank surfaces. The tank ceiling dome was covered with three applications of magnesium zincfluorosilicate wash. Lead flashing was used to protect the joint where the steel liner met the concrete dome. Asbestos gaskets were used to seal the manholes in the tank dome. The tank was waterproofed on the sides and top with tar and gunnite. Tank capacity is 2,017,405 liters (533,000 gallons). The tank was covered with approximately 2.2 metes (7.25 feet) of overburden for shielding purposes. At present, the tank farm is surrounded by a chain link fence, topped with three strands of barbed wire. The ground surface is covered with gravel and no vegetation is seen.

Location: Tank 241-BX-109 is located on the north side of the 200 East Area about 2,800 feet (850 m) north of the 221-B (B Plant) building, directly west of the 241-B Tank Farm.

Waste Type: Storage Tank
Waste Description: 241-BX-109 tank received bismuth phosphate first-cycle waste; tributyl phosphate waste; PUREX coating waste; cesium recovery waste; ion exchange waste (waste fractionization) and supernatant containing tributyl phosphate waste from 241-BY and -C tanks; non-complexed waste; uranium recovery waste; waste water. The waste material is classified as non-complexed and presently has a total waste volume of 730,505 liters (93,000 gallons) comprised of 730,505 liters (193,000 gallons) of sludge. There is 49,205 liters (13,000 gallons) drainable interstitial liquid and 30,280 liters (8,000 gallons) pumpable liquid remaining. The volume of waste converts to about a 1.7 meters (5.5 foot) depth in the tank.

purposes. At present, the tank farm is surrounded by a chain link fence, topped with three strands of barbed wire. The ground surface is covered with gravel and no vegetation is seen.

Location: Tank 241-BX-112 is located on the north side of the 200 East Area about 850 meters (2,800 feet) north of the 221-B (B Plant) building, directly west of the 241-B Tank Farm.

Waste Type: Storage Tank

Waste Description: 241-BX-112 tank received first-cycle waste; evaporator bottoms; supernatant containing evaporator bottoms waste; tri-butyl phosphate; ion exchange waste (waste fractionization); first-cycle waste from 241-C tanks: waste water; PUREX coating waste; non-complexed waste. The waste material is classified as non-complexed and presently has a total waste volume of 624,525 liters (165,000 gallons) comprised of 620,740 liters (164,000 gallons) sludge and 3,785 liters(1,000 gallons) supernatant liquid. There is 30,280 liters (8,000 gallons) drainable liquid and 7,570 liters (2,000 gallons) pumpable liquid remaining. The volume of waste converts to about a 1.4 meters (4.5 foot) depth in the tank.

Code: 241-BX-153 **Classification:** Accepted

Names: 241-BX-153; 241-BX-153 Diversion Box **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1948

Status: Inactive **End Date:** 1/1/1983

Description: Diversion Box 241-BX-153 is constructed of reinforced concrete structure built mostly below grade. Only approximate 38 centimeters (15 inches) of this diversion box appears above grade. The cover blocks are made up in sections consisting of thirty one pre-formed concrete blocks. The layers of concrete blocks are arranged in three stacked rows, the bottom row having the shortest length and the top row having the longest length with 11 total sections. The tapered ends aid in locating the blocks into place and each block overlaps with the one above and/or below it. Each block is about 51 centimeters (20 inches) high and 1.17 meters (46 inches) wide.

Location: Diversion Box 241-BX-153 is located in the southeastern portion of the 241-BX Tank Farm.

Related Sites/Structures: Diversion Box 241-BX-153 interconnects with the following: 241-B-152 diversion box and 241-B-155 diversion box, 200-E-216-PL, 241-BX Tank Farm, 241-BY Tank Farm, and 241-BX-302A Catch Tank.

Waste Type: Process Effluent

Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-BX-302A **Classification:** Accepted

Names: 241-BX-302A; 241-BX-302-A Catch Tank; 9053; 9253; 9453; Drain Lines V357; IMUST; Inactive Miscellaneous Underground Storage Tank **Reclassification:** None

Type: Catch Tank **Start Date:** 1/1/1948

Status: Inactive **End Date:** 1/1/1985

Description: The buried tank is located inside the fenced 241-BX-155 Tank Farm. It is covered with gravel and surrounded with post and chain. The tank is marked with radiological and IMUST signs.

Location: The 241-BX-302A catch tank is located inside the 241-BX Tank Farm, southeast of the 241-BX-101 tank.

Process 241-BX-302A catch tank was designed to collect waste drainage and spills from the diversion

Description: boxes during transfers.

Related Sites/ Structures: 241-BX-302A catch tank is associated with the 241-BR-152, 241-BX-153, 241-BYR-152 and 241-BXR-152 diversion boxes. Lines V357, 9053, 9253, 9453 are the drain lines from the diversion boxes.

Waste Type: Process Effluent

Waste Description: The total tank volume was estimated in 1984 to be 3,160 liters (835 gallons) of sludge with no supernate. The volume of waste converts to a waste level of about 26 cm (10.25 inches) in the tank. The contents of this tank does not meet the definition of dangerous waste (according to Ecology) and in its present condition, poses no immediate environmental or human safety hazard, either from a criticality risk or leakage of hazardous waste.

Code: 244-BX DCRT **Classification:** Accepted

Names: 244-BX DCRT; 244-BX Double-Contained Receiver Tank; 244-BX Receiver Tank; 244-BX Receiver Vault; 244-BX RT; 244-BX-TK/SMP **Reclassification:** None

Type: Receiver Tank **Start Date:** 1/1/1983

Status: Inactive **End Date:** 1/1/2005

Description: 244-BX Receiver Tank is an underground, double-contained receiver tank (DCRT) constructed of carbon steel with a 117,335 liters (31,000 gallons) design capacity. The tank sets lengthwise in a reinforced concrete, steel-lined vault. The lowest portion of the vault is 8.5 m (28 feet) below grade and houses the tank. The upper portion of the vault is comprised of three sections; the pump pit in the southern section comprises almost half the space. The filter pit is in the middle section and the instrumentation pit is in the northern section of this part of the vault.

Location: 244-BX Receiver Vault is located on the north side of the 200 East Area about 847 meters (2,780 feet) north of the 221-B (B Plant) building and about 22.1 meters (72.6 feet) east of tank 241-BX-101.

Related Sites/ Structures: 244-BX Receiver Vault interconnects with the following: 241-B, 241-BX, & 241-BY Tank Farms.

Waste Type: Chemicals

Waste Description: 244-BX Receiver Tank can accept/transport waste from 241-B, 241-BX, & 241-BY Tank Farms. This tank last received waste from the 241-BY-102 and 241-BY-109 Single-Shell Tanks during the 1991 Stabilization Campaign. The tank currently contains 17,636 gallons (66,752 L) of waste. This represents just over one-half of the tank's design capacity.

Code: 241-BXR-151 **Classification:** Accepted

Names: 241-BXR-151; 241-BXR-151 Diversion Box **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1948

Status: Inactive **End Date:** 1/1/1984

Description: Diversion Box 241-BXR-151 is an underground structure constructed of concrete. Approximately 0.3 meters (1 foot) of the diversion box concrete cover appears above grade. The outer dimensions are approximately 14.6 meters (48 feet) by 9.4 meters (30.7 feet). The structure is L shaped from the side view with 4 meters (13 feet) of the north side being 5.1 meters (16.7 feet) high and 5.4 m (17.7 feet) of the southern portion being 2.4 meters (7.75 feet) high. The southern portion of the structure is 2.3 meter (7.5 feet) below grade. The concrete cover is made up in sections consisting of twenty nine interlocking pre-formed concrete blocks.

The concrete blocks are about .9 meters (3 feet) wide and range in thickness from .46 meters (1.5 feet) to .61 meters (2 feet). Each cover block is equipped with lifting bails made from steel bar. The blocks were sealed with a combination of hot sealing compound and a flexcell bituminous fiber expansion joint.

Location: Diversion Box 241-BXR-151 is located in the southern portion of the 241-BX Tank Farm, south of the 241-BX-107 tank.

Process Description: Diversion Box 241-BXR-151 connects with the 244-BXR Vault with the 241-BX Tank Farm.

Related Sites/ Structures: The diversion box is associated with the 244-BXR vault.

Waste Type: Process Effluent

Waste Description: This unit was used for the transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-BXR-152 **Classification:** Accepted

Names: 241-BXR-152; 241-BXR-152 Diversion Box **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1948

Status: Inactive **End Date:** 1/1/1984

Description: 241-BXR-152 is an underground concrete structure. It is co-located in a series of three diversion boxes that are joined together. 241-BXR-152 is the center diversion box. 241-BR-152 Diversion Box is on the eastern end and 241-BYR-152 is on the west end of the diversion box group. It's cover blocks and lifting bails are visible from the surface.

Location: Diversion Box 241-BXR-152 is located in the southeastern portion of the 241-BX Tank Farm, inside the tank farm fence. It is south of the 241-BX-101 tank.

Process Description: Diversion Box 241-BXR-152 is constructed of concrete with a height of approximately 3.4 meters (11.1 feet). Approximately 0.3 meters (1 foot) of the diversion box concrete cover appears above grade. The outer dimensions are approximately (10.7 meters (35 feet) by 11.5 meters (37.8 feet). The structure's cover is in sections consisting of several interlocking pre-formed concrete blocks. Diversion Boxes and receiving vaults drain to catch tanks or single-shell tanks.

Related Sites/ Structures: Diversion Box 241-BXR-152 is associated with the 241-BX Tank Farm and the 241-BX-302A catch tank.

Waste Type: Process Effluent

Waste Description: This unit was used to transfer waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. It is estimated that approximately 50 pounds (23 kilograms) of lead shielding may be stored in each diversion box.

Code: 241-BXR-153 **Classification:** Accepted

Names: 241-BXR-153; 241-BXR-153 Diversion Box; Line 9453 **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1948

Status: Inactive **End Date:** 1/1/1984

Description: The 241-BXR-153 Diversion box is co-located with the 241-BYR-153 Diversion Box. 241-

BXR-153 is on the east side of the 241-BYR-153 Diversion Box. The diversion boxes are underground concrete structures. Their cover blocks and lifting bails are visible from the surface.

Location: Diversion Box 241-BXR-153 is located in the southern portion of the 241-BX Tank Farm, inside the tank farm fence. It is south of the 241-BX-104 tank.

Process Description: Diversion boxes and receiving vaults drain to catch tanks or single-shell tanks. Diversion Box 241-BXR-153 is constructed of concrete with a height of approximately 3.7 meters (12 feet). Approximately 0.3 meters (1 foot) of the diversion box concrete cover appears above grade. The outer dimensions are approximately 11.6 meters (38 feet) by 12 meters (39.3 feet). The structure's cover is in sections consisting of several interlocking pre-formed concrete blocks. The northern section consists of 12 blocks, center section has 11, and the southern section has 8 cover blocks.

Related Sites/Structures: Diversion Box 241-BXR-153 is associated with the 241-BX and 241-BY Tank Farms and the 241-B-152 and 241-B-155 diversion boxes. Line 9453 is the drain line.

Waste Type: Process Effluent

Waste Description: This unit was used to transfer waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. It is estimated that approximately 50 pounds (23 kilograms) of lead shielding may be stored in each diversion box.

Code: 244-BXR VAULT **Classification:** Accepted

Names: 244-BXR Vault; 244-BXR VAULT; IMUST; Inactive Miscellaneous Underground Storage Tank; Lines 9765 and 7453; 244-BXR Receiving Vault **Reclassification:** None

Type: Receiving Vault **Start Date:** 1/1/1948

Status: Inactive **End Date:** 1/1/1985

Description: 244-BXR Vault is an underground concrete structure. Only 0.3 meters (1 foot) of the vault concrete cover appears above grade. The vault is surrounded with post and chain and marked with IMUST signs. The vault houses four tanks of two different sizes in the lower portion of the structure, each within a large concrete chamber. The tanks are numbered BXR-001, BXR-002, BXR-003, and BXR-011 from east to west. Each tank is tied individually to diversion box 241-BXR-151. The concrete cover is made up in sections consisting of twenty-nine interlocking pre-formed concrete blocks. The concrete blocks are about 1 meter (3.4 feet) wide and just over 2.4 meters (8 feet) long.

Location: The 244-BXR Vault is located in the southern portion of the 241-BY Tank Farm, inside the tank farm fence.

Related Sites/Structures: The 244-BXR Vault interconnects with the 241-BXR-151 Diversion Box and the 241-BX Tank Farm. Lines 9765 and 7453 are the drain lines to the 244-BXR sump.

Waste Type: Storage Tank

Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. The waste volumes in tanks 244-BXR-001, 244-BXR-002, 244-BXR-003, and 244-BXR-011 are currently unknown. WHC-EP-0560 indicates large volumes of sludge and high cesium-137 concentrations in the 244-BXR vault. In addition, the nitrate and nitrite contents are elevated and could cause this waste to be designated as "dangerous" under the EPA and Ecology criteria. This vault does not pose a criticality hazard from the levels of fissionable isotopes that were found.

This Site has the Following SubSites:

for samples taken from the tank and sump in 1984 are available in WHC-SD-EN-ES-040, Rev 0. The sump may contain ferrocyanide discharged from the 241-BXR-151 diversion box.

End Date:

Description: Tank 244-BXR-003 is located in an individual cell inside of the 244-BXR Vault. The concrete cell contains a sump with a capacity of 170 liters (45 gallons). Each cell within the vault is separated from the adjacent cell by a 0.6 meter (2 foot) thick concrete wall. The tank is constructed of 0.64 centimeter (1/4 inch) Type 347 stainless steel and is 4.3 meters (14 feet) in diameter, 3.7 meters (12 feet) tall, and has a nominal capacity of 56,800 liters (15,000 gallons). The tank contains in-tank cooling coils. When in service, Tank 244-BXR-002 and Tank 244-BXR-003 were configured and used identically. The tanks were used as a pair in waste blending operations. Under normal conditions a slurry stream was brought in from tank 244-BXR-001 and mixed with nitric acid. Tank 244-BXR-003 received a maximum of 53,860 liters (14,230 gallons) per day from tank 244-BXR-001 and a maximum of 29,500 liters (7,800 gallons) per day of nitric acid. The blended solution was then pumped to Tank 244-BXR-011. Tank 244-BXR-003 was isolated in 1985 as part of the 244-BXR Vault isolation. The results for samples taken from the tank and sump in 1984 are available in WHC-SD-EN-ES-040, Rev 0.

End Date:

Description: Tank 244-BXR-011 is located in an individual cell inside of the 244-BXR Vault. The cell contains a sump with a capacity of 170 liters (45 gallons). Each cell within the vault is separated from the adjacent cell by a 0.6 meter (2 foot) thick concrete wall. The tank is constructed of 0.64 centimeter (1/4 inch) Type 347 stainless steel and is 6.1 meters (20 feet) in diameter, 6.1 meters (20 feet) tall, and has a nominal capacity of 189,000 liters (50,000 gallons). When in service, the tank was used as a pump tank for the Uranium Recovery operations. It received approximately 103,000 liters (27,200 gallons) per day of acid solutions from Tanks 244-BXR-002 and 244-BXR-003. The solutions were pumped from 244-BXR-011 to the 241-ER-151 diverter station and from there to U Plant for uranium recovery. Tank 244-BXR-011 was isolated in 1985 as part of the 244-BXR Vault isolation. The results for a tank solids analysis performed in 1978 are available in WHC-SD-EN-ES-040, Rev. 0. Literature indicates that the wall of the Tank 244-BXR-011 is buckled. Occurrence report 79-70 describes the condition of the tank. The tank failure was due to an overpressure condition on the exterior

of the tank from a higher than allowed liquid level in the cell.

The SubSite is Part Of:

Code: 244-BXR VAULT

Names: 244-BXR Vault; 244-BXR VAULT; IMUST; Inactive Miscellaneous Underground Storage Tank; Lines 9765 and 7453; 244-BXR Receiving Vault

Code: 241-BY-101

Classification: Accepted

Names: 241-BY-101; 241-BY-TK-101

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1950

Status: Inactive

End Date: 1/1/1971

Description: The unit is comprised of a carbon steel liner within a reinforced concrete shell, 11.3 meters (37 feet) high, with a capacity of 2,869,030 liters (758,000 gallons). The bottom of the unit is 13.7 meters (45 feet) below grade, and the dome is located below grade for shielding purposes. This type was built to the original design, having a dished bottom but with an increased operating depth of 7 meters (23 feet).

Location: The 241-BY Tank Farm is directly north of the 241-BX Tank Farm. The 241-BY-101 tank is located in the southeast portion of the 241-BY Tank Farm.

Waste Type: Storage Tank

Waste Description: The tank received bismuth phosphate metal waste and supernatant containing tributyl phosphate waste and evaporator bottoms from 241-BY and -C tank farms. Presently, the waste material is classified as non-complexed and has a total waste volume of 1,465,182 liters (387,000 gallons). Saltcake comprises 1,052,230 liters (278,000 gallons), sludge comprises 412,565 liters (109,000 gallons), and no supernatant. There is no pumpable liquid remaining and 18,925 liters (5,000 gallons) drainable liquid remaining.

Reported Date: April 30, 1996

Code: 241-BY-102

Description: The unit is comprised of a carbon steel liner within a reinforced concrete shell, 11.3 meters (37 feet) high, with a capacity of 2,869,030 liters (758,000 gallons). The bottom of the unit is 13.8 meters (45.3 feet) below grade, and the dome is located below grade for shielding purposes. This type was built to the original design, having a dished bottom but with an increased operating depth of 7 meters (23 feet).

Location: The 241-BY Tank Farm is directly north of the 241-BX Tank Farm. The 241-BY-103 tank is located in the northeast portion of the 241-BY Tank Farm.

Release UPR-200-E-134

Description:

Waste Type: Storage Tank

Waste Bismuth phosphate metal waste; PUREX coating waste; and supernatant containing evaporator bottoms, cladding waste, tributyl phosphate waste, and PUREX high-level and organic wash wastes from 241-BX, -BY, -C, and -B tanks. Currently contains non-complexed waste with a total waste volume of 1,514,000 liters (400,000 gallons). Saltcake comprises 1,480,200 liters (391,000 gallons), sludge comprises 34,065 liters (9,000 gallons), and no supernatant. Pumpable liquid remaining is 518,545 liters 137,000 gallons).

Reported Date: April 30, 1996

Code: 241-BY-104 **Classification:** Accepted
Names: 241-BY-104; 241-BY-TK-104 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1950
Status: Inactive **End Date:** 1/1/1977

Description: The unit is a single-shell tank built in 1948. It is comprised of a carbon steel liner within a reinforced concrete shell, 11.3 meters (37 feet) high, with a capacity of 2,869,030 liters (758,000 gallons). The bottom of the unit is 13.7 meters (45 feet) below grade, and the dome is located below grade for shielding purposes. This type was built to the original design, having a dished bottom but with an increased operating depth of 7 meters (23 feet).

Location: The 241-BY Tank Farm is directly north of the 241-BX Tank Farm. The 241-BY-104 tank is located in the southern portion of the 241-BY Tank Farm.

Process The tank received metal waste via cascade from 241-BX-106 (1951). It overflowed to 241-BY-105 via cascade (1951).

Description:

Waste Type: Storage Tank

Waste Bismuth phosphate metal waste; tributyl phosphate waste; and supernatant containing coating waste, tributyl phosphate waste, ion exchange waste, and evaporator bottoms from 241-BY, -BX, and -C tanks. Tank BY-104 contains metal waste from BX tank farms (1951-4). Received accumulated sludge from other ferrocyanide settling tanks. Coating waste, ion exchange waste, and evaporator bottoms waste was sent to the tank through 1977. Currently contains non-complexed waste with a total waste volume of 1,385,310 liters (406,000 gallons), sludge

comprises 151,400 liters (40,000 gallons), and no supernatant. There is no pumpable liquid remaining and 68,130 liters (18,000 gallons) drainable liquid remaining. This is an ITS-2 unit.

Reported Date: April 30, 1996

Code:	241-BY-105	Classification:	Accepted

Status:	Inactive	End Date:	1/1/1974

Description: The unit is a single-shell tank built in 1948-1949. It is comprised of a carbon steel liner within a reinforced concrete shell, 11.3 meters (37 feet) high, with a capacity of 2,869,030 liters (758,000 gallons). The bottom of the unit is 13.7 meters (45 feet) below grade, and the dome is located below grade for shielding purposes. This type was built to the original design, having a dished bottom but with an increased operating depth of 7 meters (23 feet).

Location: The 241-BY Tank Farm is directly north of the 241-BX Tank Farm. The 241-BY-105 tank is located in the central portion of the 241-BY Tank Farm.

Release Description: This tank is an assumed leaker with a leak of approximately 30,280 liters (8,000 gallons) reported in 1984.

Process Description: The tank received U Plant uranium recovery process waste from 241-BY-107 and 241-BY-110. The metal waste was received via cascade from 241-BY-104, which had received metal waste via cascade from 241-BX-106.

Waste Type: Storage Tank

Waste Description: Tank BY-105 received metal waste via cascade (1951), U Plant waste from tanks 241-BY-107 and 241-BY-110 (1954) and U Plant waste intermittently until 1966. The tank received wastewater (1957-1974), coating waste (1962-1967), and was an in-tank solidification bottoms receiver (1967). The tank contained evaporator bottoms waste from the in-tank solidification program (1968-1974). Sixty-three tons of Portland cement was added in 1977. Presently, the waste material is classified as non-complexed and has a total waste volume of 1,903,855 liters (503,000 gallons). Saltcake comprised 1,737,315 liters (459,000 gallons), sludge comprises 166,540 liters (44,000 gallons), and no supernatant. There is no pumpable liquid remaining and 726,720 liters (192,000 gallons) drainable liquid remaining.

Type:	Single-Shell Tank	Start Date:	1/1/1953
Status:	Inactive	End Date:	1/1/1977

Description: The unit is a single-shell tank built in 1948 which is comprised of a carbon steel liner within a reinforced concrete shell, 11.3 meters (37 feet) high, with a capacity of 2,869,030 liters (758,000 gallons). The bottom of the unit is 13.7 m (45 feet) below grade, and the dome is located below grade for shielding purposes. This type was built to the original design, having a dished bottom but with an increased operating depth of 7 meters (23 feet).

Location: The 241-BY Tank Farm is directly north of the 241-BX Tank Farm. The 241-BY-106 tank is located in the northern portion of the 241-BY Tank Farm.

Release Description: Current tank leak volume estimate of 30, 280 liters (8, 000 gallons) is based on an average of 19 tanks.

Process Description: The tank was used as a settling tank for ferrocyanide scavenged uranium recovery process waste in 1956.

Waste Type: Storage Tank

Waste Description: Bismuth phosphate first-cycle waste (1953), in-plant ferrocyanide waste from 1955-7, wastewater (1957-1974), and supernatant containing coating waste (1961-1970). In 1968 the tank began to receive evaporator bottoms from 241-BY and -C tank farms waste. The tank received in-tank solidification bottoms and recycle waste between 1970 and 1976 and evaporator feed from 1976-7. The tank also received tributyl phosphate waste. Presently, the waste material is classified as non-complexed and has a total waste volume of 2,429,970 liters (642,000 gallons). Saltcake comprises 2,070,395 liters (547,000 gallons), sludge comprises 359,575 liters (95,000 gallons), and no supernatant. There is 616,955 liters (163,000 gallons) pumpable liquid remaining and 757,000 liters (200,000 gallons) drainable liquid remaining. This is an ITS-2 unit.

Description: The unit is comprised of a carbon steel liner within a reinforced concrete shell, 11.3 meters (37 feet) high, with a capacity of 2,869,030 liters (758,000 gallons). The bottom of the unit is 45 feet below grade, and the dome is located below grade for shielding purposes. This type was built to the original design, having a dished bottom but with an increased operating depth of 7 meters (23 feet).

Location: The 241-BY Tank Farm is directly north of the 241-BX Tank Farm. The 241-BY-107 tank is located in the southern portion of the 241-BY Tank Farm.

Release Description: A leak in the amount of 57,153 liters (15,100 gallons) occurred prior to or during 1984. The leak volume was based on observed liquid level decreases within the tank.

Waste Type: Storage Tank

Waste Description: The tank received tributyl phosphate waste; bismuth phosphate first-cycle waste; and supernatant containing tributyl phosphate waste, coating waste, and evaporator bottoms from 241-C, -BX, and -T (BY) tank farms. Presently, the waste material is classified as non-complexed and has a total waste volume of 1,006,810 liters (266,000 gallons). Saltcake comprises 779,710 liters (206,000 gallons), sludge comprises 227,100 liters (60,000 gallons), there is 94,625 liters (25,000 gallons) of drainable liquid and no pumpable liquid remaining. This is an ITS-2 unit.

Status: Inactive	End Date: 1/1/1977

Description: The unit is a single-shell tank built in 1948. The unit is comprised of carbon steel liner within a reinforced concrete shell, 11.3 meters (37 feet) high, with a capacity of 2,869,030 liters (758,000 gallons). The bottom of the unit is 13.7 meters (45 feet) below grade, and the dome is located below grade for shielding purposes. This type was built to the original design, having a dished bottom but with an increased operating depth of 7 meters (23 feet).

Location: The 241-BY Tank Farm is directly north of the 241-BX Tank Farm. The 241-BY-110 tank is located in the southwestern portion of the 241-BY Tank Farm.

Waste Type: Storage Tank

Waste Description: Initially tank 241-BY-110 received first cycle waste in 1951. The tank received decontamination waste in 1952. The tank contained first cycle supernatant until 1954 when it was pumped to a ditch. The tank received in-plant ferrocyanide waste from 1954-1947. The tank contained U Plant uranium recovery process waste and coating waste from 1957-1958. The tank also received wastewater in 1957. The tank contained coating waste in 1968-1969. From 1969-1976, the tank was used for storage of evaporator bottoms waste. The tank contained concentrated evaporator feed bottoms waste from 1976-1967. Presently, the waste material is classified as non-complexed and has a total waste volume of 1,506,430 liters (398,000 gallons). Saltcake comprises 1,116,575 liters (295,000 gallons), sludge comprises 398,000 liters (103,000 gallons), and no supernatant. There is no pumpable liquid remaining and 34,065 liters (9,000 gallons) drainable liquid remaining.

Description: The unit is comprised of a carbon steel liner within a reinforced concrete shell, 11.3 meters (37 feet) high, with a capacity of 2,869,030 liters (758,000 gallons). The bottom of the unit is 13.7 meters (45 feet) below grade, and the dome is located below grade for shielding purposes. This type was built to the original design, having a dished bottom but with an increased operating depth of 7 meters (23 feet).

Location: The 241-BY Tank Farm is directly north of the 241-BX Tank Farm. The 241-BY-111 tank is located in the western portion of the 241-BY Tank Farm.

Waste Type: Storage Tank

Waste Description: The tank received bismuth phosphate metal waste; tributyl phosphate; PUREX coating waste; organic wash waste; and supernatant containing evaporator bottoms, tributyl phosphate waste, and organic wash waste from 241-BY and -C tanks. Presently, the waste material is classified as non-complexed and has a total waste volume of 1,737,315 liters (459,000 gallons). Saltcake comprises 1,657,830 liters (438,000 gallons), sludge comprises 79,485 liters (21,000 gallons), there is no drainable liquid or pumpable liquid remaining. Net total of liquids pumped from this tank is 1,185,462 liters (313,200 gallons).

Reported Date: April 30, 1996

Names: 241-BYR-09A; 241-BY-109 Valve Pit **Reclassification:** None
Type: Valve Pit **Start Date:** 1/1/1951
Status: Inactive **End Date:**
Description: The valve pit is an underground, concrete structure extending approximately 6.1 meters (20 feet) below ground surface.
Location: The valve pit is located inside the 241-BY Tank Farm, on the northwest side of the 241-BY-109 tank.
Process Description: The valve pit contained a pipe valve. The valve handle extended above the ground surface. It was installed as part of the uranium recovery operation project.

Code: 241-BYR-152 **Classification:** Accepted
Names: 241-BYR-152; 241-BYR-152 Diversion Box **Reclassification:** None
Type: Diversion Box **Start Date:** 1/1/1950
Status: Inactive **End Date:** 1/1/1984
Description: 241-BYR-152 is co-located in a series of three diversion boxes that are joined together. 241-BXR-152 is the center diversion box. 241-BR-152 Diversion Box is on the east end and 241-BYR-152 is on the west end of the diversion box group. The diversion boxes are underground cement structures. Their cover blocks and lifting bails are visible from the surface.
Location: Diversion Box 241-BYR-152 is located in the southeastern portion of the 241-BX Tank Farm, inside the tank farm fence. It is south of the 241-BX-101 tank.
Process Description: Diversion Box 241-BYR-152 is constructed of concrete with a height of approximately 3.7 meters (12 feet). Approximately 0.3 meters (1 foot) of the diversion box concrete cover appears above grade. The outer dimensions are approximately 11 meters (36.1 feet) by 11.5 meters (37.8 feet). The structure's cover is in sections consisting of several interlocking pre-formed concrete blocks. Diversion boxes and receiving vaults drain to catch tanks or single-shell tanks.
Related Sites/ Structures: Diversion Box 241-BYR-152 is associated with the 241-BX Tank Farm and 241-BY Tank Farms and the 241-BXR-152 Diversion Box.
Waste Type: Process Effluent
Waste Description: This unit was used for the transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-BYR-153 **Classification:** Accepted
Names: 241-BYR-153; 241-BYR-153 Diversion Box **Reclassification:** None
Type: Diversion Box **Start Date:** 1/1/1950
Status: Inactive **End Date:** 1/1/1984
Description: The diversion boxes are underground concrete structures. Their cover blocks and lifting bails are visible from the surface. The 241-BYR-153 Diversion box is co-located with the 241-BXR-153 Diversion Box. 241-BYR-153 is on the west side of the 241-BXR-153 Diversion Box.
Location: Diversion Box 241-BYR-153 is located in the southern portion of the 241-BX Tank Farm,

inside the tank farm fence. It is south of the 241-BX-104 tank.

Process Description: Diversion boxes and receiving vaults drain to catch tanks or single-shell tanks. Diversion Box 241-BYR-153 is constructed of concrete with a height of approximately 3.7 meters (12 feet). Approximately 0.3 meters (1 foot) of the diversion box concrete cover appears above grade. The outer dimensions are approximately 11.3 meters (37 feet) by 10.5 meters (34.5 feet). The structure's cover is in sections consisting of several interlocking pre-formed concrete blocks. The northern section consists of 10 blocks, center section has 11, and the southern section has 8 cover blocks.

Related Sites/ Structures: Diversion Box 241-BYR-153 is associated with the 241-BX and 241-BY Tank Farms.

Waste Type: Process Effluent
Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-BYR-154	Classification: Accepted
Names: 241-BYR-154; 241-BYR-154 Diversion Box	Reclassification: None
Type: Diversion Box	Start Date: 1/1/1950
Status: Inactive	End Date: 1/1/1984

Description: The diversion box is an underground concrete structure. Its cover blocks and lifting bails are visible from the surface.

Location: Diversion Box 241-BYR-154 is located in the southwestern portion of the 241-BX Tank Farm, inside the tank farm fence. It is south of the 241-BX-110 tank.

Process Description: Diversion Box 241-BYR-154 is constructed of concrete with a height of approximately 3.7 meters (12 feet). Approximately 0.3 meters (1 foot) of the diversion box concrete cover appears above grade. While the outer dimensions are approximately 9.9 meters (32.5 feet) by 9.9 meters (32.5 feet), the structure's shape is irregular because the north section of the diversion box is short by 2.7 meters (9 feet) and the south side is short by 4.1 meters (13.5 feet). The structure's cover is in sections consisting of several interlocking pre-formed concrete blocks. The northern section consists of 10 blocks, center section has 9, and the southern section has 4 cover blocks. Diversion boxes and receiving vaults drain to catch tanks or single-shell tanks.

Related Sites/ Structures: Diversion Box 241-BYR-154 interconnects with the following: 241-BY Tank Farm.

Waste Type: Process Effluent
Waste Description: This unit was used for the transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 200-E-59	Classification: Accepted
Names: 200-E-59; 241-BY-ITS2 Condenser Vessel; 241-BY-ITS2-TK-1; IMUST; ITS-2	Reclassification: None
Type: Storage Tank	Start Date: 1/1/1968
Status: Inactive	End Date: 1/1/1977

Status: Inactive**End Date:** 1/1/1999

Description: The site is the soil inside and adjacent to the chain link fence that surrounds the 241-B Tank Farm. Various radiological postings and warning signs are attached to the chain link fence. The interior of the tank farm complex is covered with gravel. Many risers and monitoring devices for the underground structures are visible on the surface. The individual unplanned releases associated with the 241-B Tank Farm are not separately marked or posted. Occasionally, radioactive contamination is found adjacent to the outside of the tank farm fence, resulting in a contamination zone extension around the tank farm perimeter. These areas will also be considered tank farm soil. A posted Contamination Area, marked with steel posts and chain, currently extends east and south outside the 241-B Tank Farm fence. The posted area size and shape varies with additional radiological surveys.

Location: The site is located east of Baltimore Ave. and south of 12th Street in 200 East Area.

Release Description: The exact extent (horizontal and vertical) of the soil contaminated by unplanned releases that occurred within this farm over the years are not known. Some of the single shell tanks have leaked to the soil below the tank farm. Other releases spread contamination to the surface soil surrounding the tanks.

Related Sites/ Structures: Unplanned Releases UPR-200-E-4, UPR-200-E-6, UPR-200-E-38, UPR-200-E-73, UPR-200-E-74, UPR-200-E-75, UPR-200-E-76, UPR-200-E-108, UPR-200-E-109, UPR-200-E-127, UPR-200-E-128, UPR-200-E-129, and UPR-200-E-130 are associated with the 241-B Tank Farm. Two of these sites are listed in TPA Appendix B as TSD-associated sites (UPR-200-E-76 and UPR-200-E-109). All are to be addressed with the closeout of the tank farm TSD. As such, site 200-E-120 is also a TSD-associated site.

Waste Type: Soil

Waste Description: Liquid releases occurred from underground leaks in tanks and transfer lines. Airborne contamination spreads occurred from activities conducted in valve pits and diversion boxes. Both types of releases contributed to the contamination in the soil.

Code: 200-E-197-PL **Classification:** Accepted

Names: 200-E-197-PL; Encased Pipelines Between 241-BR-152 Diversion Box and 241-B Tank Farm; Lines 9002, 9006, 9010, 9014, 9017, 9020, 9031, 9032, 9035, 9037, 9038, 9041, 9044 and 9047 **Reclassification:** None

Type: Encased Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground concrete transfer line encasement. Fourteen 10 centimeter (6 inch) diameter, carbon steel lines are located within the same concrete encasement. They are placed with seven lines on the bottom of the encasement and seven lines above those lines within the concrete encasement.

Location: The pipeline extends from 241-BR-152 Diversion Box, inside 241-BX Tank Farm to the 241-B-101, 241-B-102 and 241-B-103 tanks inside 241-B Tank Farm.

Related Sites/Structures: The waste lines are associated with 241-BR-152 diversion Box, 241-B-101, 241-B-102 and 241-B-103 single shell tanks.

Code: 200-E-208-PL **Classification:** Accepted

Names: 200-E-208-PL; Lines V304 and V305 from 241-BY Tank Farm to 241-B-252 Diversion Box **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is two underground, 10 centimeter (4 inch) diameter, carbon steel lines buried in the same soil trench.

Location: The lines extend out of the north side of the 241-BY Tank Farm, turn south on the west side of Baltimore Ave. and cross under Baltimore Ave. to connect to the 241-B-252 Diversion Box, located inside the 241-B Tank Farm.

Related Sites/ Structures: The lines are associated with tanks 241-BY-109 and 241-BY-111 and 241-B-252 Diversion Box.

Code: 200-E-216-PL **Classification:** Accepted

Names: 200-E-216-PL; Lines V235, V236, V237, V242, C251, V252, and V253; Transfer Lines Between 241-BX-153, 241-B-151 and 241-B-152 Diversion Boxes **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is seven stainless steel lines that are buried in the same soil trench. All of the lines are 9 centimeter (3.5 inch) diameter lines.

Location: The transfer lines are located southeast of 241-BX Tank Farm. The lines exit the southeast corner of 241-BX Tank Farm and cross under Baltimore Ave. to connect to the diversion boxes inside 241-B Tank Farm. The lines branch off, forming a "V". Lines V251, V252, V253 and V242 go to the 241-B-152 Diversion Box. Lines V235, V236 and V237 go to the 241-B-151 Diversion Box (see subsites).

Related Sites/ Structures: The transfer lines are associated with the 241-BX-153 Diversion Box, located inside 241-BX Tank Farm and 241-B-151 and 241-B-152 Diversion Boxes, located inside 241-B Tank Farm.

This Site has the Following SubSites:

Code: 200-E-216-PL:1

Names: 200-E-216-PL:1; All seven lines; V235, V23, V237, V251, V252, V253 and V242

Code: 200-E-216-PL:2

Names: 200-E-216-PL:2; Northern Portion of Soil Trench Containing Lines V235, V236 and V237

Code: 200-E-216-PL:3

Names: 200-E-216-PL:3; Southern Portion of Soil Trench Containing Lines V251, V252, V253 and V242

Code: 200-E-216-PL:1 **Classification:** Accepted

Names: 200-E-216-PL:1; All seven lines; V235, V23, V237, V251, V252, V253 and V242 **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: Subsite 1 is the portion of the group of lines exiting the 241-BX Tank Farm where all seven lines are in the same soil trench.

The SubSite is Part Of:

Code: 200-E-216-PL

Names: 200-E-216-PL; Lines V235, V236, V237, V242, C251, V252, and V253; Transfer Lines Between 241-BX-153, 241-B-151 and 241-B-152 Diversion Boxes

Code: 200-E-216-PL:2 **Classification:** Accepted

Names: 200-E-216-PL:2; Northern Portion of Soil Trench Containing Lines V235, V236 and V237 **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive

End Date:

Description: Subsite 2 is the northern portion of the split soil trench containing lines V235, V236 and V237 that connects to the 241-B-151 Diversion Box.

The SubSite is Part Of:

Code: 200-E-216-PL

Names: 200-E-216-PL; Lines V235, V236, V237, V242, C251, V252, and V253; Transfer Lines Between 241-BX-153, 241-B-151 and 241-B-152 Diversion Boxes

Code: 200-E-216-PL:3

Classification: Accepted

Names: 200-E-216-PL:3; Southern Portion of Soil Trench Containing Lines V251, V252, V253 and V242

Reclassification: None

Type: Direct Buried Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: Subsite 3 is the southern portion of the split soil trench containing lines V251, V252, V253 and V242 that connects to the 241-B-152 Diversion Box.

The SubSite is Part Of:

Code: 200-E-216-PL

Names: 200-E-216-PL; Lines V235, V236, V237, V242, C251, V252, and V253; Transfer Lines Between 241-BX-153, 241-B-151 and 241-B-152 Diversion Boxes

WMA C

Code: 216-C-8 **Classification:** Accepted
Names: 216-C-8; 216-C-8 Crib; 216-C-8 French Drain; 271-CR Crib **Reclassification:** None
Type: French Drain **Start Date:** 6/1/1962
Status: Inactive **End Date:** 6/1/1965

Description: In June 2001, the crib location was no longer marked or posted. The area had been recently covered with gravel during road construction in the vicinity of 7th Street and Buffalo Ave. In 2006, a single post and sign marked the crib location. The pipeline that fed 216-C-8 is WIDS sitecode 200-E-290-PL.

Location: The site is located southeast of the 241-C Tank Farm, outside the tank farm perimeter fence.

Process Description: The site received radioactively contaminated ion exchange waste from the 271-CR Building

Related Sites/Structures: The site is associated with the 271-CR building and pipeline 200-E-290-PL.

Waste Type: Process Effluent

Waste Description: The site received the ion exchange waste from the 271-CR Building. The waste volume is unknown. The site contains less than 10 curies total beta.

Code: 241-C-101 **Classification:** Accepted
Names: 241-C-101; 241-C-TK-101 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1946
Status: Inactive **End Date:** 1/1/1970

Description: The tank is an underground, steel tank with a cylindrical reinforced-concrete wall that rests on a reinforced-concrete cylindrical footing. The footing gradually tapers to a reinforced-concrete basemat foundation. The basemat foundation is dished-shaped and lined with a layer of grout and a layer of asphaltic waterproofing membrane. A steel liner lines the bottom and sidewall of the tank.

Location: The 241-C-101 tank in the eastern portion of the 241-C Tank Farm.

Process Description: The 241-C-101 tank received bismuth phosphate metal waste, tributyl phosphate process waste, and PUREX process coating waste from tank 241-C-106, which had high levels of strontium in the waste. From 1952 to 1955 the tank was sluiced to recover uranium that had been discharged as waste.

Related Sites/Structures: Four monitoring drywells are identified for this tank. Additionally this tank is equipped with pumps, thermocouples and other ancillary equipment. This tank cascades to 241-C-102. Nine risers are associated with the tank.

Waste Type: Storage Tank

Waste Description: This tank contains bismuth phosphate metal waste, tributyl phosphate waste, and PUREX coating waste. Document WHC-SD-WM-ER-349 references the most complete estimated inventory for this tank. Because this tank was the first tank in a cascading series, most of the solids precipitated out of the solutions into this tank.

Related Sites/ Structures: Structures associated with this tank include 5 drywells, tank monitoring instrumentation, tank risers, the three other tanks in this waste cascading series, and associated piping.

Waste Type: Storage Tank

Waste Description: This tank has waste from the following process: PUREX coating waste, tributyl phosphate waste, coating waste, PUREX high-level waste, B Plant high-level waste, B Plant waste fractionization low-level waste, PUREX sludge supernatant, PUREX low-level waste, waste fractionization PUREX sludge, PUREX organic wash waste, laboratory waste, decontamination waste, REDOX ion exchange waste, REDOX high-level waste, noncomplexed waste, waste fractionization ion exchange waste, N Reactor waste, PNL waste, and evaporator bottoms from 241-A -B, -BX, and -C tank farms. This unit was used as the receiver for operating P-10 saltwell systems within the 241-C Tank Farm. An additional source of waste is PUREX and insoluble strontium-rich sluicing solids from the operation of 244-CR Vault.

Code: 241-C-103 VP **Classification:** Accepted

Names: 241-C-103 VP; 241-C Valve Pit; 241-C-103 Valve Pit **Reclassification:** None

Type: Valve Pit **Start Date:** 1/1/1979

Status: Inactive **End Date:**

Description: The waste site is an underground corrugated metal structure.

Location: The valve pit is located inside 241-C tank farm, on the southwest side of the 241-C-103 tank.

Process Description: The valve pit was installed as part of the C Farm tank waste interim stabilization salt well system.

Code: 241-C-104 **Classification:** Accepted

Names: 241-C-104; 241-C-TK-104 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1946

Status: Inactive **End Date:** 1/1/1980

Description: The underground tank is constructed with a cylindrical reinforced-concrete wall that rests on a reinforced-concrete cylindrical footing. The footing gradually tapers to a reinforced-concrete basemat foundation. The basemat foundation is dished-shaped and lined with a layer of grout and a layer of asphaltic waterproofing membrane. A steel liner lines the bottom and sidewall of the tank.

Location: Tank 241-C-104 is located in the southern row of tanks, inside the 241-C Tank Farm.

Process Description: This tank was sluiced during the 1952 to 1955 uranium recovery sluicing operation. During 1954, this tank was used as a tank-to-tank sluicing receiver. This waste was later sent to the 244-CR process vault. The tank began receiving bismuth phosphate metal waste in 1946.

Related Sites/ Structures: Tank 241-C-104 is the first tank in the 241-C-104, 241-C-105, and 241-C-106 cascade line. Other associated structures include ventilation, monitoring drywells, instrumentation, and piping.

Waste Type: Storage Tank

Waste Description: Waste is comprised of unknown waste, sludge, and pumpable liquid. This tank received bismuth phosphate metal waste starting in 1946, strontium-leached sluicing solids in 1977, and

fissile material (including uranium-223) from PUREX thorium campaigns.

Code: 241-C-105 **Classification:** Accepted
Names: 241-C-105; 241-C-TK-105 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1946
Status: Inactive **End Date:** 1/1/1979

Description: The underground tank is constructed with a cylindrical reinforced-concrete wall that rests on a reinforced-concrete cylindrical footing. The footing gradually tapers to a reinforced-concrete basemat foundation. The basemat foundation is dished-shaped and lined with a layer of grout and a layer of asphaltic waterproofing membrane. A steel liner lines the bottom and sidewall of the tank.

Location: Tank 241-C-105 is located near the center of the 241-C Tank Farm.

Process Description: As part of the 241-C-104, 241-C-105, 241-C-106 cascade line, this tank received bismuth phosphate metal waste from 1947 until 1953. This tank was used as a receiver for PUREX sludge supernate enroute to B Plant for cesium ion exchange processing. This tank was sluiced during 1952 and 1953 for the uranium recovery program.

Related Sites/ Structures: The tank is associated with Radiation monitoring wells, 8 active; Operating exhausters; Temperature element, read manually; Liquid level gage, and automatic on CASS.

Waste Type: Storage Tank

Waste Description: This tank was used as a receiver tank for PUREX sludge supernate enroute to B Plant. It received bismuth phosphate metal waste from 1947 to 1953. The tank contains unknown waste, sludge, and pumpable liquid.

Code: 241-C-106 **Classification:** Accepted
Names: 241-C-106; 241-C-TK-106 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1947
Status: Inactive **End Date:** 1/1/1979

Description: The underground tank is constructed with a cylindrical reinforced-concrete wall that rests on a reinforced-concrete cylindrical footing. This footing gradually tapers to a reinforced-concrete basemat foundation. The basemat foundation is dished shaped and lined with a layer of grout and a layer of asphaltic waterproofing membrane. A partial spherical shell dome rests on the cylindrical wall. A steel liner lines the bottom and sidewall of the tank. The operating depth for this tank is 5.2 meters (17 feet).

Location: The tank is located in the northeastern portion of the 241-C Tank Farm.

Process Description: This tank is the last tank in the 241-C-104, 241-C-105 and 241-C-106 cascade. One of the first generation tanks, this unit was designed to receive non-boiling waste. Tank 241-C-106 received bismuth phosphate metal waste in 1947. The tank was sluiced from 1952 to 1955 for uranium recovery efforts.

Related Sites/ Structures: Associated structures for 241-C-106 include monitoring equipment, cascade piping and tanks, ventilation and drywells.

Waste Type: Storage Tank

Waste Description: This tank received bismuth phosphate metal waste, and PUREX process fission product waste,

Description: which included large amounts of strontium. The tank was sluiced in 1952 -1955 for the uranium recovery project. The waste contains process supernate, unknown waste products, sludge, and pumpable liquid.

Code: 241-C-107 **Classification:** Accepted

Names: 241-C-107; 241-C-TK-107 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1946

Status: Inactive **End Date:** 1/1/1978

Description: The underground tank is constructed with a cylindrical reinforced-concrete wall that rests on a reinforced-concrete cylindrical footing. This footing gradually tapers to a reinforced-concrete basemat foundation. The basemat foundation is dished shaped and lined with a layer of grout and a layer of asphaltic waterproofing membrane. A partial spherical shell dome rests on the cylindrical wall. A steel liner lines the bottom and sidewall of the tank. The operating depth for this tank is 5.2 meters (17 feet).

Location: The 241-C-107 tank is located in the northwestern portion of the 241-C Tank Farm.

Process Description: This is the first tank in the 241-C-107, 241-C-108, 241-C-109 cascade line, designed to receive non-boiling waste. Tank 241-C-107 received first cycle waste and process decontamination wastes from B Plant. This tank also received insoluble, strontium-leached sluicing solids.

Related Sites/ Structures: Structures associated with this tank include other tanks in the cascade, piping and pumps, instrumentation, and ventilation.

Waste Type: Storage Tank

Waste Description: This tank received Bismuth Phosphate first cycle waste beginning in 1946. The tank received insoluble strontium leached, sluicing solids in 1977. This unit is a low-heat load, passively ventilated tank.

Code: 241-C-108 **Classification:** Accepted

Names: 241-C-108; 241-C-TK-108 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1947

Status: Inactive **End Date:** 1/1/1977

Description: The underground tank is constructed with a cylindrical reinforced-concrete wall that rests on a reinforced-concrete cylindrical footing. This footing gradually tapers to a reinforced-concrete basemat foundation. The basemat foundation is dished shaped and lined with a layer of grout and a layer of asphaltic waterproofing membrane. A partial spherical shell dome rests on the cylindrical wall. A steel liner lines the bottom and sidewall of the tank. The operating depth for this tank is 5.2 meters (17 feet).

Location: Tank 241-C-108 is located near the center of the 241- C Tank Farm.

Process Description: Tank 241-C-108 was designed as the second tank of the 241-C-107, 241-C-108, 241-C-109 cascade series. It received non-boiling, cascade overflow from tank 241-C-107. Wastes received by this tank include first cycle waste, and process decontamination waste from B Plant. The tank also acted as a primary settling tank for "In-Farm" waste scavenging for the Uranium Recovery process.

Related Sites/ Structures: Structures associated with this tank include cascade piping, tanks 241-C-107, and 241-C-109, dry wells, instrumentation, and ventilation.

designed to receive non-boiling waste. The tank received bismuth phosphate first cycle waste from 1946 to 1967. Tanks 241-C-108, 241-C-109, 241-C-110, 241-C-111, and 241-C-112 were also used as primary settling tanks for "In-Farm" scavenging for the Uranium Recovery process.

Related Sites/ Structures: Associated structures with this tank include four dry wells, instrumentation the two other tanks in the cascade series, piping, and ventilation.

Waste Type: Storage Tank

Waste Description: Tank 241-C-110 is the first tank in the 241-C-110, 241-C-111, and 241-C-112 cascade line.

This tank received bismuth phosphate first cycle waste and process decontamination waste from B Plant. Additionally, this tank was used as a primary settling tank for "In-Farm" scavenging for the Uranium Recovery process.

Code: 241-C-111

Classification: Accepted

Names: 241-C-111; 241-C-TK-111

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1946

Status: Inactive

End Date: 1/1/1978

Description: The underground tank is constructed with a cylindrical reinforced-concrete wall that rests on a reinforced-concrete cylindrical footing. This footing gradually tapers to a reinforced-concrete basemat foundation. The basemat foundation is dished shaped and lined with a layer of grout and a layer of asphaltic waterproofing membrane. A partial spherical shell dome rests on the cylindrical wall. A steel liner lines the bottom and sidewall of the tank. The operating depth for this tank is 5.2 meters (17 feet).

Location: The 241-C-111 tank is located on the western side of the 241-C Tank Farm.

Process Description: This tank is the second tank in the 241-C-110, 241-C-111, 241-C-112 cascade line. It was designed to receive non-boiling waste. The tank received bismuth phosphate first cycle waste beginning in 1946. Tanks 241-C-108, 241-C-109, 241-C-110, 241-C-111, and 241-C-112 were also used as primary settling tanks for "In-Farm" scavenging for the Uranium Recovery process.

Related Sites/ Structures: Associated with this tank include five dry wells, instrumentation, the two other tanks in the cascade series, piping, and ventilation.

Waste Type: Storage Tank

Waste Description: Tank 241-C-111 is the second tank in the 241-C-110, -111, and -112 cascade line. This tank received bismuth phosphate first cycle waste and B Plant decontamination waste. Additionally, this tank was used as a primary settling tank for "In-Farm Scavenged Uranium". There is no pumpable liquid remaining in the tank.

Code: 241-C-112

Classification: Accepted

Names: 241-C-112; 241-C-TK-112

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1946

Status: Inactive

End Date: 1/1/1976

Description: The underground tank is constructed with a cylindrical reinforced-concrete wall that rests on a reinforced-concrete cylindrical footing. This footing gradually tapers to a reinforced-concrete basemat foundation. The basemat foundation is dished shaped and lined with a layer of grout and a layer of asphaltic waterproofing membrane. A partial spherical shell dome rests on the

Location: west of the 241-C-151 Diversion Box.

Process Description: Diversion boxes and receiving vaults drain to catch tanks. They are designed to contain leaks or spills from waste transfers and drainage during jumper operations within the unit.

Related Sites/Structures: The 241-C-152 diversion box is associated with 241-C-301 Catch Tank. This unit interconnects the 241-B-154, and 241-B-153 diversion boxes with the 241-C Tank Farm.

Waste Type: Equipment
Waste Description: It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Waste Type: Process Effluent
Waste Description: This unit was used to transfer waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operations. Radiological contamination is estimated to be extremely high.

Code: 241-C-153	Classification: Accepted
Names: 241-C-153; 241-C-153 Diversion Box	Reclassification: None
Type: Diversion Box	Start Date: 1/1/1946
Status: Inactive	End Date: 1/1/1985

Description: The diversion box is an underground, reinforced concrete structure. Surface features include concrete cover blocks and lifting bails.

Location: The 241-C-153 Diversion Box is located in the southwestern portion of the 241-C Tank Farm, south of the 241-C-110 tank.

Process Description: Diversion boxes and receiving vaults drain to catch tanks. They are designed to contain leaks or spills resulting from waste transfers during jumper operations within the unit.

Related Sites/Structures: The diversion box is associated with the 241-C-301 Catch Tank and 241-C-Tank Farm. This unit interconnects the 241-C-151 and 241-C-152 diversion boxes.

Waste Type: Process Effluent
Waste Description: The diversion box transferred liquid waste from the processing plants to the tank farms. The Part A Permit assumed that 50 pounds (23 kilograms) of lead shielding bricks may also be stored in this diversion box.

Waste Type: Chemicals
Waste Description: This unit was used to transfer waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. Diversion box contamination is estimated to be high in alpha, beta, and gamma. Chemical residues may be present.

Code: 241-C-201	Classification: Accepted
Names: 241-C-201; 241-C-TK-201	Reclassification: None
Type: Single-Shell Tank	Start Date: 1/1/1947
Status: Inactive	End Date: 1/1/1977

Description: The underground tank is a vertically configured, reinforced-concrete cylinder, with a slab roof. It is lined with steel. The tank rests on a footing which is integral to the tank base.

Location: The 241-C-201 tank is located on the north side of the 241-C Tank Farm, inside the tank farm

fence.

Process Description: This tank is a 200-series single-shell tank, designed to receive non-boiling waste. Tanks 241-C-201, 241-C-202, 241-C-203, and 241-C-204 have tie lines between each tank to equalize the waste volumes in each tank. This tank received metal waste, and is plumbed to the 241-C-252 diversion box.

Related Sites/ Structures: Structures associated with this tank include: ventilation, piping, instrumentation, and the 241-C-202, 241-C-203 and 241-C-204 tanks.

Waste Type: Storage Tank

Waste Description: Tank 241-C-201 began to operate in 1947 by receiving bismuth phosphate metal waste. This tank was sluiced during the uranium recovery process. No pumpable liquid remains in the tank.

Code: 241-C-202 **Classification:** Accepted

Names: 241-C-202; 241-C-TK-202 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1947

Status: Inactive **End Date:** 1/1/1977

Description: The underground tank is a vertically configured, reinforced-concrete cylinder, with a slab roof. It is lined with steel. The tank rests on a footing which is integral to the tank base.

Location: Tank 241-C-202 is located on the north side of the 241-C Tank Farm, inside the tank farm fence.

Process Description: This tank is a 200-series single-shell tank, designed to receive non boiling waste. Tanks 241-C-201, 241-C-202, 241-C-203, and 241-C-204 have lines between each tank to equalize the waste volumes in each tank. This tank received metal waste, and is plumbed to the 241-C-252 diversion box.

Related Sites/ Structures: Structures associated with this tank include: ventilation, piping, instrumentation, and the other 200-series tanks.

Waste Type: Storage Tank

Waste Description: Tank 241-C-202 began to operate in 1947 by receiving metal waste. Tanks 241-C-201, -202, -203, and -204 were used to settle waste while supernatant was sent to a crib. This tank was sluiced for uranium recovery. No pumpable liquid remains in the tank. Metal waste in the tank was removed in 1954 and the tank received waste from hot semi-works in 1955 and 1956. Most of the hot semi-works waste was removed in 1970. Waste retrieval completed in August 2005 with the retrieval of 1,032 gallons of waste, resulting in an ending volume in the tank of 147 gallons. Retrieval was accomplished using a vacuum retrieval system. Waste was transported to 241-AN-106 through a hose-in-hose transfer line.

Code: 241-C-203 **Classification:** Accepted

Names: 241-C-203; 241-C-TK-203 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1947

Status: Inactive **End Date:** 1/1/1976

Description: The site is a vertically configured, underground reinforced-concrete tank, with a slab roof. It is lined with steel. The tank rests on a footing which is integral to the tank base.

Location: The 241-C-203 tank is located on the north side of the 241- C Tank Farm, inside the tank farm fence.

Process Description: This tank is a 200-series single-shell tank, designed to receive non-boiling waste. Tanks 241-C-201, 241-C-202, 241-C-203, and 241-C-204 have lines between each tank to equalize the waste volumes. This tank received metal waste and is plumbed to the 241-C-252 diversion box.

Related Sites/ Structures: Structures associated with this tank include; ventilation, piping, instrumentation, and the other 200-series tanks.

Waste Type: Storage Tank

Waste Description: Tank 241-C-203 began to operate in 1947 by receiving metal waste. In 1986, a cracked sludge surface was observed with no visible liquids. Approximately 9504 liters (2501 gallons) of waste was removed from this tank and transferred to double shell tank 241-AN-106 in 2004.

Code: 241-C-204 **Classification:** Accepted

Names: 241-C-204; 241-C-TK-204 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1948

Status: Inactive **End Date:** 1/1/1977

Description: The tank is a vertically configured, reinforced-concrete cylinder, with a slab roof. The tank is lined with steel. The tank rests on a footing which is integral to the tank base.

Location: The 241-C-204 tank is located on the north side of the 241- C Tank Farm, inside the tank farm fence.

Process Description: This tank is a 200-series single shell tank, designed to receive non-boiling waste. Tanks 241-C-201, 241-C-202, 241-C-203, and 241-C-204 have lines between each tank to equalize the waste volumes in each tank. This tank received metal waste, and is plumbed to the 241-C-252 diversion box.

Related Sites/ Structures: Structures associated with this tank include; ventilation, piping, instrumentation, and the other 200-series C Tank Farm tanks.

Waste Type: Storage Tank

Waste Description: Tank 241-C-204 began to operate in 1948 by receiving metal waste. Tanks 241-C-201, -202, -203, and -204 were used to settle waste while supernatant was sent to a crib. This tank was sluiced for uranium recovery. No pumpable liquid remains in the tank.

Code: 241-C-252 **Classification:** Accepted

Names: 241-C-252; 241-C-252 Diversion Box **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1946

Status: Inactive **End Date:** 1/1/1985

Description: The diversion box is an underground, reinforced concrete structure. Surface features include concrete cover blocks and lifting bails.

Location: The diversion box is located in the northwest portion of the 241-C Tank Farm, west of tank 241-C-204.

Process Description: Diversion boxes and receiving vaults drain to catch tanks. They are designed to contain leaks and spills from waste transfers and drainage during jumper operations within the unit.

Related Sites/ Structures: Diversion box 241-C-252 is associated with the 241-C-301 Catch Tank and the 241-C Tank

Farm. The unit interconnects diversion box 241-C-151 and the 241-C Tank Farm.

Waste Type: Process Effluent

Waste Description: This unit was used to transfer waste solutions from processing and decontamination operations.

Volumes were variable according to specific plant operations. Radiological contamination is expected to be high in alpha, beta, and gamma. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Waste Type: Equipment

Waste Description: It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in

each diversion box.

Code: 241-C-301

Classification: Accepted

Names: 241-C-301; 241-C-301C; 241-C-301-C Catch Tank; IMUST; Inactive Miscellaneous Underground Storage Tank; Lines V114 and V155

Reclassification: None

Type: Catch Tank

Start Date: 1/1/1946

Status: Inactive

End Date: 1/1/1985

Description: The 241-C-301 Catch tank is an underground tank. It is surrounded with post and chain and marked with Inactive Miscellaneous Underground Storage Tank (IMUST) signs.

Location: The 241-C-301 catch tank is located in the northwest portion of the 241-C Tank Farm, northwest of the 241-C-112 tank.

Process Description: Tank 241-C-301C received drainage from diversion boxes 241-C-151, 241-C-152, 241-C-153, and 241-C-252. These diversion boxes received wasted transfers from and the C Farm, B Plant, and PUREX. Incidental wastes were received from the Hot Semiworks operations. Catch tanks are components of tank farms that collect spills and/or leaks during waste transfers between processing facilities and tank farms. Catch tanks also received any water from rainfall, snowmelt, or dust that entered the diversion boxes (the diversion boxes were later weather proofed.) The tanks were coal coated for corrosion protection, and later underwent two cathodic protection upgrades. The catch tank was constructed with 15.2 centimeter (6 inch) thick walls, coated with Amercoat to obtain a non-porous surface.

Related Sites/Structures: This tank is associated with 241-C-151, 241-C-152, 241-C-153, 241-C-252 diversion boxes and 241-C Tank Farm. Line V114 and V155 are the drain lines from the diversion boxes.

Waste Type: Storage Tank

Waste Description: The 241-C-151, 241-C-152, 241-C-153 and 241-C-252 diversion boxes drained waste solutions from leaks or spills that occurred during waste transfer operations. The wastes received in the catch tank include waste from B Plant, PUREX and Hot Semiworks operations. In 1994, the tank contained 5586 liters (1470 gallons) of liquid supernate and 34,260 liters (9016 gallons) of sludge. The tank may also have received ferrocyanide waste.

Status: Inactive **End Date:** 1/1/1985

Description: The diversion box is an underground, reinforced concrete structure. Surface features include concrete cover blocks and lifting bails.

Location: The 241-CR-153 Diversion Box is located in the southern portion of the 241-C Tank Farm, northwest of the 244-CR Vault. It is attached to the 241-CR-152 Diversion Box.

Process Description: This diversion box is designed to contain leaks from transfers and drainage from operations within the unit. This unit acts as secondary containment for transfer line jumper connections.

Related Sites/Structures: This unit adjoins the 241-C-152 diversion box. Line 8307 is the diversion Box drain line.

Waste Type: Chemicals
Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation.

Waste Type: Equipment
Waste Description: It was estimated that approximately 50 pounds (23 kilograms) of waste lead was stored in this unit.

Code: 244-CR VAULT **Classification:** Accepted
Names: 244-CR Vault; 244-CR VAULT; Line 8765 **Reclassification:** None
Type: Receiving Vault **Start Date:** 1/1/1946
Status: Inactive **End Date:** 1/1/1988

Description: This vault is an underground, reinforced concrete structure. It is a two-level, multi-cell structure (cells 1, 2, 3 and 11). The lower cell contains the process vessels. Upper cells contain piping and equipment. The structure is constructed with concrete cover blocks which, when removed, allow access to the upper cells. The lower cells contain four process vessels: TK-CR-001, TK-CR-011, TK-CR-002, and TK-CR-003 (see subsites).

Location: This unit is located in the southern portion of the 241-C Tank Farm, southeast of the 241-CR-151 Diversion Box.

Release Description: In 2008, the Hanford C-Farm Leak Assessment Report (RPP-ENV-33418) was issued. It documented failed pipelines and unplanned releases associated with C Farm activities. On February 18, 1965, the 244-CR Vault was found flooded up to approximately the level of the tank tops. Immediate steps were taken to reduce the liquid level by jetting the solution to the 011 Tank. Partial cause of the flooding is attributed to a failure in the coating waste line which enters the 241-CR-151 diversion box. Drainage from this diversion box collects in the 002-CR vault sump. Water from a sampler flush line and drainage from rain and snow contributed to the liquid level in the vault. To date, the 001, 002, and 003 sumps have been emptied, and the 011 sump is being emptied, to the 011 Tank. This liquid is being pumped from the 011 Tank to Tank 103-A in the 241-A Tank Farm. In May 1966, a leak in the PUREX coating waste route (via 241-CR-152 diversion box) was detected by an abnormal liquid level increase of the 002CR vault sump. The leaking flexible jumper in the 241-CR-152 diversion box was replaced. Diversion box 241-CR-152 and 244-CR Vault sump are concrete structures with painted surfaces. It is uncertain whether leaked waste was contained inside diversion box 241-CR-152 and 244-CR Vault sump.

Process Description: The receiver was used for interim storage and processing operations of 241-C Tank Farm. It had the capacity to add chemicals, mix solutions and cool the tank contents. Waste was also received from the Hot Semiworks Facility. The 244-CR-003 Tank in the 244-CR Vault is used for the interim storage of salt well waste from 241-C Tank Farm.

Related Sites/ Structures: The associated structures include the 241-C Tank Farm and the Hot Semiworks operations. Line 8765 is the drain line from 241-CR-151 to the 244-CR sump.

Waste Type: Storage Tank
Waste Description: The unit contained the following wastes: metal waste, first cycle waste, B Plant decontamination waste, PUREX fission product waste, uranium recovery sluicing waste, coating waste, radioactive condensates, sink wastes, REDOX spent solvent waste, other REDOX waste, PUREX organic wash waste, PUREX acid process waste, PUREX spent solvent waste, strontium recovery waste, and critical mass laboratory waste.

This Site has the Following SubSites:

Description: 244-CR-001 is a 189,250 liter (50,000 gallon) tank located in a 6.7 meter (22 foot) by 7.9 meter (26 foot) by 8.8 meter (29 foot) cell (cell 1) within the 244-CR Vault. The concrete cell has a 170 liter (45 gallon) capacity sump. The 244-CR Vault and associated tanks and cells were used as the uranium sludge recovery and distribution vault for the 241-C Tank Farm. CR Vault was also used for the interim storage and transfer of waste from B-Plant, PUREX and Hot Semi-Works. Tank 244-CR-001 was the slurry accumulator, receiving waste from the C Farm tanks. The slurry was processed with nitric acid. In 2002, the tank was estimated to contain 7,570 liters (2,000 gallons) of waste solids from the Uranium Recovery Program. In 2005, the tank contained 5,197 liters (1,375 gallons) of liquid and sludge. Cell #1 contained 291 liters (77 gallons) of liquid.

Description: 244-CR-011 is a 189,250 liter (50,000 gallon) tank located in a 6.7 meter (22 foot) by 7.9 meter (26 foot) by 8.8 meter (29 foot) cell (cell 11) within the 244-CR Vault. The concrete cell has a 170 liter (45 gallon) capacity sump. The 244-CR Vault and associated tanks and cells were used as the uranium sludge recovery and distribution vault for the 241-C Tank Farm. CR Vault was also used for the interim storage and transfer of waste from B-Plant, PUREX and Hot Semi-Works. Initially, tank 244-CR-011 acted as a process pump tank for the transfer of processed waste from the CR Vault to the diversion station for transfer to the Uranium Recovery facility or other operations. In 2002, the tank was estimated to contain 132,475 liters (35,000 gallons) of supernate and rainwater. In 2005, 15,082 liters (3,990 gallons) of sludge was reported. No liquid volume was remaining in the tank. Cell 11 contained 27,639 liters (7,312 gallons) of liquid and sludge.

Description: The unit is a french drain, It is covered and partially filled with gravel.

Location: The drain is located on the south side of the 291-CR Ventilation Building stack, inside the 241-C Tank Farm fence.

Process Description: This drain received condensate from the 291-CR Stack, plenum chamber exhaust fans and the

Description: plenum inlet.

Related Sites/ Structures: The structure is associated with the 291-CR ventilation building.

Waste Type: Water

Waste Description: This unit received condensate from the 291-CR Stack, the plenum chamber exhaust fans and the plenum inlet.

Code: 200-E-133 **Classification:** Accepted

Names: 200-E-133; Contaminated Soil at 241-C Tank Farm; Contamination Migration Beyond the fence at C Farm **Reclassification:** None

Type: Contamination Migration **Start Date:** 1/1/1946

Status: Inactive **End Date:**

Description: The site is the soil inside and adjacent to the chain link fence that surrounds the 241-C Tank Farm. Various radiological postings and warning signs are attached to the chain link fence. The interior of the tank farm complex is covered with gravel. Many risers and monitoring devices for the underground structures are visible on the surface. The individual unplanned releases associated with the 241-C Tank Farms are not separately marked or posted. Occasionally, radioactive contamination is found adjacent to the outside of the tank farm fence, resulting in a contamination zone extension around the tank farm perimeter. These areas are also part of this site.

Location: The 241-C Tank Farm is located at the intersection of 7th Street and Buffalo Ave. in 200 East Area.

Release Description: The exact extent (horizontal and vertical) of the soil contaminated by unplanned releases that occurred within this farm complex over the years are not known. Some of the single shell tanks have leaked to the soil below the tank farm. Other releases spread contamination to the surface soil surrounding the tanks. In 2008, the Hanford C-Farm Leak Assessment Report (RPP-ENV-33418) was issued. It documented failed pipelines and unplanned releases associated with activities inside the 241-C Tank Farm. Some of the releases included the underground process line (V172) from the 252-C diversion box to 241-C-112 tank in C Tank Farm failure. The failed pipeline, inside C tank farm, was isolated. Jumpers were fabricated and installed to establish a new process route. Line V112, adjacent to diversion box 241-C-151, was identified as a leaker. The date and amount of waste leaker from this pipeline is unknown. In August 1974, Occurrence Report 74-120 states that pipeline V-103, located inside 241-C farm, leaked and caused high levels of contamination between tanks 241-C-104 and 241-C-105. High readings were noted in dry well 30-03-02. A liquid level rise in Tank 103-C, the cesium feed tank, was apparently caused by a failed line in the encasement between the 152-CR diversion box and Tank 102-C which permitted coating waste from the Purex Plant to leak into the encasement and drain to Tanks 101-C, 102-C, and 103-C via the tank pump pits. Coating waste has been routed through a spare line to Tank 102-C and no further leaks have been detected. The coating waste solution accumulated in Tank 103-C did not significantly affect cesium loading capability as a cask was loaded normally following the incident.

Related Sites/ Structures: The site is associated with UPR-200-E-16, UPR-200-E-27, UPR-200-E-68, UPR-200-E-81, UPR-200-E-82, UPR-200-E-107, UPR-200-E-118, UPR-200-E-136, and UPR-200-E-137. Most of these sites are listed in TPA Appendix B as TSD-associated sites, and are to be addressed with the closeout of the tank farm TSD. As such, site 200-E-133 is also a TSD-associated site.

Waste Type: Process Effluent
Waste Description: Liquid releases occurred from underground leaks in tanks and transfer lines. Airborne contamination spreads occurred from activities conducted in valve pits and diversion boxes. Both types of releases contributed to the contamination in the soil.

Code: 2607-EG	Classification: Accepted
Names: 2607-EG	Reclassification: None
Type: Septic Tank	Start Date: 1/1/1951
Status: Inactive	End Date:

Description: There are two, 2607-EG septic tanks. The first tank failed and was replaced in 1972. The 2607-EG Septic Tank is marked by a large diameter, vertical concrete pipe. It received sanitary wastewater and sewage from the 271-CR Building. The associated drain field had a capacity of 619 gallons (2,350 liters) per day.

Location: This septic tanks are located southeast of the 241-C Tank Farm fence and east of the 271-CR Building.

Process Description: The 2607-EG Septic Tanks and associated drain fields were designed to accept sanitary sewer effluent from the 271-CR Building.

Related Sites/Structures: The 2607-EG Septic Tank is associated with the 241-C Tank Farm and the 271-CR Building.

Waste Type: Sanitary Sewage
Waste Description: The current flow rates to Septic Tank 2607-EG are unknown. However, the 2607-EG septic system received sanitary sewer effluent from the 271-CR Building at a rate of 6 cubic feet (0.2

cubic meters) per day in 1987.

Code: UPR-200-E-72 **Classification:** Accepted
Names: UPR-200-E-72; Radioactive Contamination from Uncovered Buried Waste; UN-200-E-72 **Reclassification:** None
Type: Unplanned Release **Start Date:** 1/1/1985
Status: Inactive **End Date:**
Description: A WIDS sign has been placed at the approximate location of the site.
Location: The site is located south of the 241-C Tank Farm, near the 216-C-8 Crib.
Release Description: In 1985, radiological surveys were being performed outside the 241-C Tank Farm fence following a contamination incident at 241-C-151. A contaminated area was found south of 241-C Tank Farm that indicated the burial of previously undocumented contaminated material. The area contained specks of contamination reading up to 7 rad per hour. The source of the contamination is assumed to be the buried material.
Waste Type: Misc. Trash and Debris
Waste Description: The contamination consisted of beta/gamma particulates with dose rates up to 7 rad per hour on the uncovered material and the surrounding area.

Names: UPR-200-E-91; UN-200-E-91; UN-216-E-19 **Reclassification:** None
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**
Description: This site was a large area of contaminated soil, located north and east of the 241-C Tank Farm. In 1981, the contaminated soil was removed from this area and taken to another location (UPR-200-E-56). The radiological posting was removed in 1981. This release site is no longer marked or posted.
Location: UPR-200-E-91 was located adjacent to the northeast corner of the 241-C Tank Farm.
Release Description: The release occurred over time, due to radioactive particles migrating out of the adjacent 241-C Tank Farm. At one time, water from an equipment decontamination station, located inside the tank farm, seeped downhill into this area. Vapor emissions and windblown particulates from the contaminated surfaces of the tank farm contributed to the buildup of ground contamination at the site.
Related Sites/Structures: UPR-200-E-91 was associated with the 241-C Tank Farm. The contaminated soil was removed to UPR-200-E-56. A smaller radiologically posted area is located in the vicinity of where this unplanned release had been. See WIDS site code 200-E-115.
Waste Type: Soil
Waste Description: The release consisted of wind blown radiologically contaminated soil from tank farm activities and water run off from an equipment decontamination located inside 241-C tank farm. The contaminated soil was removed. The area outside the tank farm fence was revegetated with perennial wheatgrass and cheatgrass in 1981.

WMA S/SX

Code: 216-S-3 **Classification:** Accepted

Names: 216-S-3; 216-S-3 Crib; 216-S-5 **Reclassification:** None

Type: Crib **Start Date:** 1/1/1953

Status: Inactive **End Date:** 1/1/1956

Description: The unit consists of two open bottomed crib boxes 3.1 meters (10 feet) by 3.1 meters (10 feet) made of timbers. The two crib boxes are connected in series 15 meters (50 feet) apart, with overflow from one box into the other via a pipe. These boxes are set into a gravel layer in the bottom of a trench. The trench was the backfilled. Each box contains two flanged riser pipes extending from the top of the box.

Location: The unit was located outside the 241-S Tank Farm east fence. In 1996, the eastern tank farm fence line was expanded. The crib is now inside the tank farm fence.

Process Description: The unit received condensate from the riser condensers on the 241-S-101 and 241-S-104 Tanks.

Related Sites/Structures: The crib is associated with the condensers on the 241-S-101 and 241-S-104 tanks located inside the 241-S Tank Farm. The site is also associated with the 216-S-15 Pond.

Waste Type: Process Effluent

Waste Description: The site received condensate from condensers on the 241-S-101 and 241-S-104 Tanks in the 241-S Tank Farm. The waste is low in salt and is neutral to basic. The inorganics at the site consist of nitrate, sodium, sodium dichromate, sodium hydroxide, sodium aluminate, and ammonium nitrate. The Reduction Oxidation (REDOX) Radiation Monitoring Report for September 1953 states that the condensate diverted to this crib was sampled. The analysis indicated 95% of the activity was due to zirconium-niobium.

Code: 216-S-15 **Classification:** Accepted

Names: 216-S-15; 216-S-2; 241-S-110 Pond; UN-216-W-3; 110-S Tank Overflow Pond **Reclassification:** None

Type: Pond **Start Date:** 1/1/1951

Status: Inactive **End Date:** 1/1/1952

Description: This site consists of a pond that was deactivated by removing the above-ground piping and backfilling it with clean soil.

Location: This site is located at the northeast corner of the 216-S-3 Crib. The site was located outside the east 241-S Tank Farm fence. In 1996, the eastern tank farm fence line was expanded. The site is now inside the tank farm fence.

Process Description: The site provided surface liquid disposal for the 241-S-110 Tank condenser spray cooling water.

Related Sites/Structures: The site is associated with the 241-S-110 tank.

Waste Type: Process Effluent

Waste Description: The site received condenser spray cooling water from the 241-S-110 Tank. The waste was low in salt, neutral to basic, and contained nitrates.

Code: 241-S-A **Classification:** Accepted
Names: 241-S-A; 241-S-A Diversion Box; 241-S-A Valve Pit **Reclassification:** None
Type: Valve Pit **Start Date:** 1/1/1952
Status: Inactive **End Date:**
Description: This unit is a rectangular concrete structure used to divert waste flow to the proper destination, Valve handles extend through and above a concrete cover block on the 241-S-A Valve Pit.
Location: The 241-S-A Valve Pit is located in the 241-S Tank Farm, between Tanks 241-S-102 and 241-S-101.
Process Description: The 241-S-A Valve Pit is used to direct waste flow.
Related Sites/Structures: Structures associated with the 241-S-A Valve Pit include: a flush pit, a leak detector, valve handles, and the 241-S-102 Tank.
Waste Type: Process Effluent
Waste Description: The unit transports waste solutions from processing and decontamination operations. Quantities of waste are variable according to specific plant operations. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-S-B **Classification:** Accepted
Names: 241-S-B; 241-S-B Diversion Box; 241-S-B Valve Pit **Reclassification:** None
Type: Valve Pit **Start Date:** 1/1/1952
Status: Inactive **End Date:**
Description: This unit is a rectangular concrete structure used to divert waste flow to the proper destination. Valve handles extend through and above a concrete cover block on the 241-S-B Valve Pit.
Location: The 241-S-B Valve Pit is located in the 241-S Tank Farm, south of Tanks 241-S-102 and 241-S-101.
Process Description: The 241-S-B Valve Pit is used to direct waste flow.
Related Sites/Structures: Structures associated with the 241-S-B Valve Pit include: a flush pit, a leak detector, valve handles, and the 241-S-102 Tank.
Waste Type: Process Effluent
Waste Description: The unit transports waste solutions from processing and decontamination operations. Quantities of waste are variable according to specific plant operations. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-S-C **Classification:** Accepted
Names: 241-S-C; 241-S-C Diversion Box; 241-S-C Valve Pit **Reclassification:** None
Type: Valve Pit **Start Date:** 1/1/1952
Status: Inactive **End Date:**
Description: This unit is a rectangular concrete structure used to divert waste flow to the proper destination.

Valve handles extend through and above a concrete cover block on the 241-S-C Valve Pit.

Location: The 241-S-C Valve Pit is located in the 241-S Tank Farm, south of Tanks 241-S-107 and 241-S-108.

Process Description: The 241-S-C Valve Pit is used to direct waste flow.

Related Sites/ Structures: Structures associated with the 241-S-C Valve Pit include: a flush pit, a leak detector, valve handles, and the 241-S-107 Tank.

Waste Type: Process Effluent

Waste Description: The unit transports waste solutions from processing and decontamination operations. Quantities of waste are variable according to specific plant operations. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-S-D **Classification:** Accepted

Names: 241-S-D; 241-S-D Diversion Box; 241-S-D Valve Pit **Reclassification:** None

Type: Valve Pit **Start Date:** 1/1/1952

Status: Inactive **End Date:**

Description: This unit is a rectangular concrete structure used to divert waste flow to the proper destination. Valve handles extend through and above a concrete cover block on the 241-S-D Valve Pit.

Location: The 241-S-D Valve Pit is located in the 241-S Tank Farm, south of Tanks 241-S-107 and 241-S-108.

Process Description: The 241-S-D Valve Pit is used to direct waste flow.

Related Sites/ Structures: Structures associated with the 241-S-D Valve Pit include: a flush pit, a leak detector, valve handles, and the 241-S-107 Tank.

Waste Type: Process Effluent

Waste Description: The unit transports waste solutions from processing and decontamination operations. Quantities of waste are variable according to specific plant operation. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-S-101 **Classification:** Accepted

Names: 241-S-101; 241-S-TK-101 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1953

Status: Inactive **End Date:** 1/1/1980

Description: This unit is a second generation single-shell storage tank. Tank 241-S-101 is the first tank of a three-tank cascade series. This tank is a reinforced concrete, cylindrical structure with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-S-101 is located within 241-S Tank Farm Facility. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Description: Tank 241-S-101 received waste from REDOX, Pacific Northwest Laboratory, and PUREX facilities. Additional sources include N reactor, 241-U, 241-S, and 241-SX Tank Farms.

Related Sites/ Structures: Structures associated with Tank 241-S-101 include passive ventilation, a liquid observation well, five drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-S-101 included: REDOX high-level wastes, REDOX coating waste, supernatant containing Pacific Northwest Laboratory waste, coating waste, PUREX low-level waste, laboratory waste, B Plant high-level waste, terminal liquor and evaporator bottoms, partial neutralization feed, N Reactor waste, ion exchange waste, and double-shell slurry feed from 241-U, 241-S and 241-SX Tank Farms.

Code: 241-S-102

Classification: Accepted

Names: 241-S-102; 241-S-TK-102

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1953

Status: Inactive

End Date: 1/1/1980

Description: This unit is a second generation single-shell storage tank. Tank 241-S-102 is the second tank of a three-tank cascade series. This tank is concrete reinforced, cylindrical, and dome-roofed with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-S-102 is located within 241-S Tank Farm Facility. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Release Description: On 7/27/2007, a spill was reported inside the 241-S Tank Farm at the S-102 Pump Pit. Higher than normal radiation levels (200-250 mr/hr at 8-15 feet) were observed. A spill of liquid from an above ground transfer line occurred while attempting to backflush a clogged pump screen. The release was estimated to be less than 100 gallons.

Process Description: Waste sources for Tank 241-S-102 include the REDOX facility and 241-U, 241-S, 241-SX, and 241-SY Tank Farms.

Related Sites/ Structures: Structures associated with Tank 241-S-102 include a passive ventilation liquid observation well, eight dry wells, and temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-S-102 include: evaporator bottoms, REDOX high-level waste, noncomplexed waste, double-shell slurry feed, and partial neutralization feed from 241-S, 241-SX, 241-SY, and 241-U Tank Farms.

Code: 241-S-103

Classification: Accepted

Names: 241-S-103; 241-S-TK-103

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1953

Status: Inactive

End Date: 1/1/1980

Description: This unit is a second generation single-shell storage tank. Tank 241-S-103 is the third tank of a three-tank cascade series. This tank is a reinforced concrete, cylindrical structure with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-S-103 is located within 241-S Tank Farm Facility. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Waste sources for Tank 241-S-103 include the REDOX facility and 241-S, 241-SX, 241-SY,

Description: and 241-U Tank Farms.

Related Sites/ Structures: Structures associated with Tank 241-S-103 include passive ventilation, a liquid observation well, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-S-103 included REDOX high-level waste, REDOX coating waste, evaporator bottoms, noncomplexed waste, partial neutralization feed, and double-shell slurry feed from 241-S, 241-SX, 241-SY, and 241-U Tank Farms.

Code: 241-S-104

Classification: Accepted

Names: 241-S-104; 241-S-TK-104

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1953

Status: Inactive

End Date: 1/1/1968

Description: This unit is a second generation single-shell storage tank. Tank 241-S-104 is the first tank of a three-tank cascade series. This tank is a reinforced concrete, cylindrical structure with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-S-104 is located within 241-S Tank Farm Facility. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Description: Tank 241-S-104 received waste from the REDOX facility and the 241-S Tank Farm.

Related Sites/ Structures: Structures associated with Tank 241-S-104 include passive ventilation, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-S-104 included REDOX high-level and coating waste, and waste from 241-S Tank Farm.

Code: 241-S-105

Classification: Accepted

Names: 241-S-105; 241-S-TK-105

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1953

Status: Inactive

End Date: 1/1/1976

Description: This unit is a second generation single-shell storage tank. Tank 241-S-105 is the second tank of a three-tank cascade series. This tank is a reinforced concrete, cylindrical structure with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-S-105 is located within 241-S Tank Farm Facility. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Description: Tank 241-S-105 received waste from the REDOX facility.

Related Sites/ Structures: Structures associated with Tank 241-S-105 include passive ventilation, a liquid observation well, five drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: REDOX coating and high-level waste were transferred to Tank 241-S-105.

Description:

Code: 241-S-106 **Classification:** Accepted
Names: 241-S-106; 241-S-TK-106 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1953
Status: Inactive **End Date:** 1/1/1976

Description: This unit is a second generation single-shell storage tank. Tank 241-S-106 is the third tank of a three-tank cascade series. This tank is a reinforced concrete, cylindrical structure with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-S-106 is located within 241-S Tank Farm Facility. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Description: Waste sources for Tank 241-S-106 include the REDOX facility and 241-S Tank Farms.

Related Sites/ Structures: Structures associated with Tank 241-S-106 include passive ventilation, a liquid observation well, six drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-S-106 included REDOX high-level waste and evaporator bottoms from the 241-S Tank Farm.

Code: 241-S-107 **Classification:** Accepted
Names: 241-S-107; 241-S-TK-107 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1952
Status: Inactive **End Date:** 1/1/1980

Description: This unit is a second generation single-shell storage tank. Tank 241-S-107 is the first tank of a three-tank cascade series. This tank is a reinforced concrete, cylindrical structure with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-S-107 is located within 241-S Tank Farm Facility. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Description: Waste sources for Tank 241-S-107 include REDOX and PUREX facilities, Pacific Northwest Laboratory, N Reactor, and 241-BX, 241-C, 241-S, 241-SX, 241-SY, 241-U Tank Farms.

Related Sites/ Structures: Structures associated with Tank 241-S-107 include passive ventilation, six drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-S-107 included REDOX high-level waste and coating waste, decontamination waste, B Plant high-level and low-level waste, Pacific Northwest Laboratory waste, laboratory waste, N Reactor waste, PUREX low-level waste, ion exchange waste, fractionization waste, evaporator bottoms, double-shell slurry feed, partial neutralization feed, and complexed concentrate from 241-BX, 241-C, 241-S, 241-SX, 241-SY, and 241-U Tank Farms.

Waste Description: operations. Volumes were variable according to specific plant operations. Lead shielding may also be contained inside the diversion box.

Waste Type: Equipment

Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles. Waste lead is also stored in the diversion box.

Code: 241-S-302A **Classification:** Accepted

Names: 241-S-302A; 241-S-302-A Catch Tank; IMUST; Inactive Miscellaneous Underground Storage Tank; Lines V542, V763, V764, and DR324 **Reclassification:** None

Type: Catch Tank **Start Date:** 1/1/1949

Status: Inactive **End Date:** 1/1/1991

Description: This unit is a cylindrical, steel tank. The catch tank is buried underground for radiation shielding. The tank is surrounded with posts and chain and labeled with IMUST signs.

Location: The 241-S-302A Catch Tank is located east of the 241-S and the 241-SX Tank Farms, inside the tank farm fence. It is north of the 241-S-151 diversion box.

Process Description: The tank was installed to receive spills, leakage, line flushes, and drainage associated with waste transfers through the 241-S-151 and 241-SX-151 Diversion Boxes.

Related Sites/Structures: The 241-S-302A Catch Tank is associated with the 241-S-151 and the 241-SX-151 Diversion Boxes. Drain lines V542, V763, V764 and DR324 are associated with the diversion boxes.

Waste Type: Process Effluent

Waste Description: The tank collected leaking and excess process waste that passed through the 241-S-151 and 241-SX-152 Diversion Boxes. Wastes characteristic of the 241-S, 241-SX and 241-U Tank Farms as well as the 222-S Laboratory are expected to be present in the catch tank.

Code: 241-S-304 **Classification:** Accepted

Names: 241-S-304; 241-S-304 Catch Tank **Reclassification:** None

Type: Catch Tank **Start Date:** 1/1/1991

Status: Inactive **End Date:** 1/1/2005

Description: The catch tank is below ground surface, inside a concrete pump pit with concrete cover blocks. The pump pit measures 3 meters by 3 meters (10 foot by 10 foot) and is 1.75 meters (5.75 feet) deep. The catch tank is constructed of carbon steel.

Location: The 241-S-304 Catch Tank is located east of 241-SX Tank Farm and northeast of the 241-S-151 Diversion Box. It is inside the fenced boundary of the 241-S, SX and SY Tank Farm complex.

Process Description: The 241-S-304 catch tank received precipitation drainage and drainage from the 241-S-151 Diversion Box. This tank was placed into service in 1991 to replace the 241-S-302A catch tank.

Related Sites/Structures: The tank is associated with the 241-S-151 Diversion Box.

Waste Type: Process Effluent

Waste Description: The catch tank receives precipitation drainage and 241-S-151 Diversion Box drainage.

Code:	244-S DCRT	Classification:	Accepted
Names:	244-S DCRT; 244-S Double-Contained Receiver Tank; 244-S Receiver Tank; 244-S RT; 244-S-TK/SMP; Lines 5350 and 5351; 244-S Catch Station	Reclassification:	None
Type:	Receiver Tank	Start Date:	1/1/1987
Status:	Inactive	End Date:	1/1/2005
Description:	The 244-S Receiver Tank is constructed of carbon steel. It sets vertically inside a reinforced concrete, steel lined vault with 0.31 meters (1 foot) thick walls and a 1.4 meters (4.5 foot) thick base. The tank vault is separated from a pump pit above by a 30 centimeter (12 inch) thick concrete slab.		
Location:	The 244-S Receiver Tank is located inside the S,SX,SY Tank Farm fence, south of the 241-SY-103 Tank.		
Process Description:	The 244-S Receiver Tank served as an interim storage area for liquid radioactive mixed waste.		
Related Sites/Structures:	This unit is associated with Diversion Boxes 241-S-151 and 241-UX-154. The 244-S Receiver Tank is also associated with 222-S, Plutonium Finishing Plant, U Plant, and T Plant Facilities.		
Waste Type:	Storage Tank		
Waste Description:	The unit stores and transports radioactive mixed waste solutions from processing and decontamination operations. Quantities are variable according to specific plant operations.		

Code:	241-SX-A	Classification:	Accepted
Names:	241-SX-A; 241-SX-A Diversion Box; 241-SX-A Valve Pit	Reclassification:	None
Type:	Valve Pit	Start Date:	1/1/1954
Status:	Inactive	End Date:	
Description:	This unit is a rectangular concrete structure used to divert waste flow to the proper destination. It has been covered with foam. Valve handles extended through and above the concrete cover block.		
Location:	The 241-SX-A Valve Pit is located southeast of Tank 241-SX-102 and northeast of Tank 241-SX-105.		
Process Description:	The 241-SX-A Valve Pit is used to direct waste flow.		
Related Sites/Structures:	Structures associated with the 241-SX-A Valve Pit include: a flush pit, a leak detector, valve handles, and Tank 241-SX-102.		
Waste Type:	Process Effluent		
Waste Description:	The unit is used to transport radioactive waste solutions from processing and decontamination operations. Quantities are variable according to specific plant operation. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.		

Code:	241-SX-B	Classification:	Accepted
Names:	241-SX-B; 241-SX-B Diversion Box; 241-SX-B	Reclassification:	None

cylindrical structure with a steel liner. The tank is buried underground to provide radiation shielding.

Location: Tank 241-SX-102 is located in the 241-SX Tank Farm. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Description: Waste sources for Tank 241-SX-102 include the REDOX facility, and the 241-BX, 241-TX, 241-SX, and 241-U Tank Farms.

Related Sites/Structures: Structures associated with Tank 241-SX-102 include: drywells, a liquid observation well, a hydrogen monitor, temperature and surface level measurement instruments. This tank is actively vented through Tank 241-SX-109 which is connected to the 241-SX Sludge Cooler.

Waste Type: Storage Tank

Waste Description: Waste transferred to 241-SX-102 included: REDOX high-level waste, carbonate waste, concrete, REDOX high-level waste, ion exchange waste, evaporator bottoms, and partial neutralization feed from 241-BX, 241-SX, 241-TX, and 241-S Tank Farms.

Code: 241-SX-103

Classification: Accepted

Names: 241-SX-103; 241-SX-TK-103

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1954

Status: Inactive

End Date: 1/1/1980

Description: This unit is a third generation single-shell tank designed for self-boiling waste. Tank 241-SX-103 is the third tank of a three tank cascade series. This tank is a reinforced concrete, cylindrical structure with a steel liner. The tank is buried underground to provide radiation shielding.

Location: Tank 241-SX-103 is located in the 241-SX Tank Farm. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Description: Waste sources for Tank 241-SX-103 include the REDOX facility, and the 241-BX, 241-S, and 241-SX Tank Farms.

Related Sites/Structures: Structures associated with Tank 241-SX-103 include: drywells, a liquid observation well, a hydrogen monitor, temperature and surface level measurement instruments. This tank is actively vented through Tank 241-SX-109 which is connected to the 241-SX Sludge Cooler.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-SX-103 included: REDOX high-level waste, concrete, coating waste, evaporator bottoms, organic wash waste, and partial neutralization feed from 241-BX, 241-SX, and 241-S Tank Farms.

Code: 241-SX-104

Classification: Accepted

Names: 241-SX-104; 241-SX-TK-104

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1955

Status: Inactive

End Date: 1/1/1980

Description: This unit is a third generation single-shell tank designed for self-boiling waste. Tank 241-SX-104 is the first tank of a three tank cascade series. This tank is a reinforced concrete, cylindrical structure with a steel liner. The tank is buried underground to provide radiation shielding.

Location: Tank 241-SX-104 is located in the 241-SX Tank Farm. This facility is located on Thirteenth

Street, northwest of the REDOX Plant.

Process Description: Waste sources for Tank 241-SX-104 include the REDOX facility, the 241-S, and the 241-SX Tank Farms.

Related Sites/Structures: Structures associated with Tank 241-SX-104 include: drywells, a liquid observation well, a hydrogen monitor, temperature and surface level measurement instruments. This tank is actively vented through Tank 241-SX-109 which is connected to the 241-SX Sludge Cooler.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-SX-104 included: REDOX high-level waste and ion exchange waste, double-shell slurry feed, and evaporator bottoms from the 241-S and the 241-SX Tank Farms.

Code: 241-SX-105 **Classification:** Accepted

Names: 241-SX-105; 241-SX-TK-105 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1955

Status: Inactive **End Date:** 1/1/1980

Description: This unit is a third generation single-shell tank designed for self-boiling waste. Tank 241-SX-105 is the second tank of a three tank cascade series. This tank is a reinforced concrete, cylindrical structure with a steel liner. The tank is buried underground to provide radiation shielding.

Location: Tank 241-SX-105 is located in the 241-SX Tank Farm. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Description: Waste sources for Tank 241-SX-105 include the REDOX facility, the 241-BX, 241-S, 241-TX and 241-U Tank Farms.

Related Sites/Structures: Structures associated with Tank 241-SX-105 include: lateral wells, drywells, a liquid observation well, a hydrogen monitor, temperature and surface level measurement instruments. This tank is actively vented through Tank 241-SX-109 which is connected to the 241-SX Sludge Cooler.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-SX-105 included: REDOX high-level waste and ion exchange waste, double-shell slurry feed, evaporator bottoms, and partial neutralization feed from 241-BX, 241-S, 241-X, and 241-U Tank Farms.

Code: 241-SX-106 **Classification:** Accepted

Names: 241-SX-106; 241-SX-TK-106 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1954

Status: Inactive **End Date:** 1/1/1980

Description: This unit is a third generation single-shell tank designed for self-boiling waste. Tank 241-SX-106 is the third tank of a three tank cascade series. This tank is a reinforced concrete, cylindrical structure with a steel liner. The tank is buried underground to provide radiation shielding.

Location: Tank 241-SX-106 is located in the 241-SX Tank Farm. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Description: Waste sources for Tank 241-SX-106 include the REDOX facility, 241-BX, 241-S, 241-TX, and 241-U Tank Farms.

Process Description: 241-B, 241-C, 241-S, 241-SY, 241-SX, 241-TX and 241-U Tank Farms.

Related Sites/ Structures: Structures associated with Tank 241-SX-106 include drywells, a liquid observation well, a hydrogen monitor, temperature and surface level measurement instruments. This tank is actively vented through Tank 241-SX-109 which is connected to the 241-SX Sludge Cooler.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-SX-106 included: Hanford laboratory waste, Pacific Northwest Laboratory waste, REDOX and waste fractionation ion exchange waste, evaporator bottoms, B Plant low level waste, PUREX low level waste, coating waste, and partial neutralization feed from 241-B, 241-BX, 241-C, 241-S, 241-SX, 241-SY, 241-TX, and 241-U Tank Farms.

Code: 241-SX-107 **Classification:** Accepted

Names: 241-SX-107; 241-SX-TK-107 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1956

Status: Inactive **End Date:** 1/1/1964

Description: This unit is a third generation single-shell tank designed for self-boiling waste. Tank 241-SX-107 is the first tank of a three tank cascade series. This tank is a reinforced concrete, cylindrical structure with a steel liner. The tank is buried underground to provide radiation shielding.

Location: Tank 241-SX-107 is located in the 241-SX Tank Farm. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Description: Waste sources for Tank 241-SX-107 include the REDOX facility, 100 F Area, and the 241-SX Tank Farm.

Related Sites/ Structures: Structures associated with Tank 241-SX-107 include lateral wells, drywells, temperature and surface level measurement instruments. This tank is actively ventilated through the 241-SX Sludge Cooler.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-SX-107 included: coating waste and REDOX high-level waste. The unit contains 41 small bottles of neutralized waste from 100 F Area, each containing less than 1 gram (0.04 ounce) Plutonium 239.

Code: 241-SX-108 **Classification:** Accepted

Names: 241-SX-108; 241-SX-TK-108 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1955

Status: Inactive **End Date:** 1/1/1962

Description: This unit is a third generation single-shell tank designed for self-boiling waste. Tank 241-SX-108 is the first tank of a three tank cascade series. This tank is a reinforced concrete, cylindrical structure with a steel liner. The tank is buried underground to provide radiation shielding.

Location: Tank 241-SX-108 is located in the 241-SX Tank Farm. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Description: Waste sources for Tank 241-SX-108 include the REDOX facility, and the 241-SX Tank Farm.

Related Sites/ Structures: Structures associated with Tank 241-SX-108 include: lateral wells, drywells, temperature and surface level measurement instruments. This tank is actively vented through the 241-SX Sludge

bottles or containers containing a total of 4 ounces (110 grams) natural uranium, 2 ounces (62 grams) depleted uranium, 0.21 ounce (6 grams) enriched uranium, and 7 ounces (204 grams) plutonium were added to this unit.

Code: 241-SX-111 **Classification:** Accepted
Names: 241-SX-111; 241-SX-TK-111 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1956
Status: Inactive **End Date:** 1/1/1974

Description: This unit is a third generation single-shell tank designed for self-boiling waste. Tank 241-SX-111 is the second tank of a three tank cascade series. This tank is a reinforced concrete, cylindrical structure with a steel liner. The tank is buried underground to provide radiation shielding.

Location: Tank 241-SX-111 is located in the 241-SX Tank Farm. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Description: The waste source for Tank 241-SX-111 is the REDOX Facility.

Related Sites/Structures: Structures associated with Tank 241-SX-111 include: lateral wells, drywells, temperature and surface level measurement instruments. This tank is actively vented through the 241-SX-Sludge Cooler.

Waste Type: Storage Tank
Waste Description: Waste transferred to Tank 241-SX-111 included: REDOX high-level waste and supernatant containing REDOX high-level waste and REDOX ion exchange waste from the 241-SX Tank Farm.

Code: 241-SX-112 **Classification:** Accepted
Names: 241-SX-112; 241-SX-TK-112 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1956
Status: Inactive **End Date:** 1/1/1969

Description: This unit is a third generation single-shell tank designed for self-boiling waste. Tank 241-SX-112 is the third tank of a three tank cascade series. This tank is a reinforced concrete, cylindrical structure with a steel liner. The tank is buried underground to provide radiation shielding.

Location: Tank 241-SX-112 is located in the 241-SX Tank Farm. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Description: Waste sources for Tank 241-SX-112 include the REDOX Facility, and the 241-SX Tank Farm.

Related Sites/Structures: Structures associated with Tank 241-SX-112 include: lateral wells, drywells, temperature and surface level measurement instruments. This tank is actively vented through the 241-SX-Sludge Cooler.

Waste Type: Storage Tank
Waste Description: Waste transferred to Tank 241-SX-112 included: REDOX high-level waste and supernatant containing REDOX high-level waste from 241-SX Tank Farm.

Code: 241-SX-113 **Classification:** Accepted

shielding.

Location: Tank 241-SX-115 is located in the 241-SX Tank Farm. This facility is located on Thirteenth Street, northwest of the REDOX Plant.

Process Description: The waste source for Tank 241-SX-115 is the REDOX Facility.

Related Sites/ Structures: Structures associated with Tank 241-SX-115 include: lateral wells, drywells, and a surface level measurement instrument. This tank has passive ventilation.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-SX-115 included: REDOX high-level waste and supernatant containing REDOX high-level waste.

Code: 241-SX-151 **Classification:** Accepted

Names: 241-SX-151; 241-SX-151 Diversion Box **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1954

Status: Inactive **End Date:** 1/1/1983

Description: The diversion box is a rectangular reinforced concrete structure. Most of the structure is below ground. A few inches of the structure that extends above ground is covered with a gray weather coating. The tank farm fence is posted with various radiological postings.

Location: The 241-SX-151 Diversion Box is located northeast of tank 241-SX-101, inside the 241-SX Tank Farm fence.

Process Description: The 241-SX-151 Diversion Box was used to direct liquid waste to other tank farm locations in 200 East and West Areas via jumper connections and underground transfer lines.

Related Sites/ Structures: The 241-SX-151 Diversion Box is associated with the 241-S-151 and 241-SX-152 Diversion Boxes and the 241-SX Tank Farm.

Waste Type: Process Effluent

Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. Lead shielding may also be contained inside the diversion box.

Waste Type: Equipment

Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles. Waste lead is also stored in the diversion box.

Code: 241-SX-152 **Classification:** Accepted

Names: 241-SX-152; 241-SX-152 Diversion Box; 241-SX-152 Transfer Box **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1954

Status: Inactive **End Date:** 1/1/1981

Description: The diversion box is a rectangular reinforced concrete structure. Most of the structure is below ground. A few inches of the structure that extends above ground is covered with a gray weather coating. The tank farm fence is posted with various radiological postings.

Location: The 241-SX-152 Diversion Box is located north of Tank 241-SX-101, inside the 241-SX Tank Farm fence.

Process Description: The 241-SX-152 Diversion Box was used to direct liquid waste to other tank farm locations in 200 East and West Areas via jumper connections and underground transfer lines.

Related Sites/Structures: The 241-SX-152 Diversion Box is associated with the 241-SX-151 Diversion Box, the 241-U-151 Diversion Box, 231-SX-302 catch tank through line V595, and the 241-SX Tank Farm.

Waste Type: Process Effluent

Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. Lead shielding may also be contained inside the diversion box.

Waste Type: Equipment

Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles. Waste lead is also stored in the diversion box.

Code: 241-SX-401 **Classification:** Accepted

Names: 241-SX-401; 241-SX-401 Condenser Shielding Building; 241-SX-401 Waste Disposal Condenser House **Reclassification:** None

Type: Process Unit/Plant **Start Date:** 1/1/1954

Status: Inactive **End Date:** 1/1/1975

Description: This unit is constructed of reinforced concrete with walls varying in thickness from 0.31 to 0.77 meters (1 to 2.5 feet) thick for shielding purposes.

Location: The 241-SX-401 Condenser Building is located west of Tank 241-SX-106, inside the 241-SX Tank Farm.

Process Description: This building processed condensation from the 241-SX Tank Farm off gases.

Related Sites/Structures: A dry well is associated with the condenser building, 216-S-21 crib and pipeline 200-W-160-PL.

Waste Type: Equipment

Waste Description: The unit contains radioactively contaminated equipment and concrete. The quantity of waste has not been determined. Radiation levels are high.

Code: 241-SX-402 **Classification:** Accepted

Names: 241-SX-402; 241-SX-402 Condenser Shielding Building; 241-SX-402 Waste Disposal Condenser House **Reclassification:** None

Type: Process Unit/Plant **Start Date:** 1/1/1954

Status: Inactive **End Date:** 1/1/1975

Description: This unit is constructed of reinforced concrete with walls varying in thickness from 0.31 to 0.77 meters (1 to 2.5 feet) thick for shielding purposes.

Location: The 241-SX-402 Condenser Building is located west of Tank 241-SX-109 within 241-SX Tank Farm.

Process Description: This unit processed condensation for the 241-SX Tank Farm off gases.

**Related Sites/
Structures:****Waste Type:** Equipment**Waste** The unit contains radioactively contaminated equipment and concrete. The quantity of waste**Description:** has not been determined. The unit is only mildly contaminated.**Code:** 200-W-96**Classification:** Accepted**Names:** 200-W-96; Contaminated Soil at 241-S/SX/SY
Tank Farm**Reclassification:** None**Type:** Unplanned Release**Start Date:****Status:** Inactive**End Date:****Description:** The site is the soil inside and adjacent to the chain link fence that surrounds the 241-S/SX/SY Tank Farms. Various radiological postings and warning signs are attached to the chain link fence. The interior of the tank farm complex is covered with gravel. Many risers and monitoring devices for the underground structures are visible on the surface. The individual unplanned releases associated with the 241-S,SX,SY Tank Farms are not separately marked or posted. Occasionally, radioactive contamination is found adjacent to the outside of the tank farm fence, resulting in a contamination zone extension around the tank farm perimeter. These areas will also be considered tank farm soil. The 216-S-3 crib, 216-S-15 overflow pond and a portion of the 242-S Evaporator building are also located inside the tank farm fence.**Location:** The site is located east of Cooper Ave., inside 200 West Area.**Release Description:** The exact extent (horizontal and vertical) of the soil contaminated by unplanned releases that occurred within this farm over the years are not known. Some of the single shell tanks have leaked to the soil below the tank farm. Other releases spread contamination to the surface soil surrounding the tanks. On 7/27/2007, a spill was reported inside the 241-S Tank Farm at the S-102 Pump Pit. Higher than normal radiation levels (200-250 mr/hr at 8-15 feet) were observed. A spill of liquid from an above ground transfer line occurred while attempting to backflush a clogged pump screen. The release was estimated to be less than 100 gallons.**Related Sites/

WMA T

Code: 241-T-101 **Classification:** Accepted
Names: 241-T-101; 241-T-TK-101 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1944
Status: Inactive **End Date:** 1/1/1979

Description: This unit is a first generation, underground single-shell storage tank. Tank 241-T-101 is the first tank of a cascade that also includes tanks 241-T-102 and 241-T-103. The tank is cylindrical, dome-roofed, and concrete-reinforced with a steel liner lying across the tank bottom and up the concrete wall. This unit is below grade for shielding purposes.

Location: Tank 241-T-101 is located on the north side of the 241-T Tank Farm, which is located north of the intersection of 23rd Street and Camden Avenue.

Process Description: Tank 241-T-101 received waste from multiple sources including Tank 241-SX-106, Tank 241-S-110, B Plant and T Plant.

Related Sites/Structures: Structures associated with Tank 241-T-101 include: thermocouple tree, liquid observation wells, surface level measurement device, and leak detection dry wells.

Waste Type: Storage Tank

Waste Description: Waste sources for 241-T-101 include coating waste from Tank 241-SX-106, coating and ion exchange waste from B Plant, and metal waste from T Plant operations.

Code: 241-T-102 **Classification:** Accepted
Names: 241-T-102; 241-T-TK-102 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1945
Status: Inactive **End Date:** 1/1/1976

Description: This unit is a first generation, underground single-shell storage tank. Tank 241-T-102 is the second tank of a cascade that also includes tanks 241-T-101, and 241-T-103. The tank is cylindrical, dome roofed, concrete reinforced with a steel liner lying across the tank bottom and up the concrete wall. This unit is below grade for shielding purposes.

Location: Tank 241-T-102 is located on the north side of the 241-T Tank Farm, which is located north of the intersection of 23rd Street and Camden Avenue.

Process Description: Tank 241-T-102 received waste cascading from Tank 241-T-101. Additional sources include waste from Tank 241-S-110, Tank 241-C-102, and the T-Plant.

Related Sites/Structures: Structures associated with Tank 241-T-102 include surface level measurement device, liquid observation well, salt well screen, and nozzles.

Waste Type: Storage Tank

Waste Description: Waste sources for the 241-T-102 include coating waste from Tank 241-SX-106, coating and ion exchange waste from B Plant, and metal waste from the T Plant operations.

Code: 241-T-103 **Classification:** Accepted
Names: 241-T-103; 241-T-TK-103 **Reclassification:** None

Description: 104, coating waste from Tank 241-C-102, tributyl phosphate waste and first cycle decontamination waste.

Related Sites/ Structures: Structures associated with 241-T-107 include dry wells, passive ventilation, temperature measurement device, and surface level measurement devices.

Waste Type: Storage Tank

Waste Description: Waste types transferred to Tank 241-T-107 include first cycle bismuth phosphate waste, tributyl phosphate, ion exchange waste, and coating waste.

Code: 241-T-108 **Classification:** Accepted

Names: 241-T-108; 241-T-TK-108 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1945

Status: Inactive **End Date:** 1/1/1974

Description: This unit is a first generation, underground single-shell tank. Tank 241-T-108 is the second tank of the third cascade of tanks receiving waste in the T-Farm. The tank is cylindrical, dome-roofed, and concrete-reinforced with a steel liner lying across the tank bottom and up the concrete well. This unit is below grade for shielding purposes.

Location: Tank 241-T-108 is located in the center of the 241-T Tank Farm, which is located north of the intersection of 23rd Street and Camden Avenue.

Process Description: Waste sources for Tank 241-T-108 include: evaporator bottoms from Tank 241-TX-117, tributyl phosphate process waste, and first cycle decontamination waste. It received cascade overflow waste from Tank 241-T-107.

Related Sites/ Structures: Structures associated with 241-T-108 include drywells, passive ventilation, temperature measurement device, and surface level measurement devices.

Waste Type: Storage Tank

Waste Description: Waste types transferred to Tank 241-T-108 include: tributyl phosphate, bismuth phosphate first-cycle waste, Hanford Laboratory operations waste, supernatant containing tributyl phosphate waste, B Plant low-level waste, ion exchange waste, and evaporator bottoms.

Code: 241-T-109 **Classification:** Accepted

Names: 241-T-109; 241-T-TK-109 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1945

Status: Inactive **End Date:** 1/1/1974

Description: This unit is a first generation, underground single-shell tank. Tank 241-T-109 is the third tank of the third cascade of tanks receiving waste in the T Farm. The tank is cylindrical, dome-roofed, and concrete-reinforced with a steel liner lying across the tank bottom and up the concrete wall. This unit is below grade for shielding purposes.

Location: Tank 241-T-109 is located in the western portion of the 241-T Tank Farm, which is located north of the intersection of 23rd Street and Camden Avenue.

Process Description: Waste sources for Tank 241-T-109 include saltcake from 241-T Evaporator that was added from Tank 241-TX-117, tributyl phosphate, and first cycle decontamination cascade overflow waste from Tank 241-T-108.

Related Sites/ Structures: Structures associated with the 241-T-109 include drywells, passive ventilation, temperature, and surface level measurement device.

Waste Type: Storage Tank

Waste Description: Waste types transferred to Tank 241-T-109 include: bismuth phosphate first-cycle waste, tributyl phosphate waste, evaporator bottoms, B Plant low-level waste, ion exchange waste, and waste from 241-T and -TX tank farms.

Code: 241-T-110 **Classification:** Accepted

Names: 241-T-110; 241-T-TK-110 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1944

Status: Inactive **End Date:** 1/1/1976

Description: This unit is a first generation, underground single-shell tank. Tank 241-T-110 is the first tank of the fourth cascade of tanks receiving waste in the T Farm. The tank is cylindrical, dome-roofed, and concrete-reinforced with a steel liner lying across the tank bottom and up the concrete wall. This unit is below grade for shielding purposes.

Location: Tank 241-T-110 is located in the southeastern portion of the 241-T Tank Farm, which is located north of the intersection of 23rd Street and Camden Avenue.

Process Description: Waste sources for Tank 241-T-110 include 224-U waste and second cycle decontamination waste.

Related Sites/ Structures: Structures associated with 241-T-110 include drywells, passive ventilation, liquid observation well, and a surface level measurement device.

Waste Type: Storage Tank

Waste Description: Waste types transferred to 241-T-110 include bismuth phosphate second-cycle waste and the 224-U Building waste.

Code: 241-T-111 **Classification:** Accepted

Names: 241-T-111; 241-T-TK-111 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1945

Status: Inactive **End Date:** 1/1/1974

Description: This unit is a first generation, underground single-shell tank. Tank 241-T-111 is the second tank of the fourth cascade of tanks receiving waste in the T Farm. The tank is cylindrical, dome-roofed, and concrete-reinforced with a steel liner lying across the tank bottom and up the concrete wall. This unit is below grade for shielding purposes.

Location: Tank 241-T-111 is located in the southern portion of the 241-T Tank Farm, which is located north of the intersection of 23rd Street and Camden Avenue.

Process Description: Waste sources for Tank 241-T-111 include 224-U waste and second cycle decontamination cascade overflow waste from Tank 241-T-110.

Related Sites/ Structures: Structures associated with 241-T-110 include drywells, passive ventilation, liquid observation well, and a surface level measurement device.

Waste Type: Storage Tank

Waste Description: Waste types transferred to Tank 241-T-111 include: bismuth phosphate second-cycle waste and

224-U Building waste.

Code: 241-T-112 **Classification:** Accepted
Names: 241-T-112; 241-T-TK-112 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1946
Status: Inactive **End Date:** 1/1/1976

Description: This unit is a first generation, underground single-shell tank. Tank 241-T-112 is the third tank of the fourth cascade of tanks receiving waste in the T Farm. The tank is cylindrical, dome-roofed, and concrete-reinforced with a steel liner lying across the tank bottom and up the concrete wall. This unit is below grade for shielding purposes.

Location: Tank 241-T-112 is located in the southwestern portion of the 241-T Tank Farm, which is located north of the intersection of 23rd Street and Camden Avenue.

Process Description: Waste sources for tank 241-T-112 include second cycle decontamination waste, decontamination waste, and laboratory waste.

Related Sites/ Structures: Structures associated with 241-T-112 include drywells, passive ventilation, temperature and surface level measurement devices.

Waste Type: Storage Tank

Waste Description: Waste types transferred to Tank 241-T-112 include: bismuth phosphate second-cycle waste, Pacific Northwest Laboratory waste, decontamination waste; and supernatant containing B Plant low-level waste and ion exchange waste from the 241-T tank.

Code: 241-T-151 **Classification:** Accepted
Names: 241-T-151; 241-T-151 Diversion Box **Reclassification:** None
Type: Diversion Box **Start Date:** 1/1/1944
Status: Inactive **End Date:** 1/1/1980

Description: The diversion box is a rectangular reinforced concrete structure. Most of the structure is below ground. A few inches of the structure that extends above ground is covered with a gray weather coating. The tank farm fence is posted with various radiological postings.

Location: The 241-T-151 Diversion Box is located near the southeast corner of 241-T Tank Farm, inside the tank farm fence.

Process Description: The 241-T-151 Diversion Box was used to direct liquid waste to other tank farm locations in 200 East and West Areas via jumper connections and underground transfer lines.

Related Sites/ Structures: The 241-T-151 Diversion Box is associated with the 241-T-153 and 241-U-151 Diversion Box, the 241-T-301 Catch Tank, and the 241-T Tank Farm.

Waste Type: Process Effluent

Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. Lead shielding may also be contained inside the diversion box.

Waste Type: Equipment

Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles. Waste lead is also stored in the diversion box.

Waste Type: Equipment
Waste Description: Equipment associated with this unit include transfer piping and nozzles. Waste lead is also stored in the diversion box.

Code: 241-T-201 **Classification:** Accepted
Names: 241-T-201; 241-T-TK-201 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1952
Status: Inactive **End Date:** 1/1/1976

Description: This unit is an underground, concrete-reinforced vertical single-shell tank. Tank 241-T-201 has a steel liner and rests upon a concrete base slab. This unit is below grade for shielding purposes.

Location: Tank 241-T-201 is located in the western portion of the 241-T Tank Farm.

Process Description: Some documents state the waste in 241-T-201 is from the 224-U Building. However, WHC-SD-WM-ER-351 states the 241-T-201 was full of "224" waste when initial level readings were taken in 1952, but does not specify if the waste was from 224-T or 224-U. ARH-2155 and RHO-CD-673 both state that the 216-T-32 Crib received 224-T waste via the 241-T-201 tank.

Related Sites/Structures: The tank is associated with the 216-T-32 crib and the 241-T-252 Diversion Box. Equipment associated with 241-T-201 includes passive ventilation, temperature, and surface level measurement devices.

Waste Type: Storage Tank
Waste Description: Waste in Tank 241-T-201 is from the 224 Building.

Code: 241-T-202 **Classification:** Accepted
Names: 241-T-202; 241-T-TK-202 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1952
Status: Inactive **End Date:** 1/1/1976

Description: This unit is an underground, concrete-reinforced vertical single-shell tank. Tank 241-T-202 has a steel liner and rests upon a concrete base slab. This unit is below grade for shielding purposes.

Location: Tank 241-T-202 is located in the western portion of the 241-T Tank Farm.

Process Description: Some documents state the waste in 241-T-201 is from the 224-U Building. However, WHC-SD-WM-ER-351 states the 241-T-201 was full of "224" waste when initial level readings were taken in 1952, but does not specify if the waste was from 224-T or 224-U. ARH-2155 and RHO-CD-673 both say that the 216-T-32 Crib received 224-T waste via the 241-T-201 tank.

Related Sites/Structures: Structures associated with 241-T-202 include the 241-T-252 Diversion Box, passive ventilation, temperature, and surface level measurement devices.

Waste Type: Storage Tank
Waste Description: Waste in Tank 241-T-202 is from the 224 Building.

Code: 241-T-203 **Classification:** Accepted
Names: 241-T-203; 241-T-TK-203 **Reclassification:** None

southwest of the 241-T-112 Tank.

Process Description: This unit transported waste solutions from processing and decontamination operations.

Related Sites/Structures: The diversion box is associated with 241-T-201, 241-T-202, 241-T-203, 241-T-204, 241-T-153, 221-T, and 241-T Tank Farm. The diversion box drains to the 241-T-301 Catch Tank.

Waste Type: Process Effluent

Waste Description: This unit transported various mixed waste solutions from processing and decontamination operations. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Waste Type: Equipment

Waste Description: Transfer piping and nozzles are associated with the 241-T-252 Diversion Box.

Waste Type: Equipment

Waste Description: Waste lead is also stored in the diversion box.

Code: 241-T-301B **Classification:** Accepted

Names: 241-T-301B; 241-T-301-B; IMUST; Inactive Miscellaneous Underground Storage Tank; Lines V664 and V727; 241-T-0301; 241-T-301 Catch Tank **Reclassification:** None

Type: Catch Tank **Start Date:** 1/1/1944

Status: Inactive **End Date:** 1/1/1985

Description: The 241-T-301B Catch Tank is an underground, reinforced concrete tank. The tank is surrounded with posts and chain and labeled with IMUST signs. This unit has a concrete-domed lid and uses a vertical construction design. The catch tank is below grade for shielding purposes.

Location: The 241-T-301B catch tank is located in the southwestern portion of the 241-T Tank Farm, east of the 241-T-252 Diversion Box.

Process Description: This unit collected overflow waste from diversion boxes 241-T-151, 241-T-152, 241-T-153, and 241-T-252 via a 15.2 centimeter (6 inch) schedule 40 stainless steel pipe.

Related Sites/Structures: The 241-T-301 Catch Tank is associated with the 241-T-151, 241-T-152, 241-T-153, and 241-T-252 diversion boxes. Drain lines V664 and V727 connect the diversion boxes to the catch tank.

Waste Type: Process Effluent

Waste Description: This tank collected overflow radioactive process waste from 241-T-252, 241-T-151, 241-T-152 and 241-T-153 Diversion Boxes.

Code: 241-TR-152 **Classification:** Accepted

Names: 241-TR-152; 241-TR-152 Diversion Box; Line 6053 **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1944

Status: Inactive **End Date:** 1/1/1980

Description: This unit is constructed of reinforced concrete and is rectangular in shape.
Location: This unit is located east of Tank 241-T-104 within the 241-T Tank Farm.
Process Description: This unit was used for the transfer of waste solutions from processing and decontamination operations.

Related Sites/Structures: The 241-TR-152 Diversion Box is associated with the 241-TR-153 and 241-TXR-151 Diversion Boxes, and the 241-T Tank Farm. The drain line is line 6053.

Waste Type: Equipment
Waste Description: It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Waste Type: Equipment
Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles.

Waste Type: Process Effluent
Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operations.

Names: 241-TR-153; 241-TR-153 Booster Pump Pit; 241-TR-153 Diversion Box; Line 6172 **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1944

Status: Inactive **End Date:** 1/1/1983

Description: This unit is constructed of reinforced concrete and is rectangular in shape.
Location: The 241-TR-153 Diversion Box is located east of Tank 241-T-107 within the 241-T Tank Farm.
Process Description: This unit was used for the transfer of waste solutions from processing and decontamination operations.

Related Sites/Structures: The 241-TR-153 Diversion Box is associated with the 241-TR-152 and 241-TXR-151 Diversion Boxes, 241-T Tank Farm, and the 241-T-301B Catch Tank. The drain line to 241-T-102 is number 6172.

Waste Type: Equipment
Waste Description: Waste lead is stored in the diversion box.

Waste Type: Equipment
Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles.

Waste Type: Chemicals
Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation.

Code: 200-W-52 **Classification:** Accepted

Names: 200-W-52; 216-T-7 Crib; 241-T-3 Crib **Reclassification:** None

Type: Crib **Start Date:** 1/1/1948
Status: Inactive **End Date:** 1/1/1955

Description: The crib is located inside the 241-T Tank Farm fence. The fence is posted with Radiological Buffer Area/Underground Radioactive Material signs. The tank farm has a gravel surface. The crib is not separately identified.

Location: The crib is located inside the 241-T Tank Farm fence, east of the 216-T-7 Tile Field.

Process Description: The site consists of one wooden crib box with inlet and outlet piping and a riser pipe. The box is set into a gravel layer in the bottom of a pit with sloping sides. It is connected to a tile field that is located west of the crib. The 216-T-7 crib received second cycle supernate from 221-T, 224-T waste and tank 5-6 waste after it cascaded through the 241-T-110, 241-T-111 and 241-T-112 tanks. The 216-T-7 Tile Field received overflow from the crib.

Related Sites/ Structures: The crib is associated with the 216-T-7 Tile Field, the 241-T Tank Farm, 221-T and 224-T.

Waste Type: Process Effluent
Waste Description:

Code: 200-W-93 **Classification:** Accepted
Names: 200-W-93; Contaminated Soil at 241-T Tank Farm **Reclassification:** None

Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**

Description: The site is the soil inside and adjacent to the chain link fence that surrounds the 241-T Tank Farm. Various radiological postings and warning signs are attached to the chain link fence. The interior of the tank farm complex is covered with gravel. Many risers and monitoring devices for the underground structures are visible on the surface. The 216-T-7 and 216-T-32 Cribs are located inside the tank farm fence and are marked with "Crib" signs. The 216-T-7 Tile Field is partially inside the tank farm, but most of it extends westward, beyond the fence line. The individual unplanned releases associated with the 241-T Tank Farm are not separately marked or posted. Occasionally, radioactive contamination is found adjacent to the outside of the tank farm fence, resulting in a contamination zone extension around the tank farm perimeter. These areas will also be considered tank farm soil. A posted Underground Radioactive Material area currently extends outside the 241-T Tank Farm fence on the west side.

Location: The site is located west of 221-T, at the intersection of 23rd Street and Camden Ave., in 200 West Area.

Release Description: The exact extent (horizontal and vertical) of the soil contaminated by unplanned releases that occurred within this farm over the years are not known. Some of the single shell tanks have leaked to the soil below the tank farm. Other releases spread contamination to the surface soil surrounding the tanks.

Related Sites/ Structures: Unplanned Releases UPR-200-W-7, UPR-200-W-147 and UPR-200-W-148 are associated with the 241-T Tank Farm. The 216-T-7 and 216-T-32 Cribs are located inside the tank farm fence.

Waste Type: Process Effluent
Waste Description: Liquid releases occurred from underground leaks in tanks and transfer lines. Airborne contamination spreads occurred from activities conducted in valve pits and diversion boxes.

Both types of releases contributed to the contamination in the soil.

The Following Sites Were Consolidated With This Site:

Code: UPR-200-W-7

Names: UPR-200-W-7; Contamination Spread from the 241-T-151 and 241-T-152 Diversion Boxes; UN-200-W-7

Code: UPR-200-W-147

Names: UPR-200-W-147; 241-T-103 Leak

Code: UPR-200-W-148

Names: UPR-200-W-148; 241-T-106 Leak

WMA TX/TY

Code: 242-T	Classification: Accepted
Names: 242-T; 242-T Evaporator Facility; 241-T Evaporator	Reclassification: None
Type: Evaporator	Start Date: 1/1/1950
Status: Inactive	End Date: 1/1/1986

Description: The 242-T is a reinforced concrete and structural steel building. The facility consists of the 242-T building with the control room in the southeast portion, 242-TB and the 242-TA vault. The evaporator portion of 242-T contains a feed cell, an evaporator vessel, a cyclone separator, a catch tank and two preheater tanks. The condensate portion contains the off-gas vessels, two condensate catch tanks and a sample gallery. The 242-TA Vault is a concrete lined pit with a ground level steel cover. A 15,120 liter (4000 gallon) receiver tank is inside the vault. This tank received Z Plant waste.

Location: The building is adjacent to the east side of the 241-TX/TY Tank Farm fence.

Process Description: The 242-T Evaporator Facility was originally constructed to increase storage capacity in the existing underground tank farm tanks through a batch evaporation, waste concentration process. From 1950 to 1955 and 1965 through 1976, 242-T operated as a tank waste evaporator. The evaporation operation of non-boiling tank farm waste was discontinued in 1976. From 1976 to 1980, the 242-T Evaporator was used to neutralize Z Plant salt acid waste. This process ended in 1980, with the completion of the 244-TX Double-Shell Receiver Tank. From 1980 to 1985 the control area of the facility was utilized to support the saltwell pumping program.

Related Sites/ Structures: The 242-T is associated with the 241-TX/TY tanks.

Waste Type: Process Effluent

Waste Description: During the 1950's, the facility concentrated separation process, first cycle decontamination waste from the tank farms. First cycle waste typically contained 10% of the original fission products and 1% plutonium in solution with nitrates, phosphates and sulfates. From the 1960's to the late 1970's, it received single-shell supernatant waste, complexed radioactive waste, and dilute miscellaneous radioactive waste. From 1976 to 1980, the evaporator was used to neutralize Z Plant waste. During its active life, the facility received and processed 127,204,560 liters (33,652,000 gallons) of waste.

Code: 242-T-135	Classification: Accepted
Names: 242-T-135; IMUST; Inactive Miscellaneous Underground Storage Tank	Reclassification: None
Type: Storage Tank	Start Date:
Status: Inactive	End Date:

Description: The unit is a tank partially below grade, constructed of stainless steel. An agitator and a hopper are installed on top of the tank. The tank is surrounded with steel posts and chain, located behind a steel radiation shield wall. The area surrounding the tank is posted with Contamination Area and IMUST signs.

Location: The tank is located adjacent to the east wall of the 242-T Catch Tank Room and north of the 242-T Control Room. The 242-T buildings are located adjacent to the 241-TX Tank Farm, outside the fence.

Process: The tank was installed to hold decontamination solutions from the 242-T Evaporator. The

Process Description: solutions were charged through a hopper on the top of the tank and removed through the top using a jet.

Related Sites/ Structures: The unit is associated with the operation of the 242-T evaporator .

Waste Type: Process Effluent

Waste Description: The contents of the tank are not known. The tank mission was storage of 242-T decontamination solutions. The content of the tank would include 242-T decontamination solutions.

Code: 242-T-151 **Classification:** Accepted

Names: 242-T-151; 242-T-151 Diversion Box. Line V830 **Reclassification:** None

Type: Diversion Box **Start Date:**

Status: Inactive **End Date:**

Description: This unit is constructed of reinforced concrete and is rectangular in shape.

Location: This unit is located southeast of the 241-TX-116 Tank, inside the 241-TX Tank Farm.

Process Description: This unit was used for the transfer of waste solutions from processing and decontamination operations.

Related Sites/ Structures: The 242-T-151 Diversion Box is associated with the 241-TX Tank Farm, 241-T-153 Diversion Box, and 242-T Evaporator. The drain line for this diversion box is V830.

Waste Type: Equipment

Waste Description: It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Waste Type: Process Effluent

Waste Description: This unit was used for the transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operations.

Waste Type: Equipment

Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles.

Code: 242-TA-R1 **Classification:** Accepted

Names: 242-TA-R1; IMUST; Inactive Miscellaneous Underground Storage Tank; Receiver Tank TK-R1; Receiver TK-Vault; Z Waste; 242-TA; 242-TA Receiver Tank Vault **Reclassification:** None

Type: Receiving Vault **Start Date:**

Status: Inactive **End Date:**

Description: The unit is a below-grade 16 foot diameter (at bottom) by 20 foot high cylindrical structure, with a 16 foot octagon-shaped top at grade level. The vault is constructed of concrete and contains a 4200 gallon tank. The surface is surrounded with a metal rail fence and labeled with IMUST signs.

Location: The unit is located inside the 241-TX Tank Farm, adjacent to the southwest corner of the 242-T

Building.

Process Description: The Z Waste Receiver Tank received high salt waste from tank D-5 in the 241-Z building. The Z Waste Receiver Tank waste was sent to the Blend Tank TK-B1 inside the 242-T building. Off-gasses from the tank are sent to the vessel vent system in the 242-TB building.

Related Sites/ Structures: The tank is associated with the 241-Z facility.

Waste Type: Process Effluent

Waste Description: The waste reportedly contains 0.007 grams per gallon of Plutonium; 4.756 molar concentration of nitrate ion; 0.15 molar concentration of Sodium ion; 0.842 molar concentration of trivalent Aluminum; 0.648 molar concentration of free Hydrogen atoms; 0.454 molar concentration of divalent Aluminum Fluoride; 0.180 molar concentration of bivalent Magnesium; 0.087 molar concentration of trivalent Iron; 0.059 molar concentration of Potassium ion; 0.013 molar concentration of Sulphate ion; and 0.0005 molar concentration of divalent Uranium Oxide.

Code: 241-TX-101	Classification: Accepted
Names: 241-TX-101; 241-TX-TK-101	Reclassification: None
Type: Single-Shell Tank	Start Date: 1/1/1949
Status: Inactive	End Date: 1/1/1980

Description: This unit is a second-generation underground single-shell storage tank. Tank 241-TX-101 is the first tank of a four-tank cascade series. This cylindrical tank is concrete-reinforced with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TX-101 is located in the southeastern portion of the 241-TX Tank Farm.

Process Description: Waste sources for Tank 241-TX-101 included the REDOX Facility, PUREX, and B-Plant.

Related Sites/ Structures: Structures associated with Tank 241-TX-101 include passive ventilation, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to this unit includes bismuth phosphate metal waste, REDOX waste, coating waste, tributyl phosphate, and waste fractionation ion exchange waste. Other waste includes high level and low level waste from B-Plant, non-complexed waste, PUREX low-level waste, organic wash waste, partial neutralization feed waste, and evaporator bottoms. The unit also received decontamination waste from 241-C, -BX, -SX, -TX Tank Farms.

Code: 241-TX-102	Classification: Accepted
Names: 241-TX-102; 241-TX-TK-102	Reclassification: None
Type: Single-Shell Tank	Start Date: 1/1/1950
Status: Inactive	End Date: 1/1/1975

Description: This unit is a second-generation, underground single-shell storage tank. Tank 241-TX-102 is the second tank of a four-tank cascade series. This cylindrical tank is concrete-reinforced with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TX-102 is located in the southern portion of the 241-TX Tank Farm.

Process**Description:**

**Related Sites/
Structures:** Structures associated with Tank 241-TX-102 include passive ventilation, drywells, and a surface level measurement instrument.

Waste Type: Storage Tank

**Waste
Description:** Waste transferred to Tank 241-TX-102 included bismuth phosphate metal waste, 242-T Evaporator waste, and supernatant containing REDOX high-level waste, and evaporator bottoms from 241-TX Tanks.

Type: Single-Shell Tank

Start Date: 1/1/1950

Status: Inactive

End Date: 1/1/1980

Description: This unit is a second-generation, underground single-shell storage tank. Tank 241-TX-103 is the third tank of a four-tank cascade series. This cylindrical tank is concrete-reinforced with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TX-103 is located in the southern portion of the 241-TX Tank Farm.

**Process
Description:** Waste sources for Tank 241-TX-103 included the 242-A Evaporator, and the 241-TX Tanks.

**Related Sites/
Structures:** Structures associated with Tank 241-TX-103 include passive ventilation, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

**Waste
Description:** Waste transferred to Tank 241-TX-103 included bismuth phosphate metal waste, 242-T Evaporator waste, noncomplexed waste, tributyl phosphate waste, and partial neutralization feed from 241-TX Tanks.

Code: 241-TX-104

Classification: Accepted

Names: 241-TX-104; 241-TX-TK-104

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1950

Status: Inactive

End Date: 1/1/1977

Description: This unit is a second-generation, underground single-shell storage tank. Tank 241-TX-104 is the fourth tank of a four-tank cascade series. This cylindrical tank is concrete-reinforced with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TX-104 is located in the southwestern portion of the 241-TX Tank Farm.

**Process
Description:** Waste sources for Tank 241-TX-104 included the REDOX Facility, PUREX, and B-Plant, 242-T Evaporator, and Tank Farms 241-TY and 241-TX.

**Related Sites/
Structures:** Structures associated with Tank 241-TX-104 include passive ventilation, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

**Waste
Description:** Waste transferred to Tank 241-TX-104 included bismuth phosphate metal waste, 242-T

Description: Evaporator waste, and supernatant containing REDOX ion exchange and high-level waste, PUREX organic wash waste, B Plant low-level waste, and tributyl phosphate from 241-TY and 241-TX Tanks.

Code: 241-TX-105 **Classification:** Accepted

Names: 241-TX-105; 241-TX-TK-105 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1952

Status: Inactive **End Date:** 1/1/1976

Description: This unit is a second-generation, underground single-shell storage tank. Tank 241-TX-105 is the first tank of a four-tank cascade series. This cylindrical tank is concrete-reinforced with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TX-105 is located in the southeastern portion of the 241-TX Tank Farm.

Process Description: Waste sources for Tank 241-TX-105 included the REDOX Facility, PUREX, and the 241-BX and 241-SX Tank Farms.

Related Sites/Structures: Structures associated with Tank 241-TX-105 include passive ventilation, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to tank 241-TX-105 included bismuth phosphate metal waste, 242-T Evaporator waste, and supernatant containing REDOX ion exchange and high-level waste, and PUREX organic wash waste from 241-BX and 241-SX Tank Farms.

Code: 241-TX-106 **Classification:** Accepted

Names: 241-TX-106; 241-TX-TK-106 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1952

Status: Inactive **End Date:** 1/1/1977

Description: This unit is a second-generation, underground single-shell storage tank. Tank 241-TX-106 is the second tank of a four-tank cascade series. This cylindrical tank is concrete-reinforced with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TX-106 is located in the southeastern portion of the 241-TX Tank Farm.

Process Description: Waste sources for Tank 241-TX-106 included the REDOX Facility, PUREX, 242-T Evaporator, and the 241-TX Tank Farm.

Related Sites/Structures: Structures associated with Tank 241-TX-106 include passive ventilation, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-TX-106 included bismuth phosphate metal waste, tributyl phosphate waste, 242-T Evaporator waste, and supernatant containing REDOX ion exchange and high-level waste, PUREX organic wash waste, evaporator bottoms, and coating waste from 241-TX Tanks.

single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TX-109 is located in the eastern portion of the 241-TX Tank Farm.

Process Description: Waste sources for Tank 241-TX-109 included the 242-T Evaporator and the 241-T, 241-TX, and 241-TY Tank Farms.

Related Sites/ Structures: Structures associated with Tank 241-TX-109 include passive ventilation, a liquid observation well, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-TX-109 included: bismuth phosphate first-cycle waste, 242-T Evaporator waste, and evaporator bottoms from the 241-T, 241-TX, and 241-TY Tanks.

Code: 241-TX-110 **Classification:** Accepted

Names: 241-TX-110; 241-TX-TK-110 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1949

Status: Inactive **End Date:** 1/1/1977

Description: This unit is a second-generation, underground single-shell storage tank. Tank 241-TX-110 is the second tank of a four-tank cascade series. This cylindrical tank is concrete-reinforced with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TX-110 is located in the central portion of the 241-TX Tank Farm.

Process Description: Waste sources for Tank 241-TX-110 included the 242-T Evaporator and T Plant.

Related Sites/ Structures: Structures associated with Tank 241-TX-110 include passive ventilation, a liquid observation well, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-TX-110 included bismuth phosphate first-cycle waste and 242-T Evaporator waste.

Code: 241-TX-111 **Classification:** Accepted

Names: 241-TX-111; 241-TX-TK-111 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1950

Status: Inactive **End Date:** 1/1/1977

Description: This unit is a second-generation, underground single-shell storage tank. Tank 241-TX-111 is the third tank of a four-tank cascade series. This cylindrical tank is concrete-reinforced with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TX-111 is located in the central portion of the 241-TX Tank Farm.

Process Description: Waste sources for Tank 241-TX-111 included the 242-T Evaporator, T Plant, and the 241-TY Tanks.

Related Sites/ Structures: Structures associated with Tank 241-TX-111 include passive ventilation, a liquid observation well, drywells, temperature and surface level measurement instruments.

Structures: well, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-TX-111 included bismuth phosphate first-cycle waste, 242-T

Evaporator waste, and supernatant containing tributyl phosphate waste from 241-TX Tanks.

Code: 241-TX-112 **Classification:** Accepted

Names: 241-TX-112; 241-TX-TK-112 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1950

Status: Inactive **End Date:** 1/1/1976

Description: This unit is a second-generation, underground single-shell storage tank. Tank 241-TX-112 is the fourth tank of a four-tank cascade series. This cylindrical tank is concrete-reinforced with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TX-112 is located in the western portion of the 241-TX Tank Farm.

Process Description: Waste sources for Tank 241-TX-112 included the 242-T Evaporator, T Plant, and the 241-TY Tanks.

Related Sites/Structures: Structures associated with Tank 241-TX-112 include passive ventilation, a liquid observation well, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-TX-112 included 242-T Evaporator waste, bismuth phosphate

first-cycle waste, and supernatant containing evaporator bottoms from the 241-TX Tanks.

Code: 241-TX-113 **Classification:** Accepted

Names: 241-TX-113; 241-TX-TK-113 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1952

Status: Inactive **End Date:** 1/1/1976

Description: This unit is a second-generation, underground single-shell storage tank. Tank 241-TX-113 is the first tank of a three-tank cascade series. This cylindrical tank is concrete-reinforced with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TX-113 is located in eastern portion of the 241-TX Tank Farm.

Process Description: Waste sources for Tank 241-TX-113 included the 242-T Evaporator and the 241-TX Tanks.

Related Sites/Structures: Structures associated with Tank 241-TX-113 include passive ventilation, a liquid observation well, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste Transferred to Tank 241-TX-113 included 242-T Evaporator waste and supernatant

containing evaporator bottoms from 241-TX Tanks.

Code: 241-TX-114 **Classification:** Accepted

Names: 241-TX-114; 241-TX-TK-114 **Reclassification:** None

Location: Tank 241-TX-116 is located in the northeastern portion of the 241-TX Tank Farm.

Process Description: Waste sources for Tank 241-TX-116 included the 241-TX Tanks.

Related Sites/Structures: Structures associated with Tank 241-TX-116 include passive ventilation, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-TX-116 included supernatant containing evaporator bottoms from 241-TX Tanks. Diatomaceous earth was added in 1969.

Code: 241-TX-117 **Classification:** Accepted

Names: 241-TX-117; 241-TX-TK-117 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1952

Status: Inactive **End Date:** 1/1/1976

Description: This unit is a second-generation, underground single-shell storage tank. Tank 241-TX-117 is the second tank of a three-tank cascade series. This cylindrical tank is concrete-reinforced with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TX-117 is located in the northern portion of the 241-TX Tank Farm.

Process Description: Waste sources for Tank 241-TX-117 included the 242-T Evaporator and 241-TX Tanks.

Related Sites/Structures: Structures associated with Tank 241-TX-117 include passive ventilation, a liquid observation well, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-TX-117 included supernatant containing first-cycle waste and evaporator bottoms from 241-TX Tanks. Diatomaceous earth was also added in 1969.

Code: 241-TX-118 **Classification:** Accepted

Names: 241-TX-118; 241-TX-TK-118 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1952

Status: Inactive **End Date:** 1/1/1980

Description: This unit is a second-generation, underground single-shell storage tank. Tank 241-TX-118 is the third tank of a three-tank cascade series. This cylindrical tank is concrete-reinforced with a single steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TX-118 is located northwestern portion of the 241-TX Tank Farm.

Process Description: Waste sources for Tank 241-TX-118 included 242-T Evaporator, 234-Z and 235-Z Buildings, and the 241-T, 241-TX, 241-TY, 241-U Tank Farms.

Related Sites/Structures: Structures associated with Tank 241-TX-118 include passive ventilation, a liquid observation well, drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to tank 241-TX-118 included 242-T Evaporator feed tank waste, 234-Z and

Description: 235-Z Buildings waste, caustic solution, tributyl phosphate waste, decontamination waste, bismuth phosphate first-cycle waste, evaporator bottoms, partial neutralization feed, and coating waste from the 241-T, 241-TX, 241-TY, and 241-U Tank Farms.

Code: 241-TX-153 **Classification:** Accepted

Names: 241-TX-153; 241-TX-153 Diversion Box **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1949

Status: Inactive **End Date:** 1/1/1980

Description: The diversion box is a rectangular reinforced concrete structure. Most of the structure is below ground. A few inches of the structure that extends above ground is covered with a gray weather coating. The tank farm fence is posted with various radiological postings.

Location: This unit is located inside the 241-TX Tank Farm, southeast of the 241-TX-101 Tank.

Process Description: This unit is used to transfer of solutions from processing and decontamination operations to various tank farm facilities via underground transfer lines..

Related Sites/ Structures: The 241-TX-153 Diversion Box is associated with the 241-TX-155 Diversion Box and the 241-TX Tank Farm, the 241-TX-302A and 241-TX-302B Catch Tanks and UPR-200-W-126. The pipeline from the diversion box to the 216-T-19 crib is sitecode 200-W-213-PL.

Waste Type: Process Effluent

Waste Description: This unit was used for transfer of waste solution from processing and decontamination operations. Volumes were variable according to specific plant operations. Lead shielding may also be contained inside the diversion box.

Waste Type: Equipment

Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles. Waste lead is also stored in the diversion box

Code: 241-TX-302A **Classification:** Accepted

Names: 241-TX-302A; 241-TX-302-A Catch Tank; IMUST; Inactive Miscellaneous Underground Storage Tank; Lines V627 and V628 **Reclassification:** None

Type: Catch Tank **Start Date:** 1/1/1949

Status: Inactive **End Date:** 1/1/1982

Description: This unit is an underground, horizontal cylindrical tank made of steel. The tank farm surface has been covered with gravel. The tank is surrounded with posts and chain and labeled with IMUST signs.

Location: This tank is located southwest of the 241-TX-153 Diversion Box, inside the 241-TX Tank Farm.

Process Description: The 241-TX-302A Catch Tank received drainage from Diversion Box 241-TX-153 and associated encasements.

Related Sites/ Structures: This unit is associated with the 241-TX-153 Diversion Box and the 241-TX-302X Catch Tank. Lines V627 and V628 are the drain lines from the 241-TX-153 diversion Box.

Waste Type: Process Effluent

Waste Description: This tank collected waste solution spills that occurred during transfers from processing and decontamination operations via the 241-TX-153 Diversion Box. Volumes collected were

variable according to specific plant operations. In 1994, it was estimated the tank contained approximately 113 liters (30 gallons) of supernate liquid and 9261 liters (2450 gallons) of sludge.

Code: 241-TX-302XB **Classification:** Accepted

Names: 241-TX-302XB; IMUST; Inactive Miscellaneous Underground Storage Tank; 241-TX-302B Catch Tank; 241-TX-302-X; 241-TX-302-X (B) **Reclassification:** None

Type: Catch Tank **Start Date:** 1/1/1948

Status: Inactive **End Date:** 1/1/1985

Description: This unit is a horizontal, cylindrical tank made of carbon steel. The tank is surrounded with posts and chain and labeled with IMUST signs. The tank is buried underground to provide radiation shielding.

Location: This catch tank is located east of Tank 241-TX-101, inside the 241-TX Tank Farm.

Process Description: This tank received drainage from a concrete encasement originating at the 241-TX-153 Diversion Box.

Related Sites/Structures: The 241-TX-302-X Catch Tank is associated with Diversion Box 241-TX-153.

Waste Type: Storage Tank

Waste Description: This unit was used for containment of waste solution spills that occurred during transfers from processing and decontamination operations. The contents include metal waste and radiological mixed waste. As of May 1994, 1341 liters (353 gallons) remained in the tank. Per WRPS-0901391, the liquid waste level at that time was 6.5 inches and the solid waste level was 3 inches. The solids volume is 103 gallons. The amount of liquid waste in the tank was estimated to be 237 gallons. The total volume is 340 gallons.

Code: 244-TX DCRT **Classification:** Accepted

Names: 244-TX DCRT; 244-TX Double-Contained Receiver Tank; 244-TX Receiver Tank; 244-TX Receiver Vessel; 244-TX RT; 244-TX-TK/SMP **Reclassification:** None

Type: Receiver Tank **Start Date:** 1/1/1981

Status: Inactive **End Date:** 1/1/2005

Description: This unit is an underground, horizontal cylindrical vessel that sets in a reinforced concrete, steel-lined vault.

Location: The unit is located north of the 241-TX Tank Farm, within the 241-TY Tank Farm fence.

Process Description: Waste sources for the 244-TX Receiver Tank included the Plutonium Finishing Plant, T Plant, and the 241-T Tank Farm.

Related Sites/Structures: The 244-TX Receiver Tank is associated with the Plutonium Finishing Plant, T- Plant, 241-T Tank Farm, and 241-TX-152 Diversion Box.

Waste Type: Process Effluent
Waste Description: Waste transferred to this unit include T Plant decontamination waste, Plutonium Finishing Plant waste, and waste solution stored in the 241-T Tank Farms.

Code: 241-TXR-151 **Classification:** Accepted
Names: 241-TXR-151; 241-TXR-151 Diversion Box; **Reclassification:** None
Line 7765
Type: Diversion Box **Start Date:** 1/1/1949
Status: Inactive **End Date:** 1/1/1980

Description: The diversion box is a rectangular reinforced concrete structure. Most of the structure is below ground. A few inches of the structure that extends above ground is covered with a gray weather coating. The tank farm fence is posted with various radiological postings.

Location: This unit is located east of the 244-TXR Vault, inside the 241-TX Tank Farm fence.

Process Description: This unit is used to transfer waste solutions from processing and decontamination operations to various tank farm facilities.

Related Sites/ Structures: Structures associated with the 241-TXR-151 Diversion Box include the 241-TR-152 and 241-TR-153 Diversion Boxes and the 244-TXR Vault. The drain line to the 244-TXR sump is line 7765.

Waste Type: Process Effluent
Waste Description: This unit was used for transfer of radioactive waste solutions from processing and decontamination operations. Contamination in the diversion box is estimated to be high in alpha, beta and gamma radiation. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Waste Type: Equipment
Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles. Waste lead is also stored in the diversion box.

Code: 241-TXR-152 **Classification:** Accepted
Names: 241-TXR-152; 241-TXR-152 Diversion Box; **Reclassification:** None
Line 7053
Type: Diversion Box **Start Date:** 1/1/1949
Status: Inactive **End Date:** 1/1/1980

Description: This unit is constructed of reinforced concrete and is rectangular in shape. The 241-TXR-152 has been weather covered.

Location: This unit is located east of Tank 241-TX-105, inside the 241-TX Tank Farm.

Process Description: This unit was used for the transfer of waste solutions from processing and decontamination operations.

Related Sites/ Structures: The 241-TXR-152 Diversion Box is associated with the 241-TXR-151 Diversion Box and the 241-TX Tank Farm and drains to the 241-TX-101 Tank through line 7053.

Waste Type: Equipment
Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles. Waste lead is also stored in the diversion box.

Waste Type: Process Effluent
Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operations. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-TXR-153 **Classification:** Accepted
Names: 241-TXR-153; 241-TXR-153 Diversion Box; Line 7253 **Reclassification:** None
Type: Diversion Box **Start Date:** 1/1/1949
Status: Inactive **End Date:** 1/1/1980
Description: This unit is constructed of reinforced concrete and is rectangular in shape. The 241-TXR-153 has been weather covered.
Location: This unit is located east of Tank 241-TX-105, inside the 241-TX Tank Farm.
Process Description: This unit was used for the transfer of waste solutions from processing and decontamination operations.
Related Sites/Structures: The 241-TXR-153 Diversion Box is associated with the 241-TXR-151 Diversion Box and the 241-TX Tank Farm and drains to the 241-TX-105 Tank through line 7253.

Waste Type: Process Effluent
Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operations. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Waste Type: Equipment
Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles. Waste lead is also stored in the diversion box.

Code: 244-TXR VAULT **Classification:** Accepted
Names: 244-TXR VAULT; 244-TXR Vault (Tanks TXR-001, -002, -003); IMUST; Inactive Miscellaneous Underground Storage Tank; 241-TXR-244; 244-TXR **Reclassification:** None
Type: Receiving Vault **Start Date:** 1/1/1950
Status: Inactive **End Date:** 1/1/1957
Description: The 244-TXR Vault is a rectangular, reinforced concrete pit. The vault is surrounded with post and chain and marked with IMUST signs. The vault houses three steel storage tanks (244-TK-TXR-1, -TXR-2, and TXR-3; see "Subsite" sections). The 244-TK-TXR-1 Tank has a 50,000 gallon (189,000 liter) capacity and the 244-TK-TXR-2 and TXR-3 each have a 15,000 gallon (56,800 liters) capacity. The vault is buried to a depth that places the upper surface of its lid about 12 inches (30.5 centimeters) above grade.
Location: The vault is located within the tank farm fence, south of the 241-TX Tank Farm and west of Camden Avenue.
Process Description: The vault and associated tanks were used for processing was from 241-T and 241-TX tank farms and to transfer the processed waste to U Plant for uranium recovery.

Related Sites/ Structures: connected to the 241-TXR-151, 241-TR-152, and 241-TR-153 Diversion Boxes.

Waste Type: Equipment
Waste Description: Equipment associated with the 244-TXR Vault includes the steel tanks, piping, nozzles, and other miscellaneous equipment.

Waste Type: Chemicals
Waste Description: The vault received uranium waste, generated at T-Plant, that was transferred to the 241-T and 241-TX Tank Farms. The vault product consisted of processed slurry that was transferred to U Plant for uranium recovery.

Status: Inactive	End Date:

Description: Tank 244-TXR-0001 is located in a concrete cell, inside the 244-TXR Vault. The cell is 6.7 meters (22 feet) by 7.9 meters (26 feet) by 8.8 meters (28.8 feet). The tank is 6.1 meters (20 feet) tall and 6.1 meters (20 feet) in diameter. The tank has a 189,000 liter (50,000 gallon) capacity. The tank was used as a slurry accumulator for bismuth phosphate waste from tanks in T and TX farms. The tank is isolated and stabilized. Samples were collected and analyzed in 1984 from both the tank and the sump. Results included 1.05 micro curies/liter Total Alpha, 4,510 micro curies/liter Total Beta, and 4,490 micro curies/liter cesium-137- GEA. 0.108 N0-2 and 0.442 N03 were noted without units. Hanford Occurrence Report 79-68 indicates this tank is of questionable integrity.

Description: Tank 244-TXR-002 is located in a concrete cell, inside the 244-TXR Vault. The cell is 4.9 meters (16 feet) by 6.1 meters (20 feet) by 5.8 meters (19 feet). The tank is 3.7 meters (12 feet) tall and 4.3 meters (14 feet) in diameter. It has a 56,775 liter (15,000 gallon) capacity. The tank was used to acidify material for the uranium recovery process. Slurry was transferred from tank 001 and nitric acid was added prior to being pumped to U-Plant. The tank is isolated and stabilized. The tank contains 11,147 liters (2945 gallons) of sludge and no supernate. Samples

were collected and analyzed in 1975 from the tank and had a dose rate of 1.5 R/hr. Results included 0.72 micro curies/liter Pu, 100 micro curies/liter Cs-134, 22,000 micro curies/liter Cs-137 and 10 micro curies/liter Sr-90. There was also 630 mg/L Al, 19,400 mg/L Na, 82,500 mg/L NO₃ and 110 mg/L Cl.

Code: 241-TY-101

Classification: Accepted

Names: 241-TY-101; 241-TY-TK-101

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1953

Status: Inactive

End Date: 1/1/1973

Description: This unit is a second-generation, underground single-shell storage tank. Tank 241-TY-101 is the first tank of a two-tank cascade series. This tank is concrete-reinforced, cylindrical, and dome-roofed with a steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TY-101 is located in the northeastern portion of the 241-TY Tank Farm.

Process Description: Waste sources for Tank 241-TY-101 include the 242-T Evaporator and T-Plant.

Related Sites/ Structures: Structures associated with Tank 241-TY-101 include passive ventilation, drywells, temperature and surface level measurement devices.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-TY-101 included bismuth phosphate first-cycle waste, tributyl phosphate waste, and evaporator bottoms from 241-TY, -TX, and -SX Tank Farms.

Code: 241-TY-102

Classification: Accepted

Names: 241-TY-102; 241-TY-TK-102

Reclassification: None

Location: Tank 241-TY-104 is located on the west side of the 241-TY Tank Farm.

Process Description: Waste sources for Tank 241-TY-104 include the 242-T Evaporator and T-Plant.

Related Sites/Structures: Structures associated with Tank 241-TY-104 include passive ventilation, drywells, temperature and surface level measurement devices.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-TY-104 included tributyl phosphate waste, REDOX ion exchange waste, PUREX organic wash waste, bismuth phosphate first-cycle waste, and decontamination waste from 241-TX and -TY Tank Farms.

Code: 241-TY-105 **Classification:** Accepted

Names: 241-TY-105; 241-TY-TK-105 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1953

Status: Inactive **End Date:** 1/1/1959

Description: This unit is a second generation single-shell storage tank. Tank 241-TY-106 is the second tank of a two-tank cascade series. This tank is concrete-reinforced, cylindrical, and dome-roofed with a steel liner lying across the tank bottom and up the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-TY-106 is located in the southwestern portion of the 241-TY Tank Farm.

Process Description: Tank 241-TY-106 received tributyl phosphate waste.

Related Sites/Structures: Structures associated with Tank 241-TY-106 include passive ventilation, drywells, temperature and surface level measurement devices.

Waste Type: Storage Tank

Waste Description: Tank 241-TY-106 contains tributyl phosphate waste. Diatomaceous earth was added in 1969.

Description:

Code: 241-TY-153	Classification: Accepted
Names: 241-TY-153; 241-TY-153 Diversion Box	Reclassification: None
Type: Diversion Box	Start Date: 1/1/1953
Status: Inactive	End Date: 1/1/1981

Description: This unit is constructed of reinforced concrete and is rectangular in shape.

Location: This unit is located in the southeast corner of the 241-TY Tank Farm.

Process Description: This unit was used for the transfer of waste solutions from processing and decontamination operations.

Related Sites/ Structures: The 241-TY-153 Diversion Box is associated with the 241-TY Tank Farm, the 241-TY-302A Catch Tank, and the 241-TX-153 and 241-TX-155 Diversion Boxes. The drain line is V651.

Waste Type: Equipment

Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles.

Waste Type: Equipment

Waste Description: Waste lead is stored in the diversion box.

Waste Type: Process Effluent

Waste Description: This unit was used for transfer of waste solution from processing and decontamination operations. Lead shielding may also be contained inside the diversion box.

Code: 241-TY-302A	Classification: Accepted
Names: 241-TY-302A; 241-TY-302-A Catch Tank; IMUST; Inactive Miscellaneous Underground Storage Tank; Line V651	Reclassification: None
Type: Catch Tank	Start Date: 1/1/1953
Status: Inactive	End Date: 1/1/1981

Description: This unit is a horizontal, cylindrical tank made of steel. The tank is surrounded with post and chain and marked with IMUST signs. The tank is buried underground to provide radiation shielding.

Location: This unit is located in the southeast corner of the 241-TY Tank Farm.

Process Description: The catch tank received drainage from Diversion Box 241-TY-153.

Related Sites/ Structures: The 241-TY-302A Catch Tank is associated with the 241-TY-153 Diversion Box and the 241-TY Tank Farm. The drain line is line V651.

Waste Type: Process Effluent

Waste Description: This tank collected overflow waste solutions from processing and decontamination operations that passed through the 241-TY-153 Diversion Box. Volumes were variable according to specific plant operation. The volume is unknown and not monitored.

Code: 241-TY-302B **Classification:** Accepted
Names: 241-TY-302B; 241-TY-302-B Catch Tank; **Reclassification:** None
IMUST; Inactive Miscellaneous Underground
Storage Tank
Type: Catch Tank **Start Date:** 1/1/1953
Status: Inactive **End Date:** 1/1/1981

Description: This unit is a horizontal, cylindrical tank made of steel. The tank is surrounded with post and chain and marked with IMUST signs. The tank is buried underground to provide radiation shielding.

Location: This unit is located in the northeast corner of the 241-TY Tank Farm.

Process Description: This catch tank received drainage from a concrete encasement originally at Diversion Box 241-TY-153.

Related Sites/ Structures: The 241-TY-302B Catch Tank is associated with the 241-TY-153 Diversion Box.

Waste Type: Storage Tank
Waste Description: This unit accepted overflow waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation.

Code: 200-W-94 **Classification:** Accepted
Names: 200-W-94; Contaminated Soil at 241-TX/TY **Reclassification:** None
Tank Farm
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**

Description: The site is the soil inside and adjacent to the chain link fence that surrounds the 241-TX/TY Tank Farm complex. Various radiological postings and warning signs are attached to the chain link fence. The interior of the tank farm complex is covered with gravel. Many risers and monitoring devices for the underground structures are visible on the surface. The individual unplanned releases associated with the 241-TX/TY Tank Farms are not separately marked or posted. Occasionally, radioactive contamination is found adjacent to the outside of the tank farm fence, resulting in a contamination zone extension around the tank farm perimeter. These areas will also be considered tank farm soil. A portion of the 242-T Evaporator building is located inside the tank farm fence.

Location: The site is located south of 23rd Street and west of Camden Ave., in 200 West Area.

Release Description: The exact extent (horizontal and vertical) of the soil contaminated by unplanned releases that occurred within this farm over the years are not known. Some of the single shell tanks have leaked to the soil below the tank farm. Other releases spread contamination to the surface soil surrounding the tanks.

Related Sites/ Structures: Unplanned Release sites UPR-200-W-12, UPR-200-W-17, UPR-200-W-100, UPR-200-W-126, UPR-200-W-129, UPR-200-W-149, UPR-200-W-150, UPR-200-W-151, UPR-200-W-152 and UPR-200-W-153 are associated with the 241-TX/TY Tank Farms.

Waste Type: Process Effluent
Waste Description: Liquid releases occurred from underground leaks in tanks and transfer lines. Airborne contamination spreads occurred from activities conducted in valve pits and diversion boxes.

WMA U

Code: 241-U-A **Classification:** Accepted

Names: 241-U-A; 241-U-A Diversion Box; 241-U-A Valve Pit **Reclassification:** None

Type: Valve Pit **Start Date:** 1/1/1973

Status: Inactive **End Date:**

Description: This unit is a rectangular reinforced concrete structure. The valve pit is below grade with the cover block above grade. It has been covered with foam. Valve handles extended above the cover block through penetrations.

Location: Valve Pit 241-U-A is located southeast of Tank 241-U-102 and northeast of Tank 241-U-105.

Release Description: This unit is designed to contain leaks from transfers and drainage from operations within the unit.

Process Description: This unit was designed to route waste solutions to the 241-U Tanks from the 242-S Evaporator Building.

Related Sites/Structures: The 241-U-A Valve Pit is associated with the 241-U Tank Farm and the 241-U-105 Tank. Flush Pit 241-U-A is also associated with the valve pit.

Waste Type: Process Effluent

Waste Description: The unit transports waste solutions from processing and decontamination operations. Quantities are variable according to specific plant operations. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-U-B **Classification:** Accepted

Names: 241-U-B; 241-U-B Diversion Box; 241-U-B Valve Pit **Reclassification:** None

Type: Valve Pit **Start Date:** 1/1/1973

Status: Inactive **End Date:**

Description: This unit is a rectangular reinforced concrete structure that has been covered with foam. The valve pit is below grade with the cover block above grade. Valve handles extended above the cover block through penetrations.

Location: Valve Pit 241-U-B is located southwest of Tank 241-U-101 and northwest of Tank 241-U-104.

Process Description: This unit was designed to route waste solutions to the 241-U Tanks from the 242-S Evaporator Building.

Related Sites/Structures: The 241-U-B Valve Pit is associated with the 241-U Tank Farm and the 241-U-105 Tank. Flush Pit 241-U-B is also associated with the valve pit.

Waste Type: Process Effluent

Waste Description: The unit transports waste solutions from processing and decontamination operations. Quantities are variable according to specific plant operations. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Names: 241-U-D; 241-U-D Diversion Box; 241-U-D Valve Pit **Reclassification:** None
Type: Valve Pit **Start Date:** 1/1/1973
Status: Inactive **End Date:**
Description: This unit is a rectangular reinforced concrete structure that has been covered with foam. The valve pit is below grade with the cover block above grade. Valve handles extend above the cover block through penetrations.
Location: Valve Pit 241-U-D is located southwest of Tank 241-U-107 and northwest of Tank 241-U-110.
Process Description: This unit was designed to route waste solutions to the 241-U Tanks from the 242-S Evaporator Building.
Related Sites/Structures: The 241-U-D Valve Pit is associated with the 241-U Tank Farm and the 241-U-111 Tank. Flush Pit 241-U-D is also associated with the valve pit.
Waste Type: Process Effluent
Waste Description: The unit transports waste solutions from processing and decontamination operations. Quantities are variable according to specific plant operations. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-U-101 **Classification:** Accepted
Names: 241-U-101; 241-U-TK-101 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1946
Status: Inactive **End Date:** 1/1/1959
Description: This unit is a first-generation, underground single-shell storage tank. Tank 241-U-101 is the

first tank of a three-tank cascade series. This tank is concrete-reinforced, cylindrical, dome-roofed with a single steel liner lying across the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-U-101 is located northeastern portion of the 241-U Tank Farm.

Process Description: Waste sources for Tank 241-U-101 included the T-Plant and REDOX Facilities.

Related Sites/ Structures: Structures associated with Tank 241-U-101 include passive ventilation, two drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-U-101 included metal waste from T-Plant. Waste was received from various storage tanks for processing in the 242-T Evaporator. Tank 241-U-101 received a variety of solid waste items. These included experimental fuel elements, shroud tubes, and samarium balls. The total fissile material contents of the waste was 54.01 ounces (1,530 grams) of 4.5 percent enriched uranium and 0.21 ounces (6 grams) of plutonium.

Code: 241-U-102

Classification: Accepted

Names: 241-U-102; 241-U-TK-102

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1946

Status: Inactive

End Date: 1/1/1976

Description: This unit is a first-generation, underground single-shell storage tank. Tank 241-U-102 is the second tank of a three-tank cascade series. This tank is concrete-reinforced, cylindrical, dome-roofed with a single steel liner lying across the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-U-102 is located in the northern portion of the 241-U Tank Farm.

Process Description: Waste sources for Tank 241-U-102 included the T-Plant and REDOX Facilities.

Related Sites/ Structures: Structures associated with Tank 241-U-102 include passive ventilation, six drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-U-102 included metal waste from T-Plant. Waste was also received from various storage tanks for processing in the 242-T Evaporator.

Code: 241-U-103

Classification: Accepted

Names: 241-U-103; 241-U-TK-103

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1947

Status: Inactive

End Date: 1/1/1978

Description: This unit is a first-generation, underground single-shell storage tank. Tank 241-U-103 is the third tank of a three-tank cascade series. This tank is concrete-reinforced, cylindrical, dome-roofed with a single steel liner lying across the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-U-103 is located in the northwestern portion of the 241-U Tank Farm.

Release Description: UPR-200-W-128.

Process

Description:

Related Sites/ Structures: Structures associated with Tank 241-U-103 include a hydrogen monitor, passive ventilation, liquid observation well, five drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-U-103 included metal waste from T-Plant and waste from various storage tanks for processing in the 242-T Evaporator.

Code: 241-U-104

Classification: Accepted

Names: 241-U-104; 241-U-TK-104

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1947

Status: Inactive

End Date: 1/1/1961

Description: This unit is a first-generation, underground single-shell storage tank. Tank 241-U-104 is the first tank of a three-tank cascade series. This tank is concrete-reinforced, cylindrical, dome-roofed with a single steel liner lying across the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-U-104 is located in the eastern portion of the 241-U Tank Farm.

Release Description: UPR-200-W-155

Process Description: Waste sources for Tank 241-U-104 included the T-Plant and REDOX Facilities.

Related Sites/ Structures: Structures associated with Tank 241-U-104 include passive ventilation, four drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-U-104 included bismuth phosphate metal waste. Diatomaceous earth was added in 1969.

Code: 241-U-105

Classification: Accepted

Names: 241-U-105; 241-U-TK-105

Reclassification: None

Type: Single-Shell Tank

Start Date: 1/1/1947

Status: Inactive

End Date: 1/1/1978

Description: This unit is a first-generation, underground single-shell storage tank. Tank 241-U-105 is the second tank of a three-tank cascade series. This tank is concrete-reinforced, cylindrical, dome-roofed with a single steel liner lying across the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-U-105 is located in the central portion of the 241-U Tank Farm.

Process Description: Waste sources for Tank 241-U-105 included the T-Plant and REDOX Facilities.

Related Sites/ Structures: Structures associated with Tank 241-U-105 include, a hydrogen monitor, passive ventilation, liquid observation well, five drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-U-105 included bismuth phosphate metal waste, REDOX waste,

coating waste, decontamination waste, and evaporator feed and bottoms waste.

Code: 241-U-106 **Classification:** Accepted
Names: 241-U-106; 241-U-TK-106 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1948
Status: Inactive **End Date:** 1/1/1977

Description: This unit is a first-generation, underground single-shell storage tank. Tank 241-U-106 is the third tank of a three-tank cascade series. This tank is concrete-reinforced, cylindrical, dome-roofed with a single steel liner lying across the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-U-106 is located in the western portion of the 241-U Tank Farm.

Process Description: Waste sources for Tank 241-U-106 included the T-Plant and REDOX Facilities.

Related Sites/Structures: Structures associated with Tank 241-U-106 include passive ventilation, liquid observation well, four drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank
Waste Description: Waste transferred to Tank 241-U-106 included bismuth phosphate metal waste, REDOX waste, coating waste, decontamination waste, and evaporator feed and bottoms waste.

Status: Inactive **End Date:** 1/1/1979

Description: This unit is a first-generation, underground single-shell storage tank. Tank 241-U-108 is the

second tank of a three-tank cascade series. This tank is concrete-reinforced, cylindrical, dome-roofed with a single steel liner lying across the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-U-108 is located in the central portion of the 241-U Tank Farm.

Process Description: Waste sources for Tank 241-U-108 included the T Plant, U Plant, and REDOX Facilities.

Related Sites/ Structures: Structures associated with Tank 241-U-108 include a hydrogen monitor, passive ventilation, liquid observation well, four drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-U-108 included bismuth phosphate metal waste, REDOX waste, coating waste, decontamination waste, and evaporator feed and bottoms waste.

Code: 241-U-109 **Classification:** Accepted

Names: 241-U-109; 241-U-TK-109 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1949

Status: Inactive **End Date:** 1/1/1980

Description: This unit is a first-generation, underground single-shell storage tank. Tank 241-U-109 is the third tank of a three-tank cascade series. This tank is concrete-reinforced, cylindrical, dome-roofed with a single steel liner lying across the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-U-109 is located in the western portion of the 241-U Tank Farm.

Process Description: Waste sources for Tank 241-U-109 included the T Plant, U Plant, and REDOX Facilities.

Related Sites/ Structures: Structures associated with Tank 241-U-109 include a hydrogen monitor, passive ventilation, liquid observation well, four drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to this unit included bismuth phosphate metal waste, REDOX waste, coating waste, decontamination waste, and evaporator feed and bottoms waste.

Code: 241-U-110 **Classification:** Accepted

Names: 241-U-110; 241-U-TK-110 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1946

Status: Inactive **End Date:** 1/1/1975

Description: This unit is a first-generation, underground single-shell storage tank. Tank 241-U-110 is the first tank of a three-tank cascade series. This tank is concrete-reinforced, cylindrical, dome-roofed with a single steel liner lying across the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-U-110 is located in the southeastern portion of the 241-U Tank Farm.

Process Description: Waste sources for Tank 241-U-110 included the T Plant, U Plant, and REDOX Facilities.

Related Sites/ Structures: Structures associated with Tank 241-U-110 include a hydrogen monitor, passive ventilation, five drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank
Waste Description: This unit received first-cycle decontamination waste, REDOX waste, and evaporator feed.

Code: 241-U-111 **Classification:** Accepted
Names: 241-U-111; 241-U-TK-111 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1947
Status: Inactive **End Date:** 1/1/1980

Description: This unit is a first-generation, underground single-shell storage tank. Tank 241-U-111 is the second tank of a three-tank cascade series. This tank is concrete-reinforced, cylindrical, dome-roofed with a single steel liner lying across the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-U-111 is located in the southern portion of the 241-U Tank Farm.

Process Description: Waste sources for Tank 241-U-111 included the T Plant and REDOX Facilities.

Related Sites/Structures: Structures associated with Tank 241-U-111 include a hydrogen monitor, passive ventilation, liquid observation well, five drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank
Waste Description: Tank 241-U-111 received first-cycle decontamination waste, REDOX waste, and 242-T Evaporator waste.

Code: 241-U-112 **Classification:** Accepted
Names: 241-U-112; 241-U-TK-112 **Reclassification:** None
Type: Single-Shell Tank **Start Date:** 1/1/1947
Status: Inactive **End Date:** 1/1/1975

Description: This unit is a first-generation, underground single-shell storage tank. Tank 241-U-112 is the third tank of a three-tank cascade series. This tank is concrete-reinforced, cylindrical, and dome-roofed with a single steel liner lying across the tank wall. The tank is buried underground to provide radiation shielding.

Location: Tank 241-U-112 is located in the southwestern portion of the 241-U Tank Farm.

Process Description: Waste sources for Tank 241-U-112 included the T Plant and REDOX Facilities.

Related Sites/Structures: Structures associated with Tank 241-U-112 include a hydrogen monitor, passive ventilation, five drywells, temperature and surface level measurement instruments.

Waste Type: Storage Tank
Waste Description: Waste transferred to Tank 241-U-112 included bismuth phosphate first-cycle waste and REDOX high-level waste from the 241-U Tank Farm.

Code: 241-U-153 **Classification:** Accepted
Names: 241-U-153; 241-U-153 Diversion Box **Reclassification:** None
Type: Diversion Box **Start Date:** 1/1/1946

Status: Inactive **End Date:** 1/1/1981

Description: The tank farm is surrounded with a locked chain link fence. The tank farm has been covered with a layer of gravel. The 241-U-153 Diversion Box structure is mostly below ground. It is a reinforced concrete structure with 3 inch (8 centimeter) Hanford style nozzles.

Location: The 241-U-153 Diversion Box is located in the southeast corner of the 241-U Tank Farm. It is east of the 241-U-110 tank.

Process Description: This unit was used for the transfer of waste solutions from processing and decontamination operations.

Related Sites/ Structures: This unit is associated with the 241-U-151, 241-U-152, 241-UR-152, 241-U-153 Diversion Boxes, 200-W-181-PL, 200-W-184-PL, 200-E-185-PL and the 241-U Tank Farm.

Waste Type: Equipment
Waste Description: Waste lead is stored in the diversion box.

Waste Type: Process Effluent
Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operations. Lead shielding may also be contained inside the diversion box.

Waste Type: Equipment
Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles.

Code: 241-U-201 **Classification:** Accepted

Names: 241-U-201; 241-U-TK-201 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1956

Status: Inactive **End Date:** 1/1/1977

Description: This tank is made of reinforced-concrete and is lined with a steel cylinder. The structure has a concrete base slab and is buried underground to provide radiation shielding.

Location: Tank 241-U-201 is located inside the 241-U Tank Farm, west of tank 241-U-109.

Process Description: Waste sources for Tank 241-U-201 included the REDOX Facility and 241-U Tanks.

Related Sites/ Structures: 241-U-201 is associated with 241-U-202, 241-U-203, 241-U-204 and 241-U-252. It has passive ventilation and temperature and surface level measurement instruments.

Waste Type: Storage Tank
Waste Description: Waste transferred to Tank 241-U-201 included supernatant containing REDOX high-level waste from the 241-U Tank Farm.

Code: 241-U-202 **Classification:** Accepted

Names: 241-U-202; 241-U-TK-202 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1956

Status: Inactive **End Date:** 1/1/1978

Description: This tank is made of reinforced-concrete and is lined with a steel cylinder. The structure has a

concrete base slab and is buried underground to provide radiation shielding.

Location: Tank 241-U-202 is located inside the 241-U Tank Farm, west of tank 241-U-109.

Process Description: Waste sources for Tank 241-U-202 included the REDOX Facility and 241-U Tanks.

Related Sites/Structures: 241-U-202 is associated with 241-U-201, 241-U-203, 241-U-204 and 241-U-252. It has passive ventilation and temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-U-202 included supernatant containing REDOX high-level waste from the 241-U Tank Farm.

Code: 241-U-203 **Classification:** Accepted

Names: 241-U-203; 241-U-TK-203 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1956

Status: Inactive **End Date:** 1/1/1977

Description: This tank is made of reinforced-concrete and is lined with a steel cylinder. The structure has a concrete base slab and is buried underground to provide radiation shielding.

Location: Tank 241-U-203 is located inside the 241-U Tank Farm, west of the 241-U-112 tank.

Process Description: Waste sources for Tank 241-U-203 included the REDOX Facility and 241-U Tanks.

Related Sites/Structures: 241-U-203 is associated with 241-U-201, 241-U-202, 241-U-204 and 241-U-252. It has passive ventilation and temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-U-203 included supernatant containing REDOX high-level waste from the 241-U Tank Farm.

Code: 241-U-204 **Classification:** Accepted

Names: 241-U-204; 241-U-TK-204 **Reclassification:** None

Type: Single-Shell Tank **Start Date:** 1/1/1954

Status: Inactive **End Date:** 1/1/1978

Description: This tank is made of reinforced-concrete and is lined with a steel cylinder. The structure has a concrete base slab and is buried underground to provide radiation shielding.

Location: Tank 241-U-204 is located inside the 241-U Tank Farm, west of the 241-U-112 tank.

Process Description: Waste sources for Tank 241-U-204 included the REDOX Facility and 241-U Tanks.

Related Sites/Structures: 241-U-204 is associated with 241-U-201, 241-U-202, 241-U-203, and 241-U-252. It has passive ventilation and temperature and surface level measurement instruments.

Waste Type: Storage Tank

Waste Description: Waste transferred to Tank 241-U-204 included supernatant containing REDOX high-level waste from the 241-U Tank Farm.

Code: 244-U DCRT **Classification:** Accepted

Names: 244-U DCRT; 244-U Double-Contained Receiver Tank; 244-U Receiver Tank; 244-U Receiving Vault; 244-U RT; 244-U-TK/SUMP **Reclassification:** None

Type: Receiver Tank **Start Date:** 1/1/1987

Status: Inactive **End Date:**

Description: This site consists of an underground reinforced concrete structure in a steel-lined vault. Inside the vault (lower part of structure) is a 21,000-gallon (79,500 liter) carbon steel tank, set horizontally. The structure also contains a pump pit and sump. Approximately 0.31 meter (1 foot) of the structure extends above ground.

Location: This site is located near the southeast corner of the 241-U Tank Farm.

Process Description: This site was intended to receive saltwell waste from the 241-U Tank Farm. This site has not been used for its intended purpose. No waste has been placed in this tank.

Related Sites/ Structures: The unit is associated with 241-U Tank Farm and the 244-U-2904 Flush Pit.

Waste Type: Water

Waste Description: This site does not contain waste, although the site was designed to receive saltwell waste. The unit tank does contains water from operational tests.

Code: 244-U-2904 **Classification:** Not Accepted

Names: 244-U-2904; 244-U Flush Pit **Reclassification:** None

Type: Flush Pit **Start Date:**

Status: Inactive **End Date:**

Description: The site is a building inside the 241-U tank farm fence. The building does not contain any radioactive or hazardous material. The postings on the 241-U Tank Farm fence include Contamination Area, Radiation Area, Radioactive Material and Underground Radioactive Material Area signs.

Location: The flush pit is located in the southeast corner of the 241-U Tank Farm, inside the tank farm fence. It is directly south of the 244-U Double Contained Receiver Tank.

Process Description: The 244-U DCRT was never commissioned and hence has never seen any waste. The flush pit associated with this DCRT has never had any waste associated with it and is considered inactive.

Related Sites/ Structures: The flush pit is associated with the 244-U DCRT.

Code: 241-UR-151 **Classification:** Accepted

Names: 241-UR-151; 241-UR-151 Diversion Box; Drain Lines 5764 and 5765 **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1949

Status: Inactive **End Date:** 1/1/1980

Description: The diversion box and surrounding area has been covered with shotcrete. This unit is constructed of reinforced concrete and is rectangular in shape.

Location: The 241-UR-151 Diversion Box is located in the northern portion of the 241-U Tank Farm, inside the tank farm fence.

Process Description: This unit is the master diversion box for the 241-U Tank Farm. The diversion box was used to transfer waste solution to and from the tank farm.

Related Sites/ Structures: The 241-UR-151 Diversion Box is associated with the 241-UR-152, 241-UR-153, 241-UR-154, and 241-U-151 Diversion Boxes. The unit is also associated to the 221-U Canyon Building and various 200 West Area Operations Facilities. The drain lines are 5764 and 5765.

Waste Type: Process Effluent

Waste Description: This unit was used for transfer of waste solutions from processing and decontamination. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Waste Type: Equipment

Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles.

Waste Type: Equipment

Waste Description: Waste lead is stored in the diversion box.

Code: 241-UR-152 **Classification:** Accepted

Names: 241-UR-152; 241-UR-152 Diversion Box; Line 5053 **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1949

Status: Inactive **End Date:** 1/1/1980

Description: This unit is an underground reinforced concrete structure. All nozzles are 4 inch (10 centimeters) REDOX style.

Location: This unit is located east of Tank 241-U-101, inside the 241-U Tank Farm.

Process Description: This unit was used for the transfer of waste solutions from processing and decontamination operations.

Related Sites/ Structures: The 241-UR-152 Diversion Box is associated with the 241-UR-151 Diversion Box and the 241-U-101, 241-U-102, and 241-U-103 cascade series. The drain line to 241-U-102 is line 5053.

Waste Type: Equipment

Waste Description: Equipment associated with the diversion box includes transfer piping and nozzles.

Waste Type: Equipment

Waste Description: Waste lead is stored in the diversion box.

Waste Type: Chemicals

Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operations.

Code: 241-UR-153 **Classification:** Accepted
Names: 241-UR-153; 241-UR-153 Diversion Box; Line 5253 **Reclassification:** None

Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operations.

Code: 244-UR VAULT **Classification:** Accepted

Names: 244-UR VAULT; 244-UR Vault (Tanks -001 Through -004); IMUST; Inactive Miscellaneous Underground Storage Tank; Lines 5764 and 5765 **Reclassification:** None

Type: Receiving Vault **Start Date:** 1/1/1952

Status: Inactive **End Date:** 1/1/1975

Description: The 241-U Tank Farm is posted as a Contamination Area. The vault was covered with pumped concrete in 1992. The vault is surrounded with post and chain and marked with IMUST signs. The 244-UR Vault is an underground concrete structure divided vertically into four sections (process vaults). Each section houses a tank and a sump. The sections are divided horizontally to provide pump pits above the tanks. The pump pits contain pumps and piping that were used during liquid transfers. The walls, floors, horizontal divisions, and roofs (ground level) are constructed of reinforced concrete. The sumps are located in the sections occupied by Tanks 244-UR-001, 244-UR-002, 244-UR-003 and 244-UR-004. Tank 244-UR-001 is a slurry accumulator tank. Tanks 244-UR-002 and 244-UR-003 are identical blend tanks. Tank 244-UR-004 is a process tank. There are also above ground service facilities that include four instrument shelters, an inlet filter enclosure, and six risers used to measure liquid levels in tanks and sumps. Conditioned inlet air to the vault was supplied through an above grade supply system located just north of the vault. Exhaust air from the vault was passed through an underground filter chamber, then to an above grade exhaust fan and discharge stack. The 244-UR Vault was used until 1956 and was taken out of regular service in 1957. Apparently, the vault tanks were not used after this time and the entire vault was interim stabilized in 1985. Presumably, some wastes (sludges and liquids) were left in the tanks of the 244-UR Vault at the close of active vault use in the 1950's as records from the 1970's and early 1980's report varying amounts of wastes in the tanks and tank pits/sumps. Intrusion of water (precipitation) from the ground surface above the vault contributed to the varying amounts of liquid found in the tank pits during this period. SD-WM-TI-356 lists liquid level readings (and the reasons for increases and decreases in the liquid level readings) in the tanks and sumps over the period from 1974 through 1985. The records associated with the tank isolation project (B-231) of the mid 1980's provide the most reliable current estimates of tank and tank pit waste volumes. These estimates are provided for each of the tanks (see subsites section). Project B-231 isolated the 244-UR Vault as a single system. Four above grade instrument and electrical enclosures were removed. The underground conduit trenches existing between each enclosure and the companion vault compartment were sealed by casting a concrete slab over the enclosure footing. Grade level raw water nozzles that connected to the vault internal piping were cut and capped. Grade level steam distribution piping and control valving were removed. Process steam lines that connected to the vault internal piping were cut and capped. Encased process pipelines interconnect the 244-UR Vault with the 241-UR-151 Diversion Box. Closure of these lines was not required as both diversion boxes were already isolated. Process air lines were cut and blind flanges were installed onto both sides of each branch line isolated. The evaporative cooling unit was abandoned in place and the ducting cut, then sealed with a concrete plug. The above grade ventilation fans, above grade ducting, and discharge stack were previously removed. The fan inlet plenum was built into the fan base structure and was plugged by filling the plenum with sand and casting a fiberglass weather cover over the fan inlet ducts. The grade level vault cover

blocks were sealed by a fiberglass weather cover. WHC-EP-0560 states that liquid level readings for 1979 indicate the 244-UR-001 and 244-UR-003 had been pumped down to "minimum level", whereas 244-UR-002 was still listed as "active" ("Auxiliary Tanks, Sumps, and Vaults Solid and Liquid Volumes", J. E. Mirabella, 1978). Tank 244-UR-004 was also pumped to a minimum level.

Location: This site is located at the north end of the 241-U Tank Farm.

Process Description: The 244-UR Vault was constructed in 1951 for use in conjunction with uranium recovery processing conducted in U Plant (221-U). The function of the vault included reception of uranium-bearing waste slurries from Tanks 241-U-101, 241-U-102, 241-U-103, and 241-U-107 in the 241-U Tank Farm, which at that time contained neutralized metal waste generated by the original bismuth phosphate process. The vault was used for subsequent blending, pH adjustment (acidification) and conditioning of this waste as feed material for the tributyl phosphate uranium extraction process in the U Plant Canyon.

Related Sites/Structures: The unit is associated with 241-U Tank Farm and transfer lines. The drain lines to the sump are lines 5764 and 5765.

Waste Type: Process Effluent

Waste Description: This unit received waste from 241-U Tank Farm. The volumes in Tanks 244-UR-001, 244-UR-002, 244-UR-003 and 244-UR-004 are unknown and not monitored. Tank volume estimates are provided in WHC-SD-EN-ES-040, Rev. 0 (see subsites information).

Waste Type: Equipment

Waste Description: The vault equipment, tanks, and concrete surfaces are contaminated.

Waste Type: Asbestos (non-friable)

Waste Description: The vault contains a pipe that has asbestos insulation and is encased in concrete. This pipe is also radioactively contaminated.

This Site has the Following SubSites:

Code: 244-UR VAULT:1

Names: 244-UR VAULT:1; 244-UR-001

Type: Receiving Vault

Start Date:

Status: Inactive

End Date:

Description: The site is a vertical 0.635-centimeter (0.25-inch) carbon steel plate tank having a capacity of 189,250 liters (50,000 gallons). The tank dimensions are 6.1 meters by 6.1 meters (20 feet by 20 feet). The tank contains 7,010 liters (1,872 gallons) of sludge and 1476.2 liters (390 gallons) of supernatant. The tank was constructed in 1951 and was in operation from 1952 to 1956. The tank was taken out of service in 1957. Currently, the tank is stabilized and isolated. Tank 244-

UR-001 was used as a slurry accumulator tank (comparable to 244-BXR Vault Tank, 244-BX-001 and 244-TXR Vault Tank, 244-TX-001). As such, it was used as the collection point for waste slurries sluiced-mined from the U Tank Farm. The accumulated wastes were pumped from Tank 244-UR-001 to other tanks in the vault for further conditioning (see subsites 244-UR-002 and 244-UR-003). Limited analytical data on the contents of Tank 244-UR-001 are available from a 1977 Atlantic Richfield Hanford Company (ARHCO) employee memorandum, "Isolation Criteria for 'Auxiliary' Tanks", C. M. Walker (Memorandum not in Waste Information Data System [WIDS] files). The values listed below have been taken from WHC-SD-EN-ES-040, Rev. 0. - pH 7.5, radiation level 25 millirads/hour, specific gravity 1.0 - cesium-137 476 microcuries/liter (1,800 microcuries/gallon) - uranium 0.528 milligrams/liter (2 milligrams/gallon) - total beta 845 microcuries/liter (3,200 microcuries/gallon) - total alpha 0.032 microcuries/liter (0.12 microcuries/gallon). Limited information on the contents of the 244-UR-001 Sump were reported in the same memorandum listed above. The values listed below have been taken from WHC-SD-EN-ES-040, Rev. 0. - pH 8.6, radiation level 30 millirads/hour - cesium-137 673 microcuries/liter (1,700 microcuries/gallon) - total beta 845 microcuries/liter (3,200 microcuries/gallon) - total alpha 0.0145 microcuries/liter (0.055 microcuries/gallon) WHC-SD-EN-ES-040, Rev.0 has listed the following safety issues: - Hydrogen Buildup: Low risk since the total waste volume in the tank and sump is limited to about 18,925 liters (5,000 gallons). - Ferrocyanide: No risk since little or no ferrocyanides are present and the tank contains mostly water. - Organic Salts: Tributyl phosphate containing wastes were present in this tank, so some amount of organic salts is probably present. However, it is expected that this represents a low risk as the wastes are dilute. - Flammability: Low risk as little or no flammable material and no ignition sources are present. - Vapor Emission: Low risk because present waste content is not expected to contain significant amounts of volatile material. - Tank Integrity: No evidence of leaks emerged in the 1970's. Present waste content is not strongly corrosive, yet design life of the tank has been exceeded. Consequently, there is low to moderate risk of tank leakage. - Criticality Safety: Low risk (traces of plutonium only). - Radiological Hazard: High risk because UPR-200-W-24 resulted in contamination of soils surrounding the vault. Background readings in the vault are the 1 to 50 millirem range. - Heat Generation: Low risk (No Data). SD-WM-TI-356 lists liquid level readings and cumulative change history for the tank and sump. The last reading for the tank, on July 15, 1985, was 20.3 centimeters (8.00 inches). The last reading in the sump, on June 27, 1985, was 55.9 centimeters (22.00 inches).

Description: The site is a vertical type 347, stainless steel, 0.635-centimeter (0.25-inch) thick tank having a capacity of 56,775 liters (15,000 gallons). The tank is 3.66 meters by 4.27 meters (12 feet by 14 feet). The tank contains 8720.6 liters (2,304 gallons) of sludge and 810 or 2157.5 liters (214 or 570 gallons) (conflicting data) of supernatant. The tank was constructed in 1951 and was in operation from 1952 to 1976 (?). The tank is stabilized and isolated. Tanks 244-UR-002 and 244-UR-003, essentially identical tanks, were used for blending, temperature adjustment, acidification, and venting of wastes received from 244-UR-001 (comparable to 244-BXR Vault Tank, 244-BX-002 and 244-TXR Vault Tank, 244-TX-002). Nitric acid used in this conditioning was received from Tank 244-UR-004. A sample of liquid was obtained from cell

2 of the 244-UR Vault on November 5, 1974 (Sample # T-9505). (Source data not available in the Waste Information Data System [WIDS] files.) The results listed below have been taken from WHC-SD-EN-ES-040, Rev. 0 and WHC-EP-0560. - visual appearance, yellow with no solids - pH 9.1, radiation level 1 millirad/hour, specific gravity 1.01 - cesium-137 177 microcuries/liter (670 microcuries/gallon) - aluminum <.0013 molar (> < 35 milligrams/liter) - sodium .0732 molar (1,690 milligrams/liter) - nitrite .000645 molar (30 milligrams/liter) - nitrate .0306 molar (1,900 milligrams/liter) - plutonium < 1.40 micrograms/liter (<5.34 micrograms/gallon) - phosphate >>.00356 molar (340 milligrams/liter) - iron .0000414 molar (>>1 milligram/liter) - carbonate .0325 molar (2,000 milligrams/liter) - strontium-89,90 5.68 microcuries/liter (21.5 microcuries/gallon) - water 99.95% Although the memorandum indicates that the sample was from Tank 244-UR-002, it is suspected that the sample is actually from the pit or sump since the June 7, 1977 Atlantic Richfield Company (ARCHO) internal memorandum, "Isolation Criteria for 'Auxiliary' Tanks", C. M. Walker, 1977, gives limited analytical results for Tank 244-UR-002 and sump contents as follows. - total beta 845 microcuries/liter (3,200 microcuries/gallon) - total alpha 0.032 microcuries/liter (0.12 microcuries/gallon). Tank - pH 0.7, radiation level 50 millirads/hour - specific gravity 1.03 - cesium-137 0.87 microcuries/liter (3.3 microcuries/gallon) - total beta 1321 microcuries/liter (5,000 microcuries/gallon) - total alpha 0.37 microcuries/liter (1.4 microcuries/gallon) Sump - pH 9.0, radiation level 10 millirads/hour - cesium-137 47.56 microcuries/liter (180 microcuries/gallon) - total beta 66.05 microcuries/liter (250 microcuries/gallon) - total alpha 0.1 microcuries/liter (0.38 microcuries/gallon) WHC-SD-EN-ES-040, Rev.0 has listed the following safety issues. - Hydrogen Buildup: Low risk since the total waste volume in the tank and sump is limited to about 11,355 liters (3,000 gallons) of dilute liquid waste. Any hydrogen generated should readily diffuse out of the tank and vault. - Ferrocyanide: No risk since little or no ferrocyanides are present and the tank contains mostly water. - Organic Salts: Tributyl phosphate containing wastes were present in this tank, so some amount of organic salts is probably present. However, it is expected that this represents a low risk as the wastes are dilute. - Flammability: Low risk as little or no flammable material and no ignition sources are present. - Vapor Emission: Low risk because present waste content is not expected to contain significant amounts of volatile material. - Tank Integrity: No evidence of leaks emerged in the 1970's. Present waste content is not moderately corrosive, and the design life of the tank has been exceeded. Consequently, there is moderate to high risk of tank leakage. - Criticality Safety: Low risk (traces of plutonium only). - Radiological Hazard: High risk because UPR-200-W-24 resulted in contamination of soils surrounding the vault. Background readings in the vault are the 1 - 50 millirem range. - Heat Generation: Low risk (No Data).

SD-WM-TI-356 lists liquid level readings and cumulative change history for the tank and sump. The last reading for the tank, on July 12, 1985, was 71.8 centimeters (28.25 inches). The last reading in the sump, on April 23, 1985, was 55.9 centimeters (15.25 inches).

Description: The 244-UR-004 is a stainless steel process tank measuring 3 meters (10 feet) in diameter and 4.2 meters (14 feet) tall. The tank has a 31,150 liter (8,230 gallon) capacity. The UR-004 was used to store nitric acid and has been reported to be empty. This tank fed nitric acid to the UR-002 and UR-003 tanks, during the Uranium Recovery Process operation in the 1950's. Because it was an acid feed tank, it is not believed to be radiologically contaminated.

The SubSite is Part Of:**Code:** 244-UR VAULT**Names:** 244-UR VAULT; 244-UR Vault (Tanks -001 Through -004); IMUST; Inactive Miscellaneous Underground Storage Tank; Lines 5764 and 5765

Code: 200-W-95**Classification:** Accepted**Names:** 200-W-95; Contaminated Soil at 241-U Tank Farm; Contamination Migration Beyond the 241-U fence**Reclassification:** None**Type:** Contamination Migration**Start Date:****Status:** Inactive**End Date:**

Description: The site is the soil inside and adjacent to the chain link fence that surrounds the 241-U Tank Farm. Various radiological postings and warning signs are attached to the chain link fence. The interior of the tank farm complex is covered with gravel. Many risers and monitoring devices for the underground structures are visible on the surface. The individual unplanned releases associated with the 241-U Tank Farm are not separately marked or posted. Occasionally, radioactive contamination is found adjacent to the outside of the tank farm fence, resulting in a contamination zone extension around the tank farm perimeter. These areas will also be considered tank farm soil. A small area near the west access gate, outside the fence, was excavated to attempt to remove contaminated soil. This area was marked with Contamination Area signs but was covered with clean dirt and downposted to an Underground Radioactive Material area in December 2003.

Location: The site is located at the intersection of 16th Street and Camden Ave., in 200 West Area.

Release Description: The exact extent (horizontal and vertical) of the soil contaminated by unplanned releases that occurred within this farm over the years are not known. Some of the single shell tanks have leaked to the soil below the tank farm. Other releases spread contamination to the surface soil surrounding the tanks.

Related Sites/ Structures: Unplanned Releases UPR-200-W-128, UPR-200-W-132, UPR-200-W-154, UPR-200-W-155, UPR-200-W-156, UPR-200-W-157, UPR-200-W-24 and 200-W-91 are associated with the 241-U Tank Farm. These WIDS sitecodes have been consolidated into 200-W-95.

Waste Type: Process Effluent

Waste Description: Liquid releases occurred from underground leaks in tanks and transfer lines. Airborne contamination spreads occurred from activities conducted in valve pits and diversion boxes. Both types of releases contributed to the contamination in the soil.

The Following Sites Were Consolidated With This Site:**Code:** 200-W-91**Names:** 200-W-91; Underground Radioactive Material Area Adjacent to the North Side of 241-U Tank Farm

Code: UPR-200-W-24
Names: UPR-200-W-24; Release from the 244-UR Vault; UN-200-W-24

Code: UPR-200-W-128
Names: UPR-200-W-128; Contamination Release Inside 241-U Tank Farm

Code: UPR-200-W-132

Not Applicable

Code: 100-B-4 **Classification:** Not Accepted

Names: 100-B-4; Building Foundation; Undocumented Solid Waste Site **Reclassification:** None

Type: Spoils Pile/Berm **Start Date:**

Status: Inactive **End Date:**

Description: The site is a rectangular area 8.5 meters (28 feet) east/west by 13.1 meters (43 feet) north/south and encircled by large stones neatly stacked 0.3 meters (1 foot) high. Inside the area and on the north end is a 4 meter (13 foot) by 4.0 meter (13 foot) area encircled by 0.3 meter (1 foot) soil berm. Two 0.3 meter (1 foot) mounds of soil are in the south portion of the area. The surrounding area appears to have been a plowed field that was cleared of large stones. A long line of similar rocks runs parallel to the perimeter road, between the encircled area and the road. The site is distinguishable from the surrounding area only by the arrangement of large stones and soil. During a site visit on 9/13/94, two metal objects were present nearby, but didn't appear to be necessarily associated with this site. One of the objects looked like an empty, rusty paint can.

Location: The site is in the 100B area , 760 meters (2500 feet) northeast of the 105-B reactor building and 170 meters (550 feet) northwest of 1607-B1. It is due west of the perimeter road.

Code: 100-B-7 **Classification:** Not Accepted

Names: 100-B-7; 100-B Clean Water Pipelines; 100-B Service Water Pipelines **Reclassification:** None

Type: Product Piping **Start Date:** 1/1/1944

Status: Inactive **End Date:** 1/1/1968

Description: The site encompasses the clean water upstream pipelines for the 100-B Area, including underground pipelines used to transport raw, fire, export, and sanitary water from the river pumphouse, to the water treatment facilities and to 100-B Area facilities and fire hydrants. Excluded lines are those within buildings, process and septic sewer pipes, pipes that carried water treated with sodium dichromate, and all lines that are downstream from the reactor building, i.e., those lines that carry cooling water from the reactor to the retention basin, trench, and/or the river are excluded.

Location: The location is described as underground lines running from the 181-B Pumphouse to the 183-B Water Treatment Facilities, and from there to other 100-B Area buildings, fire hydrants, and south to the 100-C Area, stopping at a line about half-way between the B and C areas, at about northing 144370 N.

Process Description: Reactor cooling water was pumped from the Columbia River, settled and treated to remove minerals, and pumped to the reactor core at a rate of 1.93E+05 liters (51,000 gallons) to 2.69E+05 liters (71,000 gallons) per minute.

Related Sites/Structures: Related structures include the 181-B River Pumphouse, the 182-B Reservoir, 108-B Building, 183-B Basins and Clearwells, 185-B Building, 190-B Building, and 105-B Reactor. Associated pipeline sites include 100-B-14 (Septic and Process Sewer Pipelines), 100-B-8 (Effluent Pipelines), and 100-C-5 (100-C Area Water Treatment Facility Pipelines, which connect to these in the 100-B Area).

Waste Type: Water

Waste: Only uncontaminated piping remains.

Description:

Code: 100-B-17 **Classification:** Accepted

Names: 100-B-17; Transite on Columbia River Shoreline at 100B **Reclassification:** Rejected (8/19/2010)

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site is an old dumping area. The site is below the high water mark and is visible only at very low river flow.

Location: The site is located just west of 181-B River Pumphouse on the Columbia River shoreline. At approximate coordinates, E 564499.8, N 145319.2 and E 564509.9 and N 145332.3.

Waste Type: Demolition and Inert Waste

Waste Description: The waste is a mixture of material ranging from corrugated transite, fire brick, milk bottles, concrete form fittings, small rebar, pipe fittings, chunks of vitrified clay, nuts and bolts. The corrugated transite consists of 15-20 large chunks that vary from 0.61 to 1.83 m (2 to 6 ft), 0.15 to 0.61 m (0.5 to 2 ft) wide, spread over most of a 220 sq m (2400 sq ft), in a single layer orientation. The transite is covered with green slime and the metal pieces are extremely rusted. Likely, the material has been in the river for a long time. The corrugated transite is not breaking into smaller chunks.

Code: 100-B-29 **Classification:** Not Accepted

Names: 100-B-29; Pipe Located Southeast of the 183-B Clearwells **Reclassification:** None

Type: Product Piping **Start Date:**

Status: Inactive **End Date:**

Description: The site consisted of an approximately 0.15 m (6 in) diameter carbon steel pipe, about 3 m (10 ft) long, with a partially intact mastic wrap (P6120025). The pipe was oriented in a northwest to southeast direction. The northwesterly end was jagged metal suggesting that it may have been severed during an excavation. T

Location: The site is located in the 100-B/C Area southeast of the 183-B Clearwells and southeast of the road intersection of Bodie and Bow Streets. The approximate Washington State Plane coordinates are E 564943, N 144341.

Code: 100-B-30 **Classification:** Not Accepted

Names: 100-B-30; Pipe Located South of the 100-B/C Perimeter Road **Reclassification:** None

Type: Product Piping **Start Date:**

Status: Inactive **End Date:**

Description: The site consists of an approximately 0.08 m (3 in) carbon steel pipe, over 4 m (13 ft) long, with a coupling joint on one end. The pipe appears to be lined with concrete. The other end was severed, possibly with the use of a cutting torch. The pipe is oriented in a northwest to southeast direction and is not part of an intact system. The southeasterly end of the pipe is partially buried below grade and the presence of vegetation at that end suggests that the pipe has been at this location for an extended period of time. There is no evidence of staining or any additional pipe or piping systems in the area, and is located in an area of other scattered surface

debris outside the 100-B/C perimeter fence. The pipe is believed to be surficial debris only.

Location: The site is located in 100-B/C Area, south of the 100-B/C perimeter road, and north of the railroad tracks. At approximate Washington State Plane Coordinates E 564732, N 143699, The inner pipe material was sampled on February 18, 2009 (Sample No. J18HX2) and analyzed for asbestos using Polarized Light Microscopy. The results showed that the material did not contain asbestos minerals.

Waste Type: Equipment

Waste Description: The waste is a single segment of pipe.

Code: 118-B-7	Classification: Accepted
Names: 118-B-7; 111-B Solid Waste Burial Site	Reclassification: Rejected (12/9/2004)
Type: Burial Ground	Start Date: 1/1/1951
Status: Inactive	End Date: 1/1/1968

Description: The unit appears as the southern portion of a cobble-covered field. The central portion of the field is covered with natural vegetation and there is a permanent concrete marker in the southern section.

Location: This unit is located adjacent to and just south of the 111-B Decontamination Station.

Process Description: This site received decontamination materials and assorted equipment from the 111-B Decontamination Facility and workshop from 1951 to 1968.

Waste Type: Equipment

Waste Description: This unit received small amounts of waste from the 111-B Facility, which was originally used as a charge makeup and reactor fuel inspection station. After one year, the 111-B Facility was used as a decontamination facility for equipment and a workshop for low-level contaminated equipment. This unit also received decontamination materials and assorted equipment from that building. Small amounts of reactor hardware may have also been placed in this unit. Potential contaminants include: Co-60, Ni-63, RCRA metals

Code: 126-B-1	Classification: Accepted
Names: 126-B-1; 184-B Power House Ash Pit; 188-B Ash Disposal Area	Reclassification: Rejected (6/25/1998)
Type: Coal Ash Pit	Start Date: 1/1/1944
Status: Inactive	End Date: 1/1/1969

Description: The 126-B-1 site is a large vegetation covered depression and surrounding ash piles. The depression is approximately 60 meters (200 feet) long, 60 meters (200 feet) wide, and 3 meters (10 feet) deep. An earthen berm divides the site into two sections. The pit is bounded on the north, east, and west sides by three large ash piles that extend 9 to 10 meters (30 to 33 feet) high. On the west side of the pit is a large wooden ramp that is in a state of disrepair. A large pipe enters the depression in the southwest corner. Including the surrounding ash piles, the overall site dimensions are approximately 200 meters by 200 meters (650 feet by 650 feet).

Location: The 126-B-1 Ash Pit is located north of the 184-B Powerhouse.

Process Description: Coal ash from the 184-B Powerhouse was mixed with raw river water and sluiced in slurry form to the ash pit via a 20 centimeter (8 inch) ashcolite pipe.

Related Sites/ Structures: The ash pit is related to the 184-B Powerhouse.

Waste Type: Ash

Waste Description: The site received coal ash from the 184-B Powerhouse. Coal ash from analogous sites has been analyzed using the EP Toxicity Test in accordance with WAC 173-303, and no hazardous materials were found.

Code: 126-B-4

Classification: Accepted

Names: 126-B-4; 126-B-4 Brine Pit. 184-B Salt Dissolving Pit and Brine Pump House; B Area Brine and Salt Dilution Pits

Reclassification: Rejected (9/9/1997)

Type: Sump

Start Date: 1/1/1944

Status: Inactive

End Date: 1/1/1969

Description: The salt dissolving pits and brine pump pit were part of a single below-grade concrete structure that provided brine for the 184-D Powerhouse. The structure has been demolished and buried in situ. No evidence of the site remains at the surface. Before the structure was demolished, it was described as being partially backfilled with rubble with approximately 1900 liters (500 gallons) of water in the brine pump pit. The two salt dissolving pits each had inner dimensions of 4.3 meters (14 feet) long by 2.4 meters (8 feet) wide by 2.8 meters (9.25 feet) tall. They had a design high water line 2.4 meters (7.75 feet) from the pit bottom. An overflow slot connecting the two dissolving pits was located 0.3 meters (1 foot) above the high water line. The bottom of each pit was filled with a 12.7 centimeter (5 inch layer) of 1.3 to 2.6 centimeter (1/2 to 1 inch) gravel topped by a 17.8 centimeter (7 inch) layer of 0.3 to 0.6 centimeter (1/8 to 1/4 inch) gravel. The dissolving pits each had a 2.4 meter (8 foot) by 0.9 meter (3 feet) opening at the top for receiving salt. Each pit had a capacity of 23,600 kilograms (52,000 pounds) of salt. The brine pump pit is located adjacent to the two salt dissolving pits. The pit was 3.3 meters (10.67 feet) long by 2.2 meters (7.33 feet) wide by 2.1 meters (7 feet) deep. It held two pumps and associated piping (all brass) for the brine system. The floor of the pump pit sloped toward a 46 by 46 by 46 centimeter (18 by 18 by 18 inch) sump in a corner.

Location: The site is located north of 184-B and just south of the railroad tracks.

Process Description: The brine was used to regenerate the zeolite ion exchange demineralizers that were part of the powerhouse water treatment system.

Related Sites/ Structures: The site is associated with the 184-B Power House.

Waste Type: Demolition and Inert Waste

Waste Description: The structure was demolished and buried in situ.

Description:

Code: 128-B-1

Classification: Not Accepted

Names: 128-B-1; 100 B/C Burning Pit; 100-B Burning Pit

Reclassification: None

Type: Burn Pit

Start Date: 1/1/1943

Status: Inactive

End Date: 1/1/1968

Description: The site has been described as a burn pit. During a field investigation on October 17, 1995, it was noted that the area is covered with cheatgrass and appears undisturbed with no evidence of burning. An elevated area to the south is covered with rabbitbrush, boulders, and appears to be

disturbed. The elevated area also shows no evidence of burning.

Location: The 128-B-1 burn pit is identified in PNL-6456 as a 30 meters (100 feet) by 30 meters (100 feet) pit at coordinates WCS83S E565942.7, N145244.7 (N71500 W78500). This places it in a low area southeast of 116-C-1 and west of the perimeter road.

Code: 132-B-2 **Classification:** Accepted

Names: 132-B-2; 132-B-2 Stack; 116-B Reactor Exhaust Stack **Reclassification:** None

Type: Stack **Start Date:** 1/1/1944

Status: Inactive **End Date:** 1/1/1968

Description: The unit is part of the 105-B Reactor Gas and Exhaust Air System. The unit is still standing and constructed of reinforced concrete with a base diameter of approximately 4.9 meters (16 feet).

Location: The unit is located on the south side of 105-B.

Related Sites/Structures: Following completion of the confinement project in 1960, the air was diverted via an above-ground aluminum duct and an underground, reinforced concrete duct to the 117-B Filter Building. After flowing through the filters, the air went through a below-grade concrete duct and an above-grade aluminum duct into the exhaust stack.

Waste Type: Demolition and Inert Waste

Waste Description: Until the 117 Filter Building was built in 1960, air moving from the least contaminated zones through increasingly contaminated zones was discharged to the unit unfiltered. The unit received low-level contamination from the reactor.

Code: 1607-B3 **Classification:** Accepted

Names: 1607-B3; 1607-B3 Sanitary Sewer System; 1607-B3 Septic Tank System; 124-B-3 **Reclassification:** Closed Out (5/31/2001)

Type: Septic Tank **Start Date:** 1/1/1944

Status: Inactive **End Date:** 1/1/1974

Description: The site is a closed out septic system which includes a septic tank, tile field, and associated piping. The site is no longer apparent and appears as a cobble-covered field with natural vegetation growing on its surface. The 1607-B3 Septic Tank was constructed of reinforced concrete. The tank was 2.9 meters (9.5 feet) long, 1.4 meters (4.5 feet) wide and 3.5 meters (11.42 feet) deep (inner dimensions). The tank had a design capacity of 6,360 liters (1,680 gallons) based on a user capacity of 48 persons, a flow of 132 liters (35 gallons) of sewage per capita per day, and an average detention time of 1 day. The top of the tank was at the ground surface and the tank was accessible through three 0.9-meter (3-foot) manholes.

Location: The site is located approximately 60 meters (200 feet) north of the 184-B Building.

Related Sites/Structures: The site is associated with the 184-B Powerhouse.

Waste Type: Sanitary Sewage

Waste Description: This unit received an unknown amount of sanitary sewage from 184-B Powerhouse.

Code: 1607-B4 **Classification:** Accepted

Names: 1607-B4; 1607-B4 Sanitary Sewer System; 1607-B4 Septic Tank; 1607-B4 Septic Tank System; 124-B-6 **Reclassification:** Closed Out (2/23/2001)

Type: Septic Tank **Start Date:** 1/1/1944

Status: Inactive **End Date:** 1/1/2000

Description: The site is a closed out septic system associated with the 151-B Substation. A sign stating Abandoned Septic Tank per WAC (246-272-1850) DynCorp Environmental is posted at the site. There are four yellow posts surrounding the structure. Within the posts are the old wooden cover, a pile of sand, and cobble. The septic tank is concrete box that had a wooden lid covered with asphalt roofing material. The reinforced concrete septic tank is 1.8 meters (6 feet) long, 0.9 meters (3 feet) wide, and 2.5 meters (8 feet, 4 inches) deep (inner dimensions). The tank had a design capacity of 1325 liters (350 gallons) based on a user capacity of 10 persons, a flow of 132 liters (35 gallons) of sewage per capita per day, and an average detention time of 1 day. The tank walls are 20 centimeters (8 inches) thick with a 15 centimeter (6 inch) floor. The tile field was constructed of 10 centimeter (4 inch) pipes with a minimum length of 2.4 meter (8 feet) per capita. The laterals are open-jointed and spaced 2.4 meters (8 feet) apart.

Location: The tank is located near the northwest corner of the 151-B Substation. The tile field is located west of the tank.

Process Description: This site received sanitary sewage from the 151-B Substation.

Waste Type: Sanitary Sewage

Waste Description: This unit received sanitary sewage from 151-B Electrical Distribution Facility. The flow rate to the unit was estimated at less than 132 Liters (35 gallons) per day.

Closure Info: Closure of the septic tank was completed in 2000. The tank contents were sampled and analyzed for radiological contaminants. The sample results were lower than detection limits. The tank contents were pumped out and the tank was filled with clean fill material. A letter was sent to notify the Washington State Department of Health of the abandonment.

Code: 1607-B6 **Classification:** Accepted

Names: 1607-B6; 1607-B6 Septic Tank System; 124-B-5; 1607-B5; 1607-B5 Sanitary Sewer System; 1607-B5 Septic Tank System **Reclassification:** None

Type: Septic Tank **Start Date:** 1/1/1944

Status: Active **End Date:**

Description: The site currently appears as a small concrete box with a wooden lid. It is posted with a "Confined Space" warning sign. There is a yellow steel post at each of its four corners. The reinforced concrete septic tank is 8 ft 4 in (2.5 m) deep with a 25-person capacity (35 gal [130 L] per capita) and an average detention period of 24 hr. Its walls are 8 in (20 cm) thick and its floor is 6 in (15 cm) thick. The tile drain field is 4 in (10 cm) vitrified pipe, concrete pipe or drain tile with a minimum of 8 linear ft (2.4 m) per capita. The laterals are open-jointed and spaced 8 ft (2.4 m) apart. This system is active. This system includes the feed pipeline from the 183-B Filter House, the septic tank, and the drain field.

Location: This septic system is south of the 182-B Reservoir and Pumphouse.

Waste Type: Sanitary Sewage

Waste Description: This unit receives 35 gal/day (130 L/day) of sanitary sewage from the 182-B Pump Station and cooling water and leakage from pumps located in the 182-B facility. It also received sewage from 183-B Headhouse, which was decommissioned in 1987.

Code: 100-C-2 **Classification:** Not Accepted
Names: 100-C-2; Monitoring Station 1614-B-1; Possible Building Foundation and Parking Lot **Reclassification:** None
Type: Foundation **Start Date:**
Status: Inactive **End Date:**
Description: The site is a small square concrete slab and nearby gravel parking area. Northwest of the slab is a gravel road with a gravel area on the other side. A few small pieces of asbestos transite, a few dry-cell batteries, and some steel anchoring cable were noted around the site during a 9/13/94 field investigation by Kathryn J. Moss.
Location: The site is located near the southwest corner of the 100BC Area, adjacent to the southwest corner of the patrol road. The site is approximately 170 meters (558 feet) southwest of the 118-B-1 Burial Ground.

Code: 100-C-4 **Classification:** Not Accepted
Names: 100-C-4; Export Water Line Valve Pit **Reclassification:** None
Type: Valve Pit **Start Date:**
Status: Active **End Date:**
Description: The site is a valve pit located along the export water line. The pit is marked with post and chain. The 1.8 by 1.8 meter (6 by 6 foot) wooden cover is caving into the valve pit. The cover is posted with a "Danger: Cave-In Potential" sign.
Location: The site is located approximately 600 meters (2000 feet) east of the 105-C Reactor Building, between the 100-B Perimeter Road and Route 1 near mile post 9.
Related Sites/ Structures: The site is associated with the export water line from 182-B Reservoir to the 200 Areas.

Code: 100-C-5 **Classification:** Not Accepted
Names: 100-C-5; 100-C Clean Water Pipelines; 100-C Service Water Pipelines **Reclassification:** None
Type: Product Piping **Start Date:** 1/1/1952
Status: Inactive **End Date:** 1/1/1969
Description: The site encompasses the clean water upstream pipelines for the 100-C Area, including underground pipelines used to transport raw, fire, export, and sanitary water from the river pump house, to the water treatment facilities and to 100-C Area facilities and fire hydrants. Lines within buildings, process and septic sewer pipes, pipes that carried water treated with sodium dichromate, and all lines that are downstream from the reactor building, i.e., those lines that carry cooling water from the reactor to the retention basin, trench, and/or the river are excluded.
Location: The location is described as underground lines running from the 181-C Pump house to the 183-C Water Treatment Facilities, and from there to other 100-C Area buildings, fire hydrants, and north to the 100-B Area, stopping at a line about half-way between the B and C areas, at about northing 144370 N.
Process Description: Reactor cooling water was pumped from the Columbia River, settled and treated to remove minerals, and pumped to the reactor core at a rate of 1.93E+05 liters (51,000 gallons) to 2.69E+05 liters (71,000 gallons) per minute.

Related Sites/ Structures: Related structures are the 181-C Pump house, 182-C Reservoir, the 183-C Basins and Clearwells, the 190-C Buildings, and the 105-C Reactor Building. Other pipeline sites in the 100-B\C Area include 100-C-9, the 100-C Area Process and Sanitary (Septic) Sewer Underground Pipelines; 100-C-6, the Effluent Pipelines; and 100-B-7, the 100-B Area Water Treatment Facilities Pipelines.

Waste Type: Water

Waste Description: Only uncontaminated piping remains.

Code: 100-C-8

Classification: Accepted

Names: 100-C-8; 105C Hydraulic Oil Release

Reclassification: Rejected (3/13/2002)

Type: Unplanned Release

Start Date: 1/1/1998

Status: Inactive

End Date: 1/1/1998

Description: The site is not marked or posted, no visible evidence of the spill remains because the concrete rubble that it was spilled on has been removed.

Location: The spill was located below the Rod Control Room of the 105-C Reactor Building, in a pile of concrete rubble approximately 7 feet deep. This rubble was contained within the basement directly below the old (now demolished) Outer Rod Room.

Release Description: On Monday, August 24, 1998, at approximately 0900 hours, the CAT 375 excavator broke a main hydraulic line while dismantling a concrete pad at 105-C. The excavator was taken out of service for repair. The exact quantity was not known at the time of the hose failure and was believed to be below the DOE reportable threshold of 160 liters (42 gallons). A large area was sprayed due to the hydraulic system being under pressure. On Wednesday, August 26, 1998, the 105-C Task Lead was notified the excavator hydraulic line was repaired and the replacement fluid equaled 182 liters (48 gallons). It is assumed that the entire hydraulic system was full to capacity prior to the hose failure and that the amount released was the exact amount of product that was put back into the reservoir [182 liters (48 gallons)].

Waste Type: Oil

Waste Description: Unocal Unax AW46 Hydraulic Oil, unregulated product.

Code: 124-C-4

Classification: Not Accepted

Names: 124-C-4; Sanitary Waste Site

Reclassification: None

Type: Sanitary Sewer

Start Date:

Status: Inactive

End Date:

Description: This site was assigned by Bill Hayward based on the information from BHI D&D in the 1995 RARA Summary Report. D&D could not identify the site location nor could the BHI historian. The site is thought to be either 1607-B10 or 1607-B11 as they are the only remaining septic systems in the 100B Area that have a 124 alias assigned to them. If a determination can be made that it is one of above referenced septic systems, the 124-C-4 will be added to the site as an alias. This site reference (as a separate site) will then be removed from the database.

Code: 100-D-10

Classification: Not Accepted

Names: 100-D-10; Storm Drain Outfall; Undocumented Liquid Waste Site **Reclassification:** None

Type: Depression/Pit (nonspecific) **Start Date:**

Status: Inactive **End Date:**

Description: The Technical Baseline Report (section 4.40) states that reportedly there was a small outfall structure upstream of the 1907-DR outfall. It was demolished at the same time as the 1907-DR outfall. The Technical Baseline Report states that the structure was similar in construction to the 1907-DR, only much smaller. It was used as a discharge outfall for the storm drain system of the 190-DR tank pit, which consisted of drains, sump, and pump to lift runoff to the outfall. The trench from the outfall structure to the waterline is apparent and appears to have a telephone cable buried in its bottom.

Location: The structure was located adjacent to the concrete block telephone building on the Columbia River bank and just south of the 100-D Area fence.

Related Sites/ Structures: The site was related to the 190-DR tank pit.

Waste Type: Stormwater Runoff

Waste Description: The unit reportedly received storm water run-off from the 190-DR tank pit.

Code: 100-D-11 **Classification:** Not Accepted

Names: 100-D-11; Temporary Garage and Gasoline Dispensing Station; Temporary Garage TC-21 **Reclassification:** None

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:** 1/1/1950

Location: The site's location is not known. Temporary construction facilities were generally placed near the site of the project. The water treatment facilities are located south-southwest of the 105-DR Reactor.

Waste Type: Oil

Waste Description: This site has the potential for soil contamination from gasoline, oil, and engine coolant.

Code: 100-D-17 **Classification:** Accepted

Names: 100-D-17; Burn Pit; Undocumented Solid Waste Site **Reclassification:** Rejected (8/27/1997)

Type: Burn Pit **Start Date:**

Status: Inactive **End Date:**

Description: The site is a burn pit that is visible in 1948 photos (#901 and #922). The site now appears as a large, vegetation covered field. There are no features that clearly identify the site.

Location: The site is located southeast of the 105-DR Reactor, outside of the 100D perimeter fence and north of Route 2 North.

Waste Type: Construction Debris

Waste Description: The site likely contains burned construction debris.

Code: 100-D-26 **Classification:** Not Accepted
Names: 100-D-26; Borrow Pit; Potential Burial Trenches **Reclassification:** None
Type: Depression/Pit (nonspecific) **Start Date:**
Status: Inactive **End Date:**

Description: The site is a borrow pit used as a source of clean fill. On July 10, 1997 a field investigation was performed by T. F. Johnson. The site appeared as a depression approximately 330 feet (100 meters) in diameter that was created from excavations with heavy equipment. Four distinct trenches were observed within the depression. All four trenches were covered with blown in tumbleweeds. A few tumbleweeds were removed for inspection and no waste or discolored soil was observed. An empty 208 liter (55 gallon) steel drum was located at the end of one trench and an empty 0.95 liter (1 quart) oil can was also observed near the site.

Location: The site is located approximately 250 meters (820 feet) east of the northeast corner of the patrol road that surrounds 100-D Area.

Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: An empty steel 55 gallon drum and an empty 1 quart oil can were observed at the site.

Code: 100-D-33 **Classification:** Accepted
Names: 100-D-33; Minor Construction Burial Ground #4 East Trench **Reclassification:** Rejected (3/20/2008)
Type: Burial Ground **Start Date:** 1/1/1954
Status: Inactive **End Date:**

Description: The site appeared as a vegetation-free, cobble-covered field. The trench was estimated to have been approximately 30 meters (100 feet) long by 15 meters (50 feet) wide. A Ground Penetrating Radar scan, done in 2004, did not identify any trench-like features.

Location: The site was located east/southeast of the 105-D Reactor, just south of the rail spur to the fuels transfer bay and east of 100-D-35. The site was outside the security fence for the 105-D Reactor Building.

Process Description: The site was thought to have been used for disposal of low-level construction wastes from reactor modifications.

Related Sites/ Structures: Co-located with 100-D-35, Minor Construction Burial Ground #4 East Trench.

Waste Type: Construction Debris
Waste Description: The site received low-level construction wastes from the reactors. Potential contaminants include: Co-60, Ni-63

Code: 100-D-34 **Classification:** Not Accepted
Names: 100-D-34; Exclusion Area; 100-D/DR Grounds Surrounding Deactivated Areas **Reclassification:** None
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**

Description: The grounds within the 100-D/DR exclusion area that are not part of other waste sites.

Code: 100-D-35 **Classification:** Accepted
Names: 100-D-35; Minor Construction Burial Ground #4 East Trench **Reclassification:** Rejected (3/20/2008)
Type: Burial Ground **Start Date:** 1/1/1954
Status: Inactive **End Date:**
Description: During the March 31, 1999 site visit, no evidence of a trench was visible. The suspected site area appeared as a vegetation-free, cobble-covered field. A Ground Penetrating Radar scan, done in 2004, did not identify any trench like features.
Location: The site was thought to be located west of 100-D-33 east/southeast of the 105-D Reactor, just south of the rail spur to the fuels transfer bay and outside the security fence for the 105-D Reactor Building.
Process Description: The expected purpose of the burial ground was to dispose of 105-D Reactor thimbles, rod guides, and miscellaneous waste during the Ball 3X conversion project.
Related Sites/ Structures: Co-located with 100-D-33, Minor Construction Burial Ground #4 East Trench,
Waste Type: Construction Debris
Waste Description: The site received low-level construction wastes from the reactors. Potential contaminants include: Co-60, Ni-63

Code: 100-D-36 **Classification:** Not Accepted
Names: 100-D-36; 100-N-20; Monitoring Station 1614-D-1; Undocumented Concrete Pad **Reclassification:** None
Type: Foundation **Start Date:**
Status: Inactive **End Date:**
Description: The site is a 1.8 meter by 1.8 meter (6 foot by 6 foot) concrete pad with anchor bolts set in the surrounding edges.
Location: The site is located approximately 20 meters (65 feet) southwest of the southwest corner of the 100-D Area Patrol Road.

Code: 100-D-37 **Classification:** Not Accepted
Names: 100-D-37; 1614-D-3 Monitoring Station; Undocumented Concrete Pad **Reclassification:** None
Type: Foundation **Start Date:**
Status: Inactive **End Date:**
Description: The site is a 1.8 meter by 1.8 meter (6 foot by 6 foot) concrete pad with anchor bolts set in around the outer edges.
Location: The site is located northeast of the northeast corner of the Patrol Road in 100-D Area.

Code: 100-D-38 **Classification:** Not Accepted
Names: 100-D-38; Suspect Septic Tank **Reclassification:** None

Type: Septic Tank **Start Date:**
Status: Inactive **End Date:**
Description: The site is a junction box and manhole associated with the 1607-D2 Septic System. The site is identifiable in the field by a steel lid on top of a circular brick base.
Location: The site is located north of 105-D, just northeast of the intersection where north-south road that passes west of the 105-D and 105-DR reactors crosses the east-west road that passes north of the 105-D reactor and between the 1700 buildings.

Code: 100-D-40 **Classification:** Accepted
Names: 100-D-40; Minor Construction Burial Ground #5 Hole **Reclassification:** Rejected (3/20/2008)
Type: Burial Ground **Start Date:**
Status: Inactive **End Date:**
Description: The burial ground area appeared as a vegetation covered area. A 2004 Ground Penetrating Radar scan, did not identify any trench like features.
Location: The site was thought to be located 220 meters (720 feet) east of the 105-D Reactor Building and 23 meters (75 feet) south of the railroad tracks that service the 105-D Reactor Building.
Related Sites/ Structures: Co-located with 100-D-41 Minor Construction Burial Ground #5 Trench.
Waste Type: Equipment
Waste Description: The burial ground was dug to receive contaminated material and equipment from the 105-D Reactor Building. Potential contaminants included: Co-60, Ni-63

Code: 100-D-41 **Classification:** Accepted
Names: 100-D-41; 118-18; 118-D-18; Minor Construction Burial Ground #5 Trench **Reclassification:** Rejected (3/20/2008)
Type: Burial Ground **Start Date:** 1/1/1956
Status: Inactive **End Date:** 1/1/1956
Description: During a 1999 walkdown, no evidence of the burial ground was observed. The area appeared as a vegetation covered field.
Location: The site was thought to be located 210 meters (700 feet) east of the 105-D Reactor Building and 23 meters (75 feet) south of railroad tracks that serviced the 105-D Reactor Building.
Process Description: This burial ground has been described as receiving irradiated reactor parts, dummies, thimbles, rods, gun barrels, and other contaminated solid wastes. During the March 31, 1999 site visit, no evidence of the trench was visible. A Ground Penetrating Radar scan, done in 2004, did not identify any trench like features.
Related Sites/ Structures: Co-located with 100-D-40, Minor Construction Burial Ground #5 Hole.
Waste Type: Construction Debris
Waste Description: The waste is miscellaneous construction related solid wastes from the 100-D Reactors.
Description: Potential contaminants include: Co-60, Ni-63

Code:	100-D-53	Classification:	Accepted
Names:	100-D-53; 117-DR Filter Building; 117-DR HEPA Filter Building	Reclassification:	Interim Closed Out (3/4/2004)
Type:	Process Unit/Plant	Start Date:	1/1/1960
Status:	Inactive	End Date:	
Description:	<p>The site has been remediated and interim closed out. The ventilation exhaust filter building housed blowers and particulate filters used to treat the ventilation exhausted from the 105-DR Reactor Building. Included in this site were the 117-DR Building, the intake ventilation duct from the 105-DR Reactor Building, and the exhaust ventilation duct to the 116-DR Reactor Exhaust Stack. The building and below-grade duct work were made of reinforced concrete 0.3 to 0.6 meters (1 to 2 feet) thick. Above grade ducts were constructed of 10 gauge black steel. The building was approximately 20.7 meters (68 feet) long, 11.9 meters (39 feet) wide, and 10.4 meters (34 feet) high with 2.4 meters (8 feet) above grade. A soil berm was built up around the building from grade level to the top of the structure. The building was divided into two large filter cells with a smaller operating area between them. The filter cells each could hold six filter frames (two wide and three deep). The filter frames were designed to hold twenty-four filters that were 0.6 meters (2 feet) square by 0.3 meters (1 foot) thick. There are spaces between the frames to allow access for filter maintenance. The operating area between the two cells was divided into two levels. The upper level, called the access gallery had ten doors that led from it. Four doors opened into each of the filter cells and the other two doors provided access to the intake and exhaust ducts. The operating gallery was located below the access gallery. A sump was located at each end of the operating gallery to collect incidental drainage from above. A large open area extended the full length of the structure above the access gallery and the filter cells. It ranged in height between 2.5 and 2.4 meters (8.1 and 7.8 feet), due to the structure's sloping roof. The space provided access to the cement cover blocks that were positioned over each of the filter frames.</p>		
Location:	<p>The site was located south of the 105-DR Reactor (118-DR-2), near the 116-DR Stack (132-DR-2).</p>		
Process Description:	<p>Before filter buildings were used, unfiltered ventilation was exhausted directly from the reactor to the atmosphere. The reactor confinement system diverted the exhaust just before the stack and routed it to the filter building where it passed through a series of filters. The filtered exhaust was then routed back to the ventilation exhaust stack where it was discharged to the atmosphere. Sealwells within the filter building provided the ability to direct the exhaust into one or both of the filter cells.</p>		
Related Sites/ Structures:	<p>The site was associated with the 105-DR Reactor (118-DR-2), the 116-DR Stack (132-DR-2), the 119-DR Sample Building, and the 117-DR Seal Pit Crib (116-DR-8).</p>		
Waste Type:	<p>Equipment</p>		
Waste Description:	<p>The site contained radiologically contaminated surfaces and contamination from 105-DR Reactor ventilation exhaust. Hazardous residue from the Large Sodium Fire Facility is accounted for within that site (122-DR-1).</p>		
Closure Info:	<p>122-DR-1:2, 100-D-53, 122-DR-1:4, 132-DR-2, 122-DR-1:5, 100-D-64, 100-D-23 and 100-D-54 were addressed as a group. The information below documents information for the group of sites.</p> <p>Remedial or removal objectives and goals for the components of the LSFF TSD unit pre-filter exhaust tunnel [122-DR-1:2], the 117-DR Exhaust Filter Building [100-D-53/122-DR-1:4], 116DR reactor exhaust stack(132 DR 2/122-DR-1:5), were obtained from the Action Memorandum, USDOE Hanford 100 Area National Priorities List (NPL) 105-F and 105 DR Reactor Buildings and Ancillary Facilities (Action Memorandum). The objectives and goals</p>		

were also included in the Phase III SAP (DOE/RL-99-35) and the Remedial Design Report/Remedial Action Work Plan for the 100 Area (RDR/RAWP) (DOE/RL-96-17), which was referenced in the Action Memorandum.

Based on consideration of the requirements of CERCLA and detailed analysis of alternatives, the Tri-Parties have selected the remove/dispose alternative under a rural-residential land use scenario for the 117-DR facilities site.

The objective for the structures included the removal of the structure to a minimum of 0.9 meters (3 feet) below surface grade. Excavation was driven by remedial action objectives for direct exposure, protection of groundwater, and protection of the Columbia River. For the respective points of compliance, remedial action goals (RAGs) were established to identify radionuclide and no radionuclide contaminants of concern (COCs) and contaminants of potential concern.

Waste site COCs for the 117 DR facilities site were identified through process knowledge and are specified in the Phase III SAP (DOE/RL-99-35). The COC list was further refined and amended with the 117 DR Exhaust Filter Building Proposed Additional Soil Sampling and 1720-HA Arsenal Removal/ Disposal Summary (CNN 106839). The COCs consist of the following: americium-241, arsenic, carbon-14, barium, cesium-137, cadmium, cobalt-60, total chromium, europium-152, hexavalent chromium, europium-154, lead, europium-155, lithium, niel-63, mercury, plutonium-238, selenium, plutonium-239/240, silver, strontium-90, sodium, uranium-234, uranium-235 and uranium-238.

At the completion of the remedial action, the total excavation was approximately 1,010 meters squared (10,872 square feet) in area with an approximate depth of 5 meters (16.4 feet). Approximately 14,011 metric tons (15,412 tons) of material from the site were disposed of at the Environmental Restoration Disposal Facility.

The 117-DR facilities site is verified to be remediated in accordance with the RAOs and RAGs of the Action Memorandum and the Remaining Sites ROD and may be backfilled.

In addition, demonstration that remedial action at the 117-DR facilities site has achieved the RAOs and corresponding RAGs established in the Action Memorandum and the Remaining Sites ROD meets the RCRA closure requirements for the underlying soils. Final RCRA TSD certification of closure is pending.

Code: 100-D-55	Classification: Not Accepted
Names: 100-D-55; Gravel Pit #21; Pit 21	Reclassification: None
Type: Depression/Pit (nonspecific)	Start Date:
Status: Active	End Date:
Description:	The site is a large excavation containing another waste site, 100-D-15, which is debris in the east end of the pit. The debris is marked with post and chain and labeled as a separate waste site. The remainder of the pit is available to use as clean fill material (Gravel Pit #21). There is no other waste material in the pit. The soil is sandy.
Location:	The gravel pit is located south of the 100-D Area perimeter road.
Related Sites/ Structures:	The pit is associated with the dumping area known as Site Code 100-D-15.
Waste Type:	Demolition and Inert Waste
Waste Description:	There is an area of discarded debris located in the east end of this gravel pit. The debris is a

separate waste site known as 100-D-15. In 1994, Kaiser Hanford removed sediments from the 182-D basins and deposited them inside this gravel pit, partially over top of the previously discarded debris. The sediment was determined to be "clean dredge soil" as defined in Washington Administrative Code 173-304-100. The total content of the discarded debris is unknown.

Code: 100-D-57 **Classification:** Not Accepted

Names: 100-D-57; Earth Crib Near 107-DR **Reclassification:** None

Type: Crib **Start Date:** 1/1/1955

Status: Inactive **End Date:**

Description: This site is a duplicate of 100-D-4, which has been excavated and closed out. Site 100-D-57 was initially identified from Drawing H-1-8630-DR, which shows an "Earth Crib" at an unrecognizable, but short, distance off the southeast side of the 116-DR-9 Retention Basin. Through examination of Ground Penetrating Radar results, other documents, and excavations of the 116-DR-9, 100-D-4, and 100-D-49 sites, which effectively removed all soil and subsurface structures in this area, it has been determined that this site, 100-D-57, was created in error.

Location: The crib is located 30 meters (100 feet) east of the southeast corner of the 116-DR-9 Retention Basin.

Code: 100-D-58 **Classification:** Accepted

Names: 100-D-58; 100-DR Area On-Site Sewage System for MO-980 & 4-Closet Restroom Facility; 100-DR OSS **Reclassification:** None

Type: Septic Tank **Start Date:** 1/1/1998

Status: Active **End Date:**

Description: The septic tank portion of the site is surrounded by yellow steel posts and the drain field is surrounded with light duty chain and steel fence posts. The drainfield area is covered with tumbleweeds. The septic tank is a 5,678 liter (1,000 gallon), two compartment tank. The tank can be accessed through 0.765 meter (30 inch) diameter ribbed PVC risers that extend to grade and are covered by fiberglass lids that are bolted in place. The risers are centered over 0.609 meter (24 inch) diameter openings through the concrete lid.

Location: The site is located approximately 183 meters, (600 feet) north northwest of the 105-DR Reactor Building and 76 meters, (250 feet) southwest of the 105-D Reactor Building.

Process Description: The septic tank separates the settleable solids and floating effluent scum from the clear liquid. The effluent is passed from the septic tank to the pump chamber through a "Bio-Tube" effluent filter. The filter is located at the outlet end of the septic tank. The filter can be accessed through one of the 0.203 meter (30 inch) PVC risers. It has a removable filter element which can be easily cleaned. A 0.203 meter (4 inch) diameter PVC pipe carries the effluent from the outlet of the filter to a 5,676 liter (1,500 gallon) pump chamber. The disposal area consists of buried pressurized PVC pipe distribution system constructed in a gravel-lined trench. The outlet orifices of the system are sized at 4.76 millimeter (3/16 inch) diameter [1.5 millimeters (1/16 inch) larger than the effluent screen] to avoid orifice plugging. The disposal area provides the absorption area for disposal of the clear sewage liquid

Related Sites/Structures: The site receives sanitary sewage from MO-980 and the restroom trailer. There are no radiation zones or known contamination areas in or near MO-980 or the restroom trailer.

Waste Type: Sanitary Sewage

**Waste
Description:**

Code: 100-D-59 **Classification:** Accepted

Names: 100-D-59; French Drain at the 183-D Acid Transfer Station **Reclassification:** Rejected (1/30/2003)

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is an upright vitrified clay pipe adjacent to the acid transfer structure at the railroad tracks next to the 183-D Building. Pipes used to transfer the acids from the rail cars are still on the structure, but the pipe sending overflow to the french drain has been disconnected (part of the pipe has been removed). The french drain is about 25 centimeters (10 inches) high, and 45 centimeters (18 inches) in diameter, with a steel cover and a 2.5-centimeter (1-inch) galvanized steel pipe rising up through the steel cover.

Location: The drain is on the east side of the railroad tracks that lead up the west side of the 183-D Building. It is between the transfer station and the underground pipe channel.

Process Description: Sulfuric acid was used to adjust the pH of the water in the 183-D Water Treatment Facility. It arrived in railcars and was transported to the facility via underground pipelines. The french drain received overflow from the acid transfer operations.

Related Sites/ Structures: This drain is associated with the acid transfer station at the 183-D Building.

Waste Type: Chemical Release

Waste Description: The waste disposed to the french drain was overflow sulfuric acid from railroad car transfer operations. Any waste acid would be neutralized in the alkaline Hanford soils.

Code: 100-D-68 **Classification:** Accepted

Names: 100-D-68; 190-DR Process Water Pump House **Reclassification:** No Action (7/25/2005)

Type: Process Unit/Plant **Start Date:**

Status: Inactive **End Date:**

Description: The facility has been demolished to 1 meter (3 feet) below-grade and backfilled. Before demolition the building included a basement, pipe gallery operating floor, suction tunnel and hot well bay, process tunnels, and two valve houses.

Location: The facility was located due south of the 151-D Substation, east of the 183-DR Clearwells and southeast of the 105-DR Reactor.

Process Description: The Process Water Pump House provided high volume treated water to 105-DR Reactor for cooling. The facility contained eight electric primary water pumps that pumped treated water from the clearwell tanks to the reactor. The discharge water pipelines were composed of four sets of lines with each line 30.5 cm (12 in) in diameter. These pipelines combined into four 30.5 cm (24 in) discharge pipelines. Two sets of dual 30.5 cm (24 in) pipelines ran from the 190-DR facility to two valve pits. From each valve pit, the dual 30.5 cm (24 in) pipelines routed the process water to the 105-DR Reactor.

Related Sites/ Structures: The associated structures include the 126-DR-1 (183-DR Clearwell Tank Pit), the 118-DR-2 (105-DR Reactor), 100-D-27, (151-D Substation), and the 100-D-28 septic system, piping and

tile fields.

Waste Type: Construction Debris
Waste Description: Prior to demolition, above-grade wastes included polychlorinated biphenyls (PCBs), asbestos (roofing, siding, pipe trays, and thermal piping insulation), mercury (installed in instrumentation and control systems), lead (lead-based paint and lead washers), and oils/greases. Since the above-grade structure was completely removed during demolition, the only remaining waste was the below-grade structure. The waste in the basement included water, sludge and potentially contaminated concrete.

Closure Info: Prior to demolition, all friable asbestos was removed, including all asbestos containing material and all potential asbestos containing material from ventilation fan housings, pipes, and loose materials that had fallen to the ground. Additionally, biological hazards, i.e., bird droppings, small dead birds, and eggshells were removed.

In the spring of 2005, the above-grade portion of the facility was demolished and the below-grade portion of the facility was demolished to 1 meter (3 feet) below-grade. The debris went to ERDF. The remainder of the concrete facility was left in place. The two valve houses were also demolished. The water tunnels were left in place and are currently being used as bat habitat. All of the piping was removed and recycled.

Approximately, 20 to 25 centimeters (8 to 10 inches) of standing water that had accumulated from runoff of storm water was present in the north and south annex basement areas (B and C Bays). B Bay (a.k.a., main basement sump) contained sludge that had accumulated. The water was removed prior to below-grade demolition.

In order to leave the basement in place as clean concrete, sampling results had to show that contaminants in the concrete were below the applicable remedial action goals as defined in the Remedial Design Report/Remedial Action Work Plan for the 100 Area (DOE/RL-96-17).

Code: 100-D-79	Classification: Accepted
Names: 100-D-79; SCA Area 1; SCA Area 2; 100D Posted Soil Contamination Areas	Reclassification: Rejected (9/15/2010)
Type: Dumping Area	Start Date:
Status: Inactive	End Date:
Description: This site consists of two posted radiological soil contamination areas (SCA). Area 1 is an SCA that was found during the 2006 Orphan Site Evaluation (OSE) field investigation. The SCA is posted and is in an area of previously disturbed soils. Area 2 is also an SCA that was identified during the 100-D Orphan Site field investigation in 2006.	
Location: There are two posted soil contamination areas located north of 105-D. Area 1 is near the north perimeter road and southeast of the 1904-DR outfall. A hand held Global Positioning unit found the center of Area 1 coordinates to be E573663.40, N152389.29. Area 2 is located on the north side of the 126-D-1 (188-D) ash pile. A hand held Global Positioning unit found the center of Area 2 to be at coordinates E573470.92, N152198.90.	
Process Description: Construction drawing M-1600-D, Sheet 8 indicates that Area 1 was located in was used as a spoil pile area in 1947. No other information is available. No information was available for Area 2.	

Code: 100-D-89	Classification: Not Accepted
Names: 100-D-89; Power Pole and Junction Box Debris	Reclassification: None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: This site consists of two surface debris areas containing abandoned electrical components.

Location: This site is located 83 meters (272 feet) north of the 108-D Chemical Facility.

Process Description: The electrical service box is sitting on a 1.5 meter (5 foot) tall frame and is fed through the bottom with ridged conduit. Attached to the frame is a cord hanger with several feet of electrical cord. The electrical cord has been disconnected from the strain relief. It was most likely used as a power source for engine block warming of heavy equipment. It is not known if the utility pole serviced the electrical box.

Related Sites/ Structures: The 100-D-31 Process Sewer runs below this location.

Waste Type: Equipment

Waste Description: No contaminants of potential concern were noted. This electrical box was used as a junction box and should not have contained PCB's.

Code: 100-D-91 **Classification:** Not Accepted

Names: 100-D-91; 100-D/DR Electrical Components **Reclassification:** None
Debris

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site consists of a flat gravel area where pallets of electrical components once were staged.

Location: This site is located 12 m (39 ft) northeast of the 1713-D Store House.

Related Sites/ Structures: The closest structure was the 1713-D Store House.

Waste Type: Equipment

Waste Description: There are no contaminants of concern.

Code: 100-D-92 **Classification:** Accepted

Names: 100-D-92; Second Potential UST Near **Reclassification:** Rejected (2/11/2010)
Dichromate Station

Type: Storage Tank **Start Date:**

Status: Inactive **End Date:**

Description: This site consists of an underground concrete utility encasement for freshwater pipelines and the underlying soil located below a rail line. The site was originally reported, in a geophysical investigation, as a potential underground storage tank (UST). A detailed spatial analysis was conducted and determined that the feature was a known piping encasement located below the railroad tracks.

Location: This structure is co-located with 100-D-93 and associated with the 183-D Water Treatment facilities, the 100-D-12 Sodium Dichromate Transfer Station (pump station), 100-D-63, 100-D/DR Service Water Pipelines, 100-D/DR Clean Water Pipelines, and 100-D-56, 100-D Area Sodium Dichromate Underground Supply Lines (see subsites).

Process Description: The encasement protected utilities buried beneath rail road lines and is located approximately 0.91meter (3 feet) below grade. A 7.6 centimeter (3 inch) sodium dichromate pipeline and a 40.64 centimeter (16 inch) freshwater pipeline was observed inside the encasement.

Related Sites/ Structures: This structure is co-located with 100-D-93 and associated with the 183-D Water Treatment facilities, the 100-D-12 Sodium Dichromate Transfer Station (pump station), 100-D-63, 100-D/DR Service Water Pipelines, 100-D/DR Clean Water Pipelines, and 100-D-56, 100-D Area Sodium Dichromate Underground Supply Lines (see subsites).

Waste Type: Process Effluent

Waste Description: The encasement contains a portion of the 100-D-56 pipeline. WIDS 100-D-56 states "Historical review, geophysical surveys and a site visit in 2005 concluded that the site appeared to contain hazardous constituents (i.e. hexavalent chromium) at levels in exceedance of remedial action goals"

Potential Contaminants of Concern:
As stated in the Site Comment, the encasement location consists of a portion of the 100-D-56 pipeline. WIDS 100-D-56 states "Historical review, geophysical surveys and a site visit in 2005 concluded that the site appeared to contain hazardous constituents (i.e. hexavalent chromium) at levels in exceedance of remedial action goals".

Code: 100-D-93 **Classification:** Accepted

Names: 100-D-93; Potential UST Near Dichromate Station **Reclassification:** Rejected (5/20/2010)

Type: Storage Tank **Start Date:**

Status: Inactive **End Date:**

Description: This site consists of an underground concrete utility encasement for freshwater pipelines and the underlying soil located below a rail line. The site was originally reported, during a geophysical investigation, as a potential underground storage tank (UST). A detailed spatial analysis was conducted and determined that the feature was a known piping encasement located below the railroad tracks.

Location: This site is located 10 meters (32 feet) east of the 100-D-12 Sodium Dichromate Transfer Station and 73 meters (239 feet) southeast of the 183-D building. It is approximately 1.54 m (5 ft) below grade.

Process Description: The encasement protected utilities buried beneath rail road lines and is located approximately 0.91meter (3 feet) below grade. A 7.6 centimeter (3 inch) sodium dichromate pipeline and a 40.64 centimeter (16 inch) freshwater pipeline was observed inside the encasement.

Related Sites/ Structures: This structure is co-located with 100-D-92 and associated with the 183-D Water Treatment facilities, the 100-D-12 Sodium Dichromate Transfer Station (pump station), 100-D-63, 100-D/DR Service Water Pipelines, 100-D/DR Clean Water Pipelines, and 100-D-56, 100-D Area Sodium Dichromate Underground Supply Lines (see subsites).

Waste Type: Process Effluent

Waste Description: The encasement contains a portion of the 100-D-56 pipeline. WIDS 100-D-56 states "Historical review, geophysical surveys and a site visit in 2005 concluded that the site appeared to contain hazardous constituents (i.e. hexavalent chromium) at levels in exceedance of remedial action goals"

Code: 100-D-95 **Classification:** Accepted

Names: 100-D-95; 100-D/DR Unnumbered Septic Tanks and Tile Field **Reclassification:** Rejected (11/10/2010)

Type: Septic Tank **Start Date:**

Status: Inactive **End Date:**

Description: The site was thought to consist of two septic tanks and a tile field. Gravel and rabbit brush were observed on the surface of the site.

Location: This site is located approximately 150 meters (492 feet) northwest of the 182-D Reservoir. The coordinates are the centroid of the geophysics performed.

Process Description: During construction of the Hanford Engineer Works, temporary sewer lines and septic tanks were installed for the disposal of sanitary sewage. The "Plot Plan of Temporary Construction Facilities 100-D Area, August 1944" indicated that a septic tank and tile field were proposed at this location to service several temporary buildings.

Related Sites/Structures: This septic system may have serviced the 1735-D Division Engineers Office, Training Headquarters, Miscellaneous Storage Facility and other temporary construction facilities.

Waste Type: Sanitary Sewage

Waste Description: Transfer of non-radioactive liquid sanitary sewage waste.

Code: 120-D-1 **Classification:** Accepted

Names: 120-D-1; 100-D Ponds **Reclassification:** Closed Out (8/27/1999)

Type: Pond **Start Date:** 1/1/1977

Status: Inactive **End Date:** 1/1/1994

Description: The site was modified in 1979 to form a two-compartment pond, one overflowing to the other. The north pond was a percolation pond and the south pond was a settling pond.

Location: This site is located within the 100-D Ash Disposal Basin (126-D-1).

Process Description: The 100-D Ponds received corrosive waste from the the regeneration of ion exchange columns located in 185-D and 189-D.

Waste Type: Process Effluent

Waste Description: This site received nonhazardous 183-D Sandfilter backwash, small quantities of filtered, chlorinated water from hydraulic test loops, and fuel discharge trampoline tests. The estimated flow rate was 1.7E+05 liters/day (45,000 gallons/day). Corrosive demineralizer recharge effluent from two sources was released at intervals of once every 2 to 3 years for one regenerate source and once every 6 years for the other. Sampling indicates the potential for mercury and polychlorinated biphenyl (PCB) contamination.

Closure Info: On August 27, 1999, a letter was issued from the State of Washington Department of Ecology that declared the Treatment Storage and Disposal (TSD), RCRA Part A permit, portion of this unit to be closed.

Code: 126-D-1 **Classification:** Accepted

Names: 126-D-1; 184-D Powerhouse Ash Pit; 188-D Ash Disposal Area; 100-D Ash Disposal Basin **Reclassification:** Rejected (6/25/1998)

Type: Coal Ash Pit **Start Date:** 1/1/1950

Status: Inactive **End Date:** 1/1/1960

Description: The 126-D-1 site is a large ash disposal area. The site was originally a large excavated basin approximately 60 meters (200 feet) long, 60 meters (200 feet) wide, and 3 meters (10 feet) deep. The extent of the original basin obscured by ash piles.

Location: The site is located north of the 184-D Powerhouse.

Process Description: Coal ash from the 184-D Powerhouse was mixed with raw river water and sluiced in slurry form to the ash pit via a 20 centimeter (8 inch) ashcolite pipe.

Waste Type: Ash

Waste Description: This site received an unknown amount of coal ash that was sluiced to pits with raw river water from the 184-D Powerhouse. The ash has been determined by testing in accordance with WAC 173-303 to be nonextraction process (EP) toxic.

Code: 126-D-3 **Classification:** Accepted

Names: 126-D-3; 184-D Salt Dissolving Pit and Brine Pump House; D Area Brine and Salt Dilution Pits **Reclassification:** Rejected (10/2/1997)

Type: Sump **Start Date:**

Status: Inactive **End Date:**

Description: The salt dissolving pits and brine pump pit were part of a single below-grade concrete structure that provided brine for the 184-D Powerhouse. The structure has been demolished and buried in situ. No evidence of the site remains at the surface. The two salt dissolving pits each had inner dimensions of 4.3 meters (14 feet) long by 2.4 meters (8 feet) wide by 2.8 meters (9.25 feet) tall. They had a design high water line 2.4 meters (7.75 feet) from the pit bottom. An overflow slot connecting the two dissolving pits was located 0.3 meters (1 foot) above the high water line. The bottom of each pit was filled with a 12.7 centimeter (5 inch layer) of 1.3 to 2.6 centimeter (1/2 to 1 inch) gravel topped by a 17.8 centimeter (7 inch) layer of 0.3 to 0.6 centimeter (1/8 to 1/4 inch) gravel. The dissolving pits each had a 2.4 meter (8 foot) by 0.9 meter (3 feet) opening at the top for receiving salt. Each pit had a capacity of 23,600 kilograms (52,000 pounds) of salt. The brine pump pit is located adjacent to the two salt dissolving pits. The pit was 3.3 meters (10.67 feet) long by 2.2 meters (7.33 feet) wide by 2.1 meters (7 feet) deep. It held two pumps and associated piping (all brass) for the brine system. The floor of the pump pit sloped toward a 46 by 46 by 46 centimeter (18 by 18 by 18 inch) sump in a corner.

Location: The site is located north of 184-D and just south of the railroad tracks.

Process Description: The brine was used to regenerate the zeolite ion exchange demineralizers that were part of the powerhouse water treatment system.

Related Sites/ Structures: The site is associated with the 184-D Power House.

Waste Type: Demolition and Inert Waste

Waste Description: The structure was demolished and buried in situ.

Code: 132-D-4 **Classification:** Accepted

Names: 132-D-4; 105-D Reactor Exhaust Stack; 116-D Reactor Exhaust Stack **Reclassification:** Interim Closed Out (7/27/2005)

Type: Stack **Start Date:** 1/1/1944

Status: Inactive **End Date:** 1/1/1967

Description: The site has been remediated and interim closed out.

Location: The stack was located south of the 105-D Reactor Building.

Process Description: The unit was a monolithic structure constructed of reinforced concrete. The maximum wall thickness was 0.46 meters (1.5 feet) at the base. It rested on a double octagon-shaped base that extended 5.3 meters (17.5 feet) below grade. An opening at the base provided access to its interior portion. This opening was fitted with a steel door. The outside rungs had been removed to about 3 meters (10 feet) above grade. Originally exhaust air flowed directly from the 105-D Building to the exhaust stack. Following completion of the confinement project in 1960, the exhaust air was diverted to the 117-D Filter Building, via underground ducts, prior to release through the stack.

Waste Type: Demolition and Inert Waste

Waste Description: This unit was used to exhaust confinement air that originated from the work areas in the 105-D Reactor Building. The interior of the stack contains an unknown quantity of low-level radioactive materials.

Closure Info: 118-D-6:2, 118-D-6:3 and 132-D-4 were addressed as a group. The information below documents information for the group of sites.

The Cleanup Verification Package (CVP) for the 118-D-6:2, 105-D Reactor Ancillary Support Areas, Below-Grade Structures, and Underlying Soils; the 118-D-6:3, 105-D Reactor Fuel Storage Basin and Underlying Soils; and the 132-D-4, 105-D Reactor Exhaust Stack Foundation (CVP) demonstrated that removal action at the 105-D Reactor subsites 118-D-6:2, 118 D-6:3, and 132-D-4 has achieved the removal action objectives established in the applicable action memorandums and has achieved the corresponding RAGs established in the Removal Action Work Plan for 105-D and 105-H Building Interim Safe Storage Projects and Ancillary Buildings, the Sampling and Analysis Plan for Interim Closure of the 105-D and 105 H Reactor Below-Grade Structures and Underlying Soils (SAP), and the Remedial Design Report/Remedial Action Work Plan for the 100 Area (RDR/RAWP).

The FSB water level was lowered upon closure of the reactor and further cleaned out during 1984. Ruptured fuel elements had caused the shielding water to become highly contaminated. The remaining water was processed and released to 116-D-10 pond. Then an asphalt emulsion was applied to the floors and walls of the basin to fix loose contamination. The remaining basin hardware, perfs, buckets, and sludge were packaged and disposed of as low-level radioactive waste in the 200 Area burial grounds.

These areas were surveyed, and local contamination was removed in preparation for clean demolition. With the exception of the FSB walls and floor below 4.6 meters (15 feet), all structures in this zone were removed due to surface contamination being present. Sampling of underlying soils was not required because structures in this zone were not subjected to standing contaminated water and there was no mechanism for residual surface contamination to penetrate into the concrete and the underlying soil. The above- and below-grade structures were demolished and the demolition debris sent to ERDF. A section of 100 D-48:4 effluent pipeline remains buried under what was room 210. This section of pipeline will be considered separately from demolition zone 1 and deferred to the Remedial Action Project.

It was determined in the Sampling and Analysis Plan for Interim Closure of the 105-D and 105-H Reactor Below-Grade Structures and Underlying Soils that the 105-D FSB would not be cored to sample the underlying soils because this FSB was not known to have leaked (water

level variations were consistent with evaporation), coring was very difficult and potentially unsafe, and the soils beneath the 100-C and 105-DR FSBs were found to be clean. The 100-D Reactor Site Technical Baseline Report suggests that all of the FSBs had leaked. However, this statement is not supported by the process history of the 105-D FSB, and sampling of the underlying soils at the 105-C and 105-DR FSBs showed that they had not leaked. The FSB concrete floors from all of the previously decommissioned reactors were found to have various types of contamination that penetrated only a maximum of a few millimeters into the concrete. Sampling showed the contamination had not penetrated through the 0.3 to 0.6 meters (1 to 2 feet) of concrete in the FSB floors.

The 105-D Reactor subsites 118-D-6:2, 118-D-6:3, and 132-D-4 have been verified to be remediated in accordance with the applicable action memorandums and can be interim closed. The CVP does not demonstrate the acceptability of unrestricted access to deep zone soils (i.e., below 4.6 meters [15 feet]); therefore, institutional controls to prevent uncontrolled drilling or excavation into deep zone soils are required

Code:	1607-D3	Classification:	Accepted
Names:	1607-D3; 1607-D3 Sanitary Sewer System; 1607-D3 Septic Tank; 1607-D3 Septic Tank and Associated Drain Field	Reclassification:	Closed Out (2/23/2001)
Type:	Septic Tank	Start Date:	1/1/1944
Status:	Inactive	End Date:	1/1/2000
Description:	The site is an inactive septic system associated with the 151-D Substation. A sign stating "Abandoned Septic Tank per WAC 246-272-1850 DynCorp Environmental" is posted at the site. The tank has been abandoned per WAC 246-272-18501 and as of August 2000 is indistinguishable in a dirt and cobble field. The reinforced concrete tank is 1.8 meters (6 feet) long, 0.9 meters (3 feet wide), and 3 meters (9 feet 10 inches) deep (inner dimensions). The tank had a design capacity of 1325 liters (350 gallons) based on a user capacity of 10 persons, a flow of 132 liters (35 gallons) of sewage per capita per day, and an average detention time of 1 day. The walls are 20 centimeters (8 inches) thick. The floor is 15 centimeters (6 inches) thick. The tile field was constructed of 10 centimeter (4 inch) vitrified or concrete pipe, or drain tile with a minimum of 2.4 meter (8 foot) per capita. The laterals are open jointed and spaced 2.4 meters (8 feet) apart. Prior to decommissioning, the septic tank was surrounded by light posts and chain.		
Location:	The septic tank and drain field are located east of the 151-D Electrical Substation.		
Process Description:	The site serviced the 151-D Electrical Substation.		
Waste Type:	Sanitary Sewage		
Waste Description:	This unit received sanitary waste from the 151-D Electrical Distribution Substation. The flow rate to this unit was estimated at 3,970 Liters (1,050 gallons) per day.		
Closure Info:	The tank has been abandoned per WAC 246-272-18501. The septage was removed from the tank sometime in the past. In July 2000, the lid was removed from the tank and the void space in the tank was filled with soil. A radiological survey was done on the empty tank and excavated soil.		

Code:	122-DR-1	Classification:	Accepted
Names:	122-DR-1; 100-D-51; 105-DR Large Sodium Fire Facility; 105-DR Sodium Fire Facility	Reclassification:	Closed Out (7/1/2004)

Code: 122-DR-1:1 **Classification:** Accepted

Names: 122-DR-1:1; Office Area; Storage; Testing; 100-D-51; 105-DR 90-Day Waste Accumulation Area; 122-DR-1 Area 1 **Reclassification:** Closed Out (10/1/1996)

Type: Laboratory **Start Date:**

Status: Inactive **End Date:**

Description: Area 1 consists of the exhaust fan room, small fire room, large fire room, sodium handling room, and an office area. The exhaust fan room is 6.2 meters (20.5) feet wide, 8.2 meters (27 feet) long, and 6.4 meters (21 feet) high. In this room, waste alkali metals from various sources, including residuals from tests, failed equipment, and drum heels, were reacted at atmospheric pressure. The burn pans and equipment were cleaned periodically using water and the rinsate was collected in a sump. The wash water was pumped from the sump to a seal pit where it was neutralized prior to discharge. The small fire room is 6.2 meters (20.5 feet) wide, 8.2 meters (27 feet) long, and 6.4 meters (21 feet) high. It contains one steel cylindrical pressure vessel with a dished top. The vessel has a volume of approximately 14 cubic meters (500 cubic feet). When in use, the vessel could be purged with nitrogen or argon to maintain a controlled atmosphere. This vessel was the only one used to burn lithium-lead alloy waste. The large fire room is 6.2 meters (20.5 feet) wide, 8.2 meters (27 feet) long, and 6.4 meters (21 feet) high. It contains the Large Test Cell which is a steel cubicle 110 cubic meters (3,700 cubic feet) in volume. The cell could be purged with nitrogen or argon to maintain a controlled atmosphere. The sodium handling room contained drum melters and a 3,400 liter (900 gallon) type-304 stainless-steel sodium batch tank which provided sodium to the Large Test Cell. The tank was resupplied from sodium drums that were heated to liquefy the sodium, which was then discharged into the tank with inert gas. The office area provided space for office work and storage of nondangerous materials. During cleanup activities equipment was removed from the rooms, decontaminated and stockpiled for either recycling or reuse. The interiors of the Large Test Cell and the pressure vessel were decontaminated with a high pressure water blast to remove lead and carbonate contamination. The rooms were washed down using a pressure washer and a mildly acidic solution to remove visible residue. All penetrations into the reactor exhaust tunnels were sealed to isolate the area and prevent recontamination. A 90-day waste accumulation area was set up at the north end of the office area for use during clean up activities. The accumulation area was enclosed within a wire cage. When the waste was removed, the unit was closed. The area was clean closed.

Location: The 105-DR Large Sodium Fire Facility is located in the supply and exhaust fan wing of the 105-DR Reactor Building.

The SubSite is Part Of:

Code: 122-DR-1

Names: 122-DR-1; 100-D-51; 105-DR Large Sodium Fire Facility; 105-DR Sodium Fire Facility

Code: 122-DR-1:2 **Classification:** Accepted

Names: 122-DR-1:2; Exhaust Tunnels; 122-DR-1 Area 2 **Reclassification:** Closed Out (7/1/2004)

Type: Laboratory **Start Date:**

Status: Inactive **End Date:**

Description: Area 2 consisted of the upper and lower exhaust tunnel, the blower that moved Large Sodium Fire Facility (LSFF) exhaust from the lower to the upper tunnel, the exterior underground tunnel to the 117-DR HEPA Filter Building, and the ducts to the submerged gravel scrubber. Steel barricades at the north end of the tunnels blocked air flow to and from the reactor. The tunnel had low, but measurable radioactivity when sampled in 1987 (see DOE/RL-90-25, Rev 2, Appendix A for sampling information). This area is part of the 105-DR Reactor Building and

is also included in its Waste Information Data System (WIDS) site (118-DR-2).

Closure Info: 122-DR-1:2, 100-D-53, 122-DR-1:4, 132-DR-2, 122-DR-1:5, 100-D-64, 100-D-23 and 100-D-54 were addressed as a group. The information below documents information for the group of sites.

Remedial or removal objectives and goals for the components of the LSFF TSD unit pre-filter exhaust tunnel [122-DR-1:2], the 117-DR Exhaust Filter Building [100-D-53/122-DR-1:4], 116DR reactor exhaust stack(132 DR 2/122-DR-1:5), were obtained from the Action Memorandum, USDOE Hanford 100 Area National Priorities List (NPL) 105-F and 105 DR Reactor Buildings and Ancillary Facilities (Action Memorandum). The objectives and goals were also included in the Phase III SAP (DOE/RL-99-35) and the Remedial Design Report/Remedial Action Work Plan for the 100 Area (RDR/RAWP) (DOE/RL-96-17), which was referenced in the Action Memorandum.

Based on consideration of the requirements of CERCLA and detailed analysis of alternatives, the Tri-Parties have selected the remove/dispose alternative under a rural-residential land use scenario for the 117-DR facilities site.

The objective for the structures included the removal of the structure to a minimum of 0.9 meters (3 feet) below surface grade. Excavation was driven by remedial action objectives for direct exposure, protection of groundwater, and protection of the Columbia River. For the respective points of compliance, remedial action goals (RAGs) were established to identify radionuclide and no radionuclide contaminants of concern (COCs) and contaminants of potential concern.

Waste site COCs for the 117 DR facilities site were identified through process knowledge and are specified in the Phase III SAP (DOE/RL-99-35). The COC list was further refined and amended with the 117 DR Exhaust Filter Building Proposed Additional Soil Sampling and 1720-HA Arsenal Removal/ Disposal Summary (CNN 106839). The COCs consist of the following: americium-241, arsenic, carbon-14, barium, cesium-137, cadmium, cobalt-60, total chromium, europium-152, hexavalent chromium, europium-154, lead, europium-155, lithium, ninel-63, mercury, plutonium-238, selenium, plutonium-239/240, silver, strontium-90, sodium, uranium-234, uranium-235 and uranium-238.

At the completion of the remedial action, the total excavation was approximately 1,010 meters squared (10,872 square feet) in area with an approximate depth of 5 meters (16.4 feet). Approximately 14,011 metric tons (15,412 tons) of material from the site were disposed of at the Environmental Restoration Disposal Facility.

The 117-DR facilities site is verified to be remediated in accordance with the RAOs and RAGs of the Action Memorandum and the Remaining Sites ROD and may be backfilled.

In addition, demonstration that remedial action at the 117-DR facilities site has achieved the RAOs and corresponding RAGs established in the Action Memorandum and the Remaining Sites ROD meets the RCRA closure requirements for the underlying soils. Final RCRA TSD certification of closure is pending.

The SubSite is Part Of:

Names: 122-DR-1; 100-D-51; 105-DR Large Sodium Fire Facility; 105-DR Sodium Fire Facility

Code: 122-DR-1:3

Classification: Accepted

Names: 122-DR-1:3; Gravel Scrubber; 122-DR-1 Area 3

Reclassification: Closed Out (10/1/1996)

Type: Laboratory**Start Date:****Status:** Inactive**End Date:**

Description: Area 3 consists of a submerged gravel scrubber and ducts that were installed in 1982 as part of a filter development program. Installation of the gravel scrubber allowed the offgas from tests or burning to bypass the 117-DR HEPA Filter Building. The scrubber water was confirmed to be within pH tolerances (2.0 to 12.5) and discharged to the 116-DR-8 Crib. Two gravel samples numbered BOG9F6 and BOG9F7 were taken from the gravel scrubber. Based on evaluation of the sample data, the gravel did not designate as a Dangerous Waste (see WHC-SD-EN-EV-034, Rev. 1 for sample results). The gravel that had been removed from the unit was made available for reuse. The associated ductwork was removed. The area was clean closed.

Location: The site was located at the south end of the 100 D/DR Exclusion Fence.

The SubSite is Part Of:**Code:** 122-DR-1**Names:** 122-DR-1; 100-D-51; 105-DR Large Sodium Fire Facility; 105-DR Sodium Fire Facility

Code: 122-DR-1:4**Classification:** Accepted**Names:** 122-DR-1:4; 117-DR HEPA Filter Building; 122-DR-1 Area 4**Reclassification:** Closed Out (7/1/2004)**Type:** Laboratory**Start Date:****Status:** Inactive**End Date:**

Description: Area 4 consisted of the 117-DR HEPA Filter Building and the downstream tunnel to the reactor stack. The filter building housed the exhaust air filters. The building was about 18 meters (59 feet) long, 12 meters (39 feet) wide, and 11 meters (35 feet) high. The Filter Building was connected by underground concrete ductwork to the 116-DR exhaust stack. The filter building contained the HEPA filters, which were installed in four filter frames (24 filters per frame). In 1972, the original HEPA filters from the 105-DR Reactor were replaced before Large Sodium Fire Facility (LSFF) operations began. However, remnant radioactivity from the exhaust tunnels or filter holders had probably been picked up by the new filters. The 117-DR Filter Building was also a separate Waste Information Data System (WIDS) site (100-D-53).

Closure Info: 122-DR-1:2, 100-D-53, 122-DR-1:4, 132-DR-2, 122-DR-1:5, 100-D-64, 100-D-23 and 100-D-54 were addressed as a group. The information below documents information for the group of sites.

Remedial or removal objectives and goals for the components of the LSFF TSD unit pre-filter exhaust tunnel [122-DR-1:2], the 117-DR Exhaust Filter Building [100-D-53/122-DR-1:4], 116DR reactor exhaust stack(132 DR 2/122-DR-1:5), were obtained from the Action Memorandum, USDOE Hanford 100 Area National Priorities List (NPL) 105-F and 105 DR Reactor Buildings and Ancillary Facilities (Action Memorandum). The objectives and goals were also included in the Phase III SAP (DOE/RL-99-35) and the Remedial Design Report/Remedial Action Work Plan for the 100 Area (RDR/RAWP) (DOE/RL-96-17), which was referenced in the Action Memorandum.

Based on consideration of the requirements of CERCLA and detailed analysis of alternatives, the Tri-Parties have selected the remove/dispose alternative under a rural-residential land use scenario for the 117-DR facilities site.

The objective for the structures included the removal of the structure to a minimum of 0.9 meters (3 feet) below surface grade. Excavation was driven by remedial action objectives for direct exposure, protection of groundwater, and protection of the Columbia River. For the

respective points of compliance, remedial action goals (RAGs) were established to identify radionuclide and no radionuclide contaminants of concern (COCs) and contaminants of potential concern.

Waste site COCs for the 117 DR facilities site were identified through process knowledge and are specified in the Phase III SAP (DOE/RL-99-35). The COC list was further refined and amended with the 117 DR Exhaust Filter Building Proposed Additional Soil Sampling and 1720-HA Arsenal Removal/ Disposal Summary (CNN 106839). The COCs consist of the following: americium-241, arsenic, carbon-14, barium, cesium-137, cadmium, cobalt-60, total chromium, europium-152, hexavalent chromium, europium-154, lead, europium-155, lithium, niel-63, mercury, plutonium-238, selenium, plutonium-239/240, silver, strontium-90, sodium, uranium-234, uranium-235 and uranium-238.

At the completion of the remedial action, the total excavation was approximately 1,010 meters squared (10,872 square feet) in area with an approximate depth of 5 meters (16.4 feet). Approximately 14,011 metric tons (15,412 tons) of material from the site were disposed of at the Environmental Restoration Disposal Facility.

Start Date:

Status: Inactive

End Date:

Description: Area 5 consisted of the reactor exhaust stack. Over the life of the Large Sodium Fire Facility (LSFF) there were two routes for exhaust to take before entering the reactor exhaust stack. The first route was through the HEPA filters which had a 99.95 percent efficiency rating. The second route was through the submerged gravel scrubber which had an efficiency rating of approximately 99 percent. It was expected that there were no measurable deposits of residue from LSFF operation within the stack. The 116-DR Reactor Exhaust Stack also has a separate Waste Information Data System (WIDS) site (132-DR-2).

Closure Info: 122-DR-1:2, 100-D-53, 122-DR-1:4, 132-DR-2, 122-DR-1:5, 100-D-64, 100-D-23 and 100-D-54 were addressed as a group. The information below documents information for the group of sites.

Remedial or removal objectives and goals for the components of the LSFF TSD unit pre-filter exhaust tunnel [122-DR-1:2], the 117-DR Exhaust Filter Building [100-D-53/122-DR-1:4], 116DR reactor exhaust stack(132 DR 2/122-DR-1:5), were obtained from the Action Memorandum, USDOE Hanford 100 Area National Priorities List (NPL) 105-F and 105 DR Reactor Buildings and Ancillary Facilities (Action Memorandum). The objectives and goals were also included in the Phase III SAP (DOE/RL-99-35) and the Remedial Design

Report/Remedial Action Work Plan for the 100 Area (RDR/RAWP) (DOE/RL-96-17), which was referenced in the Action Memorandum.

Based on consideration of the requirements of CERCLA and detailed analysis of alternatives, the Tri-Parties have selected the remove/dispose alternative under a rural-residential land use scenario for the 117-DR facilities site.

The objective for the structures included the removal of the structure to a minimum of 0.9 meters (3 feet) below surface grade. Excavation was driven by remedial action objectives for direct exposure, protection of groundwater, and protection of the Columbia River. For the respective points of compliance, remedial action goals (RAGs) were established to identify radionuclide and no radionuclide contaminants of concern (COCs) and contaminants of potential concern.

Waste site COCs for the 117 DR facilities site were identified through process knowledge and are specified in the Phase III SAP (DOE/RL-99-35). The COC list was further refined and amended with the 117 DR Exhaust Filter Building Proposed Additional Soil Sampling and 1720-HA Arsenal Removal/ Disposal Summary (CNN 106839). The COCs consist of the following: americium-241, arsenic, carbon-14, barium, cesium-137, cadmium, cobalt-60, total chromium, europium-152, hexavalent chromium, europium-154, lead, europium-155, lithium, ninel-63, mercury, plutonium-238, selenium, plutonium-239/240, silver, strontium-90, sodium, uranium-234, uranium-235 and uranium-238.

At the completion of the remedial action, the total excavation was approximately 1,010 meters squared (10,872 square feet) in area with an approximate depth of 5 meters (16.4 feet). Approximately 14,011 metric tons (15,412 tons) of material from the site were disposed of at the Environmental Restoration Disposal Facility.

The 117-DR facilities site is verified to be remediated in accordance with the RAOs and RAGs of the Action Memorandum and the Remaining Sites ROD and may be backfilled.

In addition, demonstration that remedial action at the 117-DR facilities site has achieved the RAOs and corresponding RAGs established in the Action Memorandum and the Remaining Sites ROD meets the RCRA closure requirements for the underlying soils. Final RCRA TSD certification of closure is pending.

The SubSite is Part Of:

Code: 122-DR-1

Names: 122-DR-1; 100-D-51; 105-DR Large Sodium Fire Facility; 105-DR Sodium Fire Facility

Code: 122-DR-1:6

Classification: Accepted

Names: 122-DR-1:6; 116-DR-8 Crib (RCRA Action);
122-DR-1 Area 6

Reclassification: Closed Out (10/1/1996)

Type: Laboratory

Start Date:

Status: Inactive

End Date:

Description: Area 6 consists of the 116-DR-8 Crib meeting RCRA requirements. The crib was originally used from 1960 to 1964 to percolate low-level waste drainage from the 117-DR Building seal pits. When used for the Large Sodium Fire Facility (LSFF), the 116-DR-8 Crib received only water reported not to have been corrosive (the pH level was less than 12.5). This area is considered closed for the purposes of Washington Administrative Code (WAC) 173-303-610. Any contamination associated with Area 6 will be remediated in accordance with the 100-HR-3 RFI/CMS process. The 117-DR Seal Pit Crib is documented in WIDS as two separate sites.

The first site, 122-DR-1:6, which is part of the Large Sodium Fire Facility, a RCRA TSD, and has been closed for hazardous/dangerous constituents. The second site, 116-DR-8, which represents the radioactive constituents remaining at the site will be addressed under CERCLA .

Location: The unit is located south of the exclusion area fence and directly east of the 118-DR-1 Burial Ground.

The SubSite is Part Of:

Code: 122-DR-1

Names: 122-DR-1; 100-D-51; 105-DR Large Sodium Fire Facility; 105-DR Sodium Fire Facility

Code: 122-DR-1:7

Classification: Accepted

Names: 122-DR-1:7; Outdoor Storage Area; 122-DR-1 Area 7

Reclassification: Closed Out (10/1/1996)

Type: Laboratory

Start Date:

Status: Inactive

End Date:

Description: Area 7 consists of the area to the north and west of the 117-DR HEPA filter building. The burn pans used in the alkali metal fires were sometimes stored in this area. Six soil samples, three random and three authoritative, were collected for this site. The samples were number BOG979 through BOG984. All samples were well below the Hanford Site background 95% thresholds for both lithium and sodium in soil (see WHC-SD-EN-TI-307 for sample results). The area was clean closed.

Location: Area 7 consists of the area to the north and west of the 117-DR HEPA filter building.

The SubSite is Part Of:

Code: 122-DR-1

Names: 122-DR-1; 100-D-51; 105-DR Large Sodium Fire Facility; 105-DR Sodium Fire Facility

Code: 132-DR-2

Classification: Accepted

Names: 132-DR-2; 116-DR Reactor Exhaust Stack

Reclassification: Interim Closed Out (3/4/2004)

Type: Stack

Start Date: 1/1/1950

Status: Inactive

End Date: 1/1/1986

Description: The stack has been demolished. The unit was a monolithic, reinforced concrete structure with a maximum wall thickness of 0.46 meter (1.5 feet) at the base. It rested on a double octagon-shaped base that extended 5.3 meters (17.5 feet) below grade. An opening at the base provided access to its interior portion. This opening was fitted with a steel door.

Location: The unit was located on the south side of the 105-DR Building.

Related Sites/ Structures: Originally, 105-DR exhaust air flowed directly from the 105-DR to the exhaust stack. Following completion of the confinement project in 1960, the exhaust air was diverted to the 117-DR Filter Building, via underground ducts, prior to release through the stack.

Waste Type: Chemicals

Waste Description: Until 1964 the unit discharged exhaust air from the 105-DR Building. Since 1972, the unit was used to support operations relating to the 105-DR Large Sodium Fire Facility (122-DR-1). The interior of the unit contains an unknown quantity of low-level radioactive materials.

Closure Info: 122-DR-1:2, 100-D-53, 122-DR-1:4, 132-DR-2, 122-DR-1:5, 100-D-64, 100-D-23 and 100-D-54 were addressed as a group. The information below documents information for the group of sites.

Remedial or removal objectives and goals for the components of the LSFF TSD unit pre-filter exhaust tunnel [122-DR-1:2], the 117-DR Exhaust Filter Building [100-D-53/122-DR-1:4], 116DR reactor exhaust stack(132 DR 2/122-DR-1:5), were obtained from the Action Memorandum, USDOE Hanford 100 Area National Priorities List (NPL) 105-F and 105 DR Reactor Buildings and Ancillary Facilities (Action Memorandum). The objectives and goals were also included in the Phase III SAP (DOE/RL-99-35) and the Remedial Design Report/Remedial Action Work Plan for the 100 Area (RDR/RAWP) (DOE/RL-96-17), which was referenced in the Action Memorandum.

Based on consideration of the requirements of CERCLA and detailed analysis of alternatives, the Tri-Parties have selected the remove/dispose alternative under a rural-residential land use scenario for the 117-DR facilities site.

The objective for the structures included the removal of the structure to a minimum of 0.9 meters (3 feet) below surface grade. Excavation was driven by remedial action objectives for direct exposure, protection of groundwater, and protection of the Columbia River. For the respective points of compliance, remedial action goals (RAGs) were established to identify radionuclide and no radionuclide contaminants of concern (COCs) and contaminants of potential concern.

Waste site COCs for the 117 DR facilities site were identified through process knowledge and are specified in the Phase III SAP (DOE/RL-99-35). The COC list was further refined and amended with the 117 DR Exhaust Filter Building Proposed Additional Soil Sampling and 1720-HA Arsenal Removal/ Disposal Summary (CNN 106839). The COCs consist of the following: americium-241, arsenic, carbon-14, barium, cesium-137, cadmium, cobalt-60, total chromium, europium-152, hexavalent chromium, europium-154, lead, europium-155, lithium, niel-63, mercury, plutonium-238, selenium, plutonium-239/240, silver, strontium-90, sodium, uranium-234, uranium-235 and uranium-238.

At the completion of the remedial action, the total excavation was approximately 1,010 meters squared (10,872 square feet) in area with an approximate depth of 5 meters (16.4 feet). Approximately 14,011 metric tons (15,412 tons) of material from the site were disposed of at the Environmental Restoration Disposal Facility.

The 117-DR facilities site is verified to be remediated in accordance with the RAOs and RAGs of the Action Memorandum and the Remaining Sites ROD and may be backfilled.

In addition, demonstration that remedial action at the 117-DR facilities site has achieved the RAOs and corresponding RAGs established in the Action Memorandum and the Remaining Sites ROD meets the RCRA closure requirements for the underlying soils. Final RCRA TSD certification of closure is pending.

Code: 100-F-1	Classification: Not Accepted
Names: 100-F-1; 100-FR-2 Depression	Reclassification: None
Type: Depression/Pit (nonspecific)	Start Date:
Status: Inactive	End Date:
Description: The site is a depression surrounded by a post and chain barricade with warning signs stating "DANGER, KEEP AWAY." The surface of the depression is grass-covered. The site may be the location of a valve box along the raw water line that went from 190-C to the Pump House for the Radiological Science Laboratory Building and the Grazing Plot. During the April 1999 visit, metal and wooden stakes were observed on the ground and a soil gas probe was visible.	

Location: 30.5 meters (100 feet) north of the northwest corner of 118-F-1 Burial Ground.

Process Description: The GPR survey correlates fairly well with drawing SK-1-2847, High Purity Water System for 100F Biology. A raw water line tees from the raw water exiting from 190-C, goes south along the outside edge of the 105-F exclusion area fence, along the railroad track and above the north edge of the 118-F-1 Burial Ground and over to a pump house that supplied water to the Radiological Science Laboratory Building and Grazing Plot. According to the Technical Baseline Document, WHC-SD-EN-TI-169, the Grazing Plot (10-acres) was used to pasture pregnant animals and animals too young for experiments. The document goes on to state that no contaminants are known to exist at this location.

Related Sites/ Structures: The site was probably related to the 190-C Building, the Radiological Science Laboratory Building and the Grazing Plot.

Code: 100-F-5 **Classification:** Accepted

Names: 100-F-5; 1717-F Building Drywell **Reclassification:** Rejected (7/29/1997)

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is a 1.2 meters (48 inches) diameter french drain (drywell). The drywell was constructed per Hanford Standard AC-5-3 and was surrounded by steel post and chain barrier. The purpose of the site was to receive boiler steam condensate from blowdown valves. A 10 centimeter (4 inches) pipeline connected the boilers (2) of the 1717-F Building to the drywell.

Location: The site is approximately 26 meters (85 feet) west of the 1717-F Building.

Related Sites/ Structures: The site was related to the 1717-F Building (Combined Shops). The site is associated with site 100-F-32, 1717-F Building Underground Fuel Oil Tanks.

Waste Type: Steam Condensate

Waste Description: The unit received steam condensate from automatic blowdown valves connected to the boilers. The steam generation system for 1717-F was a once through system. The condensate would have received some residual salt (sodium chloride) from water softeners. Backflush from the water softeners went to the sanitary sewer system. Review of the drawings shows no indication of any additional chemical treatment during water softening. Steam condensate was not recycled to the boiler system. Drawing H-1-14566, Steam Generating Equipment Installation Piping Diagrams, shows the steam generation equipment including, the boilers, automatic blow down valves, piping to the drywell, and the drywell.

Code: 100-F-6 **Classification:** Not Accepted

Names: 100-F-6; 1716 FA Fuel Tank and Pump **Reclassification:** None

Type: Storage Tank **Start Date:**

Status: Inactive **End Date:** 1/1/1945

Description: The site is the 1716-FA Automotive Repair Shop gas tanks and gas pumps. Hanford Drawing M-2938 shows the location of the shop and gas tanks. During the April 1999 visit, a survey grade GPS was used to locate the site based on its mapped coordinates. The surrounding area was covered with cobbles and rocks with sparse vegetation, primarily rabbitbrush and grasses. Some debris was visible, including metal, concrete chunks and fragments of automobile headlights or taillights. An approximately 3.7 meter (12 foot) tall pile of soil and rock was visible to the south and appeared to be old borrow material.

Location: The site is located north of the western half of the 100F Coal Storage Area.

Related Sites/ Structures: The site was related to the 1716-FA Automotive Repair Shop.

Waste Type: Oil
Waste Description:

Code: 100-F-8 **Classification:** Accepted
Names: 100-F-8; French Drains Near 105-F Gate **Reclassification:** Rejected (7/29/1997)
Type: French Drain **Start Date:**
Status: Inactive **End Date:**

Description: The two french drains are constructed of 91 centimeter (36 inch) concrete pipe of unknown length buried to a depth which places their upper surfaces a few inches above grade.

Location: The french drains are near the main (north) entrance gate to the 105-F Reactor Building security fence. The first drain is about 22.9 meters (75 feet) south of the gate and the second is in line with the first and about 7.6 meters (25 feet) further south.

Waste Type: Water
Waste Description:

Code: 100-F-17 **Classification:** Not Accepted
Names: 100-F-17; 108-F Chemical Pump House; Chemical Storage Tanks at 108-F; Chemicals Used at 108-F Building **Reclassification:** None
Type: Storage Tank **Start Date:**
Status: Inactive **End Date:**

Description: The Pump House and storage tanks have been removed. The site was a four story steel framed building with concrete block walls, concrete foundation and floors, and a concrete tile roof with a tar and gravel surface. The entire building was in poor condition. The chemical storage tanks that were originally located on the west side of the building have been removed. A loading dock extends from the south end of the east wall. A gas dock is attached to the south end of the building. Abandoned equipment and debris is scattered around the southwest corner of the building.

Location: The 108-F building is located approximately 100 meters (330 feet) east of the 105-F Reactor Building.

Process Description: The 108-F was originally built to be used as a chemical pump house to hold and pump various chemicals needed in reactor water treatment and reactor purging (internal cleansing). It contained many holding and mixing tanks and pumps, along with storage bins for dry materials, conveyor systems, hoppers, and power shovels. Shortly after the F Reactor began operation, it was determined that such treatment would not be required and cooling water treatment could be performed elsewhere in the systems. The 108-F building was then converted to be used as a biological laboratory where the effects of radiation and contamination on plant and animal life were studied

Waste Type: Asbestos (friable)
Waste Description:

Description:

Code: 100-F-21 **Classification:** Not Accepted**Names:** 100-F-21; Exclusion Area; Grounds Surrounding Deactivated Areas **Reclassification:** None**Type:** Unplanned Release **Start Date:****Status:** Inactive **End Date:****Description:** The grounds within the 100-F exclusion area that are not part of other waste sites.

Code: 100-F-28 **Classification:** Accepted**Names:** 100-F-28; Septic Tank and Drainfield **Reclassification:** Rejected (1/29/2003)**Type:** Septic Tank **Start Date:****Status:** Inactive **End Date:****Description:** This site was a septic tank and its drainfield for an isolated office building, discovered on a 1954 drawing. No septic tank or markers were found during a field investigation at this site. The tank's mapped location placed it within an area that was excavated to a depth of between 3.1 and 4.6 meters (10 and 15 feet) for fill material. The area was lightly vegetated with cheatgrass and shrubs.**Location:** The site was located northwest of the 182-F Reservoir, east of the powerlines, approximately 50 meters (160 feet) west of the roadway, and 180 meters (590 feet) south of the perimeter road.**Waste Type:** Sanitary Sewage**Waste Description:** The unit would have received sanitary sewage. Because the unit appears to have supported only one building and that building is not near any contaminated facilities, it is highly unlikely that it received any radiological contamination.

Code: 100-F-30 **Classification:** Not Accepted**Names:** 100-F-30; 144-F Drywell **Reclassification:** None**Type:** French Drain **Start Date:****Status:** Inactive **End Date:****Description:** The site is a drywell that was observed on drawing H-1-14123 on the south side of 144-F. During a site investigation on 1/2/97, no evidence of a drywell was visible. During the April 1999 visit, a survey grade GPS was used to locate the site based on its mapped coordinates. No evidence of the site was found at this point. The area is sparsely covered with rabbitbrush and grasses.**Location:** The site is located in the 100-F Area within the former Pacific Northwest Laboratory's Experimental Animal Farm site. The 144-F building was located between the 141-C building and the 107-F Retention Basin. The drywell was located approximately 30 meters (100 feet) west of the 107-F Retention Basin Fence.**Process Description:** The dry well received rainwater from the roof of the 144-F Building. See drawing H-1-14123, Facilities for Radiation Inhalation Studies.**Waste Type:** Stormwater Runoff**Waste Description:** The drywell received stormwater from the roof of the 144-F building.**Description:**

Code: 100-F-32 **Classification:** Not Accepted
Names: 100-F-32; 1717-F Underground Fuel Oil Tanks **Reclassification:** None
Type: Storage Tank **Start Date:**
Status: Inactive **End Date:**
Description: The site is three underground fuel oil storage tanks. Each tank had a capacity of 94,625 liters (25,000 gallons). Each tank was 10.7 meters (35 feet) long and 2.4 meters (8 feet) in diameter. Pipelines ran to the 1717-F Building (Combined Shops) through a pump pit immediately east of the tanks.
Location: The three tanks are located approximately 33.5 meters (110 feet) west of 1717-F Building.
Related Sites/ Structures: The site was related to 1717-F Building. The site is associated with 100-F-5, 1717-F Building Drywell.

Code: 100-F-40 **Classification:** Accepted
Names: 100-F-40; Animal Farm Surface Impoundment **Reclassification:** Rejected (2/28/2002)
Type: Surface Impoundment **Start Date:**
Status: Inactive **End Date:**
Description: This site, a pair of impoundments and the associated ditches, is no longer visible in the field. It was discovered on aerial photos from 1965, and consisted of two surface impoundments, one covered with tumbleweeds and the other new and unvegetated. The older impoundment has a slightly meandering ditch coming to its northern end from the animal farm buildings. This ditch was dry in the September 1965 photo. A straight ditch, with water in it in the September 1965 photo, runs to the northern side of the northern impoundment, also coming from the same animal farm buildings.
Location: The impoundments are north of the 116-F-9 Trench and east of the animal farm. They are on the west side of, and adjacent to, the 100-F Area perimeter road. The approximate coordinates for the centroid of the impoundments are 147970 N and 5811115 E.
Waste Type: Animal Waste
Waste Description: Samples collected in April 2001 determined the surface ponds held only uncontaminated animal waste resulting from pen cleaning.

Code: 100-F-41 **Classification:** Accepted
Names: 100-F-41; 100-F Clean Water Pipelines; 100-F Service Water Pipelines **Reclassification:** Rejected (2/8/2007)
Type: Product Piping **Start Date:**
Status: Inactive **End Date:**
Description: The site and all four subsites have been reclassified to Rejected. The site included underground pipelines used to transport raw, fire, export, filtered, and sanitary water from the river pump house, to 100-F Area facilities, including the water treatment facilities and fire hydrants. This site does not include lines within buildings, process or septic sewer lines, chemical transfer pipelines, pipelines that carried water treated with sodium dichromate, or pipelines that were downstream from the reactor building, i.e., those lines that carried cooling water from the reactor to the retention basin, Lewis Canal and/or the river. A total of four (4) major pipelines and (43) smaller pipelines were identified as being associated with the 100-F-41 Service Water Pipelines site.

Location: The pipes were across the 100-F Area, from the 181-F intake structure to the water treatment facilities, reactor (fire and potable water, not reactor cooling water), strontium gardens, south to the fire and patrol headquarters near the 1701-F gatehouse, west to join with the export water line from the 100-D Areas, and east to the animal farm area.

Related Sites/ Structures: The clean water and fire water pipelines ran to or near virtually all the facilities at the 100-F Area. Pipeline sites in the 100-F Area include the Process Effluent Pipelines in site 100-F-19, the Water Treatment Pipelines in site 100-F-26, the river effluent lines are site 100-F-39, the clean water pipelines were 100-F-41, the experimental animal farm pipelines in site 100-F-29 and miscellaneous pipelines in 100-F-44. The other pipeline sites at the 100-F Area are 100-F-19 (Reactor Cooling Water Effluent); 100-F-26 (Water Treatment Plant Process Sewers); 100-F-29 (Experimental Animal Farm Process Sewers), and 100-F-39 (River Effluent Pipelines).

Waste Type: Equipment

Waste Description: The waste is the old buried pipes from the clean water pipeline system.

No Contaminants of Potential Concern (COPC's) are identified for underground water service lines. Asbestos-containing wrapping on underground water lines were determined to be neither a hazardous nor a dangerous material of construction (Unit Managers Meeting Minutes for July 2005).

This Site has the Following SubSites:

Code: 100-F-41:1

Names: 100-F-41:1; North/South 4-Inch Steel Pipeline North of 183-F

Code: 100-F-41:2

Names: 100-F-41:2; East/West 2-Foot Steel Pipeline Connected to 190-F

Code: 100-F-41:3

Names: 100-F-41:3; North/South 4-Inch Pipeline East of 1704-F

Code: 100-F-41:4

Names: 100-F-41:4; East/West 4-Inch Steel Pipeline at West End of 115-F

Code: 100-F-41:1

Classification: Accepted

Names: 100-F-41:1; North/South 4-Inch Steel Pipeline North of 183-F

Reclassification: Rejected (2/8/2007)

Type: Product Piping

Start Date:

Status: Inactive

End Date:

Description: The subsite has been reclassified to Rejected.

The subsite consisted of a north-south oriented; 10 centimeter (4 inch) steel pipeline segment of unknown length approximately 0.6 meters (2 feet) below ground surface. It was identified during an excavation for confirmatory sampling. The line was broken, when sampling was completed the steel pipe was returned to the test pit prior to backfilling with original material. The pipe had no insulation or wrapping of any kind. No samples were collected of the pipe or pipe interior. Drawing H-1-12436 shows a north-south 10 centimeter (4 inch) diameter Fire & Sanitary Water Line.

Location: The pipeline segment was north of the 183-F Filter Building and south of the 182-F Reservoir, and is defined by the following coordinates: N148161 E580436, N148152 E580436, N148152 E580483, and N148112 E580483.

Waste Type: Not Specified

Waste Description: The waste is the buried lines from the clean water pipeline system. These pipelines are not

Description: CERCLA hazardous waste.

Code: 100-F-41:2

Classification: Accepted

Names: 100-F-41:2; East/West 2-Foot Steel Pipeline
Connected to 190-F

Reclassification: Rejected (2/8/2007)

Type: Product Piping

Start Date:

Status: Inactive

End Date:

Description: The subsite has been reclassified to rejected.

The subsite consisted of an east-west oriented, 0.6 meter (2 feet) steel pipeline segment identified as approximately 1.8 meters (6 feet) below ground surface during an excavation for confirmatory sampling at 100-F-26:4. The pipe had no insulation or wrapping of any type. No samples were taken. This pipe was later identified on drawings H-1-12436 and H-1-12377 as a raw water line. The caption to a photo taken 12/15/04 indicates two diameters, [0.6 meters (24 inches) diameter cast iron raw water pipeline.

Location: The 100-F-41:2 pipeline segment was connected to the 190-F building foundation on the east side at coordinates N147736 E580503, and continued to N147736 E580611, N148162 E580610, and N148162 E580482.

Waste Type: Not Specified

Waste: The waste is the buried lines from the clean water pipeline system. These pipelines are not

Description: CERCLA hazardous waste.

The SubSite is Part Of:

Code: 100-F-41

Code: 100-F-41:3

Classification: Accepted

Names: 100-F-41:3; North/South 4-Inch Pipeline East of
1704-F

Reclassification: Rejected (2/8/2007)

Type: Product Piping

Start Date:

Status: Inactive

End Date:

Description: The subsite has been reclassified to rejected.

During excavation at the 100-F-26:9 sanitary sewers for collection of confirmatory samples, a north-south oriented, 10 centimeter (4 inch) pipeline was discovered approximately 1.2 meters (4 feet) below ground surface. it was intact and had no insulation or wrapping.

Construction drawing H-1-14562 showed a 7.6 centimeter (3 inch) sanitary water line trending south to north 3 meters west of the junction box sampling location. No depth was indicated on the drawing. The 1.1 centimeter (3 inch) sanitary water line shown on the construction drawing was within 1 meter of the estimated location of the discovered pipe. No reference to pipe diameter was documented to explain the size discrepancy indicated between logbook and the drawing. The discrepancy in pipeline size between the historic drawing and field observations was attributed to erroneous field measurements or the use of a larger diameter pipeline during

construction.

Location: The 100-F-41:3 pipeline was located east of the south corner of the 1704-F building beginning at coordinates N 147793 E 580672, and continuing to N 147793 E 580675 and N 147783 E 580675.

Waste Type: Not Specified

Waste Description: The waste is the buried lines from the clean water pipeline system. These pipelines are not

CERCLA hazardous waste.

The SubSite is Part Of:

Code: 100-F-41

Names: 100-F-41; 100-F Clean Water Pipelines; 100-F Service Water Pipelines

Code: 100-F-41:4

Classification: Accepted

Names: 100-F-41:4; East/West 4-Inch Steel Pipeline at West End of 115-F

Reclassification: Rejected (2/8/2007)

Type: Product Piping

Start Date:

Status: Inactive

End Date:

Description: The subsite consists of an east-west oriented, 10 centimeter (4 inch) steel pipeline approximately 1 meter (3 feet) below ground surface. The segment was identified during an excavation for confirmatory sampling. The steel pipe appeared to have no insulation or wrapping of any type. No samples were taken from the pipe. The pipe was left intact and the test pit was backfilled with the removed material.

Construction drawing H-1-12367 shows a cast iron (CI) fire and sanitary water line near the location of the discovered pipeline; and BHI-01504 indicates a 10 centimeter (4 inch) cast iron service water pipe exits the west side of the 115-F Building.

Location: It is located at the west end of the 115-F Building beginning at N147582 E580314, and continuing to N147582 E580299 and N147643 E580299.

Waste Type: Not Specified

Waste Description: The waste is the buried lines from the clean water pipeline system. These pipelines are not

CERCLA hazardous waste.

The SubSite is Part Of:

Code: 100-F-41

Names: 100-F-41; 100-F Clean Water Pipelines; 100-F Service Water Pipelines

Code: 116-F-13

Classification: Not Accepted

Names: 116-F-13; 1705-F Experimental Garden French Drain

Reclassification: None

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site has been described as a french drain. A review of documents and drawings has found no indication that a french drain ever existed at the 1705-F Experimental Garden. This site appears to be confused with both the 146-FR fish rearing ponds and the 1607-F6 septic tank.

Location: The 1705-F Experimental Garden was part of the Experimental Animal Farm which was located in the northwest corner of the 100F area. The garden was north of the 141-F building

(demolished) and east of the 1705-F building (demolished).

Related Sites/ Structures: The site is associated with 100-F-34.

Code: 118-F-9	Classification: Accepted
Names: 118-F-9; PNL Rad Site	Reclassification: Rejected (8/24/2006)
Type: Burial Ground	Start Date:
Status: Inactive	End Date:

Description: The site has been reclassified to Rejected based on analytical data and minor excavation. The site consisted of one trench running east to west. It has been backfilled and vegetation has re-established itself after the remediation. The site was not marked or posted.

Location: The site was located south of and adjacent to the southeast corner of 126-F-1.

Process Description: The site was believed to have received undocumented miscellaneous solid wastes from animal research studies at the Experimental Animal Farm.

Related Sites/ Structures: The site was associated with the 100-F Experimental Animal Farm. The site was identified as being in the same area as the 126-F-1 Ash Pit and the 100-F-20 burial ground.

Code: 132-F-2	Classification: Not Accepted
Names: 132-F-2; 132-F-2 Inhalation Laboratory; 144-F; 144-FB	Reclassification: None
Type: Laboratory	Start Date:
Status: Inactive	End Date:

Description: The site was a laboratory that was part of the Experimental Animal Farm. The building has been demolished. It was a rectangular one-story, 302 square meter (3,250 square foot), concrete block building. The building contained an office, laboratories, and indoor and outdoor animal runs. During the April 1999 visit, a survey grade GPS was used to locate the site using its mapped coordinates. A wooden stake was found in the ground at those coordinates. No evidence of the site was found. However, the area had been disturbed by heavy equipment, concrete chunks were visible and vegetation was sparse.

Location: The building was located south of the 141-F (132-F-1) sheep barn and east of the 141-C hog barn.

Process Description: The laboratory was used for particulate exposure experiments and for a series of studies on the effects of ionizing radiation on dogs. Between 300 and 400 beagles were housed at the nearby dog kennels during the studies. The primary isotopes used for the dog studies were plutonium-239 and radium-226.

Related Sites/ Structures: Effluent from the lab site went to the 100-F-31 Septic System, south of the building.

Code: 100-H-6	Classification: Not Accepted
Names: 100-H-6; Suspect Waste Site: Contaminated Ramp	Reclassification: None
Type: Unplanned Release	Start Date:

Status: Inactive

End Date:

Description: The site is a contaminated concrete ramp connected to the 105-H Reactor Building. The concrete ramp is enclosed in heavy wire mesh and is posted as a "Contamination Area".

Location: The ramp is located on the east side of the 105-H reactor building.

Release Description: Site personnel believe the ramp may have become contaminated from moving contaminated material out of the reactor basement level. They believe the wire mesh was installed to prevent tumbleweeds from accumulating in the ramp area.

Code: 100-H-15

Classification: Not Accepted

Names: 100-H-15; 100-H-25; Possible Septic Tank & Tile Field

Reclassification: None

Type: Septic Tank

Start Date:

Status: Inactive

End Date:

Description: The site appears in a photograph taken in 1950 as a rectangular site enclosed by a white rail fence. In the photograph, a line of disturbed soil is visible extending from the east end of the fenced area to a point near the southeast corner of the 151-H Electrical Substation. It appears to terminate at a manhole associated with the 1607-H1 septic tank.

Location: The site is located east of the southeast corner of the 151-H electrical substation site, at or very near the location of 118-H-2 Burial Ground (see Site Comment).

Code: 100-H-16

Classification: Accepted

Names: 100-H-16; 184-H Brine Pit; 184-H Salt Dissolving Pit and Brine Pump House; H Area Power House Brine Pit

Reclassification: Rejected (8/12/1997)

Type: Sump

Start Date: 1/1/1948

Status: Inactive

End Date:

Description: The salt dissolving pits and brine pump pit were part of a single below-grade concrete structure that provided brine for the 184-H Powerhouse. No evidence of the structure can be seen today. The salt dissolving pits each had inner dimensions of 4.3 meters (14 feet) long by 2.4 meters (8 feet) wide by 2.8 meters (9.25 feet) tall. They had a design high water line 2.4 meters (7.75 feet) from the pit bottom. An overflow slot that connected the two dissolving pits was located 0.3 meters (1 foot) above the high water line. The bottom of each pit was filled with a 12.7 centimeter (5 inch) layer of 1.3 to 2.6 centimeter (1/2 to 1 inch) gravel topped by a 17.8 centimeter (7 inch) layer of 0.3 to 0.6 centimeter (1/8 to 1/4 inch) gravel. The dissolving pits each had a 2.4 meter (8 feet) by 0.9 meter (3 feet) opening at the top for receiving salt. Each pit had a capacity of 23,600 kilograms (52,000 pounds) of salt. The brine pump pit is located adjacent to the two salt dissolving pits. The pit was 3.3 meters (10.67 feet) long by 2.2 meters (7.33 feet) wide by 2.1 meters (7 feet) deep. It held two pumps and associated piping (all brass) for the brine system. The floor of the pump pit sloped toward a 46 by 46 by 46 centimeters (18 by 18 by 18 inches) sump in a corner. A sump pump discharged to a nearby french drain (100-H-32).

Location: The site is located south of 184-H and just north of the railroad tracks.

Process Description: The brine was used to regenerate the zeolite ion exchange demineralizers that were part of the powerhouse water treatment system.

Related Sites: The site is associated with 184-H Power House and the 100-H-22 French Drain

**Related Sites/
Structures:**

Waste Type: Demolition and Inert Waste
Waste Description: The site was probably demolished in place. No documentation has been located related to cleanup. It is not known if salt cake was left in the structure.

Code: 100-H-18 **Classification:** Not Accepted
Names: 100-H-18; Undocumented Unplanned Airborne Release: Stack Emission No. 1 **Reclassification:** None
Type: Unplanned Release **Start Date:** 1/1/1955
Status: Inactive **End Date:**
Description: There are no posted areas related to this release.
Location: Affected areas included the 100-H Area and the Wahluke Slope. Figure 3 in HW-54636 shows the particulate density with the 100-H Area.
Release Description: The 105-H stack emitted approximately 0.6 curies of filterable gross beta contamination on May 3, 1955, when two ruptured slugs were removed from the reactor. The amount of material released was calculated based on the ground deposition.
Waste Type: Process Effluent
Waste Description: The waste consisted of airborne radioactive particulates released through the 105-H stack.

Code: 100-H-19 **Classification:** Not Accepted
Names: 100-H-19; Undocumented Unplanned Airborne Release: Stack Emission No. 2 **Reclassification:** None
Type: Unplanned Release **Start Date:** 1/1/1955
Status: Inactive **End Date:**
Description: There are no posted areas related to this site.
Location: Affected areas included 100-H and parts of the 600 Area to the west and south. Figure 4 in HW-54636 shows the particulate density within the 100-H Area. Figure 5 in HW-54636 has a larger scale and shows the particulate density over the greater area.
Release Description: On November 1, 1955, a ruptured slug burned briefly during discharge from the reactor. Approximately 0.8 curie of filterable gross beta contamination, mostly barium and rare earth plus yttrium, was emitted from the 105-H stack. The south one-third portion of the 100-H Area was found contaminated with concentrations as high as 12 particles per 9.3 square meters (100 square feet). The contamination level was 1,000 to 10,000 counts/minutes, with isolated particles as high as 1 100 millirads/hour. One particle, found near the 100-H Gatehouse, had a dose rate of 700 millirads/hour. The contamination was found to have spread south of 100-H Area, covering an area of approximately 18.1 square kilometers (7 square miles).
Waste Type: Process Effluent
Waste Description: The waste consisted of airborne radioactive particulates released through the 105-H stack.

Code: 100-H-20 **Classification:** Not Accepted

Names: 100-H-20; Undocumented Unplanned Release: Swallow Nests and Droppings **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1956

Status: Inactive **End Date:**

Description: There are no posted areas related to this release.

Location: The release contaminated an area extending from around the 100-H water tower over a flight path toward the White Bluffs. Figure 6 in HW-54636 shows the levels of contamination that were detected within the 100-H Area.

Release Description: After isolated cases of personnel and vehicle contamination were detected on May 15, 1956, it was discovered that swallows were making nests out of contaminated mud taken from the 107-H Liquid Waste Disposal Trench. The contaminated mud was being dropped around the 100-H water towers and at scattered locations over the flight path to the White Bluffs across the Columbia River. Concentrations ranged from 0 to 6 particles per 9.3 square meters (100 square feet), with a maximum recorded reading of 150 millirads/hour.

Related Sites/Structures: The release is related to the 107-H Liquid Waste Disposal Trench (116-H-1) and the 100-H Water Towers.

Waste Type: Soil

Waste Description: The 107-H Liquid Waste Disposal Trench received highly contaminated cooling water from the 107-H Retention Basin. The mud used by the swallows would have contained radioactive contamination from fuel element rupture.

Code: 100-H-26 **Classification:** Not Accepted

Names: 100-H-26; Exclusion Area; Grounds Surrounding Deactivated Areas **Reclassification:** None

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: The grounds within the 100-H exclusion area that are not part of other waste sites.

Code: 100-H-27 **Classification:** Not Accepted

Names: 100-H-27; 100-H Area Patrol Headquarters Storm Runoff Ditch **Reclassification:** None

Type: Ditch **Start Date:**

Status: Inactive **End Date:**

Description: The site is a ditch that receives stormwater runoff from a nearby asphalt parking areas. The ditch runs northward from a 15 centimeter (6 inch) vitrified clay pipe that discharged at a headwall. A site visit in March 1999 found the ditch almost completely filled with tumbleweeds. The ditch is not marked or posted.

Location: The site is located southeast of the 105-H Reactor facility. It is west of and adjacent to the 1607-H3 septic tank and tile field.

Waste Type: Stormwater Runoff

Waste Description:

Code: 100-H-32 **Classification:** Accepted
Names: 100-H-32; 184-H Brine Pit French Drain **Reclassification:** Rejected (1/30/2003)
Type: French Drain **Start Date:**
Status: Inactive **End Date:**
Description: There is no visual evidence of a french drain at this location. It was likely removed with the associated brine pit (100-H-16).
Location: The french drain site was located on the northeast corner of the 184-H Brine Pit (100-H-16), west of the 184-H Power House.
Process Description: The site is a french drain that received sump drainage from the 184-H Brine Pit (100-H-16). The drain was constructed of 61-centimeter (24-inch) diameter pipe. The french drain was not visible in the field during investigations for the 100-H Area Technical Baseline Report (BHI-00175). The french drain would have received only brine water.
Related Sites/ Structures: This site is associated with the 100-H-16 Brine Pit.
Waste Type: Chemicals
Waste Description: The french drain received any water or brine that collected in the 184-H Brine Pit Sump. The liquid would be expected to have contained high concentrations of sodium chloride (salt).

Code: 100-H-39 **Classification:** Accepted
Names: 100-H-39; Orphan Site H-007; Possible Thimble Pit Locations; Potential Thimble Burial Site **Reclassification:** Rejected (5/3/2010)
Type: Trench **Start Date:**
Status: Inactive **End Date:**
Description: The site is four possible thimble pit or trench locations. Historical documents indicate areas that may have been used to bury thimbles or materials related to the removal of thimbles in 100-H Area.
Location: Four potential burial sites were determined from document and photographic research. Location one is at Ground position system (GPS) coordinates (north end) E577777, N152214, (south end) E577783, N152175, (east side) E577790, N152196. The west side is the railroad tracks. Location two is approximate coordinates E577752.8, N152287.5 and E577752.8, N152257.0. Location three is coordinates E577758, N152188. Location four is the north and south centroid coordinates of the a trench - E577737.6, N152458.9 and E577737.3, N152433.
Related Sites/ Structures: This potential thimble burial site is associated with 118-H-5 and 100-H-2.
Waste Type: Equipment
Waste Description: Radioactive Thimbles may be buried at these locations. The 100-H-2 waste site is an analogous site. There are two types of radioactive waste associated with Thimbles; neutron activated steel and aluminum material containing cobalt-60 and surface contaminated waste primarily with zinc-65.

Code: 100-H-47 **Classification:** Accepted
Names: 100-H-47; 1717-H Geophysical Anomaly; Orphan Site H-015; Possible UST **Reclassification:** Rejected (2/22/2010)

around three sides and an asphalt-covered berm on the north side for tank truck unloading. The basins were completely demolished in the fall of 1996. The site was backfilled and re-vegetated in the spring of 1997. The site is marked. No radiological posting is associated with the backfilled basin.

Location: The site is located north of the 105-H Reactor and just north of the east 183-H Clearwell (WIDS Site 126-H-2).

Process Description: Originally, the basins were built as part of the 100-H water treatment structures. Approximately 1.6E+06 kilograms (3.6E+06 pounds) of waste per year were treated by solar evaporation. The water treatment basins received a maximum of approximately 1.5E+06 liters (400,000 gallons) of waste a year. The basins had a tank treatment design capacity of 2,650 liters (700 gallons) per day treated by evaporation and a tank storage design capacity of 8.2E+06 liters (2.2E+06 gallons), a collective value representing all four basins.

Related Sites/ Structures: 100-H-33, 183-H Solar Evaporaton Basins Radionuclide Components.

Waste Type: Process Effluent

Waste Description: The facility received routine and nonroutine wastes. The routine wastes consisted of spent acid etch solutions (primarily nitric, sulfuric, hydrofluoric, and chromic acids) generated by the Nuclear Fuel Fabrication process. These acidic solutions were reacted with excess sodium hydroxide before being transported to the 183-H Basins. Metal constituents include copper, silicon, zirconium, nickel, aluminum, chromium, manganese, and uranium, which were in the form of precipitates. Nonroutine wastes consisted of unused chemicals and spent solutions from miscellaneous processes. The waste has been designated an Extremely Hazardous Waste (EHW) because of toxicity, waste code (WT01). The basins also received various nonradioactive waste (listed discarded chemical products), resulting in designation for cyanide (P030), vanadium pentoxide (P120), and formic acid (U123). Additionally, Basin #2 was designated EP Toxic because of the presence of chromium (D007). More detailed descriptions of these wastes and quantities are contained in DOE/RL 88-04, Interim Status Closure/Post-Closure Plan 183-H Solar Evaporation Basins.

Closure Info: The basins were cleaned up in late 1995 with all detectable contamination removed, packed and disposed. Demolition activities were 80% complete as of January 1996. Demolition wastes were disposed of in the adjacent 183-H Clearwells. By the fall of 1996, the basins had been completely demolished. The footprint of the basins was released from radiological posting after 0.6 meters (2 feet) of soil was removed. Chemical contaminants were identified and removed to a maximum depth of 6.1 meters (20 feet). The site was backfilled and revegetated in the spring of 1997.

Clean closure of the site was not achieved due to levels of fluoride and nitrate, remaining in the soil below the excavated 4.6 meter (15 foot), that are above the Method B cleanup levels of the Model Toxics Control Act (MTCA), Washington Administrative Code (WAC) 173-340. Therefore, the unit was closed under the partial closure option with specified remedial measures provided under postclosure care. The modified closure certification was accepted by the State of Washington Department of Ecology on May 13, 1997.

Remedial measures included the placing of a vapor barrier at the bottom of the excavation and replacing the excavated soils with clean, compacted backfill. Postclosure groundwater monitoring will continue at the unit under WAC 175-303-645 final status permit, compliance monitoring program. Corrective actions for the contaminated groundwater attributable to 183-H will be coordinated with remedial actions for the 100-HR-3 operable unit pursuant to CERCLA.

Radiation surveys of the excavation after the rubble was removed was completed on 2/15/96

with a "Radtractor." Four alarms during the survey were checked out with hand-held instruments and verified to be false alarms. Final disposition of the radioactive component of the TSD will be addressed as a separate site through the RCRA Past Practice process.

Code: 126-H-1 **Classification:** Accepted

Names: 126-H-1; 184-H Powerhouse Ash Pit; 188-H Ash Disposal Area **Reclassification:** Rejected (6/25/1998)

Type: Coal Ash Pit **Start Date:** 1/1/1948

Status: Inactive **End Date:** 1/1/1965

Description: The 126-H-1 site is a large ash disposal pit and ash pile. The ash pit is approximately 76.2 meters (250 feet) long, 76.2 meters (250 feet) wide and 3.7 meters (12 feet) deep. The pit is divided into two parts by a 2.4 meter (8 foot) berm that runs east to west. The floor of the ash pit is evenly covered with ash and cinder. Some light vegetation is evident. An ash pile is located just south of the pit. The pile measures approximately 25 meters (82.0 feet) by 60 meters (196.9 feet).

Location: The site is located northwest of the 105-H Reactor and west of the where the 184-H Powerhouse was located.

Process Description: Coal ash from the 184-H powerhouse was mixed with raw river water and sluiced in slurry to the ash pit via a 20 centimeter (8 inch) steel pipeline.

Waste Type: Ash

Waste Description: Unknown amounts of coal ash were sluiced to the pit with raw river water. Ash from other Hanford ash pits has been analyzed using the EP Toxicity Test in accordance with WAC 173-303, and no hazardous materials were found.

Code: 100-K-2 **Classification:** Accepted

Names: 100-K-2; 118-K-2; 118-K-2 Sludge Burial Ground; Burial Area **Reclassification:** Rejected (12/14/2010)

Type: Burial Ground **Start Date:**

Status: Inactive **End Date:**

Description: The site consists of a suspected sludge burial ground. The size of the trench was unknown. Over time, historical documentation has indicated different locations on several sketch type drawings for the burial ground.

Location: The site is located east of the 107-KE Retention Basins, between the 107-KE Retention Basins and the 100-K Perimeter Road.

Process Description: The site is a burial ground that was used to dispose of sludge from the 116-KE-4 (107-KE) and 116-KW-3 (107-KW) Retention Basins.

Related Sites/Structures: The site was related to the 107-KE and 107-KW Retention Basins.

Waste Type: Sludge

Waste Description: The site is described as having received sludge from the retention basins (107-KE and 107-KW). Although an exact inventory for this sludge trench is not available, it is analogous to the 107-B retention basin sludge trench (116-B-14). Characterization done at the 107-B trench in 1978 found an average concentration of plutonium of 0.7 picocuries per gram and an average

beta/gamma concentration of 240 picocuries per gram. The expected radionuclides include europium-155, cobalt-60, cesium-137, strontium-90 and nickel-63.

Note: DOE/RL-94-61 Appendix K (Draft A), mistakenly lists the average plutonium concentration for the 107-B Sludge Trench (116-B-14) as 0.7 curies per gram. The original report for this sampling activity lists the value as 0.7 picocuries per gram (see UNI-946, page 2-36).

Code:	100-K-7	Classification:	Not Accepted
Names:	100-K-7; 165-KE Ethylene Glycol Tanks; 165-KE-E and 165-KE-W	Reclassification:	None
Type:	Storage Tank	Start Date:	1/1/1955
Status:	Inactive	End Date:	1/1/1971
Description:	The site was two carbon steel underground (positioned horizontally) ethylene glycol storage tanks. One tank contained pure ethylene glycol and the other tank contained a mixture of water and ethylene glycol. The tanks supplied mixed and pure ethylene glycol for injection into process water pipelines to prevent freezing during cold periods. A pair of 10 centimeters (4 inches) fill pipelines led to a street box that contained a 10 centimeters (4 inches) cap. The street box was used for making a connection to railroad tank cars. The street box was just off the edge of a railroad spur. Today, the site is gravel covered and no evidence of the site remains.		
Location:	The unit was located directly north of the 165-KE Building, adjacent to the 165-KE Building, and west of the personnel entry door.		
Related Sites/Structures:	The site was related to the 165-KE Building, the 116-KE-5 (150-KE Heat Recovery Station), and process pipelines.		
Waste Type:	Chemicals		
Waste Description:	The waste was tanks that contained ethylene glycol.		

Code:	100-K-8	Classification:	Not Accepted
Names:	100-K-8; 165-KW Ethylene Glycol Tanks; 165-KW-E and 165-KW-W	Reclassification:	None
Type:	Storage Tank	Start Date:	1/1/1955
Status:	Inactive	End Date:	1/1/1970
Description:	The site was two carbon steel underground (positioned horizontally) ethylene glycol storage tanks. One tank contained pure ethylene glycol and the other tank contained a mixture of water and ethylene glycol. The tanks supplied mixed and pure ethylene glycol for injection into process water pipelines to prevent freezing during cold periods. A pair of 10 centimeters (4 inches) fill pipelines led to a street box that contained a 10 centimeters (4 inches) cap. The street box was used for making a connection to railroad tank cars. The street box was just off the edge of a railroad spur. All piping associated with these tanks utilized welded joints with threaded couplings at the top of each tank. The pipelines related to these tanks were: (1) suction line -- 2.54 centimeters (1 inch) outside diameter by 6.1 meters (20 feet) to the building; (2) -- 10.2 centimeters (4 inches) outside diameter by 6.1 meters (20 feet) to the building (165-KW-E [east] tank only); (3) vent line -- 10.2 centimeters (4 inches) outside diameter by 9.1 meters (30 feet) (including the above ground components); (4) fill connection and street box -- 10.2 centimeters (4 inches) outside diameter by 4.6 meters (15 feet) long (empty during normal operation); (5) cross tie line -- 10.2 centimeters (4 inches) by 3.05 meters (10 feet) long (empty		

during normal operation). Today, the site is gravel covered and no evidence of the site remains.

Location: The unit was located 3.05 meters (10 feet) north of the 165-KW Building and west of the personnel entry door.

Related Sites/ Structures: The site was related to 165-KW Building, 116-KW-4 (150-KW Heat Recovery Station) and process pipelines.

Waste Type: Chemicals

Waste Description: The waste was tanks that contained Ethylene glycol. The tanks had been rinsed and flushed during the shut down of the 105-KW Reactor and did not contain any fluid.

Code: 100-K-9 **Classification:** Not Accepted

Names: 100-K-9; 104-K Dry Well; 118-KE-2 French Drain (North) **Reclassification:** None

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is the northernmost of two french drains at the 118-KE-2. The french drain is a 0.6 meters (2 feet) diameter steel pipe with a steel cover. It is gravel filled to grade and surrounded by a yellow wooden barricade. The steel cover is posted with a confined space sign. The adjacent area is covered with gravel and cobbles. Each side of the 118-KE-2 Horizontal Control Rod Cave floor was sloped towards a drain. The drain was designed to receive rainwater that percolated through the earth berm covering the Rod Cave. The drains helped minimize water pooling between the two semicircular steel cave sections which are anchored and grouted to the concrete floor. Drainage is routed to each of the french drains via 7.6 centimeter (3 inch) drain pipelines.

Location: The site is located 3.5 meters (11.5 feet) from the northwest side of the 118-KE-2, 105-KE Horizontal Control Rod Storage Cave.

Related Sites/ Structures: The site is related to the 118-KE-2, 105-KE Horizontal Control Rod Storage Cave (118-KE-2 Thimble Cave).

Waste Type: Stormwater Runoff

Waste Description: The inlet to this french drain is between the two semi-circular steel pipes. It received stormwater that percolated down through the earth berm covering the caves.

Code: 100-K-10 **Classification:** Not Accepted

Names: 100-K-10; 104-K Dry Well; 118-KE-2 French Drain (South) **Reclassification:** None

Type: French Drain **Start Date:** 1/1/1953

Status: Inactive **End Date:**

Description: The site is the southernmost of two french drains at the 118-KE-2. The french drain is a 0.6 meters (2 feet) diameter steel pipe with a steel cover. It is gravel filled to grade and surrounded by a yellow wooden barricade. The steel cover is posted with a confined space sign. The adjacent area is covered with gravel and cobbles. Each side of the 118-KE-2 Horizontal Control Rod Cave floor was sloped towards a drain. The drain was designed to receive rainwater that percolated through the earth berm covering the Rod Cave. The drains helped minimize water pooling between the two semicircular steel cave sections which are anchored and grouted to the concrete floor. Drainage is routed to each of the french drains via 3 in (7.6 cm) drain pipelines.

Location: The site is located 3.5 meters (11.5 feet) from the northwest side of the 118-KE-2, 105-KE

Location: Horizontal Control Rod Storage Cave.

Related Sites/ Structures: The site is related to the 118-KE-2, 105-KE Horizontal Control Rod Storage Cave (118-KE-2 Thimble Cave).

Waste Type: Stormwater Runoff

Waste Description: The inlet to this french drain is between the two semi-circular steel pipes. It received stormwater that percolated down through the earth berm covering the caves.

Code: 100-K-11 **Classification:** Not Accepted

Names: 100-K-11; 104-K Dry Well; 118-KW-2 French Drain (North) **Reclassification:** None

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is the northernmost of two french drains at the 118-KW-2. The french drain is a 0.6 meters (2 feet) diameter steel pipe with a steel cover. It is gravel filled to grade and surrounded by a yellow wooden barricade. The steel cover is posted with a confined space sign. The adjacent area is covered with gravel and cobbles. Each side of the 118-KW-2 Horizontal Control Rod Cave floor was sloped towards a drain. The drain was designed to receive rainwater that percolated through the earth berm covering the Rod Cave. The drains helped minimize water pooling between the two semicircular steel cave sections which are anchored and grouted to the concrete floor. Drainage is routed to each of the french drains via 3 in (7.6 cm) drain pipelines.

Location: The site is located on the northwest side of the 118-KW-2, 105-KW Horizontal Control Rod Storage Cave.

Related Sites/ Structures: The site is related to the 118-KW-2, 105-KE Horizontal Control Rod Storage Cave (118-KW-2 Thimble Cave).

Code: 100-K-15

Classification: Not Accepted

Names: 100-K-15; 183-KW Liquid Alum Storage Tank
(West)

Reclassification: None

Type: Storage Tank

Start Date:

Status: Inactive

End Date:

Description: The site is an above-ground vertical stainless-steel storage tank mounted on a concrete base. The tank was part of a system called, The Liquid Alum System, that supplied liquid alum for water treatment. The liquid was supplied either by rail car or tank truck, as both connections are shown on the Liquid Alum System diagram in HW-24800-103. The piping and instrument identification diagram, H-1-16552, shows the pipelines, valves, and instrumentation related to the tank. During the winter, the liquid alum was pumped through heat exchangers for purpose of heating and agitating the chemicals.

Location: The site is the western-most of two alum storage tanks located approximately 15.2 meters (50 feet) from the southwest corner of the 183-KW Head House and 10.7 meters (35 feet) south of the 183-KW Chlorine Vault.

**Process
Description:** Alum was used as a coagulant in water treatment. During the season of high water turbidity, activated silica was added as an aid in coagulation. Alum was fed from the storage tank and proportioned directly into the raw water line. The proportioning pump was paced by the flow of raw water in its 91-centimeter (36-inch) raw water line and fed at 30 parts per million (ppm) at a maximum flow rate of 121,000 liters per minute (32,000 gallons per minute).

**Related Sites/
Structures:** The tank was associated with the 183-KW Head House. The 183-KW Head House was the water quality center for the entire water treatment plant. In it were the facilities for metering raw water, for chemical injection into raw, filtered, and process water, and for effluent and influent control throughout the filter plant.

Code: 100-K-20	Classification: Not Accepted
Names: 100-K-20; 183-KW Sodium Silicate Storage Tank (West)	Reclassification: None
Type: Foundation	Start Date: 1/1/1955
Status: Inactive	End Date: 1/1/1964

Description: The site was the western-most of the above-ground vertical tanks that were used to store liquid sodium silicate. Initially, tank trucks supplied the chemical for the tanks. Estimating from procurement and construction drawings for the bauxite tank (Project CAI 105), the sodium silicate tanks were removed in 1964 or 1965. Following removal, the bagged dry powder form of the chemical was used. The grade-level concrete base remained following removal of the tanks. The west tank base (Sodium Silicate Tank #1) is occupied by a bauxite storage tower (silo) and transfer system.

Location: The site is the western-most of two sodium silicate storage tanks that were located southeast of the 183-KW Head House and adjacent to the sulfuric acid tanks. The western-most tank was 10.7 meters (35 feet) southeast of the 183-KW Head House.

Process Description: During the seasons of high water turbidity, activated silica solution was fed into the raw water as an aid in coagulation. The silica was activated by sulfuric acid and prepared in two open-top, flat-bottom cylindrical steel mixing tanks. Each tank was 3.5 meters (11.5 feet) in diameter and 3.35 meters (11 feet) high, and was capable of mixing a batch to supply one-half of the plant for three hours at maximum rate. The batch cycle was completely automatic and electrically controlled, with sequence operation initiated by float level. Components (sodium silicate, sulfuric acid and water), of the activated silica were measured by displacement type meters and quantities were controlled by impulse counters. After batching, the activated silica was transferred to one of four steel tanks provided within the building for storing the solution. Each tank was sized to supply one-half of the plant for five hours at maximum flow and maximum parts per million. From the storage tanks the activated silica was pumped through metering orifices before injection into the raw water stream. The quantity of activated silica injected was regulated by a control valve whose operation was calibrated so that the metered quantity was in proportion to raw water flow. HW-24800-103, Vol 2, Page 137 shows the process flow for the sodium silicate system.

Related Sites/Structures: The site was related to the 183-KW Head House.

Waste Type: Chemicals

Waste Description: The unit stored sodium silicate. While the tanks were in use, the sodium silicate was purchased and stored in liquid form.

Waste Type: Chemicals

Waste Description: The unit stored sodium silicate. While the tanks were in use, the sodium silicate was purchased and stored in liquid form.

Code: 100-K-24

Classification: Not Accepted

Names: 100-K-24; 183-KW Bauxite Tank

Reclassification: None

Type: Storage Tank

Start Date: 1/1/1966

Status: Inactive

End Date: 1/1/1972

Description: The site is a single bauxite (aluminum oxide) above-ground storage tank (silo). The addition of the tank was part of a proposal to reduce water treatment costs by approximately \$278,000 per year in the 183-KE and KW Buildings. Hanford document, HW-76926, is the engineering study that proposed replacing the existing liquid alum coagulant feed process with one which fed bauxite and sulfuric acid. The tank was constructed on the site of the former Sodium Silicate #1 Tank. The tank had a capacity of 109,000 kilograms (240,000 pounds). One of the unused solution tanks, 45,400 kilograms (100,000 pounds) in capacity in the 183 Building (KE and KW) was converted to a bauxite feed bin. The feed bin was vented and equipped with a bag filter. The two silos (KE and KW) and the feed bin together provided approximately 33 days storage capacity. Other components of the system are listed below. A pneumatic conveying system was provided that was equipped with cyclone separators to transfer bauxite from hopper cars or boxcars to the outside silos and from either silo to the feed bin inside the building. The bauxite was transferred intermittently from the silos to the feed bin and did not interfere with any rail car unloading. The system was sized to unload a rail car in a single work shift. Two dry feeders, including one spare, moved bauxite from the feed bin to a slurry mix tank. The spare feeder was included to eliminate the need to prepare slurry manually on a batch basis during maintenance shutdown of the other feeder. A mix tank, with agitator, for slurring bauxite and water was a component of the system. Two pumps in parallel were used to transfer the slurry to reaction vessels. Two parallel systems, each consisting of a glass-lined reaction vessel, with glass-lined pipe tie-ins; an eductor which took suction from the reaction vessel, adding dilution water; and a pump, in series with the eductor, discharged through the chlorine injection piping to the raw water headers. Glass-lined pipe was used between the reaction vessel and eductor, and plastic pipe between the eductors and injection piping. Acid was supplied to the reaction vessel, where it was mixed with the bauxite slurry by steam sparging, from an existing head tank by gravity feed. An exhaust system included a water scrubber to remove steam, air, and acid fumes from the reaction vessels.

Location: The unit is located 11.6 meters (38 feet) southeast of the 183-KW Head House and on the northwest portion of the original Sodium Silicate Tank concrete base.

Process Description: The bauxite (hydrous aluminum oxide) in combination with sulfuric acid was used as a coagulant in the water treatment process. Mixing of the chemicals, water and sediment caused a

gelatin-like flake (floc) to form. The water with the floc flowed from the Head House to the Sedimentation Basins where the flocs allowed to settle.

Related Sites/ Structures: The site was related to the 183-KW, (183.2) Flocculation and Sedimentation Basins and the (183.1) Head House.

Waste Type: Chemicals

Waste Description: The tank was used to store dry bauxite (hydrous aluminum oxide or hydroxides with various impurities). The tank appears to have been emptied, although dry powder can be seen through the plexiglass cover indicating that no additional cleanup was performed. Bauxite is not listed in 40 CFR 302.4 as a hazardous substance and is not a CERCLA pollutant. No dangerous wastes or CERCLA hazardous substances, pollutants, or contaminants were stored or disposed of at this site.

Code: 100-K-39

Classification: Not Accepted

Names: 100-K-39; 118-K-3 Filter Crib

Reclassification: None

Type: Crib

Start Date:

Status: Inactive

End Date:

Description: The site was reported to be a crib. The first reference to a site identified as 118-K-3 Filter Crib was DOE/RL-90-20 (1992). In this document, it states that the site was used to dispose of demineralizer, and research and development waste from the 1706-KE Building. A sketch, Figure 5-1. Proposed Boring Locations at 100-KR-1 Operable Unit High Priority Liquid Waste Facilities, shows a site labeled 118-K-3 Filter Crib between and south of the retention basins. The area where this site is mapped is the identical location of a fenced electrical distribution intertie that connects electrical service between 100K East and 100K West. WHC-SD-EN-TI-239, 100-K Area Technical Baseline Report states that the crib could not be located during field investigations for the report. Further, it says that a fenced, high-voltage power distribution system is located at the site described by DOE/RL-90-20. The document continues with the crib received liquid wastes from the 1705KE/KER Laboratory. Discussions with present and former site employees, and investigations using Hanford Drawings (H-1-20305, H-1-23215, and H-1-24226), indicate that all cribbed wastes from the 1706-KE/KER facilities were disposed in the 116-KE-2 Crib. The initial Waste Information Data System (WIDS) entry for this site was not done until 1994. The information contained on the data entry form (A-6000-501) was based on WHC-SD-SD-TI-239. It was also recommended that the site not be entered as a waste site due to the uncertainty of the site's existence. A field visit by WIDS personnel was performed on August 16, 1994. There was no evidence of a waste site at the prescribed location.

Location: The 118-K-3 Filter Crib was purported to be located between the 116-KW-3 and 116-KE-4 Retention Basins.

Related Sites/ Structures: According to DOE/RL-90-20 the site was related to the 1706-KE Building. According to Waste Information Data System (WIDS) 1994 Data Entry Form (A-6000-501) signed by the operable unit manager, the site was related to the 1705KE/KER Laboratory.

Cooling Water Effluent Underground Pipelines (See Subsites) (100-K-56), Glycol pipelines (100-K-53), or the 1904-K Process Sewer lines (100-K-47). The two raw water lines that run between the 181-KE Pumphouse and the 165-KE Control House are constructed of 152-centimeter (60-inch) diameter steel pipe with 1.3-centimeter (0.5-inch) thick walls.

Location: The site includes pipelines located between the 181-KE Pumphouse and the 165-KE Control House. Other lines included in this site are located between sections of the water treatment facility and between the 165-KE Control House and the 105-KE Reactor.

Process Description: Water from the Columbia River was extensively treated before passing through the reactors. Treatment included settling, chemical treatment, filtering, and pH management to purify and prepare the water. Water flowrate to the 105-KE Reactor was in excess of 380,000 liters (100,000 gallons) per minute. After system upgrades in 1962, the flowrate was as high as 760,000 liters (200,000 gallons) per minute.

Related Sites/ Structures: Related structures include the 181-KE River Pumphouse, the 165-KE Control House, 183.1-KE Headhouse, the 183.2-KE Basins, the 183.3-KE Filters, the 183.4-KE Clearwells, and the 190-KE Process Water Pumphouse.

Waste Type: Water

Waste Description: The pipelines included carried raw, sanitary, and fire water throughout the 100-KE Area.

End Date:

Description: The site consists of the upstream (pre-reactor) pipelines that carried raw river water from the 181-KW Pumphouse to the KW water treatment facilities and carried sanitary and fire water to various facilities. The site includes all water lines that connected the different sections of the water treatment plant, except for the sulfuric acid and sodium dichromate pipelines on the south side of the water treatment plant, and the treated water pipelines running from the 165-KW Building to the 105-KW Reactor (WIDS site 100-K-79). It includes the sanitary water pipelines connecting the 165 KE and KW Control Houses (to a point half-way between them) and the sanitary water pipeline connecting the 183 KE and KW Head Houses (to a point half-way between them). The site does not include the reactor cooling lines (100-K-55), the 1904-K Process Sewer lines (100-K-60 and 100-K-47), or the Glycol Heat Recovery pipelines (100-K-54). The two raw water lines that run between the 181-KW Pumphouse and the 165-KW Control House are constructed of 152-centimeter (60-inch) diameter steel pipe with 1.3-centimeter (0.5-inch) thick walls.

Location: The site includes pipelines located between the 181-KW Pumphouse and the 165-KW Control House. Other lines included in this site are located between sections of the water treatment facility and between the 165-KW Control House and the 105-KW Reactor.

Process Description: Water from the Columbia River was extensively treated before passing through the reactors. Treatment included settling, chemical treatment, filtering, and pH management to purify and prepare the water. Water flowing to the 105-KW Reactor was in excess of 380,000 liters (100,000 gallons) per minute. After system upgrades in 1962, the flow rate was as high as 760,000 liters (200,000 gallons) per minute.

Related Sites/ Structures: Related structures include the 181-KW River Pumphouse, the 165-KW Control House, 183.1-

Structures: KW Headhouse, the 183.2-KW Basins, the 183.3-KW Filters, the 183.4-KW Clearwells, and the 190-KW Process Water Pumphouse.

Waste Type: Water

Waste Description: The pipelines included carried raw, sanitary, and fire water throughout the 100-KE Area.

Code: 100-K-76

Classification: Not Accepted

Names: 100-K-76; 105-KW Unplanned Release
Discovered Near 130-KW-1 Emergency Diesel Tank

Reclassification: None

Type: Unplanned Release

Start Date: 1/1/1992

Status: Inactive

End Date:

Description: This site is a duplicate of 130-KW-1. The site is the location of two removed underground diesel storage tanks. The "unplanned release" is the radiation contamination detected when the tanks were excavated. The excavated tank site has been backfilled with uncontaminated soil to grade and covered with gravel. There is no separate radiological posting. However, the 100-KE/KW Reactor Areas are posted Underground Radioactive Material on the perimeter fences.

Location: The site is located in the 100-K Area, on the east side of the 105-KW Reactor Building and adjacent to the reactor exhaust stack. The underground diesel tanks were located between the stack and the 119-KW Building. Although the location description states the diesel tanks were located between the 105-KW exhaust stack and the 119-KW building, a sign is erroneously posted at the northwest corner of the 115 KW building that reads "130-KW-1 Diesel Tanks" This is further east and south of the reactor stack. There is no visual evidence that the tanks had been in either location.

Release Description: During the tank excavation, the site was found to be radioactively contaminated to a maximum of 400 counts per minute. The source and the extent of the contamination is unknown.

Related Sites/Structures: The site is a duplicate of 130-KW-1.

Waste Type: Soil

Waste Description: The site contains radioactively contaminated soil.

The Site Was Consolidated With:

Code: 130-KW-1

Names: 130-KW-1; 130-KW-1A/130-KW-1B Tanks; 105-KW Emergency Diesel Fuel Tank; 105-KW Emergency Diesel Oil Storage Tank

Code: 126-K-1

Classification: Accepted

Names: 126-K-1; 100-K Gravel Pit

Reclassification: Rejected (4/29/2009)

Type: Inert/Demolition Landfill

Start Date: 1/1/1975

Status: Active

End Date:

Description: The site has been reclassified to rejected. The debris disposed was of an inert/demolition type not regulated under CERCLA. This unit is a gravel borrow pit that resulted from 100-K Area construction. The slope of the southwest corner contains demolition waste. This area is covered with pit run backfill material. The bottom contains one layer approximately 1.5-meter

(5-foot) thick of demolition and inert waste covered with approximately 0.3 meters (1 foot) of pit run backfill material. Approximately 80% of this unit is unused.

Location: The western perimeter of this unit is located approximately 191 meters (625 feet) east of the 100-K Area's east perimeter fence and borders the eastern perimeter of the 118-K-1 Burial Ground.

Waste Type: Demolition and Inert Waste

Waste Description: The unit contains demolition and inert waste from the 100-K Area, the Near Surface Test Facility (NSTF) at Gable Mountain, and the Exploratory Shaft (ES) Site. Waste consists primarily of concrete, wood, steel pipe, structural steel, conduit, and wire.

Code: 130-K-1

Classification: Not Accepted

Names: 130-K-1; 1717-K Gasoline Storage Tank

Reclassification: None

Type: Storage Tank

Start Date: 1/1/1955

Status: Inactive

End Date: 1/1/1972

Description: The site was an underground gasoline storage tank oriented with the long axis of the tank in an east-west direction. A 6.4 centimeters (2.5 inches) pipeline connected the tank to the building. The tank was emptied and rinsed with water when the facilities were deactivated in 1971. The concrete pad over the top of the tanks was removed in July, 1989. This allowed Pacific Northwest Laboratories to return to the tank site and perform Underground Penetrating Radar (UPR) to aid in locating the tank without the interference caused by the rebar in the concrete. The tank was excavated in July 1989. The soil around where the tanks had been located was sampled, the results analyzed, and the site backfilled to match the surrounding grade.

Location: The site was located approximately 3.7 meters (12 feet) north of the 1717-K, Maintenance and Transportation Service Building and 10.7 meters (35 feet) from the northwest corner of this building.

Related Sites/ Structures: The site was related to the 1717-K, Maintenance and Transportation Service Building.

Waste Type: Oil

Waste Description: The unit was used for storage of gasoline (product).

Code: 130-K-3

Classification: Not Accepted

Names: 130-K-3; 130-K-3A and 130-K-3B; 182-K
Emergency Diesel Oil Storage Tank

Reclassification: None

Type: Storage Tank

Start Date: 1/1/1961

Status: Inactive

End Date: 1/1/1970

Description: The unit consisted of two steel underground diesel oil storage tanks. The tanks were used to supply diesel fuel to three engines located within the 182-K (Emergency Water Pump House). The engines ran emergency pumps used to provide backup cooling water for the 105-KE and 105-KW Reactors. The tanks were covered by a bermed mound of soil with the top of the mound 1.5 meters (5 feet) above grade level. The top of each tank was 1.2 meters (3.5 feet) above grade and covered by 0.46 meters (1.5 feet) of the soil berm. A 0.7 meters (2 feet) diameter manway (0.64 centimeters [0.25 inches] thick bolted steel plate cover) was located in the center of each tank. All piping associated with the tanks utilized welded joints with no threaded couplings. The piping and conduit associated with each tank was: 3 fuel oil pipelines -- 3.2 centimeters (1.25 inches) outside diameter by 3.7 meters approximately (12

feet) to the building; 1 fuel oil return pipeline -- 0.64 centimeters (3 inches) outside diameter by approximately 4.6 meters (15 feet) to the building (empty during normal operation); 1 centrifuge fuel oil pipeline -- 3.2 centimeters (1.25 inches) outside diameter by approximately 9.1 meters (30 feet) to the building; 1 vent pipeline -- 0.64 centimeters (3 inches) outside diameter by approximately 6.1 meters (20 feet) (including above ground components); 1 vertical fill pipeline connection -- 10.2 centimeters (4 inches) outside diameter by 15.2 centimeters (6 inches) tall (empty during normal operation); 1 fuel oil cross tie pipeline -- 7.6 centimeters (3 inches) outside diameter by approximately 3.05 meters (10 feet) long (empty during normal operation); 1 fuel level indicator conduit -- electrical and did not contain product. There was no history of repairs made to these tanks. In about 1970, the tanks were pumped empty of product and abandoned. The tanks were excavated on April 13, 1993 following the Site Assessment Process. The soil around where the tanks had been located was sampled, the results analyzed, and the site was backfilled to match the surrounding grade.

Location: The tanks were located (5 feet) north of the north wall of the 182-K, Emergency Water Pump House. They were 1.5 meters (5 feet) apart.

Release Description: Prior to the removal of these tanks, there were no known leaks (unplanned releases) associated with the them.

Related Sites/ Structures: The site was related to the 182-K Emergency Water Pump House (Coolant Backup System).

Waste Type: Oil

Waste Description: The two tanks were used for storage of diesel oil (product).

Code: 1607-K4	Classification: Accepted
Names: 1607-K4; 1607-K4 Sanitary Sewer System; 1607-K4 Septic Tank; 1607-K4 Septic Tank and Associated Drain Field; 124-K-2	Reclassification: Closed Out (3/5/2001)
Type: Septic Tank	Start Date: 1/1/1955
Status: Inactive	End Date:

Description: The sanitary sewer system is composed of a septic tank, two leaching trenches and associated piping. The septic tank and dosing chamber are composed of reinforced concrete per Hanford Standard E-5-11. There is a maximum of 1.5 meters (5 feet) of fill on the cover slab. There are 149 meters (150 + 238 + 102 feet) of 20 centimeter (8 inches) vitrified clay pipe to the septic tank, followed by 6.1 meters (20 feet) of 15 centimeter (6 inches) vitrified clay pipe to the larger leaching trench. There are an additional 68 meters (122 + 102 feet) of 15 centimeter (6 inches) of vitrified pipe connecting 1717-K to the system. The leaching trench contains 128 meters (420 feet) of 15 centimeters (6 inches) vitrified clay pipe laid with open joints. The second leaching trench is connected directly to the system piping with 6.1 meters (20 feet) of vitrified piping. The piping within the leach trench is a single 9.1 meters (30 feet) of vitrified piping.

Location: The system is north and northeast of 1704-K and 1717-K buildings

Related Sites/ Structures: The system serviced 1704-K (Offices) and 1717-K (Maintenance Shop) buildings.

Waste Type: Sanitary Sewage

Waste Description: This unit received sanitary sewage from the 1704-K Office Building and the 1717-K

Description: Maintenance Shop.

Closure Info: The septic system was abandoned in 1999 per the requirements of Washington Administrative

Code 246-272-1851. All septage inside the tank was removed and the empty tank was filled to eliminate void spaces. The septic system lids were left in place, in accordance with an agreement with the Washington Department of Health.

Code:	126-KE-3	Classification:	Not Accepted
Names:	126-KE-3; 183-KE Liquid Alum Storage Tank #1	Reclassification:	None
Type:	Storage Tank	Start Date:	1/1/1955
Status:	Inactive	End Date:	1/1/1997
Description:	The site is an above ground vertical stainless steel storage tank mounted on a concrete base. The tank was part of a system called the Liquid Alum System that supplied liquid alum for water treatment. The liquid was supplied either by rail car or tank truck, as both connections are shown on the Liquid Alum System diagram in HW-24800-103. The piping and instrument identification diagram, H-1-16552, shows the pipelines, valves, and instrumentation related to the tank.		
Location:	The site is the eastern-most of two alum storage tanks located approximately 10.7 meters (35 feet) south of the southwest corner of the 183-KE Head House and 10.7 meters (35 feet) south of the 183-KE Chlorine Vault.		
Process Description:	Alum was used as a coagulant in water treatment. During the season of water high turbidity activated silica was added to aid in coagulation. Alum was fed from the storage tank and proportioned directly into the raw water line. The proportioning pump was paced by the flow of raw water in its 91-centimeter (36-inch) raw water pipeline and fed at 30 parts per million (ppm) at a maximum flow rate of 121,000 liters/minute (32,000 gallons/minute). During the winter, the liquid alum was pumped through heat exchangers for purpose of heating and agitating the chemicals.		
Related Sites/ Structures:	The tank was associated with the 183-KE Head House. The head house was the water quality center for the entire water treatment plant. In it were the facilities for metering raw water, for chemical injection into raw, filtered, and process water, and for effluent and influent control throughout the filter plant.		
Waste Type:	Chemicals		
Waste Description:	The unit was used for storage of liquid alum (aluminum sulfate). Material Safety Data Sheet (MSDS) #040407 lists aluminum sulfate as an EPA hazardous substance. It is believed that this tank has been cleaned out.		

Code:	100-N-7	Classification:	Not Accepted
Names:	100-N-7; 182-N Facility Liquid Unplanned Release (Remediated)	Reclassification:	None
Type:	Unplanned Release	Start Date:	1/1/1987
Status:	Inactive	End Date:	1/1/1987
Description:	The release site consists of a concrete flume on the river bank that extends into the river. The release at this site was approximately 19 liters (5 gallon) of oil that was mixed with a continuous permitted water discharge. The oil was dispersed into the river with the rest of the permitted discharge from the flume. The flume is currently dry and there is no evidence of the release.		
Location:	The site is located on the Columbia River upstream of the 181-N Building, and extends from the 182-N Tank Farm into the river.		
Release	On February 6, 1987, approximately 19 liters (5 gallons) of turbine oil was discharged to the		

Release Description: Columbia River through the 182N tank farm raw water return line. A small (pin hole size) leak in a lube oil line in the No. 2 drive turbine allowed oil to enter the secondary steam system. Steam condensate from this system returns to the 100-N steam condensate system that drains to the river. The leak in the lube line was repaired.

Related Sites/ Structures: This site is related to the 182-N Tank Farm Overflow Outfall (NPDES Permit Outfall #005).

Waste Type: Oil

Waste Description:

Code: 100-N-8

Classification: Accepted

Names: 100-N-8; 108-N CUF; 108-N Facility

Reclassification: Rejected (9/11/2000)

Type: Loading Dock

Start Date: 1/1/1963

Status: Inactive

End Date: 1/1/1990

Description: The 108-N Chemical Unloading Facility (CUF) was designed to remove liquids from railroad cars. The 108-N Building, metal structure used to offload chemicals, tank foundations, and tank pit are part of this site and remain at the location. The ground surface around these facilities is graveled.

Location: The 108-N CUF is located within the 100-N Exclusion Area perimeter fence near the southeast corner, and east of the 116-N-8<90-day storage

Process Description: The unit was used for offloading, storage and transfer of 93% sulfuric acid and 50% sodium hydroxide solutions received by railroad car or tank truck. The 120-N-7 Unloading Station french drain was used for containment of small releases from the overhead transfer boom during offloading from railcar or truck. The facility had three 38,000 liter (10,000 gallon) above ground steel sulfuric acid tanks and one 290,000 liter (76,800 gallon) sodium hydroxide tank. Adjacent to the sulfuric acid tanks are five 120-N-6 sulfuric acid french drains where tank overflows were vented. The french drains are 0.6 meter (2 feet) in diameter and consist of a clay pipe packed with lime. The acid transfer system used a 3,800 liter (1,000 gallon) steel transfer tank located in a pit west of the 108-N Building. The tank filled with acid via gravity flow from the storage tanks. Air pressure was used to transfer acid by way of piping through the trench to the 163-N Day Tank. There are no french drains associated with the sodium hydroxide tank. Transfer pumps in the 108-N Building transferred the sodium hydroxide directly to the 163-N Day Tank from the storage tank.

Related Sites/ Structures: The 120-N-5 Acid/Caustic Transfer Trench and Neutralization Unit, the 120-N-6 Sulfuric Acid Tank french drains, and the 120-N-7 Unloading Station french drain are associated with the unit.

Waste Type: Chemicals

Waste Description: The site received 93% sulfuric acid, and 50% sodium hydroxide solutions.

Code: 100-N-9

Classification: Accepted

Names: 100-N-9; 120-N-5 Facility Liquid Unplanned Release 1 (08/07/87)

Reclassification: Rejected (9/11/2000)

Type: Unplanned Release

Start Date: 1/1/1987

Status: Inactive

End Date: 1/1/1987

Release Description: during a transfer from the 108-N Storage Tank to the 163-N Facility. On December 4, 1987, it was noticed that the trench was open to the soil at the location where the leak occurred. This open area was found to be a dry well installed in 1986 during upgrading of the trench. The dry well was installed for steam trap drainage, not for containment of acid spills. An estimated 57 to 114 liters (15 to 30 gallons) of sulfuric acid was released to the ground.

Related Sites/ Structures: The 120-N-5 Transfer Trench is associated with the release.

Waste Type: Chemical Release

Waste Description: The site received an estimated 57 to 114 liters (15 to 30 gallons) of sulfuric acid.

Code: 100-N-12 **Classification:** Not Accepted

Names: 100-N-12; 166-N / 184-N Pipelines Liquid Unplanned Release 1 (10/14/87 Cleaned Up) **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1987

Status: Inactive **End Date:** 1/1/1987

Description: The site is a leak of fuel oil found contained in a drain trench, inside the 184-N Facility. The oil was absorbed and the trench cleaned up immediately. The Auxiliary Operations Supervisor for N-Reactor at the time, Joe Zoric, said the spill did not reach the drain at the far end of the trench.

Location: The spill occurred inside the 184-N Building and accumulated in a drain trench.

Release Description: This spill was included in the 100-NR-1 Work Plan (DOE/RL-90-22 Draft E) and the 100-N Technical Baseline Report (WHC-SD-EN-TI-251). The work plan says "an unknown amount of fuel oil leaked from a loose pipe fitting at the 184-N Annex. Oil was being transferred from the day tank to the No. 2 Boiler. The oil was contained in the 184-N Annex drain trench and cleaned up. As part of the WIDS site investigation in 1994, an interview was conducted with Joe Zoric, who was a former Auxiliary Operations Supervisor and remembered this particular spill. Joe said it was a very small spill contained within the trench and did not reach the drain at the far end of the trench. According to Fact Sheet No. 100N-87-95 the spill was cleaned up, and the probable cause listed as: "The most likely cause is the coupling was loosened to perform work on the transmitter, and upon recognizing that the transmitter was not isolated, an attempt was made to retighten the coupling." The spill date was October 14, 1987.

Related Sites/ Structures: The spill occurred in the 184-N annex building.

Waste Type: Oil

Waste Description:

Code: 100-N-19 **Classification:** Accepted

Names: 100-N-19; HGP Construction Debris Dump Solid Waste Site; SWMU #11 **Reclassification:** Rejected (6/30/2004)

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site is a large area consisting of a series of pits and depressions containing soil, rock, concrete, metal, wood, and asphalt that have been dumped in the area over time. The site is

relatively long [more than 1000 meters (3000 feet) long] and narrow [about 150 meters (500 feet) wide] in shape.

Location: The Hanford Generating Plant (HGP) Construction Debris Dump is located south and east of the Bonneville Power Administration (BPA) Hanford Substation along a dirt road.

Process Description: The site was used to dispose of non hazardous construction debris from 100-N and the Hanford Generating Plant.

Related Sites/ Structures: The site is associated with 600-32 and 100-N-39 which are duplicate codes for the same site, a dumping area contained within the larger 100-N-19 Dumping Area.

Waste Type: Construction Debris

Waste Description: The site contains mounds of soil, rock, concrete, metal, wood, and asphalt that have been dumped in the area..

Code: 100-N-21 **Classification:** Accepted

Names: 100-N-21; 1143-N Blast Yard; Blast Yard Solid Waste Site **Reclassification:** Rejected (9/11/2000)

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The area has thin, scattered patches of red garnet sandblasting material. Paint chips, reported in 1994 as being mixed in with the garnet (Cote 1994), are no longer visible. The site is in use as a parking lot.

Location: The site is located in the southeast portion of the 100-N Area, southwest of MO-535 and MO-229 and east-southeast of the 1143-N Paint Shop.

Process Description: The garnet was used to sandblast non-contaminated equipment prior to painting.

Related Sites/ Structures: The 1143-N Paint Shop is related to this site.

Waste Type: Soil

Waste Description: The area has scattered patches of red garnet sandblasting material.

Code: 100-N-27 **Classification:** Accepted

Names: 100-N-27; 108-N Neutralization Pit; 108-N Sump **Reclassification:** Rejected (9/11/2000)

Type: Sump **Start Date:** 1/1/1963

Status: Inactive **End Date:** 1/1/1990

Description: The acid neutralization pit is constructed of concrete with a brick lining, and is covered with a steel lid.

Location: The unit is located west of the 108-N Building.

Release Description: No known leaks occurred in the system.

Process Description: The pit was used to manually neutralize waste acid. This site received drainage from the 108-N floor drains and from the acid transfer tank. The neutralized waste was sent via a water jet pump to the 183-N facility where it was then discharged to the river through the 260 centimeter

(102 inch) outfall line. Sufficient quantities of 50% sodium hydroxide were used to neutralize the 93% sulfuric acid waste. The brick lining was replaced at least once.

Related Sites/ Structures: This facility received drainage from the 108-N floor drains and from the acid transfer tank. Neutralized waste was sent from the 108-N Neutralization Unit by the water jet pump to the 183-N Facility where it was then discharged to the river through the 259-centimeter (102 inch) outfall line.

Waste Type: Chemicals

Waste: The pit was used to neutralize waste sulfuric acid before eventual release to the river.

Description: Chemicals received by the pit included 93% sulfuric acid and 50% sodium hydroxide.

Code: 100-N-39

Classification: Accepted

Names: 100-N-39; Hanford Substation Construction Dump Area; SWMU #11

Reclassification: Rejected (7/14/2005)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: This site should be rejected because it is a duplicate of 600-32 and contained within the larger dumping area 100-N-19. There is no similar dump near the area originally mapped (in Arcview) as the site location, inside the BPA Substation fence. The site is a construction dump with evidence of burning activity. The Hanford Generating Plant RCRA Facility Assessment Report states "The site is a large, irregular shaped burn pit and a large borrow pit covering 5 to 10 acres. The site contains large blocks of concrete and miscellaneous debris."

Location: The site is approximately 305 meters (1000 feet) south of the Hanford Generating Plant property fence.

Related Sites/ Structures: This site is a duplicate of 600-32 and 100-N-19.

Waste Type: Construction Debris

Waste: The waste includes construction debris and combustible construction waste that was burned.

Description: The site contains large blocks of concrete, miscellaneous debris, one empty drum and one pile of sand blast grit

The Site Was Consolidated With:

Code: 600-32

Names: 600-32; N Area Landfill

Code: 100-N-40

Classification: Accepted

Names: 100-N-40; Unplanned Release at 108-N

Reclassification: Rejected (9/11/2000)

Type: Unplanned Release

Start Date: 1/1/1987

Status: Inactive

End Date: 1/1/1987

Description: The site is a graveled field at the 108-N Chemical Unloading Facility.

Location: The site is located at the railcar unloading station at the 100-N-8 (108-N Chemical Unloading Facility) and 120-N-6.

Release: Approximately 38 liters (10 gallons) of sodium hydroxide was spilled to the ground on

Description: December 26, 1987. Difficulties during the transfer of sodium hydroxide from a rail car to the caustic storage tank prompted the operator to disconnect the transfer line and set it on the

ground.

Related Sites/ Structures: This release occurred at the 100-N-8 (108-N) Chemical Unloading Facility.

Waste Type: Chemical Release

Waste Description: The waste is sodium hydroxide spilled to the ground.

Code: 100-N-56

Classification: Accepted

Names: 100-N-56; 181-N Building Drywell

Reclassification: Rejected (9/11/2000)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The drywell is not visible from ground surface and is apparently located underground. The drywell, judging by the site drawing, is adjacent to the fenceline north of the 181-N Building. The ground surface is graveled. Another drywell, 100-N-73 (Miscellaneous Stream 395) is in this area, but it drains a parking lot north of the 107-N Building via a concrete trench.

Location: The site is located in the 100-N Area, north of the 181-N Building and between the double security exclusion area fences.

Process Description: The site received waste water from the 181-N River Pumphouse Building. According to Don Eckert of 100-N Operations, only river water entered the pipeline leading to the drywell.

Related Sites/ Structures: The 181-N Building is associated with this waste site.

Waste Type: Water

Waste Description: River water from inside the 181-N Pumphouse is the only source of waste water to this site.

Code: 100-N-69

Classification: Not Accepted

Names: 100-N-69; 105-NB Stormwater Injection Well; Miscellaneous Stream #801

Reclassification: None

Type: Injection/Reverse Well

Start Date:

Status: Active

End Date:

Description: The site is covered with a 0.56 meter (1.8 foot) diameter steel grate and is 2.56 meters (8.4 feet) deep. The drywell is constructed of concrete. The site appears to drain stormwater that accumulates at a low point and from roof drains on the 105-NB building. Flow rates to the drain are estimated to be less than 19 liters (5 gallons) per minute. No contaminated areas were observed at the time of the inspection.

Location: The site is located 5.4 meters (18 feet) north of the 105-NB north entrance door.

Related Sites/ Structures: The site is associated with 105-NB building.

Waste Type: Stormwater Runoff

Waste Description: This site receives less than 19 liters (5 gallons) per minute of stormwater only.

Description:

Code: 100-N-70 **Classification:** Not Accepted
Names: 100-N-70; 1705-N Stormwater Injection Well; **Reclassification:** None
Miscellaneous Stream #802
Type: Injection/Reverse Well **Start Date:**
Status: Inactive **End Date:**
Description: The site was covered with a 1 meter (3.3 foot) diameter steel grate at grade level and is constructed of concrete. The site was filled with gravel and is located in a depression. The site appeared to be a drain for stormwater that collects in a depression from the surrounding area and the roof of 1705-N. The flow rates to the site is estimated to be less than 19 liters (5 gallons) per minute. No contaminated areas were observed at the time of the inspection.
Location: The site is located between 1705-N Building and the northwest corner of the 1714-NA Building.
Related Sites/ Structures: This site drains stormwater from the 1705-N Building.
Waste Type: Stormwater Runoff
Waste Description: This site received less than 19 liters (5 gallons) per minute of stormwater runoff only.

Code: 100-N-71 **Classification:** Not Accepted
Names: 100-N-71; Project 4546.010; 100-N Sewer System **Reclassification:** None
Type: Septic Tank **Start Date:**
Status: Unknown **End Date:**
Description: This site was added to WIDS before the septic system was built; subsequently the project has been cancelled because of lack of funds (per Nolan Draper).
Location: Original planned location (not built): One Type II septic tank is located south of 1310-N. Two Type I septic tanks are located southeast of 1120-N. The new drain field is located east of 1120-N. A pipeline connects the parts of the system.
Process Description: System as designed (not built): The Type II septic tank measures 3.6 meters by 2.4 meters (12 feet by 8 feet). The Type I septic tanks measure 2.4 meters by 1.8 meters (8 feet by 6 feet). The new drain field measures 52.7 meters by 51.2 meters (173 feet by 168 feet). The total length of the associated piping is approximately 305 meters (1000 feet). The pipeline was to be routed from Lift Station #3 (south of 1310-N) to Manhole #5 (southwest of 1120-N) and to the new drain field (east of 1120-N).

Code: 100-N-72 **Classification:** Not Accepted
Names: 100-N-72; 107-N Building East Area Stormwater **Reclassification:** None
Runoff; Miscellaneous Stream #396
Type: Injection/Reverse Well **Start Date:**
Status: Inactive **End Date:**
Description: The site is a concrete french drain, about 0.5 meters (1.5 feet) in diameter, with an open metal grate cover. The bottom is about 0.3 meters (1 foot) deep, and only sand and cobbles are visible. A concrete trench, about 18 meters (60 feet) long, drains the paved and graveled area north of the 107-N Building and empties into this french drain. The trench prevents stormwater from flowing to the west, and down a steep slope in the area fenced for security exclusion. The

area is posted with underground radioactive materials (URM) signs, like most of the 100-N Area. This french drain receives stormwater only, however.

Location: This stormwater runoff is in the area east of the 107-N Building.

Process Description: This Miscellaneous Stream is stormwater runoff.

Waste Type: Stormwater Runoff

Waste Description:

Code: 100-N-73 **Classification:** Not Accepted

Names: 100-N-73; 107-N Building West Area Stormwater Runoff; Miscellaneous Stream #395 **Reclassification:** None

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:**

Description: The drain is a concrete structure with a steel lid, fed by a concrete trough running from north of the 107-N Building, along the base of the security fence.

Location: This Miscellaneous Stream is a drywell on the north side of the 181-N Pumphouse.

Process Description: This Miscellaneous Stream drains stormwater from the area north and west of the 107-N Building and flows via a concrete trench to a drywell on the north side of the 181-N Pumphouse. It is designed to prevent erosion on the river bank that could otherwise be caused by stormwater.

Related Sites/ Structures: This drywell drains the security exclusion area from north of the 107-N Building south to the french drain.

Waste Type: Stormwater Runoff

Waste Description:

Code: 100-N-74 **Classification:** Accepted

Names: 100-N-74; 183-N Building Fire System Drain; Miscellaneous Stream #492 **Reclassification:** Rejected (9/11/2000)

Type: Injection/Reverse Well **Start Date:**

Status: Active **End Date:**

Description: The site is in a graveled lot on the north side of the 183-N Building. A fire system relief valve (site 100-N-75) extends about 1 meter (3 feet) above the ground, and is surrounded by six steel barrier poles to protect it from vehicles. Two metal 10 centimeter (4 inch) pipes with handles for turning valves are next to the relief valve, but no pit is visible.

Location: The Miscellaneous Stream is in a valve pit on the north side of the 183-N Building.

Process Description: When fire system piping is opened at the valve pit for repair, untreated water from the Columbia River (via the Hanford Site export water system) drains from pipes into the pit.

Related Sites/ Structures: The Miscellaneous Stream is for the 183-N Building fire system.

Waste Type: Water
**Waste
Description:**

Code: 100-N-75 **Classification:** Accepted
Names: 100-N-75; 183-N Building Fire System Relief Valve; Miscellaneous Stream #493 **Reclassification:** Rejected (9/11/2000)
Type: French Drain **Start Date:**
Status: Active **End Date:**
Description: The relief valve is visible in a large graveled area north of the 183-N Building. It is surrounded by 6 metal posts that protect it from vehicles. The relief valve is just under 1 meter (3 feet) high, and painted red. The entire area is marked "Underground Radioactive Materials."
Location: This Miscellaneous Stream is north of the 183-N Building, adjacent to the valve pit.
**Process
Description:** This stream is a relief valve that releases during upset conditions in the plant fire system. Released water flows into a container, and overflows onto the ground. The water is from the Columbia River, via the Hanford Site export water line.

Waste Type: Water
**Waste
Description:**

Code: 100-N-76 **Classification:** Accepted
Names: 100-N-76; 181-N Pumphouse French Drains **Reclassification:** Rejected (4/12/2004)
Type: French Drain **Start Date:**
Status: Active **End Date:** 1/1/2001
Description: The site is two french drains; the drains were plugged with grout on June 13, 2001. The french drains were connected to each other underground, and provided steam condensate and stormwater drainage just east of the 181-N Pumphouse. These drains are believed to have been built to receive steam condensate blowdown. However, when the steam line was removed the drains were left behind, and drained excess stormwater. Both drains are about 46 centimeters (18 inches) in diameter and constructed of concrete. A 10 centimeter (4 inch) pipe connects them; this pipe is about 20 centimeters below the lip in the southern drain and about 1 meter (3 feet) below the lip of the northern drain. Because the northern drain is noticeable higher than the southern drain, it is difficult to tell if the pipe is level or drains preferentially toward either side. The drains are about 16 meters (52 feet) apart.
Location: The drains are on the east side of the paved and graveled road that is east of the 181-N Pumphouse.
**Process
Description:** These drains originally were built to drain steam condensate, but later drained excess stormwater.

Waste Type: Steam Condensate
**Waste
Description:**

Code: 116-N-8 **Classification:** Accepted

Names: 116-N-8; 116-N-8 Storage Pad; 1330-N; 163-N Mixed Waste and Hazardous Waste Container Storage Pad **Reclassification:** Rejected (9/6/2000)

Type: Storage Pad (<90 day) **Start Date:** 12/1/1986

Status: Active **End Date:**

Description: Containers are stored on a curbed and fenced concrete pad. The pad is covered by an open metal shed, divided into three storage areas each with its own locked gate. The entire unit is approximately 45 by 18 meters (150 by 60 feet). A small cabinet in front holds personal protective equipment and spill response materials. The front of the unit is an asphalt parking/driving area; the sides and back are gravel.

Location: The site is located south of the 163-N Building.

Release Description: No spills have been recorded at this site. No stains are visible on the concrete.

Waste Type: Soil

Waste Description: This site receives radioactively contaminated oil and miscellaneous hazardous process chemicals in drums and containers. The amounts received are variable based on operations.

Code: 120-N-5 **Classification:** Accepted

Names: 120-N-5; 108-N/163-N Transfer Line and Neutralization Pit **Reclassification:** Rejected (9/11/2000)

Type: Product Piping **Start Date:** 1/1/1963

Status: Inactive **End Date:** 1/1/1990

Description: The Transfer Line and Neutralization Pit is a 220-meter (720-foot) long polymer lined concrete pipe trench (encasement) that contains two transfer lines that run between the 108-N and the 163-N Buildings. The trench has concrete bottom and sides and a metal plate cover. The enclosed lines are one 6.4-centimeter (2.5-inch) sodium hydroxide line and one 10.2-centimeter (4-inch) sulfuric acid line. The trench runs 50 meters (154 feet) south from the 163-N Building to a neutralization pit, east for 132 meters (433 feet), and then north for 26 meters (85 feet) to the 108-N Building. The 1.22-meter (4-foot) by 3.05-meter (10-foot) concrete neutralization pit, located at coordinates N149307 and E571120, is designed to receive waste spills from within the encasement. Its upper surface is a few inches above grade. The neutralization pit has two 61-centimeter (24-inch) steel manhole covers, one marked "acid" and the other "caustic", that provide pit access. DOE/RL-90-22 describes its internal dimensions as two vaults, each measuring 1.8 by 1.8 by 3.1 meters (6 by 6 by 10 feet) deep.

Location: The site is a pipe trench that is located between the 108-N and the 163-N Buildings.

Release Description: See UPR-100-N-34, 108-N Tank Transfer, Sulfuric Acid Line Break; UPR-100-N-15, 108-N Neutralization Sump Spill; 100-N-9, 120-N-5 Facility Liquid Unplanned Release 1 (08/07/87); 100-N-10, 120-N-5 Facility Liquid Unplanned Release 2 (09/02/87); 100-N-11, 120-N-5 Transfer Trench Liquid Unplanned Release 3.

Process Description: The site transfers sulfuric acid and sodium hydroxide from the 108-N Chemical Unloading Facility to the 163-N Water Demineralization Plant for use in water treatment.

Related Sites/Structures: The piping was used to transfer acids and caustics from the 108-N Chemical Unloading Facility to the 163-N Demineralization Plant.

trenches partially filled with a bed of washed gravel or crushed stone into which perforated or open joint pipe is placed. The discharge from the septic tank is distributed through these pipes into trenches and surrounding soil.

Related Sites/ Structures: The septic system received sanitary sewage from office trailers 1113-N, 1114-N, and 1115-N. This septic system was directly hooked up to Sanitary Sewer System No.7, (124-N-7).

Waste Type: Sanitary Sewage

Waste: This unit received an unknown amount of sanitary sewage.

Description:

Code: 124-N-7 **Classification:** Accepted

Names: 124-N-7; 124-N-7 Septic Tank; 100-N Sanitary Sewer System No. 7 **Reclassification:** Rejected (9/11/2000)

Type: Septic Tank **Start Date:** 1/1/1984

Status: Inactive **End Date:** 1/1/1987

Description: A site visit in July 1999 found a 0.61 meter (2 foot) diameter manhole and two 19.6 centimeter (8 inch) diameter access ports labeled "Sewer". No drain field was identified. However, the 100-N Facility Manager said (see Deford 1996 reference below) that when the tank was pumped and filled with sand, it was covered with a layer of parking lot gravel and can no longer be located.

Location: The unit is located southwest of the 1115-N Trailer.

Process Description: Untreated sanitary sewage enters the septic tank where the heavy solids settle to the bottom of the tank. The lighter solids, fats and greases partially decompose and rise to the surface and form a layer of scum. The solids that have settled to the bottom are attacked by bacteria and form sludge. The clear sewage then enters a system of properly sized and constructed narrow trenches partially filled with a bed of washed gravel or crushed stone into which perforated or open joint pipe is placed. The discharge from the septic tank is distributed through these pipes into trenches and surrounding soil.

Related Sites/ Structures: The system received sanitary sewage from office trailers 1103-N, 1104-N, and 1145-N and after modifications received sanitary sewage from 124-N-6 Sanitary Sewer System and the 1145-N Building.

Waste Type: Sanitary Sewage

Waste: This unit received approximately 19,700 liters/day (5,200 gallons/day) of sanitary sewage from

Description: office trailers.

Code: 124-N-8 **Classification:** Accepted

Names: 124-N-8; 124-N-8 Septic Tank; 100-N Sanitary Sewer System No. 8 **Reclassification:** Rejected (9/11/2000)

Type: Septic Tank **Start Date:** 1/1/1983

Status: Inactive **End Date:** 1/1/1987

Description: A site visit in July 1999 found two concrete pads (0.6 meters by 0.6 meters [2 X 2 feet]) with 19.6 centimeter (8 inch) lids marked "Sewer" in the general location of this site. It is not known if one of the markers is from the old system (124-N-8) or the replacement sewage system (124-N-10).

Location:

Process Description: Untreated sanitary sewage enters the septic tank where the heavy solids settle to the bottom of the tank. The lighter solids, fats and greases partially decompose and rise to the surface and form a layer of scum. The solids that have settled to the bottom are attacked by bacteria and form sludge. The clear sewage then enters a system of properly sized and constructed narrow trenches partially filled with a bed of washed gravel or crushed stone into which perforated or open joint pipe is placed. The discharge from the septic tank is distributed through these pipes into trenches and surrounding soil.

Related Sites/ Structures: The system received sanitary sewage from office trailers 1132-N, 1133-N, 1134-N and 1135-N.

Waste Type: Sanitary Sewage
Waste Description: This unit received approximately 3,400 liters/day (900 gallons/day) of sanitary sewage from office trailers. .

Code: 200 ETF **Classification:** Accepted
Names: 200 ETF; 2025-E; 200 Area Effluent Treatment Facility (ETF) **Reclassification:** None
Type: Process Unit/Plant **Start Date:** 1/1/1995
Status: Active **End Date:**

Description: The Effluent Treatment Facility contains several tanks and process systems that make up the primary and secondary treatment trains for the treatment of dilute waste water generated at the Hanford Facility. The primary treatment train receives waste water in the surge tank, located outside the Effluent Treatment Facility Building on the south side. The secondary treatment train collects, concentrates, dries and packages the waste (generated by the primary treatment train systems) in lined steel containers.

Location: The Effluent Treatment Facility lies north of the Liquid Effluent Retention Facility an east of Canton Avenue in the 200 East Area.

Process Description: Mixed waste stored in the double-shell tank system is transferred to the 242-A Evaporator, where the waste is concentrated through an evaporation process. The concentrated slurry waste is returned to the double-shell tank system, and the evaporated constituents are re-condensed, collected, and transferred to the Liquid Effluent Retention Facility until they are transferred to the Effluent Treatment Facility for additional treatment. The facility consists of a primary and a secondary treatment train. The primary treatment train removes or destroys dangerous and mixed waste components from the waste water. The primary treatment train consists of the following treatment operations: pH adjustment, filtration, ultraviolet oxidation, hydrogen peroxide decomposition, fine filtration, de-gasification, reverse osmosis, polishing (ion exchange column) and final pH adjustment and verification. The secondary treatment train processes the waste byproducts removed by the primary treatment train. The secondary waste is dried to a powder, containerized and transferred to a mixed waste treatment, storage and/or disposal unit. The secondary treatment train includes the following treatment components: secondary waste receiving tanks, Effluent Treatment Facility Evaporator (forced circulation evaporator), concentrate tank, thin film dryer, container handling, and support systems. Treated effluent meets delisting requirements and is discharged as nondangerous waste to the State-Approved Land Disposal System.

Related Sites/ Structures: The Effluent Treatment Facility is associated with the 242-A Evaporator and the Liquid Effluent Retention Facility.

Waste Type: Process Effluent

Waste Type:	PROCESS EFFLUENT
Waste Description:	The unit treats process condensate containing small amounts of volatile and semivolatile organic constituents, inorganic constituents and radionuclides.
Code:	200-A TEDF
Classification:	Accepted
Names:	200-A TEDF; 216-E-43A and 216-E-43B; 600-145; TEDF Basin; 200 Area Treated Effluent Disposal Facility
Reclassification:	None
Type:	Pond
Start Date:	1/1/1995
Status:	Active
End Date:	
Description:	The 357 meter by 192 meter (1172 ft by 629 ft) fenced area contains two adjacent five acre gravel disposal basins and a metal sampling building (#6653). Pond B is north of Pond A. The 6653 metal sampling building is 4.2 meters by 6.1 meters (14 ft by 20 ft) and is located near the east fence line and gate.
Location:	Pond A (216-E-43A- South Pond) and B(216-E-43B-North Pond) and 6653 are located about 660 meters east of 216-B3C, which is east of and outside the 200 East security fence.
Process Description:	Liquid waste from seven Hanford facilities (Plutonium Finishing Plant, 222-S Complex, T-Plant Complex, 284-W Power Plant, PUREX Plant, B-Plant, and 242-A-81 Water Services Building) is transported via eleven miles of pipe to the two evaporation/infiltration ponds (Pond A and Pond B). TEDF includes no treatment.
Related Sites/ Structures:	Liquid waste from seven Hanford facilities (Plutonium Finishing Plant, 222-S Complex, T-Plant Complex, 284-W Power Plant, PUREX Plant, B-Plant, and 242-A-81 Water Services Building) is transported via eleven miles of pipe to the two evaporation/infiltration ponds (Pond A and Pond B). There are two pumping stations associated with the pipeline (one in 200 E and one in 200 W). The pipeline is WIDS sitecode 600-291.
Waste Type:	Water
Waste Description:	Liquid waste is discharged to TEDF from the Plutonium Finishing Plant, 222-S Complex, T-Plant Complex, 284-W Power Plant, PUREX Plant, B-Plant, and 242-A-81 Water Services Building. Examples of waste include non-contact process cooling water, lab waste, steam condensate, air conditioning condensate, housekeeping water, outdoor sumps (rain water), reservoir overflow, boiler blowdown, sanitary sources (water softener, safety shower/eye wash, etc), floor drains, HVAC sanitary water, raw water, storm water, strainer backflush.
Code:	202-A HWSA
Classification:	Accepted
Names:	202-A HWSA; 202-A Hazardous Waste Storage Area
Reclassification:	Rejected (9/6/2000)
Type:	Storage Pad (<90 day)
Start Date:	1/1/1986
Status:	Inactive
End Date:	1/1/1996
Description:	All remaining 90 day storage areas were removed when PUREX was closed down and cleaned to meet the deactivation end point criteria prior to transition from Westinghouse Hanford Co. to Bechtel Hanford Inc. (BHI).
Location:	The site was located north of the 202-A Building and east of the 2714-A Chemical Warehouse in the 200-East Area.
Release Description:	There were no known releases from this site.
Related Sites/	This pad was related to the PUREX facility

Structures:**Waste Type:** Barrels/Drums/Buckets/Cans**Waste Description:** When this unit was active, typical wastes contained in the staging area over a 1-year period included approximately 1,000 kilograms (2,205 pounds) of flammable waste oils, 1,900 kilograms (4,190 pounds) of combustible waste oils, and 1,600 kilograms (3,530 pounds) of wastes unidentified prior to receipt of analysis.

Code: 202-A NU **Classification:** Accepted**Names:** 202-A NU; Elementary Neutralization Unit/202-A Building; PUREX; 202-A Neutralization Unit **Reclassification:** None**Type:** Neutralization Tank **Start Date:** 7/1/1986**Status:** Active **End Date:****Location:** The tank is located in the 202-A Building.**Waste Type:** Process Effluent**Waste Description:** The system treats process condensate. A nominal flow 2.7E+05 liters (72,000 gallons) per day, is neutralized in line from a pH of between 1 and 2 to a pH of approximately 4 by addition of potassium hydroxide. This stream then passes through a 26,500-liter (7,000-gallon) underground tank containing 27 metric tons (30 tons) of calcium carbonate rock (installed January 1987) for neutralization to a final pH of between 6 and 7. It is then discharged to the 216-A-45 Crib.

Code: 202-A-E-F11 **Classification:** Accepted**Names:** 202-A-E-F11; 202-A-TK-E-F11; PUREX Tank E-F11 **Reclassification:** None**Type:** Storage Tank **Start Date:** 1/15/1956**Status:** Inactive **End Date:****Description:** The unit has a 9,840-liter (2,600-gallon) capacity.**Location:** The tank is located in the PUREX Building.**Waste Type:** Process Effluent**Waste Description:** The unit contains ammoniacal (ammonia based) radioactive mixed waste (RMW) which is processed with sodium hydroxide (NaOH) and sodium nitrate (NaNO₃). Prior to September 1987, these wastes were sent to the 216-A-36B Crib. Currently, the waste is discharged to Tank G7 for neutralization.

Code: 202-A-E5 **Classification:** Accepted**Names:** 202-A-E5; 202-A-TK-E5; PUREX Tank E5 **Reclassification:** None**Type:** Neutralization Tank **Start Date:** 1/15/1956**Status:** Inactive **End Date:****Description:** The unit has a 18,900-liter (5,000 gallon) capacity.**Location:** The tank is located in the PUREX Building.**Waste Type:** Process Effluent**Waste Description:** The unit contains: 1) decladding wastes; 2) metathesis wastes; or 3) miscellaneous wastes including flushes with similar chemical makeups. Wastes are neutralized with sodium nitrate

(NaNO₃) and potassium hydroxide (KOH) or sodium hydroxide (NaOH) before going to double-shell underground storage tanks.

Code: 202-A-F15 **Classification:** Accepted
Names: 202-A-F15; 202-A-TK-F15; PUREX Tank F-15 **Reclassification:** None
Type: Neutralization Tank **Start Date:** 1/15/1956
Status: Inactive **End Date:**
Description: The unit has a 18,900-liter (5,000-gallon) capacity.
Location: The tank is located in the PUREX Building.
Waste Type: Process Effluent
Waste Description: The unit contains high-level acid wastes which are neutralized with sugar, sodium hydroxide (NaOH), and sodium nitrite (NaNO₂) before going to double-shell underground storage tanks.

Code: 202-A-F16 **Classification:** Accepted
Names: 202-A-F16; 202-A-TK-F16; PUREX Tank F16 **Reclassification:** None
Type: Neutralization Tank **Start Date:** 1/15/1956
Status: Inactive **End Date:**
Description: The unit has a 18,900-liter (5,000-gallon) capacity.
Location: The tank is located in the PUREX Building.
Waste Type: Process Effluent
Waste Description: The unit contains high-level acid wastes which are neutralized with sugar, sodium hydroxide (NaOH), and sodium nitrite (NaNO₂) before going to double-shell underground storage tanks.

Code: 202-A-F18 **Classification:** Accepted
Names: 202-A-F18; 202-A-TK-F18; PUREX Tank F18 **Reclassification:** None
Type: Neutralization Tank **Start Date:** 1/15/1956
Status: Inactive **End Date:**
Description: The unit has a 18,900-liter (5,000-gallon) capacity.
Location: The tank is located in the PUREX Building.
Waste Type: Process Effluent
Waste Description: The unit contains miscellaneous wastes collected from all sections of the plant. The dangerous wastes consist mainly of nitric acid (HNO₃). The wastes are neutralized with sodium hydroxide (NaOH) and sodium nitrite (NaNO₂) to a pH greater than 12.5 before going to double-shell underground storage tanks.

Code: 202-A-G7 **Classification:** Accepted
Names: 202-A-G7; 202-A-TK-G7; PUREX Tank G7 **Reclassification:** None
Type: Neutralization Tank **Start Date:** 1/15/1956
Status: Inactive **End Date:**
Description: The unit has a 53,000-liter (14,000-gallon) capacity.

Waste Type: Process Effluent
Waste Description: The unit receives ammonia distillate from Tank E-F11 and is neutralized with sodium hydroxide (NaOH) and sodium nitrite (NaNO₂) before going to double-shell underground storage tanks.

Code: 202-A-U3 **Classification:** Accepted

Names: 202-A-U3; PUREX Tank U3; 202-A-TK-U3 **Reclassification:** None

Type: Neutralization Tank **Start Date:** 1/15/1956

Status: Inactive **End Date:**

Description: The unit has a 30,280-liter (8,000-gallon) capacity.

Location: The tank is located in the PUREX Building.

Waste Type: Process Effluent

Waste Description: The unit contains miscellaneous wastes collected from all sections of the plant. The dangerous wastes consist mainly of nitric acid (HNO₃). The wastes are neutralized with sodium hydroxide (NaOH) and sodium nitrite (NaNO₂) to pH of greater than 12.5 before going to double-shell underground storage tanks.

Code: 202-A-U4 **Classification:** Accepted

Names: 202-A-U4; PUREX Tank U4; 202-A-TK-U4 **Reclassification:** None

Type: Neutralization Tank **Start Date:** 1/15/1956

Status: Inactive **End Date:**

Description: The unit has a 30,280-liter (8,000-gallon) capacity.

Location: The tank is located in the PUREX Building.

Waste Type: Process Effluent

Waste Description: The unit contains miscellaneous wastes collected from all sections of the plant. The dangerous wastes consist mainly of nitric acid (HNO₃). The wastes are neutralized with sodium hydroxide (NaOH) and sodium nitrite (NaNO₂) to pH of greater than 12.5 before going to double-shell underground storage tanks.

Code: 202-A-WS-1 **Classification:** Accepted

Names: 202-A-WS-1; PUREX Waste Piles **Reclassification:** None

Type: Storage **Start Date:** 1/1/1956

Status: Inactive **End Date:**

Description: This site is located in the PUREX Building on the canyon deck and F-Cell canyon floor.

Location: The pile of material is located inside the 202-A building.

Waste Type: Equipment

Waste Description: The PUREX Containment Building is permitted for the storage of waste designated TCLP toxic for lead (D008), cadmium (D006), and chromium, (D007) and toxic (WT01). Discarded process equipment removed from service in the PUREX Plant and known to have shielding, weights, and or counterweights containing elemental cadmium or lead was stored on the canyon deck within the containment building. However, this waste has been removed and placed on a burial box inside the PUREX Storage Tunnel 2. In November 1996, chromium contaminated concrete solids from the E-Cell floor were stored in F-Cell within the containment building as

well as a lead-lined remote camera assembly on the West Crane Maintenance Platform.

Code: 205-A **Classification:** Accepted
Names: 205-A; 205-A Silica Gel Facility **Reclassification:** None
Type: Process Unit/Plant **Start Date:** 1/1/1956
Status: Inactive **End Date:** 1/1/1976

Description: The site is 2.4 meters (8 feet) high building constructed of transite, with nine tanks of various sizes inside the facility.

Location: The unit is located within the 203-A Basin, north of the PUREX canyon building. It is inside the PUREX facility fence.

Process Description: The Silica Gel facility was a prototype unit, placed in service in 1956 to prove process feasibility. The uranium solution from the solvent extraction systems often required further treatment to meet product specifications. Silica gel absorbed the zirconium and niobium contaminants, without significant loss of uranium. After successfully demonstrating the process, the 205-A unit was converted to product use. Another silica gel facility was also built at REDOX. Since the PUREX unit was not designed for continuous operation, uranium solutions from PUREX were often transferred to REDOX of treatment.

Waste Type: Process Effluent

Waste Description: The unit contains silica gel and process and flush solutions. The amount of radionuclides present is not known. There is less than 2,000 counts/minute smearable beta/gamma; 5 millirad/hour nonpenetrating, 1 millirem/hour penetrating and detectable alpha. The tanks are assumed to contain silica gel and may contain either process or flush solutions.

Code: 207-A-SOUTH **Classification:** Accepted
Names: 207-A-SOUTH; 207-A-SOUTH Retention Basin and Pump Pit; 207-A; 207-A Retention Basin; 207-A South **Reclassification:** None
Type: Retention Basin **Start Date:** 1/1/1977
Status: Inactive **End Date:** 1/1/1989

Description: The 207-A South basin consists of three, unlined concrete cells that are coated with a (white) polyurethane sealant. They are marked, but are no longer posted with radiological warning signs.

The cells were fed from the pump pit, located between the 207-A South and 207-A North basins. A 10-centimeter (4-inch) fill line entered each cell inside the basin structure. A 7.6-centimeter (3-inch) drain line exits the bottom of the each cell.

Location: The 207-A Retention Basins are located east of the 242-A Evaporator Building.

Process Description: When operating, the three cells of the 207-A South Basins were filled alternately, sampled, and discharged to the 216-A-37-1 Crib after meeting release specifications. The 242-A Evaporator could retrieve the liquid waste for reprocessing or storage in the tank farm, via line 300, if discharge specifications were not met. After the 207-A North and South basins ceased to operate, the effluent was diverted to the 200 Area Treated Effluent Disposal Facility.

Related Sites/Structures: The basins are associated with the 242-A Evaporator and the 216-A-37-1 Crib. The pipeline from the basin to the 216-A-37-1 crib is sitecode 200-E-232-PL. The pipelines from 242-A

Evaporator to the 207-A basins are sitecode 200-E-234-PL. The south basin distribution lines are sitecode 200-E-236-PL.

Waste Type: Steam Condensate

Waste The unit was used for the interim storage of the 242-A Evaporator process condensate to allow

Description: for sampling and analysis prior to being discharged to the 216-A-37-1 Crib.

The Following Sites Were Consolidated With This Site:

Code: 200-E-236-PL

Names: 200-E-236-PL; 207-A South Basin Distribution Lines; Lines 557, 558, 559, 560, 562, and 563

Code: 211-A NU

Classification: Accepted

Names: 211-A NU; Elementary Neutralization Unit/211-A Building; PUREX; 211-A Neutralization Unit

Reclassification: None

Type: Neutralization Tank

Start Date: 1/1/1986

Status: Inactive

End Date: 1/1/1990

Location: The 211-A building is located adjacent to the north side of 202-A. The 211-A NU tank is located inside the 211-A Building.

Process Description: PUREX process water was required to be very pure. The 211-A building contained the demineralizer columns (deionizer units). When the deionizers became loaded, they were recharged with acidic and basic solutions. The spent acid and basic solutions were combined in the 211-A Neutralization Unit (tank). The pH was tested and adjusted until it was 7.0 pH. Then the solution was discharged to the chemical process sewer.

Waste Type: Chemicals

Waste Description: Approximately 318 kilograms (700 pounds) per year of 9% sulfuric acid is combined with 272 kilograms (600 pound) per year of sodium hydroxide within the water demineralizer columns during regeneration.

Code: 216-A-39

Classification: Accepted

Names: 216-A-39; 216-A-39 Crib; 216-A-39 Trench

Reclassification: None

Type: Crib

Start Date: 1/1/1966

Status: Inactive

End Date: 1/1/1966

Description: The site consists of a crib and two trenches dug from the north door of the 241-AX-801-A Building. The trenches extended to the brow of the north hill, then over the hill to the flat ground below. The trenches continued eastward 27.45 meters (90 feet). Later, a pipeline was added that connected the 241-AX-801-B building to the 216-A-39 crib. Drawing H-2-33295 shows the crib structures. Each crib has three SCH 40 pipes. The drawing also states the crib was covered with approximately 6 meters (20 feet) of dirt in 1973. The risers were extended above the new grade in May 1973.

Location: Site is located near the southeast corner of the 241-AZ tank farm, inside the tank farm fence.

Release Description: This crib was built in 1966 to accommodate a liquid release that contaminated the 241-AX-801-A building. A team was changing out a valve on the 241-AX-103 tank recirculator line. The radioactive line pressurized and resulted in a release to the floor of the instrument (241-AX-801-A) building. Dose rates from the release were greater than 5 rad per hour at a distance of 3 meters (10 feet). A trench, 0.9 meters (3 feet deep), was dug to receive the liquid. The trench extended from the north side of the 241-A-801-A building to the brow of the north hill, then

continued over the hill to the flat ground below. The trench extended eastward approximately 27.45 meters (90 feet). A hole was cut through the back side of the 801 Building and a fire hose was used to wash the contamination out the door and into the trench. The first trench was covered with dirt and a second trench was dug, parallel to the first, to receive a second rinsing of the 241-AX-801-A building floor. This trench was also backfilled. A residual dose rate remained on the floor of the building. It should be noted that the RHO-CD-673 document states the release occurred at the 241-AX-801-B building. Physical evidence found at the 241-AX-801-A building and interviews with long time tank farm employees has shown that the release actually occurred at the 241-AX-801-A building.

Process Description: The 216-A-39 originally consisted of two trenches that received liquid from a spill of radioactive material in June 1966. In 1969, a pipeline was added to connect the 241-AX-801B building to the crib.

Related Sites/ Structures: The crib is associated with the 241-AX-801-A and 241-AX-801-B buildings.

Waste Type: Process Effluent

Waste Description: The site originally received waste from a radioactive spill in the 241-AX-801-A Building (June 1966). The maximum dose rate from this release was 5 rad per hour at a distance of 3 meters (10 feet). Later, the crib received floor drainage via a pipeline from the 241-AX-801-B building.

Code: 242-A **Classification:** Accepted

Names: 242-A; 242-A Evaporator **Reclassification:** None

Type: Evaporator **Start Date:** 1/1/1977

Status: Active **End Date:**

Description: The 242-A Building contains the evaporator vessel, supporting process equipment, and the principal process components of the evaporator-crystallizer system. The building comprises two adjoining, structurally independent structures, designated A and B. Structure A houses the processing and service areas while structure B houses operating and personnel support areas.

Location: This Evaporator building is located adjacent to the south side of the 241-A Tank Farm, outside the tank farm fence. It is near the corner of 4th Street and Canton Ave.

Process Description: The 242-A Evaporator is used to treat mixed waste from the Double-Shell Tank System by removing water and most volatile organics. Two waste streams leave the 242-A Evaporator following the treatment process. The first waste stream, the concentrated slurry, is pumped back into the Double-Shell Tank System (Tank Farms AN, AW, and/or AP). The second waste stream, process condensate, is routed through condensate filters for treatment before release to the Liquid Effluent Retention Facility and receives final treatment at the Effluent Treatment Facility.

Related Sites/ Structures: The structures associated with the unit include: the 241-AN, the 241-AP, and the 241-AW Tank Farms, and the 207-A Retention Basins. The pipelines from 242-A to the 207-A basins are sitecode 200-E-234-PL.

Waste Type: Chemicals

Waste Description: Waste types include: dilute non-complexed radioactive waste, PUREX dilute miscellaneous waste, PUREX cladding removal waste, and complexed radioactive waste. Hazardous chemicals used include: sodium nitrate used to regenerate ion exchange column, sodium hydroxide used for decontamination applications, and the antifoam agent used in the evaporator vessel.

Code: 241-AN-A **Classification:** Accepted
Names: 241-AN-A; 241-AN-A Diversion Box **Reclassification:** None
Type: Valve Pit **Start Date:** 1/1/1981
Status: Active **End Date:**

Description: This valve pit is fabricated of reinforced concrete. This valve pit accommodates pipes and jumpers and nozzles that go to different tanks. The valve pit is below grade with the cover block a few inches above grade.

Location: The unit is located inside the 241-AN Tank Farm fence, between the 241-AN-105 and 241-AN-106 tanks.

Process Description: The valve pit has two functions. It routes slurry from the 242-A Evaporator to the designated 241-AN tanks and routes supernate from other tank farms to the 241-AN tanks.

Related Sites/ Structures: This unit is associated with the 241-A Tank Farm, the 241-AN-101 Tank, and the 242-A Evaporator.

Waste Type: Process Effluent
Waste Description: This unit contains non-complexed waste, double-shell slurry waste, B Plant low-level waste, and PUREX low-level waste.

Code: 241-AN-B **Classification:** Accepted
Names: 241-AN-B; 241-AN-B Diversion Box **Reclassification:** None
Type: Valve Pit **Start Date:** 1/1/1981
Status: Active **End Date:**

Description: This valve pit is fabricated of reinforced concrete. This valve pit accommodates pipes and jumpers and nozzles that go to different tanks. The valve pit is below grade with the cover block a few inches above grade.

Location: The unit is located inside the 241-AN Tank Farm fence, between the 241-AN-102 and 241-AN-103 tanks.

Process Description: The valve pit has two functions. It routes slurry from the 242-A Evaporator to the designated 241-AN tanks and routes supernate from other tank farms to the 241-AN tanks. Waste material is routed through the 241-AN-B Valve Pit and then to the designated double-shell tanks. The 241-AN-B Valve Pit is connected by slurry lines and supernatant lines to the 241-AN-101, 241-AN-102, 241-AN-103 Double-Shell Tanks and the 241-AN-A Valve Pit.

Related Sites/ Structures: The unit is associated with the 241-A Tank Farm and the 241-AN-101 Tank.

Waste Type: Process Effluent
Waste Description: The unit contains non-complexed waste, double-shell slurry waste, B Plant low level waste, and PUREX low level waste.

Code: 241-AN-101 **Classification:** Accepted
Names: 241-AN-101; 241-AN-TK-101 **Reclassification:** None
Type: Double-Shell Tank **Start Date:** 9/1/1981

Status: Active **End Date:**

Description: The unit is comprised of a heat-treated, stress-relieved primary steel liner and a nonstress-relieved outer steel liner, both inside the reinforced concrete shell. The top of the dome was placed below grade for shielding.

Location: The 241-AN-101 Tank is located in the eastern portion of the 241-AN Tank Farm.

Process Description: The Double-Shell Tank System is used for the interim storage of liquid mixed waste generated on the Hanford Facility.

Waste Type: Storage Tank

Waste Description: Tank 241-AN-101 began service by receiving non-complexed waste from PUREX in September 1981. Non-complexed waste was received and transferred through this tank until September 1990 when it began receiving dilute non-complexed waste. During this time, the tank also received low-level waste from B Plant, decontamination waste from N Reactor, and dilute non-complexed waste from the 200 East Area Single-Shell Tanks. As of March 1994, the tank was receiving only dilute non-complexed waste. The tank is an active dilute receiver tank which receives non-complexed salt well waste.

Code: 241-AN-102 **Classification:** Accepted

Names: 241-AN-102; 241-AN-TK-102 **Reclassification:** None

Type: Double-Shell Tank **Start Date:** 9/1/1981

Status: Active **End Date:**

Description: The unit is comprised of a heat-treated, stress-relieved primary steel liner and a nonstress-relieved outer steel liner, both inside the reinforced concrete shell. The top of the dome was placed below grade for shielding.

Location: The 241-AN-102 Tank is located in the center portion of the 241-AN Tank Farm.

Process Description: The Double-Shell Tank System is used for the interim storage of liquid mixed waste generated on the Hanford Facility.

Waste Type: Storage Tank

Waste Description: Tank 241-AN-102 began service by receiving non-complexed waste from Tank 241-SY-102 in September 1981. The tank received non-complexed waste until December 1982. The tank received complexant concentrate waste from January 1983 until October 1983. From November 1983 until June 1984, the tank again received non-complexed waste. During 1984, the tank received low-level waste from PUREX. The tank received complexant concentrate waste from Tank 241-AW-101 from July 1984 until 1992 and has not received any waste since 1992. The tank is considered a concentrated waste holding tank.

Code: 241-AN-103 **Classification:** Accepted

Names: 241-AN-103; 241-AN-TK-103 **Reclassification:** None

Type: Double-Shell Tank **Start Date:** 9/1/1981

Status: Active **End Date:**

Description: The unit is comprised of a heat-treated, stress-relieved, primary steel liner and a nonstress-relieved outer steel liner, both inside the reinforced concrete shell. The top of the dome was placed below grade for shielding.

Location: The 241-AN-103 Tank is located in the western portion of the 241-AN Tank Farm.

Process Description: The Double-shell Tank System is used for the interim storage of liquid mixed waste generated on the Hanford facility.

Waste Type: Storage Tank

Waste Description: Tank 241-AN-103 began service by receiving non-complexed waste from Tank 241-SY-102 in September 1981. The tank received non-complexed waste until February 1984. During 1983, the tank received low-level waste from B Plant and dilute non-complexed waste from the 200-East Area single shell tanks. The tank received double-shell slurry feed waste from March 1984 until April 1986. Since May 1986, the tank has contained double-shell slurry waste. The tank has not received any waste, other than wash water, since 1986. The tank is considered a concentrated waste holding tank.

Code: 241-AN-104 **Classification:** Accepted

Names: 241-AN-104; 241-AN-TK-104 **Reclassification:** None

Type: Double-Shell Tank **Start Date:** 9/1/1981

Status: Active **End Date:**

Description: The unit is comprised of a heat-treated, stress-relieved primary steel liner and a nonstress-relieved outer steel liner, both inside the reinforced concrete shell. The top of the dome was placed below grade for shielding.

Location: The 241-AN-104 Tank is located in the eastern portion of the 241-AN Tank Farm.

Process Description: The Double-Shell Tank System is used for the interim storage of liquid mixed waste generated on the Hanford facility.

Waste Type: Storage Tank

Waste Description: Tank 241-AN-104 began service by receiving non-complexed waste in September 1981. The majority of the waste was sent from Tank 241-AW-102 during 1982. The tank continued to receive non-complexed waste until November 1982. The tank has contained double-shell slurry feed waste from December 1982 until the present. During 1983, the tank also received low-level waste from PUREX. The tank has not received waste since 1985. The tank is considered a concentrated waste holding tank.

Code: 241-AN-105 **Classification:** Accepted

Names: 241-AN-105; 241-AN-TK-105 **Reclassification:** None

Type: Double-Shell Tank **Start Date:** 9/1/1981

Status: Active **End Date:**

Description: The unit is comprised of a heat-treated, stress-relieved primary steel liner and a nonstress-relieved outer steel liner, both inside the reinforced concrete shell. The top of the dome was placed below grade for shielding.

Location: The 241-AN-105 Tank is located in the central portion of the 241-AN Tank Farm.

Process Description: The Double-Shell Tank System is used for the interim storage of liquid mixed waste generated on the Hanford Facility.

Waste Type: Storage Tank

Waste Description: Tank 241-AN-105 began service by receiving non-complexed waste in September 1981. The

tank continued to receive non-complexed waste until November 1982. The tank received double-shell slurry feed waste from Tanks 241-AW-102 and 241-AN-104 from December 1982 until 1985, when waste reception ceased. The tank is considered a concentrated waste holding tank.

Code: 241-AN-106 **Classification:** Accepted

Names: 241-AN-106; 241-AN-TK-106 **Reclassification:** None

Type: Double-Shell Tank **Start Date:** 9/1/1981

Status: Active **End Date:**

Description: The unit is comprised of a heat-treated, stress-relieved primary steel liner and a nonstress-relieved outer steel liner, both inside the reinforced concrete shell. The top of the dome was placed below grade for shielding.

Location: The 241-AN-106 Tank is located in the western portion of the 241-AN Tank Farm.

Process Description: The Double-Shell Tank System is used for the interim storage of liquid mixed waste generated on the Hanford Facility.

Waste Type: Storage Tank

Waste Description: Tank 241-AN-106 began service by receiving non-complexed waste in September 1981. The tank continued to receive non-complexed waste until January 1983. From February 1983 until February 1984, the tank received concentrated customer waste. The tank contained Hanford facility waste from March 1984 until May 1990. From June 1990 until the present, the waste contained in the tank has been designated as phosphate waste. The tank has not received any waste, other than wash water, since 1984. The supernatant was pumped to Tank 241-AP-102 during 1992. The tank is considered a concentrated waste holding tank.

Code: 241-AN-107 **Classification:** Accepted

Names: 241-AN-107; 241-AN-TK-107 **Reclassification:** None

Type: Double-Shell Tank **Start Date:** 9/1/1981

Status: Active **End Date:**

Description: The unit is comprised of a heat-treated, stress-relieved primary steel liner and a nonstress-relieved outer steel liner, both inside the reinforced concrete shell. The top of the dome was placed below grade for shielding.

Location: The 241-AN-107 Tank is located in the northwestern portion of the 241-AN Tank Farm.

Process Description: The Double-Shell Tank system is used for the interim storage of liquid mixed waste generated on the Hanford Facility.

Waste Type: Storage Tank

Waste Description: Tank 241-AN-107 began service by receiving non-complexed waste in September 1981 from Tank 241-AN-102. The tank continued to receive non-complexed waste until June 1983. From July 1983 until the present, the tank has contained complexant concentrate waste, most of which was received from Tank 241-AZ-102 during 1983. The tank has not received any waste since 1986. The tank is considered a concentrated waste holding tank.

Code: 241-AP VP **Classification:** Accepted

Description: The tank is a double-shell tank with an outer structure of reinforced concrete lined with carbon steel. The primary tank is carbon steel located within the secondary liner. The tanks are separated by an annular space. The tank is placed on a concrete foundation. The dome is below grade for shielding.

Location: The 241-AP-102 tank is located in the northeast corner of the 241-AP Tank Farm.

Process Description: The Double-Shell Tank System is used for the interim storage of liquid mixed waste generated on the Hanford Facility.

Waste Type: Storage Tank

Waste Description: Tank 241-AP-201 began service by receiving Hanford facility waste in July 1986. The tank received Hanford facility waste until May 1990. During 1988 and 1989, waste was transferred from the tank to the grout vaults. The tank received waste from PUREX during the third and fourth quarters of 1989. The tank has contained dilute non-complexed waste since June 1990. The tank has not received any waste since 1992. The tank is currently an inactive, grout feed tank containing excess water from the grout facility.

Code: 241-AP-103 **Classification:** Accepted

Names: 241-AP-103; 241-AP-TK-103 **Reclassification:** None

Type: Double-Shell Tank **Start Date:** 1/1/1986

Status: Active **End Date:**

Description: The tank is a double-shell tank with an outer structure of reinforced concrete lined with carbon steel. The primary tank is carbon steel located within the secondary liner. The tanks are separated by an annular space. The tank is placed on a concrete foundation. The dome is below grade for shielding.

Location: The 241-AP-103 tank is located on the west side of the 241-AP Tank Farm.

Process Description: The Double-Shell Tank System is used for the interim storage of liquid mixed waste generated on the Hanford Facility.

Waste Type: Storage Tank

Waste Description: Tank 241-AP-103 began service by receiving non-complexed waste in July 1986. The tank received non-complexed waste until May 1990. The tank received waste from PUREX during the first, second, and third quarters of 1988. From June 1990 until the present, the tank has contained dilute non-complexed waste. The tank has not received waste since 1991. The tank is currently an inactive dilute receiver tank.

Code: 241-AP-104 **Classification:** Accepted

Names: 241-AP-104; 241-AP-TK-104 **Reclassification:** None

Type: Double-Shell Tank **Start Date:** 1/1/1986

Description: The tank is a double-shell tank with an outer structure of reinforced concrete lined with carbon steel. The primary tank is carbon steel located within the secondary liner. The tanks are separated by an annular space. The tank is placed on a concrete foundation. The dome is below grade for shielding.

Location: The 241-AP-108 tank is located in the southeast corner of the 241-AP Tank Farm.

Process Description: The Double-Shell Tank System is used for the interim storage of liquid mixed waste generated on the Hanford Facility.

Waste Type: Storage Tank

Waste Description: The tank has contained dilute non-complexed waste from June 1990 until the present. The tank is currently an active dilute receiver tank with waste that is being concentrated by the 242-A Evaporator. From 1990 until 1992, the tank received waste from PUREX. From October 1986 until May 1990, the tank received non-complexed waste. Tank 241-AP-108 began service by receiving double-shell slurry feed waste in July 1986, and continued to receive this waste until September 1986.

Code: 204-AR **Classification:** Accepted
Names: 204-AR; 204-AR Waste Unloading Station; 204-AR-TK-1 **Reclassification:** None

Type:	Loading Dock	Start Date:	1/1/1982
Status:	Active	End Date:	
Description:	The 204-AR Unloading Facility is a reinforced concrete structure. The structure includes a shielded railcar unloading room, floor drains, a 5700 liter (1500 gallon) capacity catch tank, transfer pumps and four chemical storage tanks. The chemical tanks contain caustic, nitrite and pH buffer solutions.		
Location:	This unit is located near the corner of 4th Street and Buffalo Ave, northwest of the 241-AX-151 Diversion Box and south of the 244-AR Vault.		
Process Description:	The 204-AR Facility receives railroad tank cars of liquid radioactive waste to be remotely unloaded inside a fully enclosed, heated, and ventilated building. The structure is a versatile facility that allows the pumping, sampling, and sluicing of the tank cars. Sluicing removes sludge buildup from the tanks and is done during or after the material is pumped out. When samples results show the contents of the railroad car or the catch tank do not meet tank farm specifications, chemical adjustments are made inside the rail car or catch tank. Liquids in the catch tank is periodically to the tank farm on a batch basis. Liquid in excess of the catch tank capacity overflows into the sump pit, that can be pumped to the 241-A-A valve pit.		
Related Sites/ Structures:	The facility is includes four chemical storage/makeup tanks and a catch tank (204-AR-TK-1).		
Waste Type:	Storage Tank		
Waste Description:	The unit receives wastes generated from decontamination and regeneration operations in the 100 and the 200 Areas; from recovery, fuels fabrication, and laboratory operations in the 200 and the 300 Areas; and from decontamination operations in the 400 Area. The waste is chemically adjusted in-line during pump-out to double-shell underground storage tanks to meet corrosion specifications.		

Code:	241-AW-A	Classification:	Accepted
Names:	241-AW-A; 241-AW-A Diversion Box; 241-AW-A Valve Pit	Reclassification:	None
Type:	Valve Pit	Start Date:	1/1/1980
Status:	Active	End Date:	
Description:	The 241-AW valve pits are fabricated from reinforced concrete. The cover block for each pit is made in two sections. Each valve pit has a floor drain. Drain lines empty into tank 241-AW-102. All concrete and ferrous materials are treated with protective coating.		
Location:	The valve pit is located inside the 241-AW Tank Farm, between the 241-AW-101 and 241-AW-103 tanks.		
Process Description:	The 241-AW Tank Farm valve pits are used in three ways: (1) to route slurry from 242-A to designated 241-AW tanks; (2) to route supernatant between tanks in 241-AW Tank Farm or to other tank farms from 241-AW tanks; and (3) to route PUREX nonaging waste to 241-AW tanks.		
Related Sites/ Structures:	The unit is associated with 241-AW Tank Farm, the 241-AW-102 Tank and 200-E-210-PL.		
Waste Type:	Process Effluent		
Waste Description:	Low-level PUREX waste, complexant concentrate waste, complexed waste and dilute non-complexed waste, and non-complexed waste was received and distributed to all tanks via this		

diversion box.

Code: 241-AW-B **Classification:** Accepted

Names: 241-AW-B; 241-AW-B Diversion Box; 241-AW-B Valve Pit **Reclassification:** None

Type: Valve Pit **Start Date:** 1/1/1980

Description: The 241-AW valve pits are fabricated from reinforced concrete. The cover block for each pit is made in two sections. Each valve pit has a floor drain. Drain lines empty into tank 241-AW-102. All concrete and ferrous materials are treated with protective coating.

Location: The valve pit is located inside the 241-AW Tank Farm, between the 241-AW-101 and 241-AW-103 tanks..

Process Description: The 241-AW Tank Farm valve pits are used in three ways: (1) to route slurry from 242-A to designated 241-AW tanks; (2) to route supernatant between tanks in 241-AW Tank Farm or to other tank farms from 241-AW tanks; and (3) to route PUREX non-aging waste to 241-AW tanks.

Related Sites/Structures: The unit is associated with 241-AW Tank Farm, 241-AW-102 Tank and 200-E-210-PL.

Waste Type: Process Effluent

Waste Description: Low-level PUREX waste, complexant concentrate waste, complexed waste and dilute non-complexed, double-shell slurry waste, and non-complexed waste was received and distributed to all tanks via this diversion box.

Code: 241-AW-101 **Classification:** Accepted

Names: 241-AW-101; 241-AW-TK-101 **Reclassification:** None

Type: Double-Shell Tank **Start Date:** 1/1/1980

Status: Active **End Date:**

Description: The unit is comprised of a heat-treated, stress-relieved primary steel liner and a nonstress-relieved outer steel liner, both inside the reinforced concrete shell. The top of the dome is below grade for shielding.

Location: The 241-AW-101 tank is located in the northwest corner of the 241-AW Tank Farm.

Process Description: The Double-Shell Tank System is used for the interim storage of liquid mixed waste generated on the Hanford Facility.

Waste Type: Storage Tank

Waste Description: Tank 241-AW-101 began service by receiving non-complexed waste in July 1980. The tank continued to receive non-complexed waste until November 1981, and again from December 1982 until March 1983. From December 1981 until November 1982, the tank received dilute double-shell slurry feed waste. The tank received complexant concentrate waste from April 1982 until June 1984. From July 1984 until April 1986, the tank again received non-complexed waste. The tank received waste from PUREX and dilute non-complexed waste from the 200-East Area Single-Shell Tanks from 1984 until 1986. The tank contained double-shell slurry feed waste from May 1986 until the present. The tank has not received waste since 1986. The tank is currently an inactive concentrated waste holding tank.

Code: 241-AW-102 **Classification:** Accepted
Names: 241-AW-102; 241-AW-TK-102 **Reclassification:** None

Status: Active **End Date:**

Description: The unit is comprised of a heat-treated, stress-relieved primary steel liner and a nonstress-relieved outer steel liner, both inside the reinforced concrete shell. The top of the dome is below grade for shielding.

Location: The 241-AW-102 tank is located in the northeast corner of the 241-AW Tank Farm.

Process Description: The Double-Shell Tank System is used for the interim storage of liquid mixed waste generated on the Hanford Facility.

Waste Type: Storage Tank
Waste Description: Tank 241-AW-102 began service by receiving non-complexed waste in July 1980. The tank received non-complexed waste until May 1983. The tank received evaporator feed waste from June 1983 until December 1984. During 1983 and 1984, the tank received dilute non-complexed waste from the 200-East Area Single-Shell Tanks. Between January 1985 and April 1986, the tank received Hanford Facility waste. From May 1986 until May 1990, the tank received non-complexed waste from other Double-Shell Tanks. The tank has contained dilute non-complexed waste from June 1990 until the present. The tank is currently an active, evaporator feed tank for the 242-A Evaporator.

Code: 241-AW-103 **Classification:** Accepted
Names: 241-AW-103; 241-AW-TK-103 **Reclassification:** None

Location: The 241-AW-101 tank is located on the west side of the 241-AW Tank Farm.

Process Description: The Double-Shell Tank System is used for the interim storage of liquid mixed waste generated on the Hanford Facility.

Waste Type: Storage Tank
Waste Description: Tank 241-AW-103 began service by receiving non-complexed waste in July 1980. From August 1980 until November 1981, the tank received double-shell slurry feed waste. The tank received PUREX waste from 1983 until 1988. From December 1981 until March 1983, the tank received dilute double-shell slurry feed waste. During April and May 1983, the tank received non-complexed waste from June 1983 until May 1990. From June 1990 until the present, the tank has contained dilute non-complexed and PUREX neutralized cladding removal waste. The tank has not received waste since 1992. The tank is currently an inactive dilute receiver tank.

Inactive Miscellaneous Underground Storage
Tank; 241-AX-151 Catch Tank

Type: Diversion Box **Start Date:**

Status: Inactive **End Date:**

Description: The catch tank is a 41,640 liter (11,000 gallon) stainless steel lined catch tank located below the four diverter tanks inside the 241-AX-151 Diverter Station. The catch tank received drainage from the diverter tanks, cells and pump pit. The contents of the catch tank could be jetted to diverter tank E or F. The catch tank contains 11,150 liters (2946 gallons) of supernate waste that is anticipated to consist of waste similar to that contained in AX tank farm. The capacity of the catch tank is approximately 12,200 gallons (per RPP-RPT-31102).

The SubSite is Part Of:

Names: 241-AX-152CT; 241-AX-152-CT Catch Tank **Reclassification:** Consolidated (5/3/2006)
Type: Catch Tank **Start Date:** 1/1/1965
Status: Inactive **End Date:**
Description: The site is an underground catch tank. It is constructed of 0.76 meter (2.5 foot) thick concrete walls. The tank walls and floor are lined with stainless steel. The catch tank is under the diverter station.
Location: The 241-AX-152 Catch Tank and Diverter Station are located in the western portion of the 241-AX Tank Farm.
Related Sites/ Structures: The Catch tank is associated with the 241-AX-152 Diverter Station. The diverter station and the catch tank are part of the same structure. The drain line is line V713.
Waste Type: Process Effluent
Waste Description: This unit transfers mixed waste solutions from processing and decontamination operations. Volumes are variable according to specific plant operation. Lead shielding may also be contained inside the diversion box.

The Site Was Consolidated With:

Code: 241-AX-152DS
Names: 241-AX-152DS; 241-AX-152-DS Diverter Station; Line V713; 241-AX-152 Diverter Station

Code: 241-AX-155 **Classification:** Accepted
Names: 241-AX-155; 241-AX-155 Diversion Box; Line V713 **Reclassification:** None
Type: Diversion Box **Start Date:** 1/1/1983
Status: Inactive **End Date:**
Description: The surface features of the diversion box have been sprayed with a weather protective coating.
Location: This 241-AX-155 Diversion Box is located inside the 241-AY Tank Farm, adjacent to the 241-AX/241-AY dividing fence.
Related Sites/ Structures: This unit is associated with the 241-AX, 241-AY and the 241-AZ tank farms and the 241-AX-152 diversion box. Line V713 drains to 241-AX-152.
Waste Type: Process Effluent
Waste Description: The unit transports waste solutions from processing and decontamination operations. Quantities are variable according to specific plant operation. Lead shielding may also be contained inside the diversion box.
Waste Type: Equipment
Waste Description: It is estimated that approximately 50 pounds (23 kilograms) of waste lead is stored in each diversion box.

Code: 241-AY-101 **Classification:** Accepted
Names: 241-AY-101; 241-AY-TK-101 **Reclassification:** None
Type: Double-Shell Tank **Start Date:** 1/1/1971
Status: Active **End Date:**
Description: The unit is composed of a heat-treated, stress-relieved primary steel liner and a nonstressed-relieved secondary steel liner, both inside a reinforced concrete shell. The dome is located

below grade for shielding purposes.

Location: The 241-AY-101 tank is located on the north end of the 241-AY Tank Farm.

Process Description: The tank is used for interim storage of waste generation on the Hanford Facility.

Related Sites/ Structures: Structures associated with this tank include leak detection, monitoring and radiation instrumentation, ventilation systems, and risers

Waste Type: Storage Tank

Waste Description: Dilute complexed waste is characterized by a high content of organic carbon including organic complexants, including: ethylenediaminetetra-acetic acid, citric acid, and hydroxyethyl-ethylenediaminetriacetic acid, being the major complexants used. Main sources of dilute complexed waste in the double shell tank system are saltwell liquid inventory.

Code: 241-AY-102 **Classification:** Accepted

Names: 241-AY-102; 241-AY-TK-102 **Reclassification:** None

Type: Double-Shell Tank **Start Date:** 1/1/1972

Status: Active **End Date:**

Description: The unit is composed of a heat-treated, stress-relieved primary steel liner and a nonstressed-relieved secondary steel liner, both inside a reinforced concrete shell. The dome is located below grade for shielding purposes.

Location: The 241-AY-102 tank is located in the center of the 241-AY Tank Farm.

Process Description: The tank is used for interim storage of liquid mixed waste generated on the Hanford Site.

Related Sites/ Structures: Structures associated with this tank include leak detection monitoring and radiation instrumentation, ventilation systems and risers.

Waste Type: Storage Tank

Waste Description: The unit has received neutralized high-level waste and double-shell slurry feed and is currently a dilute noncomplexed waste receiver tank. Prior to evaporator processing, samples are taken and analyzed for parameters such as visual appearance; percent solids; exotherms or endotherms; total organic carbon; gamma energy spectrum; weight percent water; pH; specific gravity; viscosity; and for the specific ions Al, OH, Cl, CO₃, F, Na, NO₂, NO₃, Pm, PO₄, Pu, SO₄, Sr, Am, and Np. The unit received supernatant consisting of double-shell slurry feed and noncomplexed waste from A and BX tank farms.

Code: 241-AY-151 **Classification:** Accepted

Names: 241-AY-151; 241-AY-151 Diversion Box; 241-AY-151 Pump Out Pit **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1975

Status: Inactive **End Date:**

Description: This unit is an underground, reinforced concrete structure. It contains four PUREX style nozzles.

Location: The 241-AY-151 is located in the southern portion of the 241-AY Tank Farm.

Process Description: This unit was used to transport radioactive waste solutions between storage and process facilities.

Related Sites/ Structures: The unit is associated with single shell Tank Farms 241-A and 241-AX.

Waste Type: Chemicals
Waste Description: The diversion box contains PUREX organic wash, aging PUREX, PUREX acid, and B Plant high level wastes.

Waste Type: Process Effluent
Waste Description: The diversion box transferred liquid process waste between the processing plants and the tank farms. Lead shielding may also be contained inside the diversion box.

Code: 241-AZ VP **Classification:** Accepted
Names: 241-AZ VP; 241-AZ Valve Pit **Reclassification:** None
Type: Valve Pit **Start Date:**
Status: Active **End Date:**

Description: The valve pit surface features include a cement structure extending a few inches above the ground, with white cover blocks. T-handles and instrumentation extend through the cover blocks.

Location: The valve pit is located east of 241-AZ-101, inside the tank farm fence.

Process Description: The 241- AZ Valve Pit distributes waste between the 200 East Area double shell tank farms. The AZ valve pit has transfer lines internal to the AY and AZ Tank Farms (line SN-633 to 241-AY-02A pump pit, Floor Drain to AZ-101, and line SN-632 to 241-AZ-01A pump pit) and external transfer lines (line SN-630 to 241-AN-01A pump pit and line SN-637 to 241-AP-A valve pit). This AZ valve pit is RCRA compliant and is active.

Code: 241-AZ-101 **Classification:** Accepted
Names: 241-AZ-101; 241-AZ-TK-101 **Reclassification:** None
Type: Double-Shell Tank **Start Date:** 1/1/1976
Status: Active **End Date:**

Description: The unit is composed of a heat-treated, stress-relieved primary steel liner and a non-stressed-relieved secondary steel liner, both inside a reinforced concrete shell. The dome is below grade for shielding purposes.

Location: The 241-AZ-101 tank is located near the northeast corner of the 241-AZ Tank Farm.

Process Description: The Double-Shell tank system is used for the interim storage of liquid mixed waste generated on the Hanford facility.

Related Sites/ Structures: The tank contains air lift circulators, heating coils, drains, risers, and ports.

Waste Type: Storage Tank
Waste Description: Tank 241-AZ-101 began service by receiving evaporator waste in 1976. The tank continued to receive evaporator waste until 1977. From 1978 until September 1980, the tank received complexed waste, double-shell slurry feed waste, non-complexed waste, water, evaporator waste, residual liquor, and complexant concentrate waste. The tank received non-complexed waste from October 1980 until January 1984. From 1981 until 1986, the tank received waste

from PUREX. The tank has contained aging waste from February 1984 until the present. The tank is currently an inactive, concentrated waste holding tank that receives only condensate from other aging waste tanks.

Code: 241-AZ-102 **Classification:** Accepted
Names: 241-AZ-102; 241-AZ-TK-102 **Reclassification:** None
Type: Double-Shell Tank **Start Date:** 1/1/1976
Status: Active **End Date:**

Description: The unit is composed of a heat-treated, stress-relieved primary steel liner and a nonstressed-relieved secondary steel liner, both inside a reinforced concrete shell. The dome is below grade for shielding purposes.

Location: The 241-AZ-102 tank is located near the northwest corner of the 241-AZ Tank Farm

Process Description: The double-shell tank system is used for the interim storage of liquid mixed waste generated on the Hanford Facility.

Related Sites/ Structures: This tank contains air lift circulators, heating coils, drains, and nozzles.

Waste Type: Storage Tank

Waste Description: The tank is currently an inactive, dilute receiver tank that receives only condensate from other aging waste tanks. From April 1986 until the present, the tank has contained aging waste. The tank received waste from PUREX from 1986 until 1990. From February 1984 until February 1986, the tank received non-complexed waste. The tank received complexant concentrate waste from 1978 until November 1983. During December 1983 and January 1984, the tank received complexed waste. During 1977, the tank received residual liquor waste. Tank 241-AZ-102 began service by receiving water in 1976 and was labeled as a spare. The tank received evaporator waste from 1976 until 1977.

Code: 241-AZ-151CT **Classification:** Accepted
Names: 241-AZ-151CT; 241-AZ-151 Catch Tank **Reclassification:** Consolidated (5/3/2006)
Type: Catch Tank **Start Date:** 1/1/1977
Status: Inactive **End Date:**

Description: The catch tank is not visible from the surface. The catch tank portion is constructed below the diverter station.

Location: The 241-AZ-151 diverter station and catch tank are located southwest of 241-AZ-102 tank, inside the 241-AZ Tank Farm fence.

Process Description: The 241-AZ-151 Diverter Station structure transfers radioactive solutions, from various processing and decontamination operations, to tank farm tanks and facilities. Multiple transfer lines enter a 189 liter (50 gallon) tank in the diverter station. A spigot from the tank is rotated to engage in one of several pipe terminal openings to complete a desired routing. Containment is provided by the concrete walls, floor and cover blocks. The 241-AZ-151 Catch Tank is located directly below the receiving tank to contain transfer leakage. The catch tank (catch basin) has a concrete floor that slopes to a sump and collects leakage from both the pump pit and diverter room portions of the diverter station.

Related Sites/ Structures: The 241-AZ-151 Diverter Station structure, which includes the diverter station and the catch

Structures: tank, is associated with the 241-AZ Tank Farm tanks and facilities. The catch tank portion is constructed below the diverter station.

Waste Type: Process Effluent

Waste Description: This unit was used for transfer of mixed waste solutions from processing and decontamination operations. In 1994, it contained 15846 liters (4,170 gallons) of waste. In 2000, it contained 8037 liters (2115 gallons). The Tank Waste Summary documents indicate the diverter station and catch basin are active and the liquid volume changes daily. The liquid is pumped to the 241-AZ-102 tank as needed. Lead shielding may also be contained inside the diversion box.

The Site Was Consolidated With:

Names: 241-AZ-151DS; 241-AZ-151-DS Diverter Station; 241-AZ-151 Diverter Station

Reclassification: None

Type: Diversion Box

Start Date: 1/1/1976

Status: Inactive

End Date:

Description: The diverter station is an underground reinforced concrete structure. The catch tank is located under the 241-AZ-151DS Diverter Station (Drawing H-2-67256). It is part of the diverter station structure.

Location: 241-AZ-151 Diverter Station is located southwest of 241-AZ-102 tank, inside the 241-AZ Tank Farm fence.

Process Description: The 241-AZ-151 Diverter Station transfers radioactive solutions, from processing and decontamination operations, to various tank farm tanks and facilities. Multiple transfer lines enter a small, 189 liters (50 gallons) tank. A spigot from the tank is rotated to engage in one of several pipe terminal openings to complete a desired routing. Containment is provided by the concrete walls, floor and cover blocks. The 241-AZ-151 Catch Tank is located directly below the receiving tank to contain transfer leakage. The catch tank is located under the 241-AZ-151DS Diverter Station (Drawing H-2-67256). It is part of the diverter station structure.

Related Sites/Structures: The 241-AZ-151 Diverter Station and catch tank are associated with the 241-AZ Tank Farm, the AZ Loop Seal, and the 241-AZ-151 Catch Tank.

Waste Type: Process Effluent

Waste Description: This unit was used to transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operation. The types of waste received by this unit include: aging waste, concentrated complexant, double-shell slurry feed, and non-complexed waste. In 1994, it contained 15846 liters (4,170 gallons) of waste. In 2000, it contained 8037 liters (2115 gallons). The Tank Waste Summary documents indicate the diverter station and catch basin are active and the liquid volume changes daily.

The Following Sites Were Consolidated With This Site:

Code: 241-AZ-151CT

Names: 241-AZ-151CT; 241-AZ-151 Catch Tank

Code: 241-AZ-152

Classification: Accepted

Names: 241-AZ-152; 241-AZ-152 Diversion Box; 241-AZ-152 Sluice Transfer Box

Reclassification: None

Description: transfer pumps, instrument trees). There are no jumpers or transfer lines that come into the pit. Should any liquid be found in the pit a jet pump could be installed in the pits sump to pump the liquid out.

Code: 216-B-3A	Classification: Accepted
Names: 216-B-3A; B Pond First Expansion Lobe; B Pond Lobe A; West Expansion Lobe	Reclassification: Closed Out (6/27/1995)
Type: Pond	Start Date: 1/1/1983
Status: Inactive	End Date: 1/1/1994

Description: The site is a pond that was used for overflow from 216-B-3. The unit is roughly rectangular with approximately 4.5 hectares (11 acres) of surface area. It is inactive and dry. It was sampled and released from radiological controls with the exception of the percolation trench that is posted as a Soil Contamination Area.

Location: The site is located east of the 200 East Area perimeter fence. It is directly east of 216-B-3 Main Pond.

Process Description: The 216-B-3A was constructed to receive overflow from the 216-B-3 Main Pond due to the increased effluent discharge from the restart of the Plutonium Uranium Extraction (PUREX) plant (202-A). The 216-B-3A Overflow Pond was connected to the 216-B-3 Main Pond by the 216-B-351 Spillway. The spillway was designed with a manually operated slide gate in the headwall. The water flowed from the main pond, through the culvert, down a 0.61-meter (2-foot) wide, concrete-lined ditch, to a fiberglass reinforced 0.3-meter (1-foot) flume, to the overflow pond. The pond operated from October 1983 to January 1984, when the dike between the 216-B-3A and 216-B-3B ponds failed (Occurrence Report #84-02). Prior to the dike failure, the 216-B-3B Pond had never been used. All the discharge from the failed dike was contained in the 216-B-3B Pond. In response to the incident, the 216-B-3A and 216-B-3B Ponds were isolated. Effluent flow to the 216-B-3 Main Pond was reduced. A trench was dug in the 216-B-3A Pond to increase its infiltration rate. The trench measured 182 meters (600 feet) by 9 meters (30 feet) and was 2 meters (6 feet) deep. The debris from the dike failure was removed from the 216-B-3B Pond and a series of trenches were dug to increase its infiltration rate. Both 216-B-3A and 216-B-3B Ponds were fully operational by June 1984. In April 1994, discharges to the main pond and 216-B-3A lobe ceased and all effluent was rerouted to the 216-B-3C lobe via a pipeline.

Related Sites/Structures: The site is associated with the PUREX facility, the 216-B-3 Pond and UPR-200-E-14.

Waste Type: Process Effluent

Waste Description: The site received overflow from the 216-B-3 Main Pond. Potential sources include 221-B steam condensate and process cooling water, 284-E Powerhouse water, 244-CR, 244-AR and 242-A cooling water, 202-A process, condenser, and air sampler vacuum pump cooling water, 202-A chemical sewer, fractionator condensate, and WESF cooling water.

Closure Info: The 216-B-3A lobe was decommissioned and interim stabilized along with the 216-B-3 Main Pond and 216-B-3-3 Ditch. In 1994, after the pond was allowed to dry, the site was surveyed with USRADS and GM/P-11 probe surveys. Surface soil samples and samples from a depth of 18 inches were collected from six locations. The pond was downposted to no posting with the exception of the percolation trench in the bottom of the pond, which was posted as an Soil Contamination Area due to elevated background levels identified using Sodium Iodide detectors. Ten acres (4.0 hectares) was downposted to no posting and one acre (0.4 hectares) at the percolation trench was posted as a Soil Contamination Area.

Code: 216-B-3B	Classification: Accepted
Names: 216-B-3B; B Pond Lobe B; B Pond Second Expansion Lobe; East Expansion Lobe	Reclassification: Closed Out (6/27/1995)
Type: Pond	Start Date: 1/1/1983
Status: Inactive	End Date: 1/1/1995
Description:	The unit is roughly rectangular with approximately 4.4 hectares (11 acres) of surface area. It is dry with a small radiological area in the northwest corner. The 216-3A, 3B and 3C Expansion ponds make up a separate RCRA TSD Unit.
Location:	The site is located east of the 200 Area perimeter fence. It is southeast of 216-B-3 Main Pond, adjacent to the east side of the 216-B-3A overflow pond .
Process Description:	The 216-B-3A and 216-B-3B Expansion Ponds were built in 1983 to receive overflow from the 216-B-3 Main Pond due to increased discharges of effluent from the restart of PUREX. In January 1984, the dike between the 216-B-3A and 216-B-3B ponds failed. Prior to the dike failure, the 216-B-3B Pond had never been used. All the discharge from the failed dike was contained in the 216-B-3B Pond. In response to the incident, the 216-B-3A and 216-B-3B Ponds were isolated. Effluent flow to the 216-B-3 Main Pond was reduced. A trench was dug in the 216-B-3A Pond to increase its infiltration rate. The trench measured 182 meters (600 feet) by 9 meters (30 feet) and was 2 meters (6 feet) deep. The debris from the dike failure was removed from the 216-B-3B Pond and a series of trenches were dug to increase its infiltration rate. Both 216-B-3A and 216-B-3B Ponds were fully operational by June 1984. Although 216-B-3B was considered an active pond, it never received any effluent with the exception of the 216-B-3A dike failure incident.
Waste Type: Process Effluent	
Waste Description:	The 216-B-3A and 3B Expansion Lobes were constructed in 1983 to receive increased discharges from the 216-B-3 Main Pond due to the increased water volume from the restart of the PUREX Plant. A dike between the 216-B-3A and 3B ponds failed in January of 1984. The discharge from the failed dike was contained with the 216-B-3B lobe. Prior to the dike failure the 216-B-3B lobe had never received any effluent. In response to the incident, the 3A and 3B lobes were isolated and trenches were dug in the bottoms of the expansion ponds to increase infiltration rates. The 216-B-3B lobe was taken out of service in May of 1985. It remained potentially active until it was clean closed in June of 1995.

Code: 216-B-3C	Classification: Accepted
Names: 216-B-3C; B Pond Lobe C; B Pond Third Expansion Lobe	Reclassification: Closed Out (6/27/1995)
Type: Pond	Start Date: 1/1/1985
Status: Inactive	End Date: 1/1/1997
Description:	The unit is a rectangular shaped pond with approximately 17 hectares (41 acres) of surface area. It was excavated into a very coarse gravel layer with a very high percolation rate. It contained eight parallel trenches that ran in a north-south direction, extending the entire length of the pond. An area on the east side of the pond has been backfilled and surface stabilized. It is posted as an Underground Radioactive Material Area. The remainder of the pond is posted as a Contamination Area.
Location:	The site is located east of the 200 East Area perimeter fence and southeast of the 216-B-3 Main Pond.
Process	The 216-B-3C Lobe was constructed in 1985 to accommodate the increased effluent flow to the

Description: B Pond complex due to the decommissioning of the 216-A-25 (Gable Pond). From 1985 to 1994, the site received overflow from the 216-B-3 Main Pond. In 1994, when the 216-B-3-3 Ditch and the 216-B-3 Main Pond sites were decommissioned, effluent was routed directly to the 216-B-3C Pond via a pipeline. The pond received diminishing amounts of effluent until 1997, when the last remaining effluent was permanently diverted to the 200 Area Treated Effluent Disposal Facility.

Related Sites/ Structures: The site is associated with the PUREX facility, 216-B-3 Main Pond, 216-B-3A Lobe, 200-E-126-PL pipeline and the 200 East Powerhouse Ditch.

Waste Type: Process Effluent

Waste Description: The site received non-RCRA regulated waste water consisting of steam condensate and cooling water.

Code: 216-B-56

Classification: Accepted

Names: 216-B-56; 216-B-56 Crib

Reclassification: Rejected (1/25/2000)

Type: Crib

Start Date:

Status: Inactive

End Date:

Description: The site is enclosed with post and chain and labeled "crib". There are no radiological postings. A site visit on July 29, 1999, found the site surrounded by post and chain and labeled "CRIB". Three risers are visible in the center of the crib. Most of the site soil with some grasses and rabbit brush growing on the surface. There is no evidence that any stabilization has taken place. The pipeline connection to the unit was not installed. A pipe exits the ground south of the crib and extends vertically above grade approximately 0.9 meters (3 feet). The vertical pipe is labeled 'end of stub.' Well 299-E28-14 (well id A6792) is located northwest of the crib's southwest corner.

Location: The crib is located northeast of the 221-B Building, north of 7th Street and south of 216-B-59 and 216-B-59B Basins.

Process Description: Originally, the site was constructed to receive organic waste from 221-B (B-Plant). The pipeline connection to the site was never installed because of a change in disposal practices. Organic waste disposal to the ground was stopped, so this crib was never activated.

Related Sites/ Structures: Within the crib structure, there are two 20.3 centimeter (8 inch) diameter liquid level gauge wells constructed of steel with galvanized metal caps. These wells are about 4.6 meters (15 feet) long and extend 0.9 meters (3 feet) above grade. These monitoring wells are located on each side of the pipe that runs the length of the crib. There is also a 10.2 centimeter (4 inch) vent pipe, 4.6 meters (15 feet) long rising from the north end of the distributor pipe and extending 1.2 meters (4 feet) above grade. The site was planned to be connected by a steel pipeline to 241-B-154 Diversion Box, but it never was. The crib was constructed with a side slope of 1:1.5. The crib was constructed with 1.2 meters (4 feet) of 1.9 - 3.8 centimeter (0.75 - 1.5 inch) gravel at the bottom of the crib, followed by 0.4 meters (1.25 feet) of 0.64 to 1.3 centimeter (0.25 to 0.5 inch) gravel, followed by a membrane barrier covered by sand. A membrane barrier was placed over the gravel and 0.61 meters (2 feet) up the sides of the crib. The site was then backfilled. A perforated 10.2 centimeter (4 inch) vitrified clay pipe runs the length of the crib 0.9 meters (3 feet) above the bottom. The site was associated with 221-B (B-Plant).

Waste Type: Process Effluent

Waste Description: The site was built but never used. No inventory is listed for the crib.

Code: 216-B-61	Classification: Accepted
Names: 216-B-61; 216-B-61 Crib	Reclassification: Rejected (1/25/2000)
Type: Crib	Start Date: 1/1/1968
Status: Inactive	End Date:
Description:	The site is a backfilled crib that has never been used. It appears as a vegetated field. Boreholes, sampling, drawings, and process knowledge show that the crib was never used. The surface had been posted as a Contamination Area. The contamination is assumed to be the result of wind-blown contamination from adjacent areas (see sitecode 200-E-105). The contamination and the Contamination Area postings have been removed. The site is technically considered a Radiologically Controlled Area (RCA), because the 200 East Area perimeter fence is posted RCA. The crib is located inside the perimeter fence.
Location:	The unit is 152 meters (500 feet) northwest of 241-BY Tank Farm and 61 meters (200 feet) south of 12th Street.
Process Description:	The crib was built to receive intermediate level process condensate from the ITS #1 unit (located in the 241-BY Tank Farm) when the 216-B-50 Crib reached its radionuclide capacity. However, the 216-B-61 crib was never used. A 0.6 meter by 0.6 meter by 0.3 foot (2 foot by 2 foot by 1 foot) thick concrete pad was laid in the crib bottom. The crib was filled with 122 cubic meters (160 cubic yards) of 1.9 to 7.6 centimeter (0.75 to 3 inch) gravel. 279 square meters (3,000 square feet) of plastic membrane barrier were laid over the gravel. 22 cubic meters (30 cubic yards) of sand were laid over the membrane. A gage well constructed of vitrified clay 20 centimeters (8 inches) in diameter and 3.96 meters (13 feet long) extended from the crib bottom to 0.6 meters (2 feet) above grade. This vent pipe has a filter on top of the pipe. The bottom 0.6 meters (2 feet) of the pipe are perforated. A 10.2 centimeter (4 inch) diameter perforated pipe runs the length of the crib, 0.3 meters (1 foot) above the bottom of the crib.
Related Sites/ Structures:	The surface of the crib and an extended area to the south had been posted as a Soil Contamination Area (SCA). The posted SCA is WIDS site 200-E-105. The pipeline associated with this crib is sitecode 200-E-181-PL. The length of the pipeline that leads from the waste line toward the crib is 268 meters (880 feet) long, 10 centimeters (4 inch) diameter carbon steel and was designed for a waste flow up to 45.4 liters (12 gallons) per minute with equal distribution over the crib area. However, the final 60 meters (200 feet) and the tie-in connecting the 216-B-61 Crib pipeline to the waste transfer line were never installed (per 1973 drawing H-2-34522, Rev. 2). Groundwater wells 299-E33-25 and 299-E33-26 were originally drilled for the purpose of monitoring 216-B-61 Crib waste.
Waste Type:	Steam Condensate
Waste Description:	This crib was built to receive condensate from the ITS (In Tank Solidification) unit, but never received any waste. It was never used.

Code: 217-B NU	Classification: Accepted
Names: 217-B NU; Elementary Neutralization Unit/217-B Building; 217-B Neutralization Unit	Reclassification: None
Type: Neutralization Tank	Start Date: 1/1/1993
Status: Inactive	End Date:
Description:	The site is a structural steel frame building with corrugated asbestos/cement siding, and a concrete slab. The site has one room containing the deactivated demineralizer, chemical

regeneration tanks, and piping. Entrances to this unit have been sealed.

- Location:** The 217-B Building is directly north of the 221-B Canyon and northeast of 271-B.
- Process Description:** The building is currently inactive because a new ion pure system was installed in 271-B during 1993. From 1985 to 1993, the building used an Illinois water treatment demineralizer system to provide demineralized water to the B Plant and Waste Encapsulation and Storage Facility. The systems resin was depleted in 1993. Sulfuric acid and nitric acid were used to regenerate the ion exchange columns.
- Related Sites/ Structures:** Structures associated with this site include supply and return water lines, blanked steam supplies, and the demineralizer equipment.
- Waste Type:** Asbestos (non-friable)
- Waste Description:** The building has concrete/asbestos corrugated siding.
- Waste Type:** Chemicals
- Waste Description:** Demineralizer operations generated waste when the ion exchange columns were regenerated. Sodium hydroxide was used to regenerate the anion column, while sulfuric acid was used to regenerate the cation column. The sulfuric acid was neutralized with sodium carbonate, while the sodium hydroxide was neutralized with monosodium phosphate prior to discharge the 216-B-63 trench.

-
- Code:** 221-B NANU **Classification:** Accepted
- Names:** 221-B NANU; 221-B Nitric Acid Neutralization Unit; 221-B Elementary Neutralization Unit for Nitric Acid **Reclassification:** No Action (10/6/2005)
- Type:** Neutralization Tank **Start Date:** 1/1/1980
- Status:** Inactive **End Date:** 1/1/1997
- Description:** This site had been a blue plastic, acid neutralization tank. The tank has been excessed.
- Location:** The tank was located inside the 211-BA building, north of 221-B.
- Process Description:** Chemical waste from 221-B and 217-B flowed through underground chemical sewer lines to a lift station located near the southwest corner of 211-BA. The effluent was pumped out of the chemical sewer and into 211-BA building where it was diverted either to the acid neutralization tank or the sodium hydroxide neutralization tank to adjust the pH levels. The neutralized waste was released back into the underground chemical sewer line for disposal.
- Related Sites/ Structures:** The site was associated with the B Plant chemical sewer.
- Waste Type:** Process Effluent
- Waste Description:** Approximately 400 gallons (1,500 liters) per year of 1 Molar nitric acid is neutralized with 350 pounds (160 kilograms) per year of sodium carbonate.

-
- Code:** 221-B SDT **Classification:** Accepted
- Names:** 221-B SDT; 221-B Settle and Decant Tank; 221-B-8-1 and 221-B-8-2; 221-B-TK-8-1 and 221-B-TK-8-2; B Plant Settle and Decant Tank **Reclassification:** None

means of entry. The cell is currently used for contained storage.

Location: Cell 4 is located near the west end of the B Plant Canyon.

Process Description: This cell is now used to store drums of solid mixed waste (with no free liquids).

Related Sites/ Structures: Structures associated with this cell include: the hoist and cover blocks, the canyon deck, and any equipment or piping which remains in the cell.

Waste Type: Misc. Trash and Debris

Waste Description: Material stored in this area includes light bulbs with lead solder, and other solid mixed waste.

Code: 221-B-WS-2 **Classification:** Accepted

Names: 221-B-WS-2; B Plant Waste Piles **Reclassification:** None

Type: Storage **Start Date:** 1/1/1945

Status: Inactive **End Date:**

Description: The TPA and the RCRA Part A Permit Application classify this site as a waste pile that lies within a containment building. The site encompasses solid mixed waste (jumpers, counterweights, failed process equipment, and shielding) that is stored in cells and on the canyon deck.

Location: The location of the waste piles include the 221-B Canyon Deck and Cells.

Process Description: The designation of this area as a Treatment Storage or Disposal Unit is intended to satisfy requirements for the storage of solid/mixed waste within the canyon cells and on the canyon deck.

Related Sites/ Structures: Since this storage site includes the canyon deck and most of the cells, there are many structures associated with the site. Associated structures include: piping, tanks, cells, overhead equipment, tools, instrumentation, and process materials.

Waste Type: Equipment

Waste Description: This waste includes lead shielding in the cells and on the canyon deck.

Description:

Waste Type: Equipment

Waste Description: This waste includes jumpers, and other failed or isolated process equipment which may have been contaminated with wastes from fuel processing.

Code: 221-B-26-1 **Classification:** Accepted

Names: 221-B-26-1; 221-B-TK-26-1; B Plant Radioactive Organic Waste Solvent Tank 1 **Reclassification:** None

Type: Storage Tank **Start Date:** 1/1/1945

Status: Inactive **End Date:**

Description: This tank is a stainless steel cylindrical tank.

Location: The tank is located on the south side of cell 26.

Process Description: This tank was used to support the solvent extraction and organic treatment process that was performed at the B Plant to recover strontium from PUREX acidified sludge.

Related Sites/ Structures: Structures associated with the tank include piping and fittings, the other cell 26 tanks, equipment, and instrumentation.

Waste Type: Chemicals

Waste Description: This tank received organic mixed waste from the solvent extraction process of the strontium recovery program. The tank is maintained ready for use on an as needed basis.

Code: 221-B-27-2 **Classification:** Accepted

Names: 221-B-27-2; 221-B-TK-27-2; 221-B Tank 27-2 **Reclassification:** None

Type: Storage Tank **Start Date:**

Status: Inactive **End Date:**

Description: The tank is only visible if the cell cover blocks are removed. The tank is a 7,571 liter (2000 gallon) stainless steel tank.

Location: The tank is located inside cell #27, inside the 221-B Plant canyon.

Process Description: The 221-B-27-2 tank is part of the organic mixed waste storage system that was contained in cells 26, 27, 28, 29 and 30 of the B Plant canyon. The organic waste was used in the recovery and purification of strontium and cesium.

Waste Type: Process Effluent

Waste Description: The tank contained organic mixed waste used in the recovery and purification of strontium and cesium.

Code: 221-B-27-3 **Classification:** Accepted

Names: 221-B-27-3; 221-B-TK-27-3; B Plant Radioactive Organic Waste Solvent Tank 2 **Reclassification:** None

Type: Storage Tank **Start Date:** 1/1/1963

Status: Inactive **End Date:**

Description: This tank is a carbon steel cylinder, with an internal cooling coil and 17 nozzles on the head of the tank.

Location: The tank is located in the northeast corner of cell 27.

Process Description: This tank was used to support the solvent extraction and organic treatment process that was performed at the B Plant to recover strontium from PUREX acidified sludge.

Related Sites/ Structures: Structures associated with this tank include piping and fittings, the other cell 27 tanks and equipment, and instrumentation.

Waste Type: Chemicals

Waste Description: This tank received organic mixed waste from the solvent extraction process of the strontium recovery program. The tank contained waste as of September 1996.

Code: 221-B-27-4 **Classification:** Accepted

Names: 221-B-27-4; 221-B-TK-27-4; B Plant Radioactive Organic Waste Solvent Tank 3 **Reclassification:** None

Location: This building lies south of the 221-B Canyon, and west of 222-B Laboratory.

Process Description: The 224-B Concentration Facility received dilute plutonium nitrate solution that was the product of the 221-B Bismuth Phosphate process. This facility purified and reduced the volume of product. After concentration, the plutonium nitrate product was then shipped from 224-B to the 231-Z Isolation Building. the Plutonium Concentration Facility, concentrating the liquid output from the plutonium separations plant from 1,249 liters to 30 liters. The concentration took place in six radiologically contaminated process cells (Cells A, B, C, D, E, & F), located in the southeastern 1/3 of the 224-T building. The cells contained various tanks and piping. Cells A, B, D, and E contained a 40 inch centrifuge on a platform. Cell C is a pit that connects to the underground pipe tunnel from Sections 13 & 14 of 221-T. Cell F was "L" shaped and included an office and a glass enclosure where partial finished product was collected for transfer to 231-W. The contaminated process cell equipment was flushed when the process was terminated (1960's). The amount of radiological or regulated material remaining within the process cells and piping is unknown. The plutonium concentration process was identical to the concentration process done at 224-T in 200 West Area. A thorough radiological characterization was done of the 224-B Hot Cells in 1985. An inventory of radioactive material remaining in the 224-B hot cells, based on average measurements, estimated 1.1 curies of cesium-137, 22 curies of strontium-90, 3.7 curies of cobalt-60, 5 curies of americium-241, 31 curies of plutonium-239 and 2 curies of other plutonium isotopes.

Related Sites/ Structures: Structures associated with this facility include tanks, agitators, process equipment, and instrumentation.

Waste Type: Chemicals

Waste Description: The building contains residual processing agents. Hazardous constituents include mercury, polychlorinated biphenyls, cleaning agents, and radionuclides (including plutonium, americium, strontium, cobalt, and cesium). An inventory of radioactive material remaining in the 224-B hot cells (1985), based on average measurements, is estimated to be 1.1 curies of Cs-137, 22 curies of Sr-90, 3.7 curies of Co-60, 5 curies of Am-241, 31 curies of Pu-239 and 2 curies of other plutonium isotopes.

Waste Type: Equipment

Waste Description: This facility contains radiologically contaminated equipment, and concrete surfaces.

Code: 226-B HWSA	Classification: Accepted
Names: 226-B HWSA; 226-B Hazardous Waste Storage Area	Reclassification: Rejected (9/6/2000)
Type: Storage Pad (<90 day)	Start Date: 1/1/1985
Status: Active	End Date:

Description: Documents dated 1987 and 1992 described the site known as the 226-B Hazardous Waste Storage Area (HWSA) as a concrete pad surrounded by a light chain barricade. It was posted with "226-B Hazardous Waste 90-Day Staging Area", and "PCB 30 Day Storage" signs. Additional information was provided by Ron Weissenfels (B-Plant Engineer) in 1998 that described the area as temporarily being three separate storage pads located north of B-Plant, and adjacent to the 211-BA and 219-B Buildings. However, a field visit in April 2000 found only one small, locked metal shed labeled "226-B<90 Day Storage - Dangerous/Hazardous Waste". Correspondence with the responsible contractor confirmed that the three pads were consolidated into one location prior to the area being turned over to WESF (Waste Encapsulation and Storage Facility).

Location: The pad is located north of B Plant, north of 211-BA and 219-B Buildings

Process Description: This staging area provides temporary (less than 90 days) storage for hazardous wastes. The first waste receipt was on May 30, 1985.

Related Sites/ Structures: This storage pad is associated with B Plant activities and 200-E-32.

Waste Type: Chemicals

Waste Description: The staging areas temporarily store a wide variety of dangerous waste. Examples of waste previously stored here include: halogenated hydrocarbons, caustic liquids, acids, solvents, toxic chemicals and coolants and PBC's.

The Following Sites Were Consolidated With This Site:

Code: 200-E-32

Names: 200-E-32; 226-B Pad East Side 90-Day Waste Accumulation Area

Code: 242-B

Classification: Accepted

Names: 242-B; 242-B Evaporator

Reclassification: None

Type: Evaporator

Start Date: 1/1/1951

Status: Inactive

End Date: 1/1/1985

Description: The 242-B Building was used during the Hanford production plant era as a waste tank supernate evaporation facility, a twin to 242-T. Originally, the building consisted of three sections. The north section contained the evaporator vessel (a steam-heated pot evaporator) along with the associated process components. The center section consisted of the control facilities (plutonium laboratory, storage room, change room, office area, and lunch room). Later, the building was a research facility operated by PNL-BNW. Use of the building as an evaporation facility was terminated in 1962. At that time, Rooms 1 and 2 of 242-B were cleaned up to some extent and the waste evaporation equipment was removed and buried. The 242-BL Building was then constructed (attached to 242-B) as a cask loading facility. A fuel element rupture test loop was installed in Room 2 of 242-B. The buildings were used in a program involving N Reactor fuel elements. The fuel element would be sent to the 327 Building where manmade defects were introduced in the fuel element. It would then be shipped to 242-BL and heated in a rupture loop (located in 242-B) to cause failure. The fuel element would then be returned for examination at the 327 Building. This program was phased out in 1970. The 242-BL Building has not been used since that time. A significant amount of equipment remains in the facility including the hydrostatic pump, heaters, control panels, rupture test loop, and associated piping. From 1970 through 1980s, the 242-B Building, except Rooms 1 and 2, was used for research on radioactive particles. This work consisted of simulating accidents related to airborne releases of radioactive material using depleted uranium as the particle. A wind tunnel and radioactive aerosol release tanks remain installed in Room 4 of the facility. The facility remains in a shutdown condition. The following sections describe as of September 1998. 242-B Basin The basin is 3.1 meter by 2.4 meter by 3.1 meter deep (10 feet by 8 feet by 10 feet deep). It has a full capacity of 22,720 liters (6,000 gallons). In September 1998, the basin was 50% full. The basin was vacuumed in 1972, using the buffalo pump, located in the northwest corner of the building, to pump the sump in the bottom of the basin. The effluent was directed to the floor drain west of the basin, which was connected to tank farms. There are no drains in the basin. Water is contaminated with cesium-137, strontium-90, and miscellaneous fission products from formerly held N-Reactor fuel. Most contamination is believed to be trapped on scale on the walls. There is a hoist and cable above the pool, that are also likely contaminated. Pool water is otherwise fairly clean (past analysis indicate about 93 microcuries per liter of cesium-137) with only dust blown in over the years. Some pool tools are in the basin and are propped up in the corner. The water in the basin was sampled in July 1995 (SAF-S5-071, sample number S5071-01 and R7850). 242-

B Hallway A corridor or hallway connects the B and BL Buildings. Within the hall are remnants of a water purification system plus an empty hydrogenated water tank [2271 liters (600 gallons) - stainless steel]. Hydrogen gas cylinders external to the building were used to charge the tank. There is a tank inspection port on the top. The tank is not contaminated. Outside the exit door on the west end of the hallway there is a valve handle that was used to open the drain line to the tank farm (to tank 241-B-106). Room 1 Remnants of the old Crud Product Transfer Facility (CPTF) loop (a project supporting C and K Reactors) remain within the room. This was a separate project than the N Reactor fuels project that was done in Room 2. Cobalt-60 used to be stored in casks in this room (storage only). The room contains lots of miscellaneous equipment racks, carts, piping, an old autoclave that stands vertically against the north wall. There is a contaminated sump located next to the west wall that is 0.61 meters by 0.61 meters by 0.76 meters deep (2 feet by 2 feet by 2.5 feet deep). It reads 100 millirads at contact. The sump is dry. The sump serviced a sink and was pumped to a floor drain. It has no drain line in it. Prior to the occupancy of PNL, there was fixed contamination on the floors. Some floors were chipped up and new concrete poured. Other spots were covered with Amercoat paint. The entire room is a potential surface contamination area. On the south side of Room 1, there are remnants of a breathing air compressor and some ventilation ducts. Room 2 This room is located in the southeast corner of Room 1 and is constructed of concrete blocks. The room contained the N Reactor rupture test loop. It is radiologically contaminated and currently contains some fixed piping and a metal filter that has lead brick shielding surrounding it. Some N Reactor steam tubes are lying on the floor behind the shielding. There is a drain in the northwest corner. All building drains on this side of the facility were tied together and went to the tank farm (241-B-106). These are no longer connected. The room may also contain piping to/from a high pressure pump. HEPA filters are in the ceiling of this room. Room 3 Room 3 is a former storage area that is now empty. The upstairs part of the room contains furniture and empty shelving. Under the hood located next to the south wall, there are sheets of lead shielding covering fixed contamination that was residual after the original evaporator equipment was removed and the floors re-cemented. Room 4 The room was last used as the Radioactive Aerosol Release Laboratory (RARL). It contains the 3.1 meter (10 foot) diameter process vessel, steel waste tanks, a poly waste tank (all empty), and lots of miscellaneous material, such as hoods, ductwork, HEPA filters, sinks, electrical and instrument controls and miscellaneous equipment from PNL aerosol studies with depleted and natural uranium. Fixed contamination from prior operations (before PNL occupancy) remains. The interior of the tanks is likely contaminated with low levels of uranium. There are no floor drains in this side of the building. There is a sump under the large 3.1 meter (10 foot) diameter tank. Outside the room to the west is the inlet and exhaust ductwork to support the aerosol tests. Possible uranium contamination should be expected. HEPA filters are also in place. Room 5 Room 5 is the former control room when the building was used as an evaporator. Recently, the room was used for storage. It contains piping with asbestos lagging, some old shelves, and a wooden storage cabinet. Room 6 Room 6 has a hood that was used by PNL for corrosion studies on unirradiated fuel. The hood is now empty. Under the sink, there are capped off drain lines that likely went to the floor drain system. Room 7 Room 7 is a former storeroom that is now empty. Room 8 Room 8 is a store room that is empty. Room 9 Room 9 is the former kitchen/lunch room. It is now empty. The sanitary drains from this room and the restroom are out of service. They used to go a crib/drainfield east of the facility. Room 10 Room 10 is the restroom. It is out of service. Room 11 Room 11 is an equipment room that contains a water heater. It is out of service. Roof The building was re-roofed in 1969 and repaired in 1996. Facility Systems Potable and fire water are isolated to the facility. Electricity remains in service to provide lights during surveillance and maintenance. The drains to the tank farm are isolated via an isolation valve located at the northeast corner of 242-B. The sanitary sewer line to the septic tank is believed to still be connected. The ventilation system is shut down, and all ventilation discharge points are capped. The ballasts in the fluorescent lights may contain polychlorinated biphenyls (PCBs). The batteries have been removed from the emergency lights. No accountable property remains in the facility.

Location: 242-B Evaporator is located on the north side of the 200 East Area, north of the 221-B (B Plant)

building. It is about 21.3 meters (70 feet) south of tank 241-B-104, south of the 241-B Tank Farm fence.

Process Description: The 242-B Facility is also called the former first cycle evaporator building and former control building. The evaporator was installed to evaporate cladding/first cycle waste and reduce the waste volume. In the 1960's, PNL began using the facility as an Aerosol Research Facility. Studies such as free fall of powders and liquids and the burning of various types of materials were conducted.

Related Sites/ Structures: 242-B Evaporator interconnected with the following 242-B building components: cyclone stainless steel catch tank (75 gallons/284 L), cyclone separator, condenser, two catch tanks (4,185 gallons/15,840 L), feed tank (4,185 gallons/15,840 L), two pre-heaters (75 gallons/284 L). Waste was also directed to the following: 241-B-152, 241-B-154, 241-BR-152, 242-B-151, 241-C-152 diversion boxes; 241-B-104, 241-B-105, 241-B-106, 241-B-107, 241-B-108, 241-B-109, 241-C-109 single shell tanks; 241-B Retention Basin; 216-B-37 retention trench; 216-B-11A and 216-B-11B reverse wells. This site is also associated with the 2607-E9 septic tank and tile field. Additionally, the site is associated with the 242-BL, Cask Loadout Facility.

Waste Type: Equipment

Waste Description: Until October 1954, the treatment unit received byproduct cake solution and waste solution from the first decontamination waste cycle. This contained ~10% of original fission product, 1% Plutonium, and the remainder of miscellaneous chemicals. The major chemical component was bismuth phosphate. Over its active life, the unit processed 7,172,000 gallons (27,146,020 L) of waste.

Waste Type: Soil

Waste Description: Soil contamination exists external to the facility, a historical legacy because of diverter box failure from the tank farm operations in the nearby 241-B Tank Farm. Tank 241-B-103 historically would "burp" and contaminate the surroundings. The 207-B basin also was known to have "upsets" which led to field contamination in the general area.

Code: 200-E PAP

Classification: Accepted

Names: 200-E PAP; 200-E Powerhouse Ash Pit and Ash Disposal Pile; Ash Basin

Reclassification: Rejected (5/21/2008)

Type: Coal Ash Pit

Start Date: 1/1/1943

Status: Inactive

End Date: 1/1/1998

Description: The ash pit is a large open depression located east of the 284-E Powerhouse. The Ash Disposal Pile is a large mound of material dredged, over years of operation, from the Ash Pit.

Location: The Ash Pit is located inside 200 East Area, south of 4th Street and 30 meters (100 feet) east of the 284-E Powerhouse. The Ash Disposal Pile is located east of the Ash Pit.

Process Description: The site received ash from the 200 East Powerhouse. The powerhouse consisted of three coal fired boilers that were used to generate steam for the 200 East Area. An ash and water slurry was produced when the ash was sluiced from the powerhouse. The slurry was placed in the 200 East Powerhouse Ash Pit. When the ash pit became full, heavy equipment was used to remove the ash from the pit and place it in the Ash Disposal Pile, located east of the Ash Pit. The ash pit is a large basin divided into two parts by an earthen dam. Ash slurry could be directed to either compartment. The compartments were used alternately to allow one side to dry while the other was being filled. The rate of ash generation was approximately 9,480 cubic yards per year (7252 cubic meters per year) when the powerhouse was active. The pit capacity was approximately 81,020 cubic yards (61980 cubic meters) of ash. The dried ash was removed (pushed with bull dozers) periodically from the ash basins and placed in the eastern portion of

the Ash Pit (known as the disposal pile). As of April 2000, the remaining ash in the pit and disposal pile is estimated to be less than a meter deep.

Related Sites/ Structures: This pit received ash from the 284-E Powerhouse.

Waste Type: Ash

Waste Description: A waste determination of the Hanford Site 200 Area steam plant ash was performed in the early 1990s. The coal ash waste stream was determined to be nondangerous. Samples were analyzed using the TCLP (Toxicity Characteristic Leaching Procedure), and all were below the regulatory limits. Eleven sample results were also reported for pH: the results ranged from 7.66 to 11.91, with an average of 9.27. The second and third highest pH results were 10.09 and 9.94.

The rate of ash generation was approximately 9,480 cubic yards per year (7252 cubic meters per year) when the powerhouse was active. The pit held approximately 81,020 cubic yards (61980 cubic meters) of ash.

Code: 200-E-3 **Classification:** Accepted

Names: 200-E-3; Paint/Solvent Dump; Toluene Dump Site **Reclassification:** Consolidated (5/6/2004)

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site consists of an area inside a large depression. The bottom of the pit has hard pan type soil, while the sides are gravel and sand. Asphalt and other debris are on the sides of the road berm. There is no visual evidence of the dumping.

Location: The Waste Information Data System (WIDS) Information Form submitted on September 3, 1992 states the location is a pit adjacent to a berm on the north end of the 241-AN Tank Farm and west of Canton Avenue inside 200 East Area.

Release Description: There are two reports of releases to the pit north of 241-AN Tank Farm. In 1991, it was reported that approximately 39 liters (10 gallons) of toluene was dumped inside the pit during the summer of 1984 or 1985. In 1995, two ICF Kaiser painters reported disposing of liquid paint waste to the ground inside the pit north of 241-AN Tank Farm. They recalled dumping approximately 95 liters (25 gallons) of liquid in one visit and another 95 liters (25 gallons) in a second visit. In 1996, a visit to the pit with one of the painters verified the pit north of 241-AN Tank Farm, just west of Canton Ave. as the dumping site location. He indicated the area in the southeast portion of the pit as the dump site. The area effected by the chemical dumping measured approximately 9 meters by 9 meters (30 feet by 30 feet).

Waste Type: Chemicals

Waste Description: The waste dumped into the pit included approximately 229 liters (60 gallons) of paint wastes like toluene, solvents, and methyl ethyl ketone .

The Site Was Consolidated With:

Code: 200-E-10

Names: 200-E-10; 200-E-3 Toluene Dump Site; Paint/Solvent Dump South of Sub Trenches

Code: 200-E-5 **Classification:** Accepted

Names: 200-E-5; 2607-E2; 2607-E2 Septic Tank & Tile Field **Reclassification:** None

Status: Inactive **End Date:** 1/1/1995

Description: The chemical demolition site is no longer marked or posted.

Location: The site is in the northeast corner of 200 East Area, inside the 200-E Burn Pit. It is east of the 218-E-8 Burial Ground.

Process Description: The site was used as a thermal treatment (detonation) pit for excess shock sensitive or potentially explosive chemical waste in 1984.

Related Sites/ Structures: The site is associated with the 200 East Burn Pit (200-E BP).

Waste Type: Chemicals

Waste Description: This unit had detonations of the following chemicals: 1984: Isopropyl Ether 8 L (2.1 gal), 1,4-Dioxane 1,250 mL (0.33 gal), 2-Butoxyethanol 19 L (5.0 gal), Methyl Ethyl Ketone 177 mL (0.05 gal), Hydrogen Peroxide 11.36 L (3.0 gal), Dioxane 946 mL (0.25 gal), Sodium Azide 473 mL (0.12 gal), Phosphoric Acid 189 L (0.05 gal); 1985: None; 1986: None.

Code: 200-E-9 **Classification:** Accepted

Names: 200-E-9; 2607-EN; 2607-EN Septic Tank/Pump Station; 2727-E Septic System **Reclassification:** None

Type: Septic Tank **Start Date:**

Status: Active **End Date:**

Description: The above ground area is posted "Septic Tank 2607-EN". The area is surrounded with metal fence posts and chain. Three concrete and one PVC cylinders (manholes) with covers protrude above grade in the underground tank area. The surface is disturbed and covered with Russian thistle, cheat grass, and other weedy species. Two "Sanitary Tile Field" signs are located south of the septic tank.

Location: The site is 75 feet south of the southwest corner of the 2727-E Safeguards and Security Building (which is in 200 East Area on 4th Street).

Process Description: Receives sanitary sewage from 2727-E Safeguards and Security Building.

Related Sites/ Structures: The 2727-E building was serviced by this septic system.

Waste Type: Sanitary Sewage

Waste Description: Sanitary sewage from 2727-E Safeguards and Security Building

Reported Date: August 16, 1995

Code: 200-E-10 **Classification:** Accepted

Names: 200-E-10; 200-E-3 Toluene Dump Site; Paint/Solvent Dump South of Sub Trenches **Reclassification:** Rejected (5/13/2008)

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: A site visit in 1997 identified a large gravel depression north of 241-AN Tank Farm. The site consists of an area within this large depression. The bottom of the depression has hard pan type soil, while the sides are gravel and sand. Asphalt and other debris are on the sides of the road

berm. Another site visit in May 2004 found the appearance has not changed. There is no definite visual evidence of liquid dumping. The actual dumping area is not marked or posted.

Location: The site is located north of 241-AN tank farm and west of Canton Avenue inside the 200 East Area.

Release Description: In 1991, it was reported that approximately 39 liters (10 gallons) of toluene was dumped inside the pit north of 241-AN Tank Farm during the summer of 1984 or 1985. In 1995, two ICF Kaiser painters reported disposing of liquid paint waste to the ground inside the pit north of 241-AN Tank Farm. They recalled dumping approximately 95 liters (25 gallons) of liquid in one visit and another 95 liters (25 gallons) in a second visit. In 1996, a visit to the pit with one of the painters verified the pit north of 241-AN Tank Farm, just west of Canton Ave. as the dumping site location. He indicated the place in the southeast portion of the pit as the area effected by the dumping. It measured approximately 9 meters by 9 meters (30 feet by 30 feet).

Waste Type: Chemicals

Waste Description: The waste dumped into the pit included approximately 229 liters (60 gallons) of paint wastes like toluene, solvents, and methyl ethyl ketone. CERCLA reportable quantities are listed at 40 CFR 302, in Table 302.4. The RQ for toluene is 1000 lbs. There is no RQ listing for paint. The reported disposal at 200-E-10 was 25 gallons (twice) = 50 gallons, or about 400 pounds. Conservatively estimating the paint as 100% toluene, the disposal was less than the CERCLA RQ. Therefore, the release was not (is not) a threat to human health and the environment

The Following Sites Were Consolidated With This Site:

Code: 200-E-3

Names: 200-E-3; Paint/Solvent Dump; Toluene Dump Site

Code: 200-E-11

Classification: Not Accepted

Names: 200-E-11; Diesel Oil Spill at BX-BY Tank Farm

Reclassification: None

Type: Unplanned Release

Start Date: 1/1/1995

Status: Inactive

End Date: 1/1/1995

Description: The site is a spill of non-regulated diesel oil on August 7, 1995. The oil and soil were excavated and the site backfilled by September 7, 1995.

Location: The incident occurred just outside the fence directly west of tanks BY-112 and BY-111.

Release Description: A fuel truck driver on his daily refueling rounds discovered a leak of diesel oil from a generator. It was discovered that about 75 to 95 liters (20 to 25 gallons) had leaked out of the unit's two 57-liter (15-gallon) tanks. The oil had leaked out of a failed gasket on the fuel suction line between the tank and first fitting. The tanks were cascaded, and thus the fuel from the second tank was siphoned out. An analysis of the fuel was made, and it was determined that the fuel was non-regulated.

Waste Type: Oil

Waste Description: The spill was diesel oil.

Description:

Code: 200-E-12

Classification: Accepted

Names: 200-E-12; Sand Piles from RCRA General Inspection #200EFY95 Item #5

Reclassification: Rejected (1/19/2000)

Type: Laboratory

Start Date:

Status: Inactive**End Date:**

Description: A 1995 site inspection discovered this site and described it as two sandy areas which are a different color sand than the surrounding sand. The two sand piles were approximately 27 meters (30 yards) apart. During a February 1997 visit, an empty, stainless steel tank and a nearby pit were also observed at the site. The tank, labeled "X-12," measured 1.47 meters (58 inches) high and 1.35 meters (53 inches) in diameter. The area has been roped off with steel posts and rope. The sandy areas were approximately 3.7 meters (4 yards) in diameter. The site was visited again on August 26, 1998, for a GPS survey. The two sand piles appeared to have been removed; only traces of the piles remained. Between the remains of the two sand piles were equipment for some sort of experiment. A small pit with deteriorated clear plastic was observed by the "X-12" tank. The experiment equipment consisted of two large polypropylene water tanks, a large rectangular pit and a metal frame set up over the pit. One of the tanks was 2.7 to 3.0 meters (9-10 feet) tall with a 2840 liter (750 gallon) capacity. It was labeled "Non Hazardous River Water" and appeared to be approximately half full. The second water tank was only about 1.5 meters (5 feet) tall and had a larger diameter than the first tank. It was also labeled "Non Hazardous River Water" and appeared to be approximately three-quarters full. There were no volume markings on this tank. The shorter tank was also posted "Experiment in Process, Contact Ray Clayton @ 372-6037." The rectangular pit was approximately 4.6 meters (15 feet) long and 1.5 meters (5 feet) wide and 0.9 meters (3 feet) deep. The bottom of the pit was covered with a tarp and the sides appeared to be covered with plywood. Over the top of the pit was a metal frame suspending a spray device over the pit. The site was revisited on July 26, 1999, in order to confirm the current conditions of the site. The "X-12" tank is still there, sitting on a wooden pallet. The small pit with the deteriorated plastic is there and looks unchanged. The two large polypropylene tanks observed in 1998 are gone. The space where they had been located was occupied by wood debris and PVC pipe. The large rectangular pit has been filled in. What appears to have been the metal frame over the former pit is now lying on the ground to the north. A cylinder of compressed nitrogen is within 2 meters (6.6 feet) of the south sand pile remnant. The cylinder is labeled "For Research Use. Please do not move from this site. POC Fenton Khan 372-0426 or Janelle Downs 376-6641." The cylinder is resting on a metal plate and is secured to a metal post. This cylinder is the only material that is part of an ecological experiment for the vitrification project, and is separate from the other material found at the site.

Location: The site is located inside 200 East Area, southwest of PUREX. It is along a dirt road that runs north from First Street, approximately 0.8 kilometers (0.5 miles) west of the intersection of First Street and Canton Avenue. The site is approximately 0.5 kilometers (0.3 miles) north of First Street.

Process Description: After some research, it was discovered that the sand piles, identified in 1995, are actually the remains of several experiments in preparation for locating a suitable site for long term storage for vitrified material. The sand piles are evidence of seasonal soil infiltration tests, using water. The sand is not a waste site. Later, PNNL used the same area for water infiltration tests.

Code: 200-E-16**Classification:** Accepted**Names:** 200-E-16; B Plant Waste Concentrator; Low Level Waste Concentrator; Single-Stage Thermal Siphon Reboiler**Reclassification:** None**Type:** Evaporator**Start Date:****Status:** Inactive**End Date:**

Location: The low-level waste concentrator is located in cell #23 of building 221-B. Cell #23 is the first cell east of 221-BC.

Process: The low-level waste concentrator was operated to concentrate the low-level waste in the low-

Process

Description: level waste storage and treatment tank system. The low-level waste concentrator is a thermal siphon and shell and tube heat exchanger. This system has been used only for concentration of the B Plant Complex low-level waste stream. No NCAW waste has been concentrated with the B Plant low-level waste concentrator. This system currently is inactive with no intention of resuming operation and is included to reflect past operations. The low-level waste concentrator system includes the following equipment: the waste concentrator (E-23-3), the deentrainer (D-23-2), the condenser (E-23-4), and receiving tank (TK-23-1). The maximum process design capacity for the low-level waste concentrator is 7,300 gallons (27,633 liters) per day.

Waste Type: Process Effluent

Waste

Description:

Code: 200-E-17	Classification: Accepted
Names: 200-E-17; LERF Basins; 200 Area Liquid Effluent Retention Facility (LERF)	Reclassification: None
Type: Surface Impoundment	Start Date: 1/1/1994
Status: Active	End Date:

Description: The 200 Area Liquid Effluent Retention Facility (LERF) is comprised of a group of surface impoundments. The site is surrounded by a fence (about 700 meters by 400 meters). The three LERF basins are located in the southern portion and are numbered from west to east as 242AL42, 242AL43, and 242AL44, respectively. Each basin is constructed with 2 liners; a leachate collection system; sampling and liquid level risers; and a floating cover. There are three metal buildings within the fence.

Location: The basins are located in the northeast corner of 200 East Area; about 300 meters south of the 2025E building and just east of Canton Ave.

Process Description: Mixed waste from the Double-Shell Tank System is transferred to the 242-A Evaporator, where the waste is concentrated by evaporation. The evaporated constituents are recondensed, collected, and transferred to LERF. Other facility effluents may be added later. The effluent is stored in the basins until it is processed by the 200 Area Effluent Treatment Facility (ETF). Waste from the ETF may be recycled via the LERF for additional treatment.

Related Sites/Structures: Double Shell Tanks (DST), 242-A Evaporator, 2025E, 200 Area Effluent Treatment Facility (ETF), 600-211 (SALDS).

Waste Type: Process Effluent

Waste Description: Process condensate from the evaporator contains small amounts of volatile and semivolatile organics; inorganics; and radionuclides. By permit, constituents may include spent halogenated and non-halogenated solvents and ammonia.

Code: 200-E-19	Classification: Not Accepted
Names: 200-E-19; 216-B-3 Borrow Pit; B Pond Borrow Area	Reclassification: None
Type: Depression/Pit (nonspecific)	Start Date: 1/1/1994
Status: Inactive	End Date:

Description: The 216-B-3 Borrow Pit is a shallow, scarred gravel area adjacent to the northeast corner of the backfilled 216-B-3 Pond. It is slowly revegetating with native grasses and crested wheatgrass,

but large areas of bare ground remain.

Location: The site is located east of the 200 East Area perimeter fence. It is northwest of the backfilled 216-B-3 Main Pond, and north of a posted Underground Radioactive Material Area (the 216-B-3 Ditches).

Process Description: Fill material was taken from this area in 1994 for 216-B-3 stabilization activities. No waste has been placed into the borrow pit.

Related Sites/ Structures: The borrow pit is associated with the 216-B-3 Pond.

Code: 200-E-20 **Classification:** Not Accepted

Names: 200-E-20; 218-E-10 Annex; 218-E-10 Borrow Area; 218-E-10 Borrow Pit; Unused Portion of 218-E-10 Burial Ground **Reclassification:** None

Type: Depression/Pit (nonspecific) **Start Date:** 1/1/1980

Status: Inactive **End Date:**

Description: The area is posted with signs that read "Do Not Enter - 218-E-10 Burial Ground - Authorized Personnel Only." The area has revegetated naturally.

Location: The site is located inside the 200 East Area, north of the 218-E-10 burial trenches. It is near the corner of 12th Street and Akron Ave.

Process Description: The area was originally reserved for additional 218-E-10 Burial Ground trenches. No additional burial trenches were placed in this area. In 1980, clean backfill material was taken from the east side of the unused Annex area to surface stabilize the eastern 10 hectares (25 acres) of the 218-E-10 burial ground trenches. No waste has been placed into the pit. Only clean backfill material has been removed.

Related Sites/ Structures: The borrow pit and unused designated trench area is associated with the 218-E-10 Burial Ground. The unused portion of the burial ground is associated with WIDS sitecode 200-E-292, which documents a small amount of debris.

Code: 200-E-21 **Classification:** Not Accepted

Names: 200-E-21; 218-E-12A and 218-E-12B Borrow Pit; 218-E-12A and 218-E-12B Soil Borrow Area; Pit 33 **Reclassification:** None

Type: Depression/Pit (nonspecific) **Start Date:** 1/1/1979

Status: Active **End Date:**

Description: The 218-E-12A / 218-B-12B Burial Ground Borrow Pit is a large scraped area located west of the 218-E-12A Burial Ground and south of the 216-B-2 Covered Ditches. It is not marked or posted.

Location: The Borrow Pit is located west of the 218-E-12A Burial Ground and south of the 216-B-2 Covered Ditches.

Process Description: Clean backfill material from this borrow pit area was used on both the 218-E-12A and 218-E-12B Burial Grounds. The 218-E-12A Burial Ground was initially surface stabilized with material from this borrow pit in 1980. The southeast portion of the 218-E-12B Burial Ground was surface stabilized with material from this borrow pit in 1981. Additional backfill material

was added to the burial grounds from this borrow pit in 1994. No waste has been placed into the borrow pit.

Related Sites/ Structures: The borrow pit is associated with 218-E-12A and 218-E-12B Burial Grounds.

Code: 200-E-23 **Classification:** Not Accepted
Names: 200-E-23; UN-216-E-33 Borrow Pit; UPR-200-E-56 Borrow Pit **Reclassification:** None
Type: Depression/Pit (nonspecific) **Start Date:** 1/1/1979
Status: Inactive **End Date:**
Description: The borrow pit is not marked or posted, and is partially vegetated.
Location: The site is located east of the 200 East Area perimeter fence, north of the 216-A-24 Crib and UPR-200-E-56.
Release Description: See UPR-200-E-56.
Process Description: This borrow pit was the source of clean fill to cover contaminated material placed at the UPR-200-E-56 site. No waste has been placed in the pit.

Related Sites/ Structures: The site is associated with UPR-200-E-56 (alias UN-216-E-33) and the 216-A-24 crib.

Waste Type: Soil
Waste Description: After earthmoving equipment mistakenly dug into contaminated soil adjacent to the 216-A-24 crib, contaminated soil from other areas in 200 East Area were placed into the excavation to fill up the hole.

Code: 200-E-24 **Classification:** Accepted
Names: 200-E-24; 2704-HV Septic System; 6607-11 **Reclassification:** None
Type: Septic Tank **Start Date:**
Status: Active **End Date:**
Description: The septic and dosing tank area (about 60 ft by 10 ft) has five manholes at grade and two 7-ft high 4-in diameter metal pipe air vents. The drainfield is within a fenced area about 300 ft north of the septic tank area. The drainfield fenced area is about 130 ft by 360 ft; and has six valve boxes and a gate at the south end. The drainfield consists of three trenches and one trench reserved for future use.
Location: The site is west of B-Plant and east of route 4 south. It is east of 2704-HV and west of the 216-B-62 crib. A GPS survey was done in August 1998.
Process Description: This system receives sanitary sewer from 2704-HV, 2701-HV, MO723, MO850, MO046.

Related Sites/ Structures: 2704-HV, 2701-HV, MO723, MO850, MO046

Waste Type: Sanitary Sewage
Waste Description: This system receives sanitary sewage from 2704-HV, 2701-HV, MO723, MO850, MO046.

Description:Reported Date: 04-19-96

Code: 200-E-28 **Classification:** Accepted

Names: 200-E-28; 221-B Building Contaminated Steam Condensate Release **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1990

Status: Inactive **End Date:**

Description: The release occurred through the 221-B Canyon wall expansion joint located between cells 38 and 39. Visible portions of the expansion joint are 3/4" to 1" wide however, the actual point of release is below grade and is not visible. The expansion joint is located 40 feet from the west end of the building between cells 38 and 39.

Location: The release occurred at the 221-B Building (B Plant), 40 feet from the west end and under 221-B Building.

Release Description: On July 17, 1990, a nuclear process operator discovered a solution seeping from the expansion joint between cells 38 and 39, inside the electrical gallery. The seepage was collecting in the gallery floor sump. It was later determined that the release involved approximately 80,000 gallons to 230,000 gallons (over a one year time span) of radioactive steam condensate that could not be accounted for. The steam condensate contained Sr-90 and Cs-137. It is assumed to have been released to the soil column.

Related Sites/ Structures: The release is associated with B Plant operations.

Waste Type: Steam Condensate

Waste Description: The waste was approximately 80,000 to 230,000 gallons of steam condensate contaminated with Cs-137 and Sr-90 that leaked through the expansion joint between cells 38 and 39 of the B Plant Canyon Building directly into the soil column.

Code: 200-E-30 **Classification:** Accepted

Names: 200-E-30; 221-B Stack Sand Filter; 291-B Sand Filter **Reclassification:** None

Type: Sand Filter **Start Date:** 1/1/1948

Status: Inactive **End Date:** 1/1/1997

Description: It consists of a reinforced concrete structure filled with sand and gravel and a roof of pre cast concrete slabs supported by the walls and concrete beams. The unit is partially below grade. The unit measures 33.5 meters (110 feet) by 15.25 meters (50 feet) by 4.8 meters (16 feet) high. It is posted with appropriate radiological signs.

Location: The sand filter is located southeast of the 221-B canyon building, adjacent to the 291-B Stack.

Process Description: Sand Filters were added to the T Plant and B Plant exhaust systems in 1948. The sand filter was constructed for use in conjunction with the bismuth phosphate process. Later HEPA pre-filters were installed in parallel with the sand filter (291-BC and BD). The sand filter has been maintained in a stand-by mode to be used as an emergency back up system or in case of an in cell fire.

Related Sites/ Structures: The sand filter is associated with the 291-B Stack and a french drain located east of the sand filter (200-E-55). The pipeline from the sand filter to the french drain is sitecode 200-E-214-PL.

Code: 200-E-35 **Classification:** Accepted
Names: 200-E-35; 209-E 90-Day Waste Accumulation Area; 209-EA **Reclassification:** Rejected (9/14/2000)
Type: Storage Pad (<90 day) **Start Date:**
Status: Inactive **End Date:**
Description: The site is a concrete pad with a peaked roof supported by beams. The sides are fenced. The east side of the pad is the Hazardous Material storage area. The west side of the pad is the mixed waste storage area and is posted as a Radiation Area.
Location: The site is located inside the 200 East Area, on the west side of the 209-E building
Process Description: Waste generated at tank farm facilities is transported to 209-E for storage. The storage pad is divided into two areas. One part is used for storage of mixed waste, the other part is used for storage of hazardous material.

Code: 200-E-36 **Classification:** Accepted
Names: 200-E-36; 241-AZ 90-Day Waste Accumulation Area **Reclassification:** Rejected (9/6/2000)
Type: Storage Pad (<90 day) **Start Date:**
Status: Inactive **End Date:** 1/1/1993
Description: This site has been inactive at least since 1993, according to the current (May 2000) manager of 90 Day Pads for the River Protection Program (RPP). Its previous location is unknown, but only enclosed conex boxes (self-contained with a spill berm) had been used for 90 Day Storage in the past in the tank farms. This 90 Day Area was moved to RPP's only remaining 90-Day Area, at 209-E (200-E-35) before 1993.

Related Sites/ Structures: This site was associated with the 241AZ Tank Farm.

Code: 200-E-39 **Classification:** Accepted
Names: 200-E-39; Hood 32 90-Day Waste Accumulation Area; PUREX Room 52 **Reclassification:** Rejected (9/14/2000)
Type: Storage Pad (<90 day) **Start Date:**
Status: Inactive **End Date:** 1/1/1996
Description: All 90 day storage pads were removed when PUREX was closed down and cleaned to meet the deactivation end point criteria prior to transition from Westinghouse Hanford Company (WHC) to Bechtel Hanford Inc. (BHI), per J. D. Showman (e-mail communication March 2000).

Location: This site was in room 52 of the PUREX facility.

Related Sites/ Structures: This site was associated with the PUREX facility.

Code: 200-E-40 **Classification:** Accepted
Names: 200-E-40; PUREX Sample Gallery 90-Day Waste Accumulation Area **Reclassification:** Rejected (9/14/2000)
Type: Storage Pad (<90 day) **Start Date:**

Waste Description: Steel beams and piping.

Code: 200-E-48 **Classification:** Not Accepted
Names: 200-E-48; RCRA Permit General Inspection #200EFY96 Item #15 **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site is an abandoned steel I beam is 9 meters (30 feet) long and 0.3 meters (1 foot) wide. The site is not marked or posted.
Location: The site is located in the 200 East area, approximately 30 meters (100 feet) northeast of the 207 B Retention Basin.
Waste Type: Equipment
Waste Description: The site is a 9 meter (30 foot) long steel I beam.

Code: 200-E-49 **Classification:** Not Accepted
Names: 200-E-49; Borrow Pit North of BC Cribs and Trenches **Reclassification:** None
Type: Depression/Pit (nonspecific) **Start Date:** 1/1/1981
Status: Inactive **End Date:**
Description: The site is a shallow, scraped area located north of the BC Trenches. The borrow pit is currently located inside the boundary of the posted BC Radiologically Controlled Area (WIDS sitecode UPR-200-E-83) and is considered part of the BC Controlled Area.
Location: The site is located south of 200 East Area on the south side of Route 4S.
Process Description: Because of recurring surface contamination problems, the surfaces of the backfilled 200 BC Cribs and Trenches were surface stabilized beginning in August of 1981. Clean backfill material was taken from the area north of and adjacent to the BC Trenches. No waste was placed into the borrow pit.
Related Sites/Structures: The borrow pit is associated with the surface stabilization of the BC Cribs and Trenches (216-B-14 through 19 Cribs, and Trenches 216-B-21 through 34 and 216-B-52 through 58) and the BC Controlled Area (UPR-200-E-83).

Code: 200-E-50 **Classification:** Accepted
Names: 200-E-50; 284-E Brine Pit; 284-E Salt Dissolving Pit and Brine Pump Pit **Reclassification:** Rejected (4/20/2000)
Type: Sump **Start Date:** 1/1/1942
Status: Inactive **End Date:** 1/1/1995
Description: The brine pit is no longer visible. It was cleaned out, demolished into itself, and backfilled with gravel in 1999. It is not marked or posted. The salt dissolving pits and brine pump pit were part of a single below-grade concrete structure that provided brine for the 284-E Powerhouse. The two salt dissolving pits each had inner dimensions of 4.3 meters (14 feet) long by 2.4 meters (8 feet) wide by 2.8 meters (9.25 feet) tall. They had a designed high water line 2.4

Code: 200-E-52 **Classification:** Accepted
Names: 200-E-52; 200 East Powerhouse Coal Pile **Reclassification:** Rejected (5/13/2008)
Type: Depression/Pit (nonspecific) **Start Date:** 1/1/1944
Status: Inactive **End Date:** 1/1/1998

Description: Only a shallow surface covering of coal remains at the site. On the east and south banks there are large pieces of metal debris (I-beam, metal grate). A coal-covered metal plate covers the chute to the conveyor belt.

Location: The coal pile was located south of the 284 Powerhouse and east of the coal ramp.

Process Description: Large piles of coal had been stored in this area to fuel the 284-E Powerhouse. The powerhouse was shut down in December 1997.

Related Sites/ Structures: The site is associated with the 284-E Powerhouse.

Waste Type: Misc. Trash and Debris

Waste Description: A thin layer of coal and coal dust remains on the surface of the area. A few pieces of metal debris are located at the east end of the coal storage area. A waste determination for Anthracite (Anthrafil) was performed in 1994. A waste determination for bituminous coal dust was performed in 1996. The waste streams for both types of coal were determined to be nondangerous.

Code: 200-E-54 **Classification:** Accepted
Names: 200-E-54; Liquid Release to the Environment from PUREX Deep Filter Bed #1 **Reclassification:** Consolidated (6/30/2004)
Type: Unplanned Release **Start Date:** 1/1/1991
Status: Inactive **End Date:**

Description: The release to the environment occurred as a result of a water line rupture in the basement of the 293-A building.

Location: The release occurred south of the 202 A building, inside the PUREX facility fence.

Release Description: On January 13, 1991 (ref. occurrence report RL--WHC-PUREX-1991-035) a raw water line ruptured in the basement of the 293 A building, resulting in over 380,000 liters (100,000 gallons) of water flooding the basement and backing up into the PUREX Canyon exhaust ventilation ductwork, including the #1 deep bed fiberglass filter. At the time of the release, pumping the water to the tank farms was not possible due to limited available tank storage space. Disposing the water to a crib was ruled out due to the radionuclide content. While disposal options were being sought, the liquid remained in the ventilation ductwork for 21 months. Since the ductwork was not designed to retain liquids, the possibility of a release to the environment was reported in September 1992. Approval to transfer the liquid to the tank farms was given in September 1992. Based on the original release estimate of 380,000 liters (100,000 gallons), it is believed that 201,400 liters (53,000 gallons) leaked to the soil over the 21 months from the release date to the date the liquid was transferred.

Waste Type: Water

Waste Description: The water leaked into the soil over a period of 21 months.

The Site Was Consolidated With:

Code: 200-E-103
Names: 200-E-103; PUREX Stabilized Area; Radiologically Controlled Area - South Side of PUREX

Code: 200-E-61 **Classification:** Not Accepted (Proposed)
Names: 200-E-61; 202A Building Stormwater Runoff; Miscellaneous Stream #467 **Reclassification:** None
Type: Injection/Reverse Well **Start Date:**
Status: Active **End Date:**
Description: The site is a circular stormwater drain with a metal-grate cover. The drain is considered to be active.
Location: The site is located north of 202-A (PUREX Canyon), at the northwest corner of the asphalt walkway leading from the guard house to 202-A.
Waste Type: Stormwater Runoff
Waste Description: The site receives stormwater runoff from the north side of the PUREX facility.

Code: 200-E-62 **Classification:** Accepted
Names: 200-E-62; 202A Building Steam Condensate; Injection Well (Z); Miscellaneous Stream #71 **Reclassification:** None
Type: Injection/Reverse Well **Start Date:**
Status: Inactive **End Date:** 1/1/1996
Description: The drain has a portion of metal culvert extending above the surface. It has a metal cover with a rusty pipe going into it. The steam plant that fed the pipeline that drained condensate to this site has been shut down and could not be easily re-started.
Location: The site is located inside the PUREX fence, on the north side of 203-A, north of the containment dike for tank TK-P3. It is south of 275-EA.
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.
Waste Type: Steam Condensate
Waste Description: The site received non- contaminated steam condensate.

Code: 200-E-63 **Classification:** Accepted
Names: 200-E-63; Injection Well (AA); Line #8801 Steam Condensate; Miscellaneous Stream #72 **Reclassification:** None
Type: Injection/Reverse Well **Start Date:**
Status: Inactive **End Date:** 1/1/1996
Description: The drain is a 1.22 meter (4 foot) diameter, concrete drain with a metal cover.
Location: The site is located north of 202-A, on the northwest corner of the 211-A tanks, between tank

Location: TK-41 and the 211-A chemical access railroad tracks.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate
Waste Description: The site received non-contaminated steam condensate.

Code: 200-E-64	Classification: Accepted
Names: 200-E-64; Injection Well (W); Line #8801 Steam Condensate; Miscellaneous Stream #69	Reclassification: None
Type: Injection/Reverse Well	Start Date:
Status: Inactive	End Date: 1/1/1996

Description: The drain is a 0.9 meter (3 foot) diameter concrete drain, covered by a steel plate, with a rusty pipe going into it from the steam line above.

Location: The site is located on the north side of 202A, adjacent to the west end of the laboratory sample receiving dock.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate
Waste Description: The site received non-contaminated steam condensate.

Code: 200-E-69	Classification: Accepted
Names: 200-E-69; Injection Well (A); Line #8801 Steam Condensate; Miscellaneous Stream #56	Reclassification: None
Type: Injection/Reverse Well	Start Date:
Status: Inactive	End Date: 1/1/1997

Description: The site is a 1.3 meter (4.5 foot) diameter drain, with a metal cover, located beneath the steam line in the northwest corner of the PUREX complex. The rocks and soil around the drain cover are stained with rust.

Location: The site is in the northwest corner of the PUREX complex, on the east side of the interior security fence.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and

Description:

Code: 200-E-76 **Classification:** Accepted**Names:** 200-E-76; Injection Well (U); Line #8801 Steam Condensate; Miscellaneous Stream #67 **Reclassification:** None**Type:** Injection/Reverse Well **Start Date:****Status:** Inactive **End Date:** 1/1/1997**Description:** The drain is a concrete structure with a 1.5 meter (5 foot) diameter metal cover. The inside of the drain is dry with rust colored rocks. It is labeled 2A-501 - Confined Space.**Location:** The drain is located at the northeast corner of the PUREX complex, inside the inner security fence. It is east of the railroad cut.**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.**Waste Type:** Steam Condensate**Waste Description:** The site received non-contaminated steam condensate.

Description:

Code: 200-E-78 **Classification:** Accepted**Names:** 200-E-78; Injection Well (Y); Line #8801 Steam Condensate; Miscellaneous Stream #70 **Reclassification:** None**Type:** Injection/Reverse Well **Start Date:****Status:** Inactive **End Date:** 1/1/1996**Description:** The site is a drainage area that received steam condensate from a pipe extending from overhead steam lines. The pipe is attached to the south side of the 203-A building and terminates in cobble filled depression. No drain structure is visible. The steam pipe terminates into the soil inside a Contamination Area that surrounds the 203-A building.**Location:** The site is located north of 202-A, on the southeast corner of the 203-A UNH (uranyl nitrate hexahydrate) Pumphouse.**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.**Waste Type:** Steam Condensate**Waste Description:** Although the drain received non-contaminated steam condensate, the point where the steam pipe terminates into the ground is located inside a posted Contamination Area.

Code: 200-E-80 **Classification:** Accepted

Names: 200-E-80; Injection Well (V); Line #8801 Steam Condensate; Miscellaneous Stream #68 **Reclassification:** None

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:** 1/1/1996

Description: The site is a gravel area with some rusty pipes going into the ground. No drain structure is visible from the surface. The site received steam condensate.

Location: The site is located on the northeast side of 202A, next to the north wall of the 206-A fractionator.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste Description: The site received non-contaminated steam condensate.

Code: 200-E-81 **Classification:** Accepted

Names: 200-E-81; Miscellaneous Stream #533; MO-035 Facility Water Valve **Reclassification:** None

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:** 1/1/1997

Description: No drain is visible. The mobile office trailers have been removed. In December of 1997, a layer of clean gravel was laid over the area where the trailers once stood, covering the drain structure.

Location: The site is located north of 202-A, inside the double exclusion fence, just south of the PUREX Badgehouse. It was adjacent to where mobile office MO-035 had been located.

Related Sites/ Structures: The drain was associated with Mobile Office MO-035.

Waste Type: Water

Waste Description: The drain received water valve drainage from a Mobile Office trailer that has been removed from the area.

Code: 200-E-82 **Classification:** Accepted

Names: 200-E-82; Miscellaneous Stream #115; Steam Trap 2P; Yard-MSS-TRP-040 **Reclassification:** None

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:** 1/1/1997

Description: The site is a 1.3 meter (4.5 foot) diameter, corrugated metal steam valve pit. It has a metal cover. There are two valves inside the pit. The pit was dry on the day of the inspection.

Location: The site is located north of 202-A, outside the double security fence.

Process Description: The steam plant and the steam pipelines associated with PUREX have been shut down as the

Process Description: condensate drains are also inactive. Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the PUREX to 204-AR valve pit.

Waste Type: Steam Condensate

Waste Description: The site received non-contaminated steam condensate.

Code: 200-E-85 **Classification:** Accepted

Names: 200-E-85; 202A Building Pump Seal Water; Miscellaneous Stream #459 **Reclassification:** None

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:**

Description: A piece of 1/2 inch diameter PVC pipe extends approximately 0.6 meters (2 feet) out of the ground on the north side of the 2712-A building. No drain is visible at this location. It is assumed that a drain pipe from the 2712-A building may have been previously connected to this PVC pipe. It is also possible Stream ID #459 is a duplicate of 216-A-35, located west of the 2712-A building. 216-A-35 is a 1.5 meter (4 foot) diameter drain extending approximately 0.3 meters (1 foot above ground and is painted yellow).

Location: The Inventory of Miscellaneous Streams Report states this drain is located on the southwest corner of the 202-A building. The coordinates in listed in the document place it in the same location as 216-A-35. A PVC drain pipe is located adjacent to the north wall of 2712-A Building, south of 202A. This is a possible location of Stream #459, since the building contained pumps.

Process Description: The site documented site description for stream #459 has created some confusion. In 1998, when the site walkdown was done, the 2712-A Building housed air sampling pumps. This building was considered the source of pump seal water drainage. The Inventory of Miscellaneous Streams Report states that Stream ID 459 received pump seal water, but indicated it was located near the southwest corner of 202-A. The coordinates in the document indicate it is in the same location as 216-A-35.

Related Sites/ Structures: The site is associated with 202-A, 2712-A and 216-A-35

Waste Type: Water

Waste Description: The site received pump seal water.

Code: 200-E-88 **Classification:** Accepted

Names: 200-E-88; B Plant Yard Steam Condensate; Miscellaneous Stream #3 **Reclassification:** None

Description: remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste Description: The site received non-contaminated steam condensate.

Code: 200-E-91	Classification: Accepted
Names: 200-E-91; B Plant Yard Steam Condensate; Miscellaneous Stream #6	Reclassification: None
Type: Injection/Reverse Well	Start Date:
Status: Inactive	End Date: 1/1/1997

Description: The site is a 0.6 meter (2 foot) diameter, rock filled drain with no cover. The rocks are rust stained.

Location: The site is located southwest of 224-B, adjacent to the steam line.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste Description: The site received non-contaminated steam condensate.

Code: 200-E-92	Classification: Accepted
Names: 200-E-92; B Plant Yard Steam Condensate; Miscellaneous Stream #7	Reclassification: None
Type: Injection/Reverse Well	Start Date:
Status: Inactive	End Date: 1/1/1997

Description: The site is a 0.75 meter (2.5 foot) diameter drain with a fiberglass cover. The site had been covered with dirt during recent grading activities.

Location: The site is located south of 7th Street, south of the 225-B Building, adjacent to the steam line.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Names: 200-E-95; 222B Steam Condensate;
Miscellaneous Stream #308

Reclassification: None

Type: French Drain

Start Date:

Status: Inactive

End Date: 1/1/1994

Description: The site is a 0.4 meter (18 inch) diameter french drain with a blue metal cover. The drain received steam and air conditioner condensate originating from inside the 222-B Building. The place where the source pipe protruded from the concrete block wall above the drain is visible, but it was cut and capped inside the building.

Location: The site is located adjacent to the north wall of the 222-B building, near the northeast corner of the building.

Process Description: The drain received steam and air conditioner condensate. Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion. The air conditioner condensate was atmospheric moisture condensing on the cooling coils.

Waste Type: Steam Condensate

Waste Description: The site received steam condensate and air conditioner condensate. The condensate was batch discharged during winter.

Code: 200-E-97

Classification: Accepted

Names: 200-E-97; 212B Building Steam Condensate;
Miscellaneous Stream #470

Reclassification: None

Type: French Drain

Start Date:

Status: Inactive

End Date: 1/1/1997

Description: The site is a 0.4 meter (18 inch) diameter cement french drain with no lid. The cement drain structure has a cement ring that rises 5 centimeters (2 inches) above the surrounding grade. It is filled with dirt and is dry.

Location: 212-B is located near the southwest corner of the canyon 221-B building. This drain is located adjacent to the north wall of the 212-B building, in between 212-B and 221-B.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste Description: The drain received steam condensate from the 212-B building.

Code: 200-E-98

Classification: Accepted

Names: 200-E-98; 271B Building Ice Machine Overflow; **Reclassification:** None
Miscellaneous Stream #490

Type: French Drain

Start Date:

Status: Inactive

End Date: 1/1/1997

Description: The drain is not visible. A sheet metal shroud and a guard rail have been placed over the area that included the drain to keep small animals from accessing the building where pipes were removed. A portion of the source pipe is visible protruding from the cement block wall above the shroud. The pipe has been cut and capped. The shroud was placed over the site to keep stormwater and animals out of the basement of the 271-B Building. When the pipe connecting the air compressors in the basement with the air tanks outside was disconnected (see attached photo, blue structure on right is the tank, blue pipe above is the air pipe) , a potential entry point for stormwater and animal entry into the building remained. The steel cover protects the building.

Location: The site is located adjacent to the east wall of 271-B.

Process Description: The drain received overflow drainage from an ice machine in a second floor lunchroom, via a copper pipe through a cement block wall. The stream was eliminated as a Miscellaneous Stream in July 1997.

Related Sites/ Structures: The site is associated with the 271-B building.

Waste Type: Water

Waste Description: The drain received overflow from an ice machine located inside 271-B.

Code: 200-E-99

Classification: Accepted

Names: 200-E-99; Miscellaneous Stream #570; Steam
Trap 2P-Yard-MSS-TRP-017

Reclassification: None

Type: French Drain

Start Date:

Status: Inactive

End Date: 1/1/1998

Description: There is no drain structure. It is a low spot in the soil where the steam line discharged steam. The rocks and soil are stained with rust. There is a tag on the steam line that identifies it as MSS-TRP-017.

Location: The site is located adjacent to the steam line, east of the 291-B Sand Filter, near Baltimore Ave.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste Description: The site received non-contaminated steam condensate.

Description:

Code: 200-E-100

Classification: Accepted

Names: 200-E-100; Miscellaneous Stream #571; Steam Trap 2P-Yard-MSS-TRP-019 **Reclassification:** None

Type: French Drain **Start Date:**

Status: Inactive **End Date:** 1/1/1998

Description: The site is a low spot in the ground under the steam line where steam discharged. The rocks and soil are slightly stained with rust. There is a tag that identifies it as MSS-TRP-019.

Location: The site is located east of the 291-B Sand Filter, near Baltimore Ave. It is 6 meters (20 feet) west of the steam trap MSS-TRP-017 (site code 200-E-99).

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium).

Code: 200-E-105 **Classification:** Accepted

Names: 200-E-105; Soil Contamination Area on the 216-B-61 Crib **Reclassification:** Rejected (7/28/2008)

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: This site had been a radiologically posted area located on top of the 216-B-61 Crib and also extended to an area where loose tumbleweeds had accumulated between the south edge of the crib and a soil berm. The posted areas had been designated as Soil Contamination Area (SCA) and Contamination Area (CA). Later, only a very small posted (1.2 by 1.2 meters) Contamination Area, located approximately 30 meters (100 feet) west of the 216-B-61 crib remained. In October 2003, the remaining area was also down posted. All the individual radiological postings have been removed. Since the 200 East Area perimeter fence is posted as a Radiologically Controlled Area (RCA), everything inside the fence is technically a RCA.

Location: The site located in the northwest portion of 200-E Area, south of 12th Street. It is northwest of the Hanford Prototype Barrier that covers the 216-B-57 Crib.

Waste Type: Vegetation

Waste Description: The contamination is a result of blown-in tumbleweeds.

Code: 200-E-106 **Classification:** Discovery

Names: 200-E-106; IDF Integrated Disposal Facility; IDWF; ILAW; Immobilized Low-Activity Tank Waste; Immobilized Low-Activity Waste **Reclassification:** None

Type: Trench **Start Date:**

Status: Inactive **End Date:**

Description: As of January 2002, the plans for this site are to construct trenches in the middle of the southern

section of the 200 East Area.

Location: The area designated for the trenches is between 1st and 4th Streets and between the coal plant and the PUREX facility in 200 East.

Process Description: The tank waste remediation program will separate the wastes into two fractions. One fraction, consisting of high-activity wastes, will be vitrified and stored at Hanford until a national repository can be licensed. The low-activity wastes will also be vitrified, but permanently disposed at Hanford in the Immobilized Low-Activity Waste vaults.

Related Sites/ Structures: The site is associated with the RCRA Sand Pile site (site code 200-E-12, Rejected). The existing four vaults constructed for the Grout Treatment Facility Landfill (WIDS site code GTFL), may be used for disposal of ILAW or other wastes.

Waste Type: Process Effluent

Waste Description: The waste disposed in these trenches will be vitrified low-activity waste from the single and double-shelled tanks. More than 200,000 cubic meters (7,000,000 cubic feet) of waste is expected to be disposed at the site.

Code: 200-E-108

Classification: Not Accepted

Names: 200-E-108; Well Drilling Laydown Yard Pit

Reclassification: None

Type: Depression/Pit (nonspecific)

Start Date:

Status: Inactive

End Date:

Description: The site is located within a large chain link fenced area with a locked gate. It is an empty hole in the ground that has been covered with a piece of plywood.

Location: The pit is located in the southwest section of the fenced laydown yard. The laydown yard is located inside 200 East Area, north of 4th Street and east of Baltimore Avenue.

Code: 200-E-119

Classification: Not Accepted

Names: 200-E-119; 225-B West Side 90 Day Pad

Reclassification: None

Type: Storage Pad (<90 day)

Start Date: 1/1/1997

Status: Inactive

End Date: 1/1/2000

Description: This site is a discontinued 90 Day Storage Pad. Material had been stored in two, self-contained steel cabinets. When the 90 Day Storage Pad was no longer needed, the empty cabinets were moved to the 226-B laydown area. There is no visual evidence remaining at the location of where the cabinets had been located.

Location: The pad was located near the southeast corner of the intersection of 7th and Atlanta Avenues, southwest of the 225-B Waste Encapsulation and Storage Facility (WESF).

Process Description: The cabinets contained PCBs, solvents, and dangerous and mixed wastes.

Related Sites/ Structures: This site was related to the 225-B Building.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description:

B-3-2 and 216-B-3-3) had been backfilled and surface stabilized. After 1994, all the effluent was conveyed to the 216-B-3A and 216-B-3C pond lobes only through underground pipelines. In 1995 the ponds were closed. The remaining effluent was transferred the Treated Effluent Disposal Facility (TEDF). Parts of the pipelines east of 200 East Area, that had fed the ponds, were re-used to feed the TEDF disposal basin. The TEDF portion begins at Manhole #8 and extends to Pump Station #3. In the event of a failure at Pump Station #3, the effluent can be routed to 216-B-3C (C lobe). The section that connects the southeast corner of 216-B-3A to the northwest corner of 216-B-3C is constructed of 76 centimeter (30 inch) corrugated metal pipe.

Related Sites/ Structures: The site is associated with Diverter Stations #2 and Diverter Station #3 (see sitecode 200-E-118) as well as the 207-B Retention Basin, B Plant, PUREX and the 200 East Powerhouse. Portions of the original pipeline were re-used to feed the TEDF system (600-291-PL).

Waste Type: Process Effluent

Waste Description: The pipeline transported 221-B Plant, PUREX, and 200 East Area Powerhouse effluent that included process cooling water, steam condensate and chemical sewer waste.

This Site has the Following SubSites:

Code: 200-E-126-PL:1

Names: 200-E-126-PL:1; 22-Inch Diameter Poly Pipe from 207-B to Diverter Station 2

Code: 200-E-126-PL:2

Names: 200-E-126-PL:2; 21 Inch Vitrified Clay Pipe from Diverter Station 2 to the Head End of 216-B-3 Ditches

Code: 200-E-126-PL:3

Names: 200-E-126-PL:3; 24-Inch Corrugated Metal Pipe from Diverter Station #2 to Diverter Station #3

Code: 200-E-126-PL:4

Names: 200-E-126-PL:4; 216-B-3B; 216-B-3C and 216-E-28 Contingency Pond; Pond Inlet Piping to 216-B-3A

Code: 200-E-126-PL:5

Names: 200-E-126-PL:5; 30-Inch Corrugated Metal Pipe Connecting 216-B-3A Pond to 216-B-3C Pond

Code: 200-E-126-PL:1

Classification: Accepted

Names: 200-E-126-PL:1; 22-Inch Diameter Poly Pipe from 207-B to Diverter Station 2

Reclassification: Rejected (10/19/2010)

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: This subsite became part of 200-E-126-PL-B.

Location: The pipeline segments in this waste site are located inside 200 East Area, west of the Inner/Outer Area boundary. The waste site begins at the 207-B retention basin and terminates at the Inner/Outer Area boundary.

The SubSite is Part Of:

Code: 200-E-126-PL

Names: 200-E-126-PL; Underground Pipeline from 207-B to 216-B-3 Ditch

Code: 200-E-126-PL:2

Classification: Accepted

Names: 200-E-126-PL:2; 21 Inch Vitrified Clay Pipe

Reclassification: Rejected (10/19/2010)

from Diverter Station 2 to the Head End of 216-B-3 Ditches

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: This segment is the original pipeline from the 216-B-2 ditches to the 216-B-3 ditches. It is rejected because it became part of 200-E-126-PL-B.

Location: The pipeline segments in this waste site are located inside 200 East Area, west of the Inner/Outer Area boundary. The waste site begins at the 207-B retention basin and terminates at the Inner/Outer Area boundary.

The SubSite is Part Of:

Code: 200-E-126-PL

Names: 200-E-126-PL; Underground Pipeline from 207-B to 216-B-3 Ditch

Code: 200-E-126-PL:3

Classification: Accepted

Names: 200-E-126-PL:3; 24-Inch Corrugated Metal Pipe from Diverter Station #2 to Diverter Station #3

Reclassification: Rejected (10/19/2010)

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: This segment was rejected because it became part of 200-E-126-PL-B.

Location: The pipeline segments in this waste site are located inside 200 East Area, west of the Inner/Outer Area boundary. The waste site begins at the 207-B retention basin and terminates at the Inner/Outer Area boundary.

The SubSite is Part Of:

Code: 200-E-126-PL

Names: 200-E-126-PL; Underground Pipeline from 207-B to 216-B-3 Ditch

Code: 200-E-126-PL:4

Classification: Accepted

Names: 200-E-126-PL:4; 216-B-3B; 216-B-3C and 216-E-28 Contingency Pond; Pond Inlet Piping to 216-B-3A

Reclassification: Rejected (10/19/2010)

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: These segments were rejected because they became part of 200-E-126-PL-A. These are individual pipe segments that fed the 216-B-3A from the northwest corner of the pond, the 216-B-3b from the northwest corner of the pond and the 216-B-3C from the northwest corner of the pond. This subsite also includes the inlet piping that could have fed the 216-E-28 Contingency Pond.

Location: The 200-E-126-PL-A pipeline segments are located east of the 200 East Area fence line, beyond the Inner/Outer Area boundary.

The SubSite is Part Of:

Code: 200-E-126-PL

Names: 200-E-126-PL; Underground Pipeline from 207-B to 216-B-3 Ditch

Code: 200-E-126-PL:5 **Classification:** Accepted
Names: 200-E-126-PL:5; 30-Inch Corrugated Metal Pipe **Reclassification:** Rejected (10/19/2010)
Connecting 216-B-3A Pond to 216-B-3C Pond
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: This segment was rejected because it became part of 200-126-PL-A.
Location: The 200-E-126-PL-A pipeline segments are located east of the 200 East Area fence line, beyond the Inner/Outer Area boundary.

The SubSite is Part Of:

Code: 200-E-126-PL
Names: 200-E-126-PL; Underground Pipeline from 207-B to 216-B-3 Ditch

Code: 200-E-127-PL **Classification:** Accepted
Names: 200-E-127-PL; Line 1601; Pipeline from PUREX **Reclassification:** Rejected (10/19/2010)
to Gable and B-Ponds (216-A-25 and 216-B-3);
PUREX Cooling Water Line
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: Due to the restructuring of Operable Units, as described in the Tentative Agreement for Central Plateau Cleanup, this pipeline has been split into segments (see 200-E-127-PL-A and 200-E-127-PL-B). The majority of the pipeline is constructed of large diameter corrugated metal pipe. The 36 inch diameter corrugated metal pipe enlarges to 42 inch diameter corrugated metal pipe at Manhole #8 (north of B Pond). The pipeline is marked with steel posts and Underground Radioactive Material - Pipeline signs. Near the 810 gate, an area of growing contaminated vegetation was stabilized with biobarrier and posted with Underground Radioactive Material Area signs. A portion of the pipeline is under the Liquid Effluent Retention Facility (LERF) berm.
Location: The pipeline extends northward, along the east side of 200 East Area. It begins at the PUREX facility and the 216-A-42 Retention Basin. It continues northward to the 216-A-25 Pond (Gable Mountain Pond). A portion of the pipeline extends between the 241-A-201 Emergency Cooling Water storage tanks and the 216-A-42 diverter station.
Process Description: The pipeline conveyed PUREX and B Plant effluent to the (216-A-25) Gable Pond or the (216-B-3) B Pond system. The effluent stream was directed to the preferred pond via Diverter Station #3. The pipeline south of Diverter Station #3 is constructed of 91 centimeter (36 inch) diameter corrugated metal. From Diverter Station # 3 northward to the 216-A-25 Pond, the pipeline is constructed of 107 centimeter (42 inch) diameter corrugated metal pipe. The portion of the pipeline between the 241-A-201 cooling water storage tanks and the 216-A-42 basin (30 inch VCP) was taken out of service in June 1992.
Related Sites/Structures: The pipeline is associated with the PUREX, B Plant and the 242-A Evaporator facilities and 216-A-25 (Gable Mountain Pond) Also see sitecode 200-E-118 (Diverter Structure #3), 241-A-201 Emergency Cooling Water Storage Tanks, 216-A-42 basin, 200-E-127-PL-A and 200-E-127-PL-B.
Waste Type: Process Effluent
Waste Description: The pipeline conveyed process cooling water from 202-A Building (Plutonium Uranium Extraction [PUREX] Plant). From May 1958 to 1960, the unit received the above plus cooling

water from the contact condenser in the 241-A-431 Building. In 1960, the unit received the above plus the surface condensator cooling water in the 241-A-401 Building (A Tank Farm). From November 1967 to January 1968, the unit received the above plus the wastewater from the 284-E Powerhouse. From January 1968 to March 1969, the unit received the above plus the cooling water and steam condensate from the 244-AR Vault. In March 1969, the pipeline to the contact condenser cooling system from the 241-A-431 Building Vault was valved out. After March 1977, the unit received the above plus the 242-A Evaporator steam condensate cooling water. (RHO-CD-798 shows a valve at the east end of the 216-B-2-3 Ditch connecting to PUREX Cooling Water Line to Gable Pond. The graphic is labeled "Effluent Pipelines and Transfer Capabilities for Gable Mountain and B Ponds").

Code: 200-E-134 **Classification:** Accepted

Names: 200-E-134; Potentially Contaminated Soil in 241-AW Tank Farm **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1980

Status: Inactive **End Date:**

Description: The site is the potentially contaminated soil inside the chain link fence that surrounds the 241-AW Tank Farm. Various radiological postings and warning signs (RA, RBA, RMA,URMA, Internally Contaminated Systems) are attached to the chain link fence. The interior of the tank farm complex is covered with gravel. Many risers and monitoring devises for the underground structures are visible on the surface. Currently, Contamination Area postings are located around the HEPA filter housing, pits, Clean Out Boxes and other equipment within the tank farm. In November 2010, the east side of the tank farm fence was expanded (150 feet long, 5 feet wide) to allow room for vehicles to maneuver around the exhauster skid.

Location: The 241-AW Tank Farm is located at the intersection of 4th Street and Canton Ave. in 200 East Area.

Process Description: The six tanks in the 241-AW Tank Farm are double shell construction.

Code: 200-E-136 **Classification:** Accepted

Names: 200-E-136; 202-A TSD; PUREX **Reclassification:** None

Type: Process Unit/Plant **Start Date:** 1/1/1956

Status: Active **End Date:** 1/1/1990

Description: This site is the entire PUREX Treatment, Storage, and Disposal (TSD) facility. It includes the individual tanks that had been provided separate WIDS codes; they are to be consolidated into this site. The PUREX Storage Tunnels are a separate TSD and are not a part of this site. The main part of the facility is the 202-A Building, in which the fuels were reprocessed. It is a reinforced concrete structure, 1,005 feet by 119 feet by 100 feet high (306 meters by 36 meters by 30 meters), with about 40 feet (12 meters) of the height below grade. The building consists of three main structural components: (1) a thick-walled concrete 'canyon' in which the equipment for radioactive processing is contained in cells below grade; (2) a pipe, sample, and storage gallery section; and (3) a steel and transite annex that houses offices, process control rooms, laboratories, and the building services. The portion of the canyon below grade is subdivided into a row of 12 process equipment cells paralleled by a ventilation air tunnel and pipe tunnel through which intercell solution transfers are made. The air tunnel exhausts the ventilation air from the cells to the main ventilation filters and stack.

Location: The PUREX Plant is located in the southeast corner of the 200 East Area.

Process PUREX was designed and constructed to provide supplemental fuel reprocessing capabilities to

Description: separate plutonium and uranium products from irradiated fuel. The PUREX process was designed to reprocess aluminum-clad uranium metal fuel to recover weapons-grade plutonium and depleted uranium. The process was later modified to reprocess zirconium alloy clad fuel from N Reactor to recover fuels-grade plutonium, slightly enriched uranium, and neptunium.

Related Sites/ Structures: This site is associated with the individual components of this TSD that have their own WIDS numbers as of September 2001 are: 202-A-E-F11 (PUREX Tank E-F11), 202-A-E5 (PUREX Tank E5), 202-A-F15 (PUREX Tank F-15), 202-A-F16 (PUREX Tank F-16), 202-A-F18 (PUREX Tank F18), 202-A-G7 (PUREX Tank G7), 202-A-U3 (PUREX Tank U3), 202-A-U4 (PUREX Tank U4), and 202-A-WS-1 (PUREX Waste Piles). Site 216-A-29 (Snow's Canyon, PUREX Chemical Sewer), is TSD D-2-3. Sites 218-E-14 and 218-E-15 (PUREX Tunnels No. 1 and No. 2) are also a separate TSD, S-2-1. Some of the major liquid effluent disposal facilities associated with PUREX are Gable Mountain Pond (216-A-25), B-Pond (216-B-3), and the 216-A-42 Trench, which received emergency radioactive discharges that were diverted from going to the ponds. Process condensate from the final uranium cycle was monitored for radioactivity and discharged through a stainless steel pipe to the 216-A-10 Crib south of the west end of PUREX. Steam condensate was also monitored for radioactivity and discharged to the 216-A-30 Crib east of PUREX. Ammonia scrubber waste condensate was sent to the 216-A-36B Crib south of PUREX. Steam and process condensates and acid overflow from the 203-A Area tanks were sent to the 216-A-3 Crib, north of the 203-A Tank Farm. Several radiologically controlled areas are adjacent to PUREX, including 200-E-103 on the south side and 200-E-107 on the east side. Site 200-E-44 is the PUREX Railroad Cut.

Waste Type: Equipment

Waste Description: Some of the waste remaining in the facilities include lead (in paint, light bulb contacts, shielding, pipe joints, washers affixing transite), mercury (thermostats and switches), asbestos (transite siding, insulation, gaskets), organic substances (greases and residues in gearboxes and bearings), PCBs (transformers, ballasts, lubricants, oils), cadmium (dissolver moderator lining in canyon cells), and silver (silver reactor in cells), chromium (in cell debris).

Code: 200-E-137

Classification: Accepted

Names: 200-E-137; 291-B Exhaust Stack; 291-B-1

Reclassification: None

Type: Stack

Start Date: 1/1/1944

Status: Inactive

End Date: 1/1/1998

Description: The unit consists of a reinforced concrete stack, lined with acid-resistant brick resting on an octagonal, two-tiered foundation of brick and concrete. The stack is 61 meters (200 feet) high and 4.3 meters (14 feet) in diameter at the base.

Location: The exhaust stack is located south of the 221-B canyon building, west of the 291-B sand filter.

Process Description: The stack provided air exhaust for the 221-B Canyon building. Sand Filters were added to the B Plant exhaust systems in 1948. The sand filter was constructed for use in conjunction with the bismuth phosphate process. Later, HEPA pre-filters (291-BC and BD, BF and BH) were installed in parallel with the sand filter.

Related Sites/ Structures: The stack is associated with the 216-B-13 French Drain and the Sand Filter (sitecode 200-E-30).

Waste Type: Process Effluent

Waste Description: The air exhaust system was contaminated with radioactive particulates.

Description:

Code: 200-E-138 **Classification:** Accepted

Names: 200-E-138; 291-B Replacement Stack; 296-B-1 Exhaust Stack; Canyon Exhaust System; Canyon Ventilation Upgrade **Reclassification:** None

Type: Stack **Start Date:** 1/1/1998

Status: Active **End Date:**

Description: The 296-B-1 exhaust stack is a 29 meter (95 foot) carbon steel pipe anchored to the south side of the 221-B building.

Location: The 296-B-1 Stack is located adjacent to the south side of 221-B, Section 8.

Process Description: The new canyon exhaust system consists of two parallel Air Cleanup Trains (ACT) prefilters and two banks of High Efficiency Particulate Air (HEPA) filters.

Related Sites/Structures: The stack is associated with 221-B, 221-BK and the ACT prefilter and HEPA filter banks. It replaced the 291-B Exhaust Stack (200-E-137).

Waste Type: Process Effluent

Waste Description: Filtered canyon air is exhausted through the stack.

Code: 200-E-140 **Classification:** Not Accepted

Names: 200-E-140; Gravel Pit 32 **Reclassification:** None

Type: Depression/Pit (nonspecific) **Start Date:**

Status: Inactive **End Date:**

Description: The site had been an open excavation containing gravel. A site visit in October 2004 noted that the construction of the new Immobilized Low-Activity Waste (ILAW) site had extended over the gravel pit area. No evidence of the gravel pit remains.

Location: The site is located south of the PUREX facility. It is north of 1st Street and west of Canton Ave. It is on the west side of the gravel road that leads to PUREX.

Process Description: The site was used as a source of clean backfill material. It is a good source of sand and sandy soil.

Related Sites/Structures: 200-E-106 (Immobilized Low-Activity Waste storage)

Waste Type: Soil

Waste Description: The site is a source of backfill material. No waste is stored at this site.

Code: 200-E-146-PL **Classification:** Accepted

Names: 200-E-146-PL; Tank Farm Transfer Line A-4013; Transfer Line from 241-CR-152 to 241-AX-151 **Reclassification:** Rejected (10/26/2006)

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: A-4013 is a DUPLICATE entry. It is the same line as line 4103, described in sitecode 200-E-

144-PL. Transfer Line A-4013 is radiologically posted as an Underground Radioactive Material Area. The pipeline is a 3 inch diameter, stainless steel pipe. The transfer line is located in the Interplant Transfer Encasement per drawing H-2-44501, sheet 92.

Location: Line A-4013 originates inside the 241-C Farm at the 241-CR-152 Diversion Box, passes through the 241-ER-153 Diversion Box and terminates at the 241-AX-151 Diverter Station at the corner of 4th Street and Buffalo Avenue in 200 East Area.

Related Sites/ Structures: Associated with Sitecode 200-E-144-PL

Code: 200-E-210-PL **Classification:** Accepted

Names: 200-E-210-PL; Encased Lines Between 241-AW Tank Farm and 242-A Evaporator Building; Lines SL-167, SL-168, SN-219, SN-220, SN-269 and SN-270 **Reclassification:** None

Type: Encased Tank Farm Pipeline

Start Date:

Status: Active

End Date:

Description: The waste site is four underground, carbon steel lines within the same concrete encasement. Lines SL-167 and SL-168 are 5 centimeter (2 inch) diameter lines. Lines SN-219, SN-220, SN-269 and SN-270 are 7.6 centimeter (3 inch) diameter lines.

Location: The encased transfer line extends northward from the 241-AW Tank Farm and connects to the west side of the 242-A Evaporator building. The line crosses under 4th Street.

Process Description: Lines SN-219 and SN-220 drop out of the encasement near the southwest corner of the 242-A Evaporator building and continue into the 241-A Tank Farm. They connect to the 241-A-A and 241-A-B Valve Pits. SN-219 and SN-220 are inactive lines. In October 2009, SL-167 and SN-269 are considered to be active lines. SL-168 and SN-270 are back up lines that could be used if SL-167 or SN-269 failed.

Related Sites/ Structures: The lines are associated with the 241-AW-A and 241-AW-B, 241-A-A, 241-A-B valve pits, and the 242-A Evaporator facility.

Code: 200-E-211-PL **Classification:** Accepted

Names: 200-E-211-PL; Lines DR334, DR335 and DR343; Transfer Lines from 241-AW to 242-A Evaporator Building **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline

Start Date:

Status: Active

End Date:

Description: The waste site is three underground transfer lines buried in the same soil trench. Lines DR334 and DR335 are 25 centimeter (10 inch) diameter carbon steel lines double contained within 30 centimeter (12 inch) diameter carbon steel pipes. Line DR343 is a direct buried 15 centimeter (6 inch) diameter carbon steel pipe.

Location: The group of lines extend north from 241-AW Tank Farm to connect to the north side of the 242-A Evaporator Building. The lines cross under 4th Street.

Process Description: In October 2009, these lines were considered to be active.

Related Sites/ Structures: The lines are associated with 241-AW and the 242-A Evaporator.

Structures:

Code: 200-E-212-PL **Classification:** Accepted

Names: 200-E-212-PL; Lines SL-509, SL-510, SN-609 and SN-610; Transfer Lines Between 241-AW Tank Farm and 241-AP Tank Farm **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Active **End Date:**

Description: The waste site is four underground carbon steel pipelines buried in the same soil trench. Lines SL-509 and SL-510 are 5 centimeter (2 inch) diameter carbon steel pipes double contained inside 10 centimeter (4 inch) diameter carbon steel pipes. Lines SN-609 and SN-610 are 7.6 centimeter (3 inch) diameter carbon steel pipes double contained inside 15 centimeter (6 inch) diameter carbon steel pipes.

Location: The transfer lines extend from the east side of 241-AW Tank Farm to the west side of 241-AP Tank Farm. The cross under Canton Ave., north of 272-AW.

Process Description: In October 2009, these lines were considered to be active pipelines.

Related Sites/Structures: The pipelines are associated with the 241-AW and 241-AP Tank Farms.

Code: 200-E-235-PL **Classification:** Accepted

Names: 200-E-235-PL; 207-A North Basin Distribution Lines; Lines 501,502, 503, 504, 506, and 507 **Reclassification:** Consolidated (5/31/2011)

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is 7.6 centimeter (3 inch) and 10 centimeter (4 inch) diameter carbon steel pipes that distributed waste from the 207-A pump pit to the three sections of the 207-A North basin.

Location: The 207-A North Retention Basin is located east of Canton Ave. and north of 4th Street. The distribution lines extend north from the 207-A pump pit.

Related Sites/Structures: The distribution lines are associated with the 207-A pump pit and the 207-A North basins.

The Site Was Consolidated With:

Code: 207-A-NORTH

Names: 207-A-NORTH; 207-A-NORTH Retention Basin; 207-A; 207-A North; 207-A Retention Basin

Code: 200-E-236-PL **Classification:** Accepted

Names: 200-E-236-PL; 207-A South Basin Distribution Lines; Lines 557, 558, 559, 560, 562, and 563 **Reclassification:** Consolidated (5/31/2011)

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is 7.6 centimeter (3 inch) and 10 centimeter (4 inch) diameter carbon steel pipes that distributed waste from the 207-A pump pit to the three sections of the 207-A South basin.

Location: The 207-A South Retention Basin is located east of Canton Ave. and north of 4th Street. The

distribution lines extend south from the 207-A pump pit.

Related Sites/ Structures: The distribution lines are associated with the 207-A pump pit and the 207-A South basins.

The Site Was Consolidated With:

Code: 207-A-SOUTH

Names: 207-A-SOUTH; 207-A-SOUTH Retention Basin and Pump Pit; 207-A; 207-A Retention Basin; 207-A South

Code: 200-E-286

Classification: Accepted

Names: 200-E-286; A Swamp; A-Swamp and Ditch; Original 200 East Area Powerhouse Effluent Pond; Powerhouse Swamp

Reclassification: Rejected (11/4/2009)

Type: Pond

Start Date: 1/1/1946

Status: Inactive

End Date: 1/1/1953

Description: There is no longer any visible signs of the A-Swamp or the distal end of the ditch. The eastern end of the ditch was removed during the construction of 241-A Tank Farm and the later construction of 241-AP Tank Farm. The area where the swamp had been located is now underneath where the Grout Facility and Waste Treatment Plant were built.

Location: The Powerhouse Swamp had been located east of the 200 East Area fence, approximately where the head end of the 216-A-29 Ditch and Grout Facility were later constructed.

Process Description: The original, horse shoe shaped ditch emptied into a shallow depression east of the 200 East Area fence known as the Powerhouse Pond from 1946 through 1953. In 1954, the powerhouse ditch effluent was redirected to B Pond. This is the ditch currently known as the 200 East Powerhouse Ditch (sitecode 200-E PD).

Related Sites/ Structures: This site is associated with the 200 East Powerhouse Ditch (sitecode 200-E PD) and the 216-A-29 Ditch.

Code: 209-E-WS-1

Classification: Accepted

Names: 209-E-WS-1; 209-E French Drain

Reclassification: Rejected (1/25/2000)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The drain has a metal cover that is painted bright yellow, because it is located in a paved parking area. The unit is a french drain that is 1.2 meters (4 feet) in diameter and 2.4 meters (8 feet) deep.

Location: The unit is located in the parking area at the northeast corner of the 209-E Critical Mass Building, office wing.

Process Description: This site received steam condensate only. Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 209-E Building.

Waste Type: Steam Condensate

Waste Description: The unit received steam trap condensate and steam condensate from 209-E.

Code: 216-E-28 **Classification:** Not Accepted

Names: 216-E-28; 200 East Area Contingency Pond; 216-E-25 **Reclassification:** None

Type: Pond **Start Date:** 1/1/1986

Status: Inactive **End Date:**

Description: This 216-E-28 Contingency Pond is inactive and dry. It is a large cobble filled depression that is divided into three lobes by soil berms. Each lobe has a 1.2 meter (48 inch) diameter corrugated metal culvert. It is not marked or posted.

Location: The 216-E-28 Contingency Pond is located east of the 200 East Area perimeter fence and north of the 216-B-3 Main Pond.

Process Description: When the 216-B-3 Main Pond and 216-B-3-3 Ditch were isolated, a new pipeline was built to divert effluent to the 216-B-3 Pond Expansion Lobes and this Contingency Pond. The 216-E-28 Contingency Pond was designed to receive effluents from the B Pond streams. It was held in reserve for any future embankment failures in the ponds. It was never needed and never used for this process. However, in 2007 drill cuttings and mud, from three boreholes and one corehole drilled at the Waste Treatment Project Vitrification site, was placed into the Contingency Pond.

Related Sites/ Structures: The 216-E-28 Contingency Pond is associated with the 216-B-3 Pond system.

Code: 218-E-3 **Classification:** Not Accepted

Names: 218-E-3; Construction Scrap Pit **Reclassification:** None

Type: Burial Ground **Start Date:** 1/1/1954

Status: Inactive **End Date:** 1/1/1971

Description: The pit was exhumed and material removed. It is now part of an open field with sparse vegetation (rabbitbrush and cheatgrass) growing in the gravel.

Location: The site was located in the extreme southwest corner of 200 East Area, north of Highway 4S. It was north of 1st Street and east of Akron Ave,

Waste Type: Construction Debris

Waste Description: The site received metal slip forms, barrels and timbers from the construction of 202-A that became contaminated with ruthenium-106 from a REDOX stack release.

Code: 218-E-6 **Classification:** Accepted

Names: 218-E-6; B Stack Shack Burning Pit; Buried Contamination **Reclassification:** Rejected (5/13/2008)

Type: Burial Ground **Start Date:** 1/1/1955

Status: Inactive **End Date:** 1/1/1955

Description: The site is no longer marked or posted

Location: Originally the site (burn pit) was located in the southeast corner of the 221-B Exclusion Area approximately 94 meters (300 feet) south of 221-B.

Process Description: At one time the site was a burn pit that was used to burn wooden items removed from the 291-B stack area during cleanup of the 221-B Exclusion Area. A trench approximately 1.2 meters (4 feet) deep was dug. The contaminated material was then burned and the remaining ashes were covered with soil. The site was excavated to determine the remaining activity. Pieces of partially burned wood and ashes were uncovered at a depth of 1.2 meters (4 feet). Radioactivity was non-detectable. The zone was released from Radiation Zone status in 1972.

Related Sites/ Structures: The site was related to the 221-B exclusion area. Materials that were burned were collected from within this area and burned in the pit.

Waste Type: Demolition and Inert Waste

Waste Description: According to the documentation, no waste remains at this site.

In 1955, contaminated wooden forms, a shack and other wooden items were placed into a 1.2-meter (4-foot) deep trench and burned. The ashes were backfilled with dirt and the area was marked with "Underground Contamination" signs.

In 1971, the site was excavated to a depth of 1.2 meters (4 feet). A radiological survey was done on the ashes and partially burned wood. No radiological contamination was found. The site was released from Radiation Zone status. Stenner et al. (1988) report that the site has been exhumed and the contents removed to a 200 East Area burial ground.

Code: 218-E-12B ANNEX **Classification:** Not Accepted

Names: 218-E-12B ANNEX; 218-E-12B Western Portion West of Trench 37; Unused Portion of 218-W-12B **Reclassification:** None

Type: Burial Ground **Start Date:**

Status: Inactive **End Date:**

Description: The area is a barren field. The area designated for additional waste trenches in the western portion of the 218-E-12B Burial ground was never used.

Location: This site is located south of 12th Street in 200 East Area. It is west of trench 37 in the 218-E-12B burial ground.

Related Sites/ Structures: The 218-E-12B Annex is associated with WIDS sitecode 200-E-288, which documents a small amount of debris.

Code: 218-E-14 **Classification:** Accepted

Names: 218-E-14; PUREX Storage Tunnel; PUREX Tunnel No. 1 **Reclassification:** None

Type: Storage **Start Date:** 1/1/1960

Status: Inactive **End Date:** 1/1/1965

Description: PUREX Tunnel Number 1 is an extension of the railroad tunnel, extending south of the east end of the 202-A Building. It is an enclosed, above ground storage facility. It is approximately 109 meters (358 feet) long, 5.8 meters (19 feet) wide, and 6.9 meters (22.5 feet) high. The railroad tracks have a one percent downgrade to the south. The tunnel is ventilated by an absolute filtered exhauster at the south end of the tunnel.

Location: The site is located south of the east end of the 202-A building.

Process Description: The tunnel construction was completed in 1956. The tunnel is filled to capacity with failed equipment on eight rail cars. A water-fillable door has been drained and the tunnel door is sealed shut.

Waste Type: Equipment

Waste Description: This site received extremely large, heavy or highly contaminated waste equipment stored on eight railroad flatcars. The volume of waste on the rail cars ranges from 53 to over 168 cubic meters (1,900 to over 6,000 cubic feet). The curie content decayed through 1990 was 945.3 of cesium -137, 845.2 of strontium -90 and 0.0684 of ruthenium-106. Railcars 1&2 contain a HA column and jumpers with approximately 2400 curies of radioactive material. Railcar 3 contains a failed E-F11, 1WW waste concentrator with approximately 40,000 curies of radioactive material. Railcar 4 contains a G-2 centrifuge with approximately 3,000 curies of radioactive material. Railcar 5 contains a failed E-H4 waste concentrator with approximately 1,000 curies of radioactive material. Railcar 6 contains a failed E-F6, 2WW waste concentrator with approximately 700 curies of radioactive material. Railcar 7 contains a second failed E-F11, 1WW waste concentrator with approximately 40,000 curies of radioactive material. Railcar 8 contains a spare failed, waste concentrator with approximately 700 curies of radioactive material. 230 kilograms of lead is associated with the material on the railcars.

Code: 218-E-15 **Classification:** Accepted

Names: 218-E-15; PUREX Storage Tunnel; PUREX Tunnel No. 2 **Reclassification:** None

Type: Storage **Start Date:** 1/1/1967

Status: Inactive **End Date:** 1/1/1996

Description: The above grade tunnel is covered with soil. The railroad tracks have a one percent downgrade to the south end of the tunnel. The tunnel is constructed of a bituminous coated steel liner attached to external reinforced concrete. The tunnel is ventilated by a filtered exhauster at the south end of the tunnel. The water has been removed from the "water filled" door and the tunnel door has been sealed.

Location: PUREX Tunnel Number 2, located southeast of the 202A Building, is an extension of the railroad tunnel. It is east of 218-E-14 (Tunnel Number 1).

Process Description: The tunnel construction was completed in 1964. The tunnel stores contaminated equipment on flat bed rail cars and three empty liquid waste tank cars. Seventeen shipments were received during 1995 and 1996 from the 324 Laboratory Facility clean out activity. The tunnel contained a total of 28 rail cars as of July 1996.

Waste Type: Equipment

Waste Description: railroad flat cars. The tunnel has the capacity to hold 40 railcars. As of June 1996, 28 railcars had been placed in the tunnel. The tunnel contains an estimated total of 2,730,000 curies of radionuclides and 762 grams (27 ounces) of plutonium. In addition to radioactive contaminants, the equipment stored in the tunnel also contains lead, silver, mercury, cadmium, chromium, barium and oil.

Code: 2607-E1A **Classification:** Accepted

Names: 2607-E1A; 2607-E1-A; 2607-E1A Septic System; L-272 Regional System **Reclassification:** None

Type: Septic Tank **Start Date:** 1/1/1997

Status: Active **End Date:**

Description: The system includes a septic tank, a dosing chamber and a three section drain field. The area is covered with gravel and marked appropriately.

Location: The septic system is located inside 200 East Area, north of 4th Street and west of Baltimore Ave.

Process Description: This system is designed to replace several smaller septic systems located in 200 East Area. The septic system is approved for a flow rate of 54,890 liters per day (14,500 gallons per day). The septic tank is a 82,350 liter (21411 gallon) tank, located east of the three drain fields. An area west of the drain fields has been reserved for a fourth drain field, that has been proposed for future use. A 52,500 liter (13,650 gallon) dosing tank is located adjacent to the septic tank.

Waste Type: Sanitary Sewage

Waste Description: The septic system receives sanitary waste with volumes up to 54,890 liters (14,500 gallons) per day.

Code: 2607-E8 **Classification:** Accepted

Names: 2607-E8; 2607-E8 Septic Tank and Tile Field **Reclassification:** Closed Out (11/9/2004)

Type: Septic Tank **Start Date:** 1/1/1953

Status: Inactive **End Date:** 1/1/1997

Description: The septic tank surface is identified by two circular access ports surrounded with concrete. A sign, on the ground in April 2001, reads "2607-E8". The associated drain field had a capacity of 13,400 liters (3,533 gallons) per day.

Location: This unit is located north of 1st Street and east of Baltimore Avenue, across from the 2101-M Building.

Process Description: The 2607-E8 Septic Tank and associated drain field were designed to accept and treat sanitary sewer effluent from the connected facilities.

Related Sites/Structures: The 2607-E8 Septic Tank was associated with the 2607-E8 Tile Field, the 2101-M Building, the MO-021, the MO-042, the MO-043, the MO-407, the MO-413, and the MO-234 Buildings. It was replaced by the 2607-E8A regional system.

Waste Type: Sanitary Sewage

Waste Description: Septic Tank 2607-E8 receives sanitary wastewater and sewage at an estimated rate of 220 cubic feet (6.24 cubic meters) per day.

Closure Info: The system was abandoned in 1997 in accordance with Washington Administrative Code 246-

272-18501.

Code: 2607-E8A **Classification:** Accepted
Names: 2607-E8A; 2607-E8-A; 2607-E8A Regional Septic System **Reclassification:** None
Type: Septic Tank **Start Date:** 1/1/1996
Status: Active **End Date:**
Description: The septic system is surrounded with light posts and chain.
Location: The septic system is located south of the 284-E Powerhouse, on the east side of Baltimore Ave.
Process Description: The system was constructed in 1996. It is approved by the State of Washington to receive a flow of 54,890 liters per day (14,500 gallons per day).
Related Sites/ Structures: The new regional system replaced the 2607-E8 septic tank and tile field.
Waste Type: Sanitary Sewage
Waste Description:

Code: 2607-E10 **Classification:** Accepted
Names: 2607-E10 **Reclassification:** None
Type: Septic Tank **Start Date:** 1/1/1993
Status: Active **End Date:**
Description: The 2607-E10 Septic Tank system consists of two tanks and receives sanitary wastewater and sewage. The drain field associated with this system has a design capacity of 1,298 gallons (4,900 liters) per day.
Location: This unit lies north of the 216-A-37-1 Crib and east of the 241-AP Tank Farm, in the area known as the Grout Treatment Facility.
Process Description: The 2607-E10 Septic Tank and associated drain field are designed to accept and treat sanitary sewer effluent from the connected facilities.
Related Sites/ Structures: The 2607-E10 Septic Tank is associated with a drain field, the Grout Trailer, MO-392, MO-041, MO-282, MO-283, MO-284, MO-997 and MO-243-G4.
Waste Type: Sanitary Sewage
Waste Description: The 2607-E10 Septic Tank receives sanitary wastewater and sewage at an estimated rate of 665 gallons (2,500 liters) per day.

Code: 2607-E11 **Classification:** Accepted
Names: 2607-E11; 2607-E11 Septic Tank **Reclassification:** Closed Out (11/9/2004)
Type: Septic Tank **Start Date:** 1/1/1985
Status: Inactive **End Date:** 1/1/1997
Description: This unit is a two-chamber tank. The tank has an associated drain field and had a capacity of

3,500 liters (927 gallons) per day.

- Location:** The site is located inside 200 East Area, north of 4th Street and east of Baltimore Ave. The system is located southeast of the Dry Materials Receiving and Handling silos.
- Process Description:** The 2607-E11 Septic Tank and associated drain field were designed to accept sanitary sewer effluent from the 2400-E Building, the Transportable Grout Facilities, MO-385, MO-386, MO-354 and the Dry Materials Receiving and Handling Facility. This project was abandoned and it's associated buildings are no longer occupied.
- Related Sites/ Structures:** The 2607-E11 Septic Tank was installed to support the Dry Materials Receiving and Handling Facility (2400-E) Building, the Transportable Grout Facilities, and the MO-385, MO-386, MO-354 trailers.
- Waste Type:** Sanitary Sewage
- Waste Description:** This system received sanitary wastewater and sewage at an estimated rate of 835 gallons (3160 liters) per day. There are no sampling results or inventory information available for this site.
- Closure Info:** The system is closed. The system was abandoned in 1997 in accordance with Washington Administrative Code 246-272-18501. It was replaced by a new regional system.

-
- Code:** 2607-E14 **Classification:** Accepted
- Names:** 2607-E14; A Farm Pipefitters Shop Septic; 242-AC Septic **Reclassification:** None
- Type:** Septic Tank **Start Date:**
- Status:** Active **End Date:**
- Description:** The waste site is an underground septic tank that services the A Tank Farm Pipefitters shop building.
- Location:** The 242-AC Pipefitter Shop is located near the corner of 4th Street and Buffalo Ave. in 200 East Area. The septic tank is located north of 242-AC.

-
- Code:** 2607-EH **Classification:** Accepted
- Names:** 2607-EH; 2607-EH Septic System **Reclassification:** Rejected (5/31/2001)
- Type:** Septic Tank **Start Date:**
- Status:** Inactive **End Date:**
- Description:** WIDS site 2607-EH has been described as a septic tank and associated drain field.
- Location:** This septic system has been described as being located on the west side of Baltimore Avenue adjacent to the east side of the 2101-M Building.
- Waste Type:** Sanitary Sewage
- Waste Description:** According to the Hanford Site Waste Management Units Report (Cramer, 1987), the 2607-EH Septic System received sanitary wastewater and sewage from the 2101-M building at an estimated rate of 1.36 cubic meters (48.00 cubic feet) per day.

-
- Code:** 2607-EJ **Classification:** Accepted
- Names:** 2607-EJ; 2607-EJ Septic System **Reclassification:** Closed Out (5/31/2001)
- Type:** Septic Tank **Start Date:**

Status: Inactive

End Date:

Description: The 2607-EJ Septic System was the original system that serviced the 272-AW building. The tank and drainfield were removed as part of the 50 foot deep excavation for the 241-AP Tank Farm. The concrete septic tank was divided into two compartment with volumes of 7800 liters (2000 gallons) and a 3900 liters (1000 gallons). It measured 5.9 meters (19.5 feet) long, 2.1 meters (7 feet) wide, and 1.8 meters (6 feet) deep (outer dimensions). The tank had three 0.6 meter (2 foot) access ports which were covered with concrete lids. The tank was connected to a small concrete distribution box which routed the waste from the tank to the sanitary drainfield. The drainfield consisted of five 15 meter (50 foot) runs of perforated drain tile.

Location: The 2607-EJ Septic System was located east of 272-AW and west of tank 241-AP-103.

Process Description: The 2607-EJ Septic Tank and the associated drain field were designed to accept sanitary sewer effluent.

Related Sites/ Structures: The 2607-EJ Septic System was associated with the 272-AW Building.

Waste Type: Sanitary Sewage

Waste Description: The 2607-EJ Septic System received sanitary wastewater and sewage.

Closure Info: The 2607-EJ Septic System was removed during site preparation for the construction 241-AP Tank Farm. The tank and drainfield were in the layback for the 15 meter (50 foot) deep excavation for the tank farm.

Code: 2607-EK

Classification: Accepted

Names: 2607-EK

Reclassification: Closed Out (5/31/2001)

Type: Septic Tank

Start Date: 1/1/1975

Status: Inactive

End Date: 1/1/1997

Description: The 2607-EK Septic Tank is a reinforced concrete tank and posted in the field as "Septic Tank 2607EK." The associated drainfield is east of the tank. The drainfield is comprised of eleven parallel runs of 15 centimeter (6 inch) perforated drain pipe. The runs are 27 meters (90 feet) long and spaced 2.4 meters (8 feet) apart.

Location: The 2607-EK septic system is located east of Baltimore Avenue, northeast of the 2750-E building, and south of the 2607-E8 Septic System.

Process Description: The 2607-EK Septic Tank and associated drain field were designed to accept sanitary sewer effluent from the 2750-E Building.

Related Sites/ Structures: The 2607-EK Septic Tank is associated with the 2750-E Building.

Waste Type: Sanitary Sewage

Waste Description: The 2607-EK septic system received sanitary sewer effluent from the 2750-E Building at an estimated rate of 39.2 cubic meters (1,384 cubic feet) per day.

Closure Info: The 2607-EK system was abandoned in 1997 in accordance with Washington Administrative Code 246-272-18501.

Code: 2607-EL

Classification: Accepted

Names: 2607-EL; 2607-EL Septic Tank/Pump Station **Reclassification:** None

Type: Septic Tank **Start Date:**

Status: Active **End Date:**

Description: The site is surrounded with steel posts and chain. It is marked with Septic Tank signs. Three access ports are visible on the surface. This septic tank/pump station is a part of the 2607-EP System which was reconstructed in 1994. 2607-EL is permitted and approved by the Washington Department of Health for a flow of 54,890 liters per day.

Location: The site is located south of 4th Street, near the western entrance to 200 East Area. The septic system is located south of 2727-E and west of MO-294.

Process Description: The unit receives sanitary sewage from MO-286 and MO-294.

Waste Type: Sanitary Sewage

Waste Description: The waste is human sanitary sewage.

Code: 2607-EM **Classification:** Accepted

Names: 2607-EM **Reclassification:** None

Type: Septic Tank **Start Date:** 1/1/1984

Status: Active **End Date:**

Description: The site consists of the 2607-EM Septic Tank and pump station. The system is connected to the 2607-EP dosing chamber, which is connected to the 2607-EP Drainfield (soil absorption system).

Location: This unit lies northwest of the associated drain field and southeast of the 2721-E Building.

Process Description: The 2607-EM Septic Tank and associated drain field receive sanitary sewer effluent from the 2721-E Building. The tank is constructed of reinforced concrete and receives sanitary wastewater and sewage from the 2721-E Building.

Related Sites/ Structures: The 2607-EM Septic Tank is associated with the 2721-E Building.

Waste Type: Sanitary Sewage

Waste Description: The 2607-EM septic system receives sanitary sewer effluent from the 2721-E Building at an estimated rate of 217 cubic feet (6.14 cubic meters) per day.

Code: 2607-EP **Classification:** Accepted

Names: 2607-EP; 2607-EP Septic System **Reclassification:** None

Type: Septic Tank **Start Date:** 1/1/1984

Status: Active **End Date:**

Description: The 2607-EP Septic System includes a septic tank and associated drainfield.

Location: This unit is located inside 200 East Area, south of 4th Street. It lies southeast of the MO-388 and northeast of the 2721-E Building.

Process Description: The 2607-EP Septic Tank and associated drain field are designed to accept sanitary sewer effluent from the 2607-EM, the 2607-EN, and the 2607-EO systems, as well as the 2721-EA

building and the MO-388.

Related Sites/ Structures: The 2607-EP Septic Tank is associated with systems 2607-EM, 2607-EN, and 2607-EO. Prior to 1994, this system (consisting of two underground tanks) received sanitary sewage effluent from the 2721-EA Building and the MO-388.

Waste Type: Sanitary Sewage

Waste Description: The 2607-EP system receives effluent from the 2721-EA Building and MO-388 at an estimated rate of 28.30 cubic feet (0.80 cubic meters) per day.

Code: 2607-EQ

Classification: Accepted

Names: 2607-EQ

Reclassification: None

Type: Septic Tank

Start Date: 1/1/1985

Status: Active

End Date:

Description: The 2607-EQ Septic Tank is constructed of reinforced concrete. The associated drainfield is approximately 4,644 square feet (431 square meters).

Location: This unit lies northwest of the 2753-E Building and southeast of the Ames Avenue and Second Street intersection.

Process Description: The 2607-EQ Septic Tank and associated drain field are designed to accept sanitary sewer effluent from connected facilities (2571-E, 2752-E, 2753-E, MO-276, MO-277 and MO-285)

Related Sites/ Structures: The 2607-EQ Septic Tank is associated with the 2751-E, the 2752-E, and the 2753-E Buildings, as well as the MO-276, the MO-277 and the MO-285.

Waste Type: Sanitary Sewage

Waste Description: The 2607-EQ septic system receives sanitary sewage effluent at an estimated rate of 477 cubic feet (13.5 cubic meters) per day in 1987.

Code: 2607-ER

Classification: Accepted

Names: 2607-ER

Reclassification: Closed Out (5/31/2001)

Type: Septic Tank

Start Date: 1/1/1980

Status: Inactive

End Date: 1/1/1997

Description: The 2607-ER system includes a septic tank and a trench type drain field. The tank has two access ports. As of February 20, 2001, it was not posted in the field.

Location: The site is located north of the 2101-M Building and west of Baltimore Avenue, just south of the railroad tracks.

Process Description: The 2607-ER Septic Tank and associated drain field were designed to accept sanitary sewer effluent from connected facilities (MO-047, the MO-251, the MO-252, and the MO-253).

Related Sites/ Structures: The 2607-ER Septic Tank is associated with the MO-047, the MO-251, the MO-252, and the MO-253.

Waste Type: Sanitary Sewage

Waste Description: The 2607-ER septic system received sanitary sewage effluent from the MO-047, the MO-251, the MO-252, and the MO-253 at an estimated rate of 5,753 liters (1,520 gallons) per day.

Closure Info: 272-18501. The facilities were connected to a new regional system designated 2607-E8A.

Code: 2703-E HWSA **Classification:** Accepted
Names: 2703-E HWSA; 2703-E Hazardous Waste Storage Area **Reclassification:** Rejected (9/6/2000)
Type: Storage Pad (<90 day) **Start Date:** 1/1/1984
Status: Inactive **End Date:** 1/1/1996

Description: The site was a hazardous waste storage area located in a three-sided steel shed. The shed is on a concrete pad. The site is currently in use as an equipment storage area. There is a metal cabinet in the shed that is used to hold non-regulated soiled shop rags for pickup by the laundry services.

Location: The site was located in a steel shed on the east side of 2703-E, north of the compressor building.

Process Description: The 2703-E Hazardous Waste Staging Area was designed to temporarily store liquid hazardous waste before disposal.

Related Sites/ Structures: The 2703-E Hazardous Waste Staging Area was associated with the 2703-E Building.

Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: The 2703-E Hazardous Waste Staging Area typically contained wastes such as alkaline liquids, sodium hydroxide, sodium dichromate containing process solutions, and waste acids. Use of the 90-day waste storage pad was discontinued by November 4, 1996.

Code: 2704-E HWSA **Classification:** Accepted
Names: 2704-E HWSA; 2704-E Hazardous Waste Storage Area **Reclassification:** Rejected (9/14/2000)
Type: Storage Pad (<90 day) **Start Date:** 11/1/1985
Status: Inactive **End Date:** 1/1/1991

Description: The site was an asphalt pad. It is no longer visible. The location is not marked or posted, and the area is now covered with grass.

Location: The 2704-E Hazardous Waste Staging Area was located southwest of the current MO-257 and northeast of the intersection of Atlanta Avenue and Fourth Street. This 2704-E building was located east of the 2711-E Garage, but has been demolished.

Process Description: The 2704-E Hazardous Waste Staging Area was designed to temporarily store hazardous materials before disposal.

Related Sites/ Structures: The 2704-E Hazardous Waste Staging Area was associated with the former 2704-E Building.

Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: Typical liquid wastes contained at the 2704-E Hazardous Waste Staging Area included antifreeze, grease, diesel fuel, and asphalt.

Code: 2718-E-WS-1 **Classification:** Accepted
Names: 2718-E-WS-1; 2718 French Drains **Reclassification:** Rejected (1/25/2000)

Type: French Drain

Start Date:

Status: Active

End Date:

Description: The site consists of two french drains associated with the 2718-E Building. One of the french drains is not visible in the field. It was used to drain a swamp cooler, according to Hanford drawing H-2-44301. The other french drain is actually a pit used only to drain clean water from the fire sprinkler system at the 2718-E building. It has a metal lid. The inside is dry with a valved pipe in the bottom.

Location: The site is located north of 2718-E Building, inside the 209-E security fence.

Process Description: One is used to drain a swamp cooler, the other drains clean water from the fire sprinkler system at the 2718-E. The fire system is a dry pipe system, needing occasional testing. After testing, the water must be drained. There are no other sinks, drains or other water sources going to these french drains.

Related Sites/ Structures: The site is related to the 2718-E Building.

Waste Type: Water

Waste Description: One french drain receives clean raw water from testing the fire system; the other received water from a swamp cooler when it was drained for the winter.

Code: 2715-EA HWSA

Classification: Accepted

Names: 2715-EA HWSA; 2715-EA Paint Spray Booth Annex; 2715-EA Hazardous Waste Storage Area

Reclassification: Rejected (9/14/2000)

Type: Storage Pad (<90 day)

Start Date: 1/1/1984

Status: Inactive

End Date:

Description: The 2715-EA Hazardous Waste Staging Area is no longer active. All associated wastes have been removed. The area is currently used for storing new drums, excess material, scrap metal for recycling, non-regulated wastes, and flammable materials. The pad was in a shed, which is still standing, with a chain link fence as the front wall. Adjacent to the west side of the shed are two conex boxes and two chain-link fenced areas which are used as additional storage space. During a site visit on April 11, 2000, it was observed that the shed is labeled "No Smoking," "New Drum Storage" and "Danger - Items in this Building Contain Asbestos." The shed corresponds to the mapped location for building 2715-EA but the shed is not labeled with this number nor could any nearby building be located with this number. The shed contains primarily drums and also some packaged material sitting on a pallet. Material sitting on the concrete in front of the shed includes: other new drums, dollies for moving the drums, wooden boxes and metal cabinets. Some of the metal cabinets are marked "Excess." There are two conex boxes just west of the shed. These are marked "Conex 1" and "Conex 2." Conex 2 is closest to the shed. Both conex boxes have vents on the top. The area between the two conex boxes and the area between Conex 2 and the shed are fenced. The area between the two conex boxes is labeled "No Smoking or Open Flame" and "Non-regulated Waste Storage." The area between Conex 2 and the shed is labeled "Empty Drums to be Crushed for Scrap Metal." This second fenced area also contains two yellow metal cabinets marked "Flammable." Deford and Carpenter (1995) reported that one of these fenced areas was labeled with "Hazardous Waste 90-Day Storage" signs.

Location: This site is located northwest of the 275E Building and east of the 2715-ED Building.

Process Description: The 2715-EA Hazardous Waste Staging Area was designed to temporarily store hazardous waste related to the paint shop activities before disposal.

Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: The typical wastes held here were waste paint and thinning solvents.

Code: 241-EW-151 **Classification:** Accepted
Names: 241-EW-151; 241-EW-151 Vent Station; 241-EW-151 Vent Station Catch Tank; Vent Station; 200 Area East-West Vent Station **Reclassification:** None
Type: Catch Tank **Start Date:** 1/1/1955
Status: Inactive **End Date:** 1/1/2005

Description: The vent station is enclosed in a locked, chain link fence. It consists of an underground concrete structure containing a stainless steel tank in a vault with a jumper pit above the tank. The tank has two vent risers that extend above grade and a riser for the unit's leak detection system. At the bottom of the stairwell access is a floor drain that connects to a nearby french drain. Several hazard and radiological warning signs are posted on the fence. There are also two areas, outside the fence, adjacent to the northeast side of the vent station that are posted with Underground Radioactive Material signs.

Location: The site is located south of Route 3, approximately half way between 200 East and West Areas. It is south of the 609-A Fire Station.

Process Description: The 241-EW-151 Vent Station is located at the high point of the cross site transfer line. The encasement slopes approximately 4 percent on each side of the vent station. The encased underground transfer line piping depth varies from 1.5 meters (5 feet) to 4.5 meters (15 feet). The vent station is designed to contain leaks from transfers and drainage from operations within the transfer system. The piping from the vent station drains to the diversion boxes. The vent station has a jumper pit to facilitate transfer of mixed waste between 200 East and 200 West Areas. The catch tank is part of the 241-EW-151 Vent Station. The catch tank vault used to drain to a nearby french drain, but that line has been isolated. The vent station stairwell floor drain still connects to the french drain. The catch tank has a capacity of 3,030 liters (800 gallons). It is 1.4 meters (4.5 feet) in diameter and 2.1 meters (7 feet) tall. Each of the cross site pipelines has a one inch stainless steel vent line connected to the 800 gallon vent station catch tank. A manually operated valve in each vent line allows for air bleeding, pressure checking and a siphon break on the drain back line. The 241-EW-151 Vent Station drains to a sump with a leak detection alarm that signals in the fire station building.

Related Sites/Structures: This site is part of the cross-site waste transfer system and is associated with UPR-600-20, Diversion Boxes 241-UX-154 (200 West) and 241-ER-151 (200 East). The vent station is associated with the cross-site transfer line that runs between Diversion Boxes 241-UX-154 (200 West) and 241-ER-151 (200 East).

Waste Type: Process Effluent
Waste Description: The vent station transports waste solutions from processing and decontamination operations via the cross-site waste transfer system.

Code: 2607-FSN **Classification:** Accepted
Names: 2607-FSN; 609A Building Septic Tank 2607-FSN; 6607-04; 6607-4 **Reclassification:** Closed Out (11/9/2004)
Type: Septic Tank **Start Date:** 1/1/1960

Status: Inactive **End Date:** 1/1/1988

Description: The 2607-FSN Septic Tank and drainfield lie beneath an asphalt walkway and several trees.

Location: The 2607-FSN septic system was located at the southeast corner of the 609-A Building (200 Area Fire Station), which is located on the south side of Route 3 in the 600 Area.

Process Description: The 2607-FSN Septic Tank system received sanitary wastewater and sewage from the 609-A Building and disposed of it through a sub-surface soil absorption system.

Related Sites/ Structures: The 2607-FSN system was associated with the 609-A Building.

Waste Type: Sanitary Sewage

Waste Description: The 2607-FSN septic system received sanitary wastewater at a rate of approximately 1,250 gallons (4,731 liters) per week.

Closure Info: The system was abandoned and replaced by the 6607-4 septic system in 1988. It also is tied into the 2607-EP tank.

Code: 2607-GF **Classification:** Accepted

Names: 2607-GF; 2607-GF Septic System; 2607-GF Septic Tank and Drain Field **Reclassification:** Rejected (5/31/2001)

Type: Septic Tank **Start Date:**

Status: Inactive **End Date:**

Description: WIDS site 2607-GF was described in Cramer (1987) as a septic tank and associated drain field. However, it likely does not exist.

Location: This system has been described as being located north of the Dry Materials Receiving and Handling Facility (2400E) and across the railroad tracks that run on the north side of the facility.

Waste Type: Sanitary Sewage

Waste Description: According to the Hanford Site Waste Management Units Report (Cramer, 1987), the 2607-GF Septic System is not currently in use. This unit received sanitary sewage effluent from the Dry Materials Receiving and Handling Facility.

Code: 2101-M POND **Classification:** Accepted

Names: 2101-M Pond; 2101-M POND **Reclassification:** Closed Out (10/26/1995)

Type: Pond **Start Date:** 1/1/1953

Status: Inactive **End Date:** 1/1/1995

Description: The site is an unlined "U" shaped ditch. It is surrounded with post and chain. Many tumbleweeds have collected in this area.

Location: The pond was located west of the 2101-M Building.

Process Description: The pond became active in 1953 to receive swamp cooler water from the 2101-M air conditioning system, storm water run off and steam traps. In 1983, the Basalt Waste Isolation Project added some laboratories to the 2101-M building. The laboratory sinks also drained to the 2101-M Pond, until 1985. In July 1985, administrative controls were implemented to prevent the discharge of regulated waste to the 2101-M Pond.

Related Sites/ The site is associated with the 2101-M building effluent discharges.

Structures:**Waste Type:** Water**Waste Description:** From 1953 until 1983, the pond received small volumes of swamp-cooler condensate, overflow drain wastewater from the 2101-M air conditioning system, steam trap condensate and storm water runoff. From 1983 to July 1984, laboratory wastes such as barium chloride solutions, nitric acid and hydrochloric acid were discharged to the unit. Quantities are estimated at less than 1900 liters per year (500 gallons per year). Nitric acid and hydrochloric acid discharge quantities are estimated at 1 to 10 kilograms per year (2.2 to 22 pounds per year).**Closure Info:** The site has been sampled and analyzed for hazardous components. It unit was clean closed in accordance with the Washington Administrative Code (WAC) closure performance standards. The letter of acceptance from Ecology was received 10/30/1995.

Code: 212-N**Classification:** Accepted**Names:** 212-N; 212-N Building; 212-N Fissile Storage Facility; Metal and Fuel Storage Basin Facility**Reclassification:** Rejected (5/18/2010)**Type:** Storage**Start Date:** 1/1/1945**Status:** Inactive**End Date:** 1/1/1952**Description:** The building is composed of high bay, a fuel storage basin and a heater room. Each section has a concrete slab and roof and walls constructed of concrete and concrete block. Exterior dimensions of the high bay section is 8.2 by 23 by 9 meters (27 by 74 by 30 feet) high. The fuel storage basin section is 15 by 22 by 3.7 meters (49 by 72 by 12 feet) high. The heater room is 4.3 by 7.9 by 3.7 meters (14 by 26 by 12 feet) high. The total area is 555 square meters (5,970 square feet), the storage basin is 307 square meters (3,300 square feet), and the transfer basin is 37 square meters (400 square feet).**Location:** The site is located north of Route 11A, halfway between the 200 East and 200 West Areas.**Process Description:** From 1945 to 1952, the facility was used to provide underwater storage of irradiated slugs from the 100 Areas. Slugs were stored in the 6.1-meter (20-feet) reinforced concrete basins. In 1970, twenty four boxes of transuranic (TRU) contaminated laboratory hoods and equipment from the 300 Area Plutonium Recycle Test Reactor (PRTR) were placed in the facility for storage.**Related Sites/ Structures:** The building is associated with pipeline 600-285-PL, 216-N-1, 216-N-2 and 216-N-3.**Waste Type:** Equipment**Waste Description:** From 1944 to 1952, the facility was used to provide underwater storage of irradiated slugs from the 100 Areas. Slugs were stored in the 6.1-meter (20-feet) reinforced concrete basins. In 1970, twenty four boxes of transuranic (TRU) contaminated laboratory hoods and equipment from the 300 Area Plutonium Recycle Test Reactor (PRTR) were placed in the facility for storage. There is estimated to be 40 gram (1.4 ounces) of plutonium (byproduct). The total waste volume is 2.7 cubic meters (7,651 cubic feet). The waste was removed in 2006 and 2007.**Closure Info:** The basis for the reclassification of this site has been documented in the Response Action Report (RAR) for 212-N, 212-P, and 212-R Facilities Removal Action, DOE/RL 2010-031. Functions of this removal action as discussed in the Remedial Design/Remedial Action Work Plan for 200 North Area Waste Sites located in the 200-CW-3 Operable Unit (RAWP) included utility isolations, characterization sampling, hazardous material removal, decontamination, structure demolition, disposition of waste materials and site stabilization (DOE/RL 2007 55). Removal design included removal of the discrete structural components and removal of the soils up to a depth of 1 m (3.3 ft) beneath the basin and transfer pit of each structure. According to

the RAWP, decontamination and demolition activities were conducted within the footprint of each structure, defined as the area covered by the structure as seen from a plan view, plus an additional 30 m (98 ft) out from the perimeter of the walls. No formal design requirements were applicable to this removal action.

The removal action commenced in accordance with the RAWP in July 2009. Removal actions began on the 212-R and 212-N buildings in July 2009 and for 212-P in October 2009. Demolition and excavation activities were completed in November 2009. Post excavation soil evaluation activities began in October 2009 and concluded in January 2010.

The results of the post demolition soil evaluation also indicated that, without further remediation, residual concentrations in the shallow zone will support future land uses that can be represented (or bounded) by a conservation mining scenario, and that residual concentrations throughout the site pose no threat to groundwater or the Columbia River.

In accordance with the Sampling and Analysis Plan (DOE/RL-2007-54), focused discrete samples were collected at visually indicated (soil that appeared to be visually darker or a different color than surrounding soil) locations and areas expected to contain higher levels of contamination based on process knowledge. One visually indicated (discoloration at 212-R) and a total of 37 judgmental samples were collected, 11 from 212-N and 13 each from 212-P and 212-R as indicated in Appendix A of the RAR. Detailed analytical data values were provided in Appendix B of the RAR.

Soil sampling data did not contribute to the overall completion of the removal action for the 212-N, 212-P and 212-R facilities. Rather, it addressed the post demolition soil evaluation discussed in the RAWP and SAP by which the soil areas remaining in the locations of the removed structures were investigated against the interim cleanup standards developed for the collocated wastes sites in the 200-CW-3 Operable Unit. The evaluation serves an investigative purpose to determine if further remediation was needed. Results of this evaluation demonstrated that a waste site designation for these areas for further remediation is not applicable.

During the collection of focused soil samples, radiological surveys were performed of the sample matrix. Surveying was performed using standard radiological survey instruments in accordance with accepted protocols and procedures to obtain dose and contamination measurements. No elevated dose rates (dose rates above established area background) were encountered to be further investigated.

Code:	212-P	Classification:	Accepted
Names:	212-P; 212-P Building PCB Storage Facility; 212-P Storage Facility	Reclassification:	Rejected (5/18/2010)
Type:	Storage	Start Date:	1/1/1945
Status:	Inactive	End Date:	
Description:	The building is composed of two main sections (High Bay and low roof sections) and a heater room. Each section has a concrete slab floor and walls constructed of concrete and concrete block. A site visit on November 6, 1998 found that the High Bay section does not have any warning signs or radiological postings. There is a yellow "PCB" sign on the door of the storage room, located on the east side of the facility. The Basin Storage section of the building (northeast portion of the facility) is posted with a Contamination Area sign and a Danger sign. PCB contaminated equipment that was previously stored outside the southwest corner of the facility has been removed.		
Location:	The site is located north of Route 11A, halfway between 200 East and 200 West areas.		
Process	From 1944 to 1952 the facility was used to store irradiated fuel rods prior to chemical		

Description: processing in the 200 Areas. In 1982, the facility began to be used for storage of electrical transformers contaminated with PCB's. Shipments were made from the facility quarterly or as necessary to comply with the TSCA 9-month storage limitation. The High Bay portion of the building was used to store equipment and a 10,000 gallon tank of oil. The oil tank was placed on a "drip pan" secondary containment. A Dyncorp employee reported that the equipment and oil tank stored inside the High Bay has been removed.

Related Sites/ Structures: Associated with pipeline 600-286-PL, 216-N-4 and 216-N-5

Waste Type: Oil

Waste Description: Since 1982, this unit has held PCBs, and PCB-contaminated waste (nonradioactive) in temporary (up to 9 months) storage, according to TSCA (Toxic Substance Control Act). Radioactively contaminated PCBs are stored in another area of this unit. Waste types include 854 kg oil less than 50 p/M PCB; 1,348 kg oil greater than 50 p/M PCB; 703 PCB light ballasts, overpacked; 1,159 kg oil greater than 500 p/M PCB; 7 sealed transformers with less than 30 p/M PCB oil; 1 capacitor with 1% PCB askarel fluid; 11 low-voltage capacitors with greater than 50 p/M PCB oil; 2 electron microscope power supplies with greater than 50 p/M PCB oil; and 42 kg regulated solvents with greater than 500 p/M PCB. Drained items (as allowed under TSCA) are occasionally stored on an asphalt pad at the southwest corner of the building.

Waste Type: Equipment

Waste Description: Originally, the unit was built to provide underwater storage of irradiated slugs from the 100 Areas. Slugs were stored in the 20-ft reinforced concrete basins.

Closure Info: The basis for the reclassification of this site has been documented in the Response Action Report (RAR) for 212-N, 212-P, and 212-R Facilities Removal Action, DOE/RL 2010-031. Functions of this removal action as discussed in the Remedial Design/Remedial Action Work Plan for 200 North Area Waste Sites located in the 200-CW-3 Operable Unit (RAWP) included utility isolations, characterization sampling, hazardous material removal, decontamination, structure demolition, disposition of waste materials and site stabilization (DOE/RL 2007 55). Removal design included removal of the discrete structural components and removal of the soils up to a depth of 1 m (3.3 ft) beneath the basin and transfer pit of each structure. According to the RAWP, decontamination and demolition activities were conducted within the footprint of each structure, defined as the area covered by the structure as seen from a plan view, plus an additional 30 m (98 ft) out from the perimeter of the walls. No formal design requirements were applicable to this removal action.

The removal action commenced in accordance with the RAWP in July 2009. Removal actions began on the 212-R and 212-N buildings in July 2009 and for 212-P in October 2009. Demolition and excavation activities were completed in November 2009. Post excavation soil evaluation activities began in October 2009 and concluded in January 2010.

The results of the post demolition soil evaluation also indicated that, without further remediation, residual concentrations in the shallow zone will support future land uses that can be represented (or bounded) by a conservation mining scenario, and that residual concentrations throughout the site pose no threat to groundwater or the Columbia River.

In accordance with the Sampling and Analysis Plan (DOE/RL-2007-54), focused discrete samples were collected at visually indicated (soil that appeared to be visually darker or a different color than surrounding soil) locations and areas expected to contain higher levels of contamination based on process knowledge. One visually indicated (discoloration at 212-R) and a total of 37 judgmental samples were collected, 11 from 212-N and 13 each from 212-P and 212-R as indicated in Appendix A of the RAR. Detailed analytical data values were provided in Appendix B of the RAR.

Soil sampling data did not contribute to the overall completion of the removal action for the 212-N, 212-P and 212-R facilities. Rather, it addressed the post demolition soil evaluation discussed in the RAWP and SAP by which the soil areas remaining in the locations of the removed structures were investigated against the interim cleanup standards developed for the collocated wastes sites in the 200-CW-3 Operable Unit. The evaluation serves an investigative purpose to determine if further remediation was needed. Surveying was performed using standard radiological survey instruments in accordance with accepted protocols and procedures to obtain dose and contamination measurements. No elevated dose rates (dose rates above established area background) were encountered to be further investigated.

Code: 203-S & 205-S	Classification: Accepted
Names: 203-S & 205-S; 203-S Uranyl Nitrate Hexahydrate Tank Farm; 204-S; 204-S Tank Farm & Pumphouse; 205-S Process Vault & Chemical Makeup Building; 205-S Stabilized Area; 205-S Uranyl Nitrate Hexahydrate Processing Facility; 203-S	Reclassification: Consolidated (1/19/2005)
Type: Process Unit/Plant	Start Date: 1/1/1953
Status: Inactive	End Date: 1/1/1965
Description: The aboveground tanks and features of these facilities were removed in 1983. The area was backfilled and surface stabilized. The site is currently a posted Underground Radioactive Material area.	
Location: The facilities were located northwest of the 202-S (REDOX) facility.	
Process Description: The 203, and 205-S Facilities were constructed in the early 1950's as a process unit for the decontamination of uranyl nitrate hexahydrate (UNH) produced by Reduction Oxidation (REDOX) operations. The primary process unit consisted of a column filled with silica gel that removed traces of fission products from the UNH. The silica gel column (SG-1) was located in the underground 205-S vault. The vault also contained a waste neutralization tank. Operations in the vault were accomplished remotely. The 205-S facility was a two story, aboveground, chemical make-up building. It contained two chemical make-up tanks, a UNH sample room and extensive piping connected to the REDOX facility and the underground vault. The 203-S facility was an aboveground UNH storage facility that consisted of two 19,000 liter (5,000	

gallon) stainless steel tanks that were set in an open concrete basin. There was also a 204-S Tank Farm, that consisted of four 190,000 liter (50,000 gallon) aboveground tanks set in two open concrete basins. A UNH Unloading Facility was located at the adjacent railroad siding. An aboveground UNH pipeline connected the 203-S, 204-S, 205-S Area to the 224-U (UO3 Plant). During the REDOX Plant operation, the UNH solution was pumped from REDOX to the 205-S silica gel column for purification. The purified UNH was stored in the 203 and 204 tanks and the routed to 224-U, via an above ground line, for final processing. The fission products left in the silica gel column were stripped out with nitric acid. The acid was neutralized and send to cribs. UNH from the PUREX Plant were transported by truck to the unloading station and placed in the 204-S tanks. The PUREX solutions were then processed through the silica gel column. After REDOX shut down (1965), the 203-S and 205-S were placed on standby. The Unloading Station was converted to a railcar unloading station. The 204-S tanks continued to store material from the Unloading Station. Shipments included thorium nitrate, 100-N Reactor decontamination solutions and 300 Area Laboratory wastes.

Related Sites/ Structures: Structures associated with this site include the remains of the 205-S Chemical Makeup System, the 203-S Secondary Containment, the 205-S Vault, the above ground (dismantled) uranyl nitrate hexahydrate cross site transfer line, underground utilities, the salvaged or decommissioned tanks, and process equipment. It is also associated with 200-W-22 and unplanned releases UPR-200-W-10, UPR-200-W-83, UPR-200-W-86 and UPR-200-123.

Waste Type: Process Effluent

Waste Description: Waste processed and stored in this area included contaminated UNH from REDOX and PUREX, Thorium Nitrate from PUREX, 100-N Reactor decontamination waste and 300 Area Laboratory waste. Radiological contaminants may be present in and around the remaining contaminated structures (cement basins and piping) that were not removed in the 1983 stabilization efforts.

The Site Was Consolidated With:

Code: 200-W-22

Names: 200-W-22; 203-S/204-S/205-S Stabilized Area

Code: 219-S-101

Classification: Accepted

Names: 219-S-101; 219-S-TK-101; TK-101 Crib Waste Receiver; TK-101 Receiver Tank; 219-S

Reclassification: None

Type: Storage Tank

Start Date: 1/1/1951

Status: Active

End Date:

Description: The 219-S-101 Tank is a monitored stainless steel receiver tank resting in a below grade concrete vault at the 219-S Waste Handling Facility.

Location: The tank is located in the north side of Cell A in the 219-S Building. The 219-S Building is located north of the northeast end of the 222-S Building.

Process Description: The 219-S-101 Tank receives liquid mixed waste from the 222-S Laboratory processes. Waste batches from Tank 219-S-101 and 219-S-104 are pumped to Tank 219-S-102, where sodium hydroxide and sodium nitrite are added to treat the waste. Tank 219-S-102 then pumps the waste to the double-shell tank farms.

The 219-S facility was built in the early 1950s as part of the 222-S liquid waste disposal system. 219-S originally consisted of three tanks (tanks 101, 102 and 103), enclosed in an epoxy coated, underground concrete vault. The vault has two cells. Cell A contains tanks 101 and 102. Cell B contains tanks 103 and 104. Tanks 101 and 103 (103 was later replaced with tank 104) collect and store liquid waste from the 222-S laboratory. When enough waste was collected, it is

transferred to tank 102 and sampled, prior to being transferred to the tank farms. Prior to 1989, waste was transferred to the tank farm via underground lines, routed through 202-S. After 1989, the waste was transported to the tank farm via tank trailer trucks.

Related Sites/ Structures: The tank is associated with the other two 219-S Tanks, transfer lines, and the 222-S Laboratory (200-W-69).

Waste Type: Process Effluent

Waste Description: The unit receives liquid mixed waste from the 222-S Analytical Laboratory processes. The waste is transferred to Tank 219-S-TK-102 for treatment with sodium hydroxide and sodium nitrate.

Code: 219-S-102 **Classification:** Accepted

Names: 219-S-102; 219-S-TK-102; 219-S Primary Treatment Tank TK-102; 219-S Storage Tank 102 **Reclassification:** None

Type: Neutralization Tank **Start Date:** 6/1/1951

Status: Active **End Date:**

Description: The 219-S-102 Tank is a monitored stainless steel treatment and transfer tank resting in a below grade concrete vault at the 219-S Waste Handling Facility.

Location: The tank is located in a below grade concrete vault in the south side of Cell A in the 219-S Building. The 219-S Building is located north of the northeast end of the 222-S Building.

Process Description: The 219-S facility was built in the early 1950s as part of the 222-S liquid waste disposal system. 219-S originally consisted of three tanks (tanks 101, 102 and 103), enclosed in an epoxy coated, underground concrete vault. The vault has two cells. Cell A contains tanks 101 and 102. Cell B contains tanks 103 and 104. Tanks 101 and 103 (103 was later replaced with tank 104) collect and store liquid waste from the 222-S laboratory. When enough waste was collected, it is transferred to tank 102 and sampled, prior to being transferred to the tank farms. Prior to 1989, waste was transferred to the tank farm via underground lines, routed through 202-S. After 1989, the waste was transported to the tank farm via tank trailer trucks.

Waste batches from tanks 219-S-101 and 219-S-104 are pumped to tank 219-S-102, where sodium hydroxide and sodium nitrite are added to treat the waste. Tank 219-S-102 then pumps the waste to the double-shell tank farms.

Related Sites/ Structures: The tank is associated with the other two 219-S Tanks, transfer lines, the double-shell tank farms, and the 222-S Laboratory (200-W-69).

Waste Type: Process Effluent

Waste Description: The unit receives high activity mixed waste from the 222-S Laboratory processes. The waste is normally transferred from Tanks 101 and 104 for treatment. The waste is treated with sodium hydroxide to a pH greater than 12 and sodium nitrite to a concentration greater than 600 parts per million.

Code: 219-S-103 **Classification:** Accepted

Names: 219-S-103; 219-S Storage Tank 103 **Reclassification:** None

Type: Storage Tank **Start Date:** 6/1/1951

Status: Inactive **End Date:**

Description: The 219-S-103 Tank is a monitored stainless steel receiver tank resting in a below grade

concrete vault at the 219-S Waste Handling Facility.

- Location:** The tanks are located in a below grade concrete vault in the south side of Cell B in the 219-S Building. The 219-S Building is located north of the northeast end of the 222-S Building.
- Process Description:** The 219-S facility was built in the early 1950s as part of the 222-S liquid waste disposal system. 219-S originally consisted of three tanks (tanks 101, 102 and 103), enclosed in an epoxy coated, underground concrete vault. The vault has two cells. Cell A contains tanks 101 and 102. Cell B contains tanks 103 and 104. Tanks 101 and 103 (103 was later replaced with tank 104) collect and store liquid waste from the 222-S laboratory. When enough waste was collected, it is transferred to tank 102 and sampled, prior to being transferred to the tank farms. Prior to 1989, waste was transferred to the tank farm via underground lines, routed through 202-S. After 1989, the waste was transported to the tank farm via tank trailer trucks.

Tank 103 and its replacement tank 104 began service in 1996. Tank 103 was removed from service, blanked off, and left in place in 1999. They are both monitored stainless steel treatment and transfer tanks resting in a below grade concrete vault at the 219-S Waste Handling Facility. The 219-S-103 Tank used to receive high activity liquid mixed waste from the 222-S Laboratory processes. Waste batches from tanks 219-S-101 and 219-S-103 were pumped to tank 219-S-102, where sodium hydroxide and sodium nitrite were added to treat the waste. Tank 219-S-102 then pumped the waste to the double-shell tank farms. A 3.5 foot diameter (3 foot high) off gas filter is above 219-S-103. Drawing H-2-5234 labels the off gas filter tk-105.

- Related Sites/ Structures:** The tanks are associated with the other two 219-S Tanks, transfer lines, the double-shell tank farms, and the 222-S Laboratory (200-W-69).

- Waste Type:** Process Effluent
- Waste Description:** Tank 104 receives liquid mixed waste from the 222-S Analytical Laboratory processes. The waste is transferred to Tank 219-S-TK-102 for treatment with sodium hydroxide and sodium nitrite. Tank 103 used to receive high activity liquid mixed waste, that was then transferred to Tank 219-S-102 for treatment before being sent to the double-shell tank farms for storage.

-
- Code:** 219-S-104 **Classification:** Discovery
- Names:** 219-S-104; 219-S-TK-104; 219-S Storage Tank 104; 219-S-103 Replacement Tank **Reclassification:** None
- Type:** Storage Tank **Start Date:**
- Status:** Active **End Date:**
- Description:** 219-S-104 is the Replacement Tank for the 219-S-103 tank. The 219-S stainless steel tanks are located in a below grade concrete vault under the 219-S Waste Handling Facility building.
- Location:** The tanks are located on the south side of Cell B in the 219-S Building. The 219-S Building is located north of the northeast end of the 222-S Building.
- Process Description:** The 219-S tanks provide storage for hazardous and mixed waste. Tank 104 began service in 1996. Tank 219-S-104 replaced 219-S-103, which was removed from service and isolated. Similar to previous Tank 103 operations, Tank 104 receives liquid mixed waste, also from the 222-S Laboratory processes. Waste batches from tank 219-S-101 and 104 are pumped to tank 219-S-102, where sodium hydroxide and sodium nitrite are added to treat the waste. Tank 219-S-102 then pumps the waste to the double-shell tank farms.
- The 219-S facility was built in the early 1950s as part of the 222-S liquid waste disposal system. 219-S originally consisted of three tanks (tanks 101, 102 and 103), enclosed in an epoxy coated, underground concrete vault. The vault has two cells. Cell A contains tanks 101 and 102. Cell B

contains tanks 103 and 104. Tanks 101 and 103 (103 was later replaced with tank 104) collect and store liquid waste from the 222-S laboratory. When enough waste was collected, it is transferred to tank 102 and sampled, prior to being transferred to the tank farms. Prior to 1989, waste was transferred to the tank farm via underground lines, routed through 202-S. After 1989, the waste was transported to the tank farm via tank trailer trucks.

Code:	233-S	Classification:	Accepted
Names:	233-S; 233-S Plutonium Concentration Facility	Reclassification:	None
Type:	Process Unit/Plant	Start Date:	1/1/1952
Status:	Inactive	End Date:	1/1/1967

Description: This facility was demolished in 2004. The 233-S Plutonium Concentration Facility was an inactive (retired) limited access facility after 1967. The building was a reinforced concrete and structural steel assembly with corrugated steel and concrete walls. The building had eight rooms, an airlock, and a highbay area. These rooms were divided into two zones by a vertical partition of transparent plastic and structural steel. The two zones include a process area and a process viewing area. The above ground building structure was demolished in 2003 and 2004. A concrete cap has been placed over the foundation.

Location: The facility was located at the northwest side of 202-S Building.

Process Description: From 1978 to 1980 the facility was used as a demonstration project for decommissioning of contaminated facilities. Between 1963 and 1967 the facility was used to concentrate neptunium and plutonium nitrate solutions from REDOX. Prior to 1963 the facility provided the final purification and concentration of plutonium solutions using ion exchange technologies.

Related Sites/ Structures: Structures associated with the facility include process equipment, the 202-S Building, the 233-SA Building, UPR-200-W-57 and UPR-200-W-43.

Waste Type: Chemicals
Waste Description: Chemical and radiological contaminants may still be present as residual materials in building systems.

Waste Type: Equipment
Waste Description: Process equipment, systems, and building surfaces may have fixed and removable contamination as a result of processing and UPR-200-W-57.

Waste Type: Asbestos (non-friable)
Waste Description: Piping insulation, wire insulation, and ventilation components may be insulated with asbestos containing materials. Transite is used on certain building components.

Code:	241-S-302B	Classification:	Accepted
Names:	241-S-302B; 241-S-302-B Catch Tank; IMUST; Inactive Miscellaneous Underground Storage Tank	Reclassification:	None
Type:	Catch Tank	Start Date:	1/1/1952
Status:	Inactive	End Date:	1/1/1985

Description: This unit is a horizontal, cylindrical steel tank. Tank 241-S-302B is underground to provide radiation shielding protection. The tank is surrounded with posts and chain and labeled with IMUST signs.

Location: The 241-S-302B Catch Tank is located east of tank 241-S-101, south of tank 241-SY-102 and southwest of tank 241-SY-103, inside the tank farm fence.

Related Sites/ Structures: The 241-S Tank Farm and 241-S-151 Diversion Box are associated with this unit.

Waste Type: Storage Tank

Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operations.

Code: 242-S

Classification: Accepted

Names: 242-S; 242-S Evaporator

Reclassification: None

Type: Evaporator

Start Date: 1/1/1973

Status: Inactive

End Date: 1/1/1985

Description: The 242-S Evaporator is an inactive waste management unit. The principal operating areas of the evaporator include two adjoining, but structurally independent sections. Structure A, the processing and service area, is constructed of reinforced concrete shear walls and slab floors. Structure B of the building houses operating and support areas and is constructed of concrete block walls and structural steel.

Location: The site is located directly north of Tank 241-S-103 and lies outside the 241-S Tank Farm.

Process Description: The evaporation process reduced the volume of radioactive liquid by removing the water. The cooled vapor formed saltcake and residual liquor. This facility is currently in Condition III Standby, and the "B" Structure is used as a shift office for Tank Farms Operations Personnel. The "242-S Facility Shutdown/Standby Plan" provides a list of isolation work accomplished including pipelines that were blanked and equipment removed. Prior to 1980, the system was used to reduce the volume of radioactive liquid waste by evaporating water from the feed solution to produce a concentrated saltcake solution. The process condensate was sent back to the tanks. In 1985, a portion of the facility was used to process contaminated groundwater from the 216-U-1 and 216-U-2 crib area via the ion exchange column.

Related Sites/ Structures: The structures associated with this facility include tanks 242-S-TK-C-100 and 242-S-TK-1, the 241-S Tank Farm, the 216-U-14 Ditch, the 216-S-25 crib, pipeline 200-W-161-PL, the HVAC Pad south of the building, and internal process equipment.

Waste Type: Chemicals

Waste Description: The unit received liquid radioactive mixed waste from the single-shell tanks through 1980. The evaporation process reduced the volume of radioactive liquid by removing the water. The cooled vapor formed saltcake and residual liquor.

Code: 276-S

Classification: Accepted

Names: 276-S; 276-S Solvent Facility; 276-S Solvent Handling Facility

Reclassification: None

Type: Process Unit/Plant

Start Date: 1/1/1952

Status: Inactive

End Date: 1/1/1967

Description: The 276-S Building is a concrete and steel building, with transite siding on the portions of the building constructed of steel frame. The floor of the building is below grade, making up the processing area. Tanks and pumps make up most of the process equipment in the building.

Location: The building is located north of the 211-S Tanks and south of the 276-S-141 and 276-S-142

Hexone Tanks.

Process Description: The 276-S Facility provided for the storage and treatment of REDOX process solvent (methyl isobutyl ketone).

Related Sites/ Structures: Structures associated with the site include several tanks and pumps inside the building, solvent transfer lines, the 211-S Tank Farm, and the 276-S-141 and -142 Solvent Storage Tanks.

Waste Type: Chemicals

Waste Description: This unit contains contaminated surfaces inside pumps, pits, and tanks. No inventory has been determined. Hexone contamination may also be present in building systems.

The Following Sites Were Consolidated With This Site:

Code: 296-S-12

Names: 296-S-12; 296-S-12 Stacks

Code: 291-S **Classification:** Not Accepted (Proposed)

Names: 291-S; 291-S Fan and Filter Building; 291-S Fan Control Building; 291-S Fan House **Reclassification:** None

Type: Process Unit/Plant **Start Date:** 1/1/1952

Status: Active **End Date:**

Description: The fan house is an above ground concrete structure with outside dimensions of 4.2 meters by 6 meters (14 feet by 20 feet) and contains the blowers for the REDOX main ventilation system.

Location: The fan house is located adjacent to and southeast of the 291-S Stack.

Release Description: UPR-200-W-87.

Related Sites/ Structures: The 291-S Stack and sand filter are associated with the unit.

Waste Type: Equipment

Waste Description: The unit received exhaust air from the 202-S Process Building. The fans have very low levels of radiological contamination.

Code: 291-S-1 **Classification:** Not Accepted (Proposed)

Names: 291-S-1; 291-S-1 Stack; REDOX Process and Canyon Exhaust **Reclassification:** None

Type: Stack **Start Date:** 1/1/1952

Status: Active **End Date:**

Description: The unit is a double-shell structure. The outer shell is made of reinforced concrete and the inner shell is constructed of acid-resistant brick and mortar.

Location: The stack is located northeast of the 202-S Building.

Release Description: During the operation of the REDOX Facility, multiple stack emissions occurred causing areas of surface contamination. Most of the emissions consisted of short lived radionuclides.

Related Sites/ Structures: The sand filter and fan house are associated with the unit.

Waste Type: Process Effluent

waste type: PROCESS EFFLUENT**Waste Description:** The stack exhausts filtered air from the 202-S Process Building.

Code: 292-S	Classification: Accepted
Names: 292-S; 292-S Fan and Filter Building	Reclassification: None
Type: Process Unit/Plant	Start Date: 1/1/1952
Status: Inactive	End Date: 1/1/1967

Description: The unit is a concrete building, 3.4 meters (11 feet) high. Most of the concrete is 25.4 centimeters (10 inches) thick. An exhaust jet is located beneath the unit. The structure contains a 1.5-meter (5-foot) diameter by 2.3-meter (7.5-foot) high tank, 305 meters (1,000 feet) of 5.1-centimeter (2-inch) diameter tubing, and 91.5 meters (300 feet) of larger pipe up to 15.2 centimeters (6 inches) in diameter.

Location: The site is east of the 202-S Building.

Waste Type: Process Effluent

Waste Description: The unit contains radioactively contaminated surfaces on tanks, piping, and concrete (preliminary estimate is 4 curies beta).

Code: 293-S	Classification: Accepted
Names: 293-S; 293-S Off Gas Treatment; 293-S Off-Gas Treatment and Recovery; 293-S Offgas Treatment Facility	Reclassification: None
Type: Process Unit/Plant	Start Date: 1/1/1958
Status: Inactive	End Date: 1/1/1967

Description: The building extends 3.7 meters (12 feet) below grade to 9 meters (30 feet) above grade and is constructed of reinforced concrete. The main floor houses the absorption towers with a pipe valve pit in the basement. A corrugated metal lean-to, 2.6 meters (8.5 feet) by 8.5 meters (28 feet), is attached to the south wall. It houses the control room and Special Work Permit (SWP) with its concrete basement housing control piping. Underground acid storage, 4.3 meters (14 feet) by 4.0 meters (13 feet), is provided adjacent to the main building's west side. Also, ventilation supply equipment is present above ground adjacent to the south end of the lean-to structure.

Location: The site is located east of the 202-S Building.

Waste Type: Process Effluent

Waste Description: This unit and structure are radioactively contaminated.

Code: 296-S-1	Classification: Accepted
Names: 296-S-1; 296-S-1 Stack	Reclassification: Consolidated (11/10/2004)
Type: Stack	Start Date: 1/1/1950
Status: Inactive	End Date: 1/1/1976

Description: The unit is constructed of metal, and it extends from grade level to 1.8 meters (6 feet) above the roof.

Location: The stack is attached to the outside south wall of the service portion of the south pipe gallery of

202-S.

Related Sites/ Structures: The stack is associated with the 202-S facility.

Waste Type: Process Effluent

Waste Description: The unit contains surface radioactive contamination, exact amount unknown (1,000 counts/minute beta/gamma direct). The unit discharged filtered air from the south sample gallery and sample hoods of 202-S.

The Site Was Consolidated With:

Code: 202-S

Names: 202-S; 202-S REDOX; S Plant

Code: 296-S-2

Classification: Accepted

Names: 296-S-2; 296-S-2 Stack; Hoods Ventilation and PR Cage; REDOX North Sample Gallery

Reclassification: Consolidated (11/10/2004)

Type: Stack

Start Date:

Status: Inactive

End Date:

Description: The unit is constructed of metal and extends from the sample gallery level to above the roof. The fan and motor are in place. The fan and base are on a contaminated surface.

Location: The stack is located on the outside north wall of the 202-S Building.

Process Description: This stack was constructed to exhaust filtered air from REDOX north and south sample galleries and hoods.

Related Sites/ Structures: The stack is associated with the 202-S building.

Waste Type: Process Effluent

Waste Description: The unit contains an unknown amount of surface radioactive contamination. The unit discharged filtered air from the north sample gallery and sample hoods of 202-S.

The Site Was Consolidated With:

Code: 202-S

Names: 202-S; 202-S REDOX; S Plant

Code: 296-S-4

Classification: Accepted

Names: 296-S-4; Low-Level Decontamination Sink and Special Work Permit Lobby Vent; REDOX Decontamination Room; Regulated Shop; Regulated Tool Room

Reclassification: Consolidated (11/10/2004)

Type: Stack

Start Date:

Status: Inactive

End Date:

Description: The unit is constructed of metal, and extends from grade level to 1.8 meters (6 feet) above the roof. The fan and motor are in place. The fan and stack base are in a surface contaminated area.

Location: The stack is located on the east outside wall of the 202-S building.

Process Description: The unit discharged filtered air from the decontamination room and regulated shop and unfiltered air from the regulated tool room low-level decontamination sink and Special Work

Permit (SWP) lobby.

Related Sites/ Structures: The stack is associated with the 202-S building.

Waste Type: Process Effluent

Waste Description: The unit contains trace amounts of surface radioactive contamination. The unit discharged filtered air from the decontamination room and regulated shop and unfiltered air from the regulated tool room low-level decontamination sink and Special Work Permit (SWP) lobby.

The Site Was Consolidated With:

Code: 202-S

Names: 202-S; 202-S REDOX; S Plant

Code: 296-S-6

Classification: Accepted

Names: 296-S-6; 296-S-6 Stack; REDOX Silo Ventilation

Reclassification: Consolidated (11/10/2004)

Type: Stack

Start Date:

Status: Inactive

End Date:

Description: The unit is constructed of metal, and it extends from the fan base in the feed tank area to 3.5 meters (11.5 feet) above the roof.

Location: The stack is located on the roof in the northeast corner of 202-S.

Process Description: 296-S-6 was built to discharge unfiltered air from the silo gallery, organic feed tank and sample elevator.

Waste Type: Process Effluent

Waste Description: The unit contains trace amounts of surface radioactive contamination. The unit discharged unfiltered air from the silo gallery, organic feed tank, and sample elevator.

The Site Was Consolidated With:

Code: 202-S

Names: 202-S; 202-S REDOX; S Plant

Code: 296-S-7

Classification: Not Accepted (Proposed)

Names: 296-S-7; 296-S-7 East and West Stacks; 296-S-7E; 296-S-7W; Dual Stacks; REDOX Product Building (233-S) Ventilation

Reclassification: None

Type: Stack

Start Date:

Status: Inactive

End Date:

Description: The waste site consisted of two stacks, constructed of metal, extending from the fan base to above roof level. The units included a six meter (20 feet) intake duct and two electric drive fans. The systems were operated one at a time and were alternated weekly.

Location: The stacks were located on the outside north wall of the 233-SA building.

Process Description: The stacks were constructed to exhaust filtered air from the 233-S Building, the REDOX plutonium processing greenhouse, the process vessel ventilation and load out area.

Related Sites/ The stacks are associated with the 233-SA building.

Structures:

Waste Type: Process Effluent

Waste Description: The stacks contained an unknown amount of radioactive contamination. The units discharged air from 233-S.

Code: 296-S-12

Classification: Accepted

Names: 296-S-12; 296-S-12 Stacks

Reclassification: Consolidated (11/10/2004)

Type: Stack

Start Date:

Status: Inactive

End Date:

Description: There are two units, each 53 centimeters (21 inches) square and 3.2 meters (10.5 feet) high

Location: The stacks are located on the roof of the 276-S Building, over the operating gallery.

Related Sites/Structures: The stacks are associated with the 276-S building.

Waste Type: Process Effluent

Waste Description: The units received exhaust air from the 276-S Operating Gallery.

Description:

The Site Was Consolidated With:

Code: 276-S

Names: 276-S; 276-S Solvent Facility; 276-S Solvent Handling Facility

Code: 296-S-13

Classification: Accepted

Names: 296-S-13; 222-S Stack

Reclassification: None

Type: Stack

Start Date: 1/1/1951

Status: Inactive

End Date: 1/1/1978

Description: The stack originates on the second floor of 222-S and is approximately 2 meters (7 feet) in diameter by 16 meters (52 feet) tall.

Location: The stack is located in the southeast corner of the 222-S roof.

Waste Type: Process Effluent

Waste

Description:

Code: 296-S-16

Classification: Accepted

Names: 296-S-16; 219-S Stack

Reclassification: None

Type: Stack

Start Date: 1/1/1951

Status: Active

End Date:

Description: The stack is approximately 10 centimeters (4 inches) in diameter by 2.7 meters (7 feet) high.

Location: This stack is located on the west side of the 219-S Waste Handling Facility.

Process Description: Air is exhausted from the 219-S waste tanks through a de-mister (TK-105) and a single stage of High-Efficiency Particulate Air (HEPA) filtration prior to discharge through the stack to the atmosphere.

Waste Type: Process Effluent
Waste Description:

Code: 296-S-21 **Classification:** Accepted
Names: 296-S-21; 222-S Stack **Reclassification:** None
Type: Stack **Start Date:** 1/1/1978
Status: Active **End Date:**

Description: The stack is approximately 2 meters (6.5 feet) in diameter by 11.6 meters (38 feet) tall.
Location: The site is located on the southeast corner of the 222-S Laboratory.
Process Description: Air is exhausted from the 222-S Laboratory rooms, hoods, gloveboxes, and hot cells through the 222-SB or 222-SE Filter Buildings prior to discharge through the stack to the atmosphere.

Waste Type: Process Effluent
Waste Description:

Code: 2711-S **Classification:** Accepted
Names: 2711-S; 2711-S Stack Monitoring Building **Reclassification:** None
Type: Process Unit/Plant **Start Date:** 1/1/1959
Status: Inactive **End Date:**

Description: The 2711-S Building is an isolated, inactive wooden structure. The structure is old and of questionable integrity.
Location: The building is adjacent to the 291-S Air Sampler and the 291-S-1 Stack.
Process Description: The building is currently used for equipment and lead shielding storage. The building contains a motor, pump, and instrumentation for the 291-S-1 Stack Sampling Building, and supports stack monitoring activities.

Related Sites/Structures: The structures associated with this unit include the 291-S-1 Stack, the Gas Monitoring Building, and the 202-S Ventilation System.

Waste Type: Equipment
Waste Description: The building may store lead shielding. According to WHC-SP-0331, Revision 1, this lead was scheduled for removal.

Waste Type: Equipment
Waste Description: The building stores office furniture and performance monitoring equipment which may be radiologically contaminated.

Code: 2718-S **Classification:** Accepted
Names: 2718-S; 2718-S Filter Monitoring Building; 2718-S Sand Filter Monitor; 2718-S Sand Filter Sampler **Reclassification:** None

Waste Type: Demolition and Inert Waste
Waste Description: Piles of dirt and asphalt rubble that appear to be left over from cleanup operations still remain at the site.

Closure Info: In order to minimize closure costs related extensive sampling, it was decided to dispose of the structures and the first 15 centimeters (6 inches) of soil immediately beneath the structures as WT02, Washington State dangerous waste. Closure verification sampling consisted of sampling substructure soils that would remain after demolition and after the planned soil removal. Sampling was performed prior to site demolition to prevent disturbing the underlying soil. Samples B07531 through B07562 were taken in support of closure activities. A sketch showing sampling locations and tables showing sample results are available in WHC-SD-EN-TI-242, Rev. 0B.

Demolition of the metal building and concrete storage pad began immediately upon the completion of sampling. The bulk of the demolition waste was taken to an offsite RCRA landfill in September 1992.

Code: 233-SA **Classification:** Not Accepted (Proposed)
Names: 233-SA; 233-SA Exhaust Filter Building **Reclassification:** None
Type: Process Unit/Plant **Start Date:** 1/1/1967
Status: Active **End Date:**

Description: The 233-SA Exhaust Filter Building was a one-story reinforced concrete structure. The building housed two banks of double high-efficiency particulate air (HEPA) filters. Each filter bank has its own exhaust fan, stack, and monitoring instrumentation. The building has been demolished. The foundation has been capped with concrete.

Location: The 233-SA Building was located at the northwest corner of 233-S.

Process Description: The building handled the ventilation for the 233-S Facility.

Related Sites/ Structures: Structures associated with this system include the exhaust system, the 233 Building and process equipment.

Waste Type: Chemicals
Waste Description: The system contained process equipment contaminated with plutonium and americium derived from 233-S Building operations.

Code: 2904-SA **Classification:** Accepted
Names: 2904-SA; 2904-SA Cooling Water Sampler Building; 2904-SA Sample Building **Reclassification:** None
Type: Process Unit/Plant **Start Date:** 1/1/1956
Status: Inactive **End Date:** 1/1/1976

Description: The 2904-SA Sample Building is a prefabricated metal structure resting on a concrete foundation. It is located over the southern portion of the 2904-S-170 Control Structure. Process equipment within the building includes a pump, a stainless steel tank (below grade), and a sample riser that extends through the floor of the building. The exterior of the building is posted with Contamination Area and Danger-Restricted Access signs.

Location: The building is located southwest of the 202-S canyon facility, near the southwest corner of the 211-S tank farm.

Process Description: The sample shack was built to provide sampling of process waste from the REDOX facility.

Process Description: prior to being routed through the 2904-S-170 Weir to liquid waste disposal sites. The building extends 0.97 meters (3 foot 2 inches) over the south end of the 2904-S-170 Weir.

Related Sites/ Structures: The sample building is associated with the 2904-S-170 Weir and the process line connected to the weir.

Waste Type: Process Effluent

Waste Description: This unit contains trace amounts of low-level radioactive surface contamination derived from the process effluents sampled in this building.

Code: 222-SD **Classification:** Accepted

Names: 222-SD; 222 SD; 222-S DMWSA; 222-S TSD **Reclassification:** None
Dangerous and Mixed Waste Storage Area

Type: Storage **Start Date:** 6/1/1979

Status: Active **End Date:**

Description: The 222-S Dangerous Waste and Mixed Waste Storage Area (DMWSA) is a permitted treatment, Storage, and Disposal (TSD) area. It consists of two storage buildings (HS-0082 and HS-0083). The storage buildings are self-contained units with fire suppression and air conditioning, and are equipped with secondary containment. The site also includes portions of the concrete pad, which was previously used for the connex boxes in the DMWSA. The units and pad will be removed at closure under the Part B permit.

Location: The unit is located adjacent to the north of the 222-S Laboratory.

Process Description: The unit provides temporary storage for liquid and solid waste generated by the 222-S Laboratory complex. This waste includes dangerous and mixed waste.

Related Sites/ Structures: Structures associated with this unit include the waste generating facilities in the 222-S Laboratory complex.

Waste Type: Chemicals

Waste Description: Wastes generated from 222-S Analytical and 222-SA Standards Laboratories are stored in the unit. This consists of dangerous and mixed waste.

Code: 241-SY-A **Classification:** Accepted

Names: 241-SY-A; 241-SY-A Diversion Box; 241-SY-A **Reclassification:** None
Valve Pit

Type: Valve Pit **Start Date:** 1/1/1977

Status: Active **End Date:**

Description: The 241-SY-A Valve Pit is fabricated from reinforced concrete. All concrete and ferrous materials are treated with a protective coating. This unit has two cover blocks with valve handles extending through penetrations in the cover blocks.

Location: This unit is located inside the 241-SY Tank Farm south of and between Tanks 241-SY-101 and 241-SY-102.

Process Description: This unit is used to route waste solutions to and from the 241-SY Tank Farm.

Related Sites/ Structures: The 241-SY Tank Farm is associated with this unit. Additional facilities associated with the

241-SY-A Valve Pit include the 244-S, 242-S, and 244-U Facilities.

Waste Type: Process Effluent
Waste Description: The unit transports waste solutions from processing and decontamination operations. Quantities are variable according to specific plant operations. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-SY-B **Classification:** Accepted

Names: 241-SY-B; 241-SY-B Diversion Box; 241-SY-B Valve Pit **Reclassification:** None

Type: Valve Pit **Start Date:** 1/1/1977

Status: Active **End Date:**

Description: The 241-SY-B Valve Pit is fabricated from reinforced concrete. All concrete and ferrous materials are treated with a protective coating. This unit has two cover blocks with valve handles extending through penetrations in the cover blocks.

Location: This unit is located inside the 241-SY Tank Farm south of and between Tanks 241-SY-101 and 241-SY-102.

Process Description: This unit is used to route waste solutions to and from the 241-SY Tank Farm.

Related Sites/Structures: The 241-SY Tank Farm is associated with this unit. Additional facilities associated with the 241-SY-B Valve Pit include the 244-S, 242-S, and 244-U Facilities.

Waste Type: Process Effluent
Waste Description: The unit transports waste solutions from processing and decontamination operations. Quantities are variable according to specific plant operations. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-SY-101 **Classification:** Accepted

Names: 241-SY-101; 241-SY-TK-101 **Reclassification:** None

Type: Double-Shell Tank **Start Date:** 1/1/1977

Status: Active **End Date:**

Description: This unit is fabricated as three concentric tanks. The primary tank and secondary tank are made of carbon steel with the secondary tank being larger in diameter than the primary tank. The space between the carbon steel tanks is referred to as the annulus. The third tank is a concrete shell that encloses both the primary and secondary tanks for additional containment, radiation shielding, and structural support. The 241-SY-101 Double Shell Tank is underground to provide shielding from radiation.

Location: The 241-SY-101 Double Shell Tank is located southeast of the 242-S Evaporator and within the 241-SY Tank Farm.

Process Description: This unit is used to store Tank Farms processing and operational waste.

Related Sites/Structures: Structures associated with tank 241-SY-101 include the ventilation system, cover blocks on the access pits, and risers.

Waste Type: Storage Tank
Waste Description: Waste transferred to this unit includes double-shell slurry, and radioactive mixed waste from tanks 241-SY-102, 241-SX-106, and 241-U-111.

Names: 221-T CSTF; 221-T Head End; T Plant Laboratory; 221-T Containment System Test Facility

Reclassification: Closed Out (2/22/1999)

Type: Laboratory

Start Date: 1/1/1964

Status: Inactive

End Date:

Description: The 221-T CSTF consisted of the head end (Section 1) of the 221-T Canyon. In 1964, a sheet metal wall was constructed to separate Section 1 from the rest of the canyon. The head end area consists of one large process cell, a control room, laboratories, a shop, a change room, and a high bay near the cell.

Location: The 221-T CSTF is located at Section 1 of the 221-T Building.

Process Description: Between 1964 and 1990, the 221-T Building head-end housed a series of testing programs. From 1964 to 1969 Pacific Northwest Laboratories used the facility to perform experiments with radioactive cobalt, cesium, and iodine. From 1976 to 1985, Westinghouse Hanford Company used the 221-T CSTF to perform liquid metal reactor safety tests using nonradioactive sodium, lithium, and sodium iodide. From 1985 to 1990 the unit was part of the light water reactor tests which were conducted with nonradioactive cesium, manganese, zinc, lithium sulfate, iodine, and hydrogen iodide. The unit was to be used as a research laboratory intended for use as an alkali metal waste treatment unit. It was anticipated alkali operations were to begin in 1977. The unit was also intended to treat dangerous alkali metal waste by heating the waste in a treatment tank equipped with an offgas system.

Related Sites/Structures: Structures associated with the 221-T CSTF included the containment vessel, tanks, process equipment, laboratories, the 221-T Canyon, the 221-T Canyon and ventilation systems.

Waste Type: Chemicals

Waste Description: Wastes generated at the laboratory were intended to include alkali metal hydroxide, oxides, and carbonates. The maximum process design capacity for tank treatment was intended to be 100 liters (26.4 gallons) per day. The 221-T never managed dangerous waste. Previous use of the facility included experiments with radiological constituents. Residual contamination may be present.

Code: 221-T-5-6

Classification: Accepted

Names: 221-T-5-6; 221-T-TK-5-6; T Plant Complex; Tank 5-6 221-T System

Reclassification: None

Type: Storage Tank

Start Date: 1/1/1944

Status: Active

End Date:

Description: Tank 221-T-5-6 is a type 347 stainless steel tank with piping connecting the unit to other tanks in the 221-T tank system. The tank is cylindrical in shape.

Location: The tank is located in cell 5L, in the northern third of the 221-T canyon.

Process Description: Tank 221-T-5-6 provides additional storage for tank 221-T-5-9. Liquid wastes are transferred to the tank for temporary holding from 221-T-5-9. The liquid wastes are eventually transferred back to 221-T-5-9 and subsequently to 221-T-15-1.

Related Sites/Structures: Structures associated with tank 221-T-5-6 include transfer lines, cell 5L equipment, and the other tanks and sumps in the 221-T tank system

Waste Type: Process Effluent

Waste Description: The unit receives liquid mixed waste from T Plant (221-T, 2706-T) decontamination operations.

Description:

Code: 221-T-5-7 **Classification:** Accepted
Names: 221-T-5-7; 221-T-TK-5-7; T Plant Complex;
Tank 5-7 221-T System **Reclassification:** None
Type: Storage Tank **Start Date:** 1/1/1944
Status: Active **End Date:**

Description: Tank 221-T-5-7 is a type 347 stainless steel tank with piping connecting the unit to other tanks in the 221-T tank system. The tank is rectangular with a flat bottom.

Location: The tank is located in cell 5R, in the northern third of the 221-T canyon.

Process Description: Tank 221-T-5-7 is the receiving point for liquid waste collected in the 610 millimeter (24 inch) liquid collection line which extends the length of the canyon building and receives drainage from all cells (except 5R) and the railroad tunnel. The tank also receives waste from the 211-T collection sump (by way of tank 221-T-6-1 overflow to the cell 6L drain) and drainage from the decontamination pad over cell 15L. Liquid waste are transferred from 221-T-5-7 to 221-T-5-9 via a steam jet. Sump 221-T-5-8 acts as secondary containment for this tank.

Related Sites/ Structures: Structures associated with tank 221-T-5-7 include transfer lines, cell 5R equipment, and the other tanks and sumps in the 221-T tank system.

Waste Type: Process Effluent

Waste Description: The unit receives liquid mixed waste from T Plant (221-T, 2706-T) decontamination operations.

Code: 221-T-5-9 **Classification:** Accepted
Names: 221-T-5-9; 221-T-TK-5-9; T Plant Complex;
Tank 5-9 221-T System **Reclassification:** None
Type: Storage Tank **Start Date:** 1/1/1944
Status: Active **End Date:**

Description: Tank 221-T-5-9 is a type 347 stainless steel tank with piping connecting the unit to other tanks in the 221-T tank system. The tank is cylindrical in shape.

Location: The tank is located in cell 5L, in the northern third of the 221-T canyon.

Process Description: Tank 221-T-5-9 receives waste from tank 221-T-5-6 and occasionally from tank 221-T-5-7. Liquid waste is transferred from 221-T-5-9 to 221-T-15-1 via steam jet.

Related Sites/ Structures: Structures associated with tank 221-T-5-9 include transfer lines, cell 5L equipment, and the other tanks and sumps in the 221-T tank system

Waste Type: Process Effluent

Waste Description: The unit receives liquid mixed waste from T Plant (221-T, 2706-T) decontamination operations.

Code: 221-T-6-1 **Classification:** Accepted
Names: 221-T-6-1; 221-T-TK-6-1; T Plant Complex;
Tank 6-1 221-T System **Reclassification:** None

Type: Storage Tank **Start Date:** 1/1/1944
Status: Active **End Date:**

Description: Tank 221-T-6-1 is a type 347 stainless steel tank with piping connecting the unit to other tanks in the 221-T tank system. The tank is over shaped and is partially enclosed

Location: The tank is located in cell 6L, in the northern third of the 221-T canyon.

Process Description: Tank 221-T-6-1 receives waste transferred from the 211-T collection sump. The tank overflows into containment sump 6-L (cell 6L) and gravity drains to tank 221-T-5-7 via the 221-T Building's common 610 millimeter (24 inch) liquid collection line

Related Sites/ Structures: Structures associated with tank 221-T-6-1 include transfer lines, cell 6L equipment, and the other tanks and sumps in the 221-T tank system.

Waste Type: Process Effluent
Waste Description: The unit receives liquid mixed waste from T Plant (221-T, 2706-T) decontamination operations.

Code: 221-T-11-R **Classification:** Accepted
Names: 221-T-11-R; 221-T-TK-11-R; T Plant Complex; Tank 11-R 221-T System **Reclassification:** None

Type: Storage Tank **Start Date:** 1/1/1944
Status: Active **End Date:**

Description: Tank 221-T-11-R is a type 347 stainless steel tank with piping connecting the unit to other tanks in the 221-T tank system. The tank is oval shaped with an open top and flat bottom.

Location: The tank is located in cell 11R, near the center of the long axis of the 221-T canyon.

Process Description: Tank 221-T-11-R receives waste from decontamination operations over cell 11R. The wastes are transferred from 221-T-11-R to 221-T-15-1 via steam jet

Related Sites/ Structures: Structures associated with tank 221-T-11-R include transfer lines, cell 11R equipment, and the other tanks and sumps in the 221-T tank system.

Waste Type: Process Effluent
Waste Description: The unit receives liquid mixed waste from T Plant decontamination operations.

Code: 221-T-15-1 **Classification:** Accepted
Names: 221-T-15-1; 221-T-TK-15-1; T Plant Complex; Tank 15-1 221-T System **Reclassification:** None

Type: Storage Tank **Start Date:** 1/1/1957
Status: Active **End Date:**

Description: Tank 221-T-15-1 is a type 347 stainless steel tank with piping connecting the unit to other tanks in the 221-T tank system. The tank has an open top, a flat bottom, and is oval in shape.

Location: The unit is located in cell 15R, in the southern third of the 221-T canyon building.

Process Description: Tank 221-T-15-1 receives wastes transferred from Tanks 221-T-5-9 and 221-T-11-R, and liquid decontamination wastes generated on the cell 15R Decontamination Pad. This tank is the final

tank in the 221-T Tank system before the waste is off loaded to railroad tank cars in the 221-T Railroad Tunnel. Nitrate addition or pH adjustment may also take place in this tank.

Related Sites/ Structures: Structures associated with Tank 221-T-15-1 include the 241-TX-154 Diversion Box, associated transfer lines, cell 15 equipment, the other 221-T Tanks, and the double-shell tank system.

Waste Type: Process Effluent

Waste Description: The unit receives liquid mixed waste from T Plant (221-T, 2706-T) decontamination operations.

Code: 224-T

Classification: Accepted

Names: 224-T; 224-T Canyon; Plutonium Concentration Facility

Reclassification: None

Type: Process Unit/Plant

Start Date: 1/1/1944

Status: Inactive

End Date:

Description: Access to the building is restricted. The entrance portion of the building is enclosed in a locked, chain link fence. The east side of the building that coincides with the canyon cells has sealed doors marked A, B, C, D, E, and F. Each door is posted with Fissile Material, High Radiation, High Contamination and Airborne Contamination signs. Adjacent to the doors, Fixed Contamination signs are posted on painted portions of the concrete facility walls. Inside the building, the canyon portion of this building has been sealed off and is not accessible.

Location: This is a three story concrete building located southeast of 221-T and south of 222-T.

Release Description: In 1972, while modifications to the building were being made, plutonium contaminated soil was identified outside the building, presumably associated with a leaking process waste line (UPR-200-W-102).

Process Description: The building was originally constructed in 1943 as part of the T Plant bismuth-phosphate fuel processing complex. From 1944 to 1956 it functioned as the Plutonium Concentration Facility, concentrating the liquid output from the plutonium separations plant from 1,249 liters to 30 liters. The concentration took place in six radiologically contaminated process cells (Cells A, B, C, D, E, & F), located in the southeastern 1/3 of the 224-T building. The cells contained various tanks and piping. Cells A, B, D, and E contained a 40 inch centrifuge on a platform. Cell C is a pit that connects to the underground pipe tunnel from Sections 13 & 14 of 221-T. Cell F was "L" shaped and included an office and a glass enclosure where partial finished product was collected for transfer to 231-W. The contaminated process cell equipment was flushed when the process was terminated (1960's). The amount of radiological or regulated material remaining within the process cells and piping is unknown. The plutonium concentration process was identical to the concentration process done at 224-B in 200 East Area. A thorough radiological characterization was done of the 224-B Hot Cells in 1985. An inventory of radioactive material remaining in the 224-B hot cells, based on average measurements, estimated 1.1 curies of cesium-137, 22 curies of strontium-90, 3.7 curies of cobalt-60, 5 curies of americium-241, 31 curies of plutonium-239 and 2 curies of other plutonium isotopes. This characterization is assumed to be similar to what may remain in the 224-T hot cells. The building was used as a plutonium liquid and scrap plutonium storage facility from 1975 to 1985. In 1985 the building was modified to house the Transuranic Assay Facility (TRUSAF) equipment. The TRUSAF Part A Permit states the contaminated canyon portion was sealed off from the rest of the building in 1975. During the 1960's and 1970's, the 224-T building was used to store solid and liquid plutonium-bearing material. The storage area was located on the second floor, in the pipe gallery. The southwest end of the first floor of 224-T consisted of the former G-Cell (never used) and the F-10 Hood Room. This area and the

adjoining office was converted into an auxiliary measurement facility, equipped with instrumentation for measuring quantities of plutonium. There was also an enclosed equipment dismantling area that handled equipment for the recovery of plutonium residues. In 1985, a RCRA compliant storage unit Transuranic Waste Storage and Assay Facility was placed in 224-T and occupies 2/3 of the building and adjacent outdoor areas. This portion of the building is documented in WIDS Site code TRUSAF. This operation is currently on standby

Related Sites/ Structures: This portion of the 224-T building is associated with the Bismuth-Phosphate plutonium processing of nuclear fuel at 221-T from 1944 to 1956. The pipeline from 224-T to 216-T-3 reverse well is sitecode 200-W-226-PL.

Waste Type: Sludge

Waste Description: In the 1940's, plutonium solutions were concentrated in the six cells in 224-T. In the 1950's, the tanks were drained and rinsed. In 2001, Non-destructive Assay analysis of nineteen tanks found less than 2 grams of fissile material inside the tanks, except for one that contained 4 grams of fissile material.

Code: 241-T-302

Classification: Accepted

Names: 241-T-302; 241-T-302 Catch Tank

Reclassification: Rejected (9/18/2002)

Type: Catch Tank

Start Date:

Status: Inactive

End Date:

Description: Although this tank has been listed in the Tri Party Agreement (appendix B), it has been verified that this tank does not exist.

Location: It has been verified this catch tank does not exist. Previous documents have described the tank location to be adjacent to the 241-T-152 Diversion Box, inside the 241-T Tank Farm fence. This has proved to be incorrect.

Code: 224-U CNT

Classification: Accepted

Names: 224-U CNT; 224-U Condensate Neutralization Tank; 224-U Process Condensate Neutralization Tank; 224-U-TK-C-5; Process Condensate Elementary Neutralization Unit; Tank TK-C-5

Reclassification: None

Type: Neutralization Tank

Start Date: 1/1/1987

Status: Inactive

End Date: 1/1/1989

Description: The unit is part of a four tank system designed to neutralize UO₃ Plant process condensate prior to disposal in the 216-U-17 Crib.

Location: The unit lies along the north wall of cell C, inside the 224-U Building.

Process Description: The process condensate stream is currently inactive. The 224-U Condensate Neutralization Tank is presently in a standby mode with the Uranium Trioxide (UO₃) Facility. During active facility operations, a predetermined dose of phosphoric acid was pumped from TK-C-8 to TK-C-5 every time condensate was pumped from TK-X-37 to TK-C-5. The agitator in TK-C-5 worked in conjunction with a recirculating pump loop to agitate the mixture. Potassium hydroxide from TK-X-36 was added to the recirculating loop under pH feedback control. When pH was within the specified limits, the recirculating loop discharged from the system. Process condensate was discharged to Crib 216-U-17 until 1989. Afterwards it was discharged to storage tanks at the Uranium Trioxide (UO₃) Plant.

Related Sites/ Structures: Tank TK-X-36, Surge Tank TK-X-37, transfer lines, pumps, valves, instrumentation, and the 216-U-17 Crib.

Waste Type: Process Effluent

Waste Description: Under normal operating conditions, the process condensate is not designated as a dangerous waste. However, there is a potential for residual chemical or radiological contamination to be present in this neutralization system.

Code: 224-U HWSA

Classification: Accepted

Names: 224-U HWSA; 224-U Hazardous Waste Storage Area

Reclassification: Rejected (9/6/2000)

Type: Storage Pad (<90 day)

Start Date: 1/1/1986

Status: Inactive

End Date: 1/1/1995

Description: The unit consisted of a paved pad surrounded by a paved parking area on the northwest side of the 224-U Building. There is (April 12, 2000) no longer any evidence of the 90 Day Storage Pad in the area.

Location: The site was located on the northwest side of the 224-U Building.

Process Description: The hazardous waste staging area was used to store (stage) Uranium Trioxide (UO₃) and PUREX Plant related hazardous wastes prior to transport.

Related Sites/ Structures: Structures associated with this unit included the 224-U Building and any containment units located at the pad.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: Waste that was stored (staged) here included paints, solvents, and other hazardous wastes generated at the Uranium Trioxide (UO₃) Plant.

Code: 276-U

Classification: Accepted

Names: 276-U; 276-U Solvent Facility; 276-U Solvent Handling Facility; 276-U Solvent Recovery Facility

Reclassification: None

Type: Process Unit/Plant

Start Date: 1/1/1952

Status: Inactive

End Date: 1/1/1957

Description: The 276-U Solvent Recovery Facility is an aboveground concrete basin extending below grade. The unit is physically attached to the southern wall of the 221-U Canyon.

Location: The unit is directly attached to the southern wall of 221-U.

Process Description: The building is currently isolated. Prior to retirement the building was used for the makeup and treatment of the organic solutions used in the 221-U Building.

Related Sites/ Structures: Structures associated with the unit include the tanks and vacant tank pads, the 221-U Building, and the numerous access equipment and utilities related to the tanks.

Waste Type: Chemicals

Waste Description: Radiological contamination (fixed and smearable) is present on the structures and equipment. Residual chemical contamination may also be present.

hexane/benzene/butyl lithium/tetrahydrofuran 1 kg (2.2 lb); chromium metal powder 454 g (1.0 lb); toluene/ ether/benzene/ethylacetate 4 kg (8.8 lb); heptane/diethyl ether 4 kg (8.8 lb); ethyl ether/allyl magnesium bromide 1 kg (2.2 lb); benzene/ethyl acetate/ tetrahydrofuran/ether/toluene/ hydrogen sulfide/methanol 4 kg (8.8 lb); ethyl ether 29.7 kg (65.5 lb); picric acid 460 g (1.01 lb); isopropyl ether 1 kg (2.2 lb); butoxyethanol 946 g (2.1 lb); butyl cellosolve 89 g (0.2 lb); carbon trichloride 445 g (0.98 lb); butyl ethanol 9.46 kg (20.9 lb); phenylether 235 g (0.52 lb).

Closure Info: Soil samples were collected and analyzed to show the absence of chemicals in the soil.

Code: 200-W CSLA **Classification:** Accepted

Names: 200-W CSLA; Construction Surface Laydown Area; Non-Rad Burial Ground; 200-W Construction Surface Laydown Area **Reclassification:** Rejected (1/19/2000)

Type: Dumping Area **Start Date:** 1/1/1945

Status: Inactive **End Date:** 1/1/1950

Description: The site is an old construction laydown area. The laydown area is not marked. The 216-U-17 Crib is located at the northwest corner of this location. A 1997 site visit also noted the 200-UP-1 Groundwater Pump and Treat facility in the northwest portion of this location. There was evidence of scattered miscellaneous debris on the surface of the vacant area south and east of the 216-U-17 crib. In 1997, construction of the new Cross-Site Transfer Line was occurring nearby.

Location: The site is located near the southeast corner of the 16th street and Beloit Avenue intersection, inside 200 West Area.

Process Description: A copy of a historical photograph from an unidentified document was found that shows the construction laydown area being actively used. There is a large temporary hut and several smaller temporary structures and material located at the site. It is assumed to have been taken in the early 1950's, when U Plant was being renovated to begin the Uranium Metal Recovery mission. The U-Plant Technical Baseline Report states the area was a "pit" where trucks were driven to dump material. No drawings have been identified that identify a pit at this location, although an open trench is visible on a 1948 aerial photograph, east of where the 216-U-17 crib is currently located. The trench has been given WIDS sitecode 200-W-71. A meeting with HL Maxfield and RP Knight in 1987 prior to the construction of the 216-U-17 Crib confirmed the area had been used as a laydown area to support construction activities at U-Plant. That explained the large amount of surface debris in the area. The debris located over the new crib site was bladed off during construction.

Related Sites/ Structures: The area is associated with 200-W-71.

Waste Type: Misc. Trash and Debris

Waste Description: This site was used to dispose of unusable valves, piping, and other plumbing materials. Angle iron, crushed cans and drums, rusty wire and metal frames were noted on the surface in 1997.

Code: 200-W PAP **Classification:** Accepted

Names: 200-W PAP; 200-W Powerhouse Ash Pit **Reclassification:** Rejected (5/21/2008)

Type: Coal Ash Pit **Start Date:** 1/1/1943

Status: Inactive **End Date:** 1/1/1995

Description: The pit is a rectangular, open hole, approximately 7.6 meters (25 feet) deep. In February

2000, the site was empty and dry. As of April, 2000, the unit is a deep pit with steep sloped sides. It is surrounded with a light chain and posted with "Danger-Open Pit" signs. A layer of ash remains on the floor of the pit.

Location: The pit is located south of the 284-W Powerhouse, west of Beloit Ave. and north of 19th Street.

Process Description: When supporting the powerhouse operation, the pit was filled with an ash slurry that was sluiced through two underground pipes that emerge from the north side of the pit. Periodically, when the pit became too full, ash was dredged from the pit and moved to the Ash Disposal Basin located on the east side of Beloit Ave.

Related Sites/ Structures: The pit is associated with the 284-W Powerhouse and the 200-W Ash Disposal Basin.

Waste Type: Ash

Waste Description: A waste determination of the Hanford Site 200 Area steam plant ash was performed in the early 1990s. The waste stream was determined to be nondangerous. Samples were analyzed using the TCLP (Toxicity Characteristic Leaching Procedure), and all were below the regulatory limits. Eleven sample results were also reported for pH: the results ranged from 7.66 to 11.91, with an average of 9.27. The second and third highest pH results were 10.09 and 9.94.

The rate of ash generation was approximately 8,890 cubic yards per year. The pit held approximately 57,290 cubic yards of ash.

Code: 200-W PP	Classification: Accepted
Names: 200-W PP; 284-W-B; 200 West Powerhouse Ponds; 200-W Powerhouse Pond	Reclassification: Consolidated (4/20/2000)
Type: Pond	Start Date: 1/1/1984
Status: Inactive	End Date: 1/1/1995
Description: The unit consists of two elongated basins. Drawing H-2-94251 identifies the north basin as a settling pond and the south basin as a seepage pond. The sides and bottom are covered with cobbles. The head wall and the spillway between the basins are made of concrete. The basins were placed on top of the original head end of the 216-U-14 ditch. This site has been consolidated with the 216-U-14 Ditch.	
Location: The unit is located inside 200 West Area, west of the 284-W Powerhouse.	
Process Description: Prior to the construction of the Powerhouse Pond, the head end of the 216-U-14 Ditch occupied this location. The Powerhouse Pond was constructed over a portion of the 216-U-14 Ditch when the ditch was deactivated and stabilized. The Powerhouse Pond received effluent from the 284-W Powerhouse, the 283-W Water Filter Plant and the 282-W Water Reservoir from August 1984 until June 1995. In June 1995, the 284-W Powerhouse was shut down and the effluent from the filter plant and reservoir was routed to the 200 Area Treated Effluent Disposal Facility.	
Related Sites/ Structures: The basins are associated with pipeline 200-W-102-PL, 216-U-14 ditch, 284-W Powerhouse, 283-W Water Filter Plant, and 282-W Water Reservoir.	
Waste Type: Water	
Waste Description: The unit received wastes from steam production and water treatment activities from the 284-W Powerhouse. The major components of the powerhouse effluent included quench water for the boiler, basin flush water, softener backflush from the filter systems, and boiler blowdown. Approximately 23.8 million liters per month (6.29 million gallons per month) of liquid waste	

was discharged to this unit.

The Site Was Consolidated With:**Code:** 216-U-14**Names:** 216-U-14; 216-U-14 Ditch; Laundry Ditch

Code: 200-W-4**Classification:** Accepted**Names:** 200-W-4; U-Farm Landfill**Reclassification:** Rejected (5/13/2008)**Type:** Burial Ground**Start Date:** 1/1/1992**Status:** Inactive**End Date:****Description:** The site was a small excavation containing a yellow paint-like substance. The area is not marked and is no longer visible from the surface.**Location:** The unit is located outside the south fence of 241-U Tank Farm, near the corner of 16th Street and Camden Avenue**Waste Type:** Chemicals**Waste Description:** The unit waste includes lead, chromium and cadmium. It was assumed to be dried, yellow paint.

Code: 200-W-5**Classification:** Accepted**Names:** 200-W-5; Burial Ground/Burning Pit; U Plant Burning Pit; UPR-200-W-8**Reclassification:** Consolidated (5/6/2004)**Type:** Burial Ground**Start Date:****Status:** Inactive**End Date:****Description:** DUPLICATE entry.**Location:** The unit is east of 221-U Building.**Waste Type:** Misc. Trash and Debris**Waste Description:** The waste includes contaminated coveralls and soil.**Description:****The Site Was Consolidated With:****Code:** UPR-200-W-8**Names:** UPR-200-W-8; 200-W-5; Old Burial/Burning Pit; UN-200-W-8; U-Plant Burning Pit/Burial Ground

Code: 200-W-10**Classification:** Accepted**Names:** 200-W-10; Grout Wall Test; Item 10 (RCRA General Inspection); Lysimeter Test Site**Reclassification:** Rejected (5/13/2008)**Type:** Depression/Pit (nonspecific)**Start Date:** 1/1/1976**Status:** Inactive**End Date:** 1/1/1977**Description:** The 1995 inspection team observed a pit covered at grade with wood planking. It was surrounded by orange plastic fencing on steel posts marked with two signs, one Danger Keep Away and the other stating Controlled Area. Adjacent to orange fenced area were 5 centimeters (2 inch) diameter metal pipes, protruding vertically above grade at heights ranging from 0.45 to 1.05 meters (18 inches to 3 1/2 feet). Debris (consisting of wire, metal and wood) was present.**Location:** The site is located inside 200 West Area, southeast of 221-U. It is north of 13th Street,

approximately 200 feet north of the 201-W building. The site is west of the dirt road.

Waste Type: Chemicals
Waste Description: The grout consisted of 11,578 L (3059 gal) sodium silicate, 2,467 L (652 gal) formamide, and 20.2 kg (44.5 lb) calcium chloride

Code: 200-W-17 **Classification:** Accepted
Names: 200-W-17; S Plant Project W-087 Aluminum Silicate Discovery **Reclassification:** Rejected (5/6/2004)
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**

Description: The pipe trench where white aluminum silicate was found has been back-filled to grade. A single, unmarked, steel post indicates the location of the excavation. No signs are attached to the post. There is no visual evidence of aluminum silicate on the surface.

Location: The site is located in the 200 West Area, southwest of REDOX. The site is 120 meters (394 feet) north of 10th Street, along the dirt road that runs outside the REDOX exclusion area fence line.

Release Description: On July 17, 1995, while digging a new pipeline (project 200 W-087), a band of white material was found in the trench excavation. A sample was collected and analyzed. The source of the aluminum silicate is likely to be the same as WIDS site 200-W-1 Mud Pit.

Related Sites/ Structures: Associated structures include 200-W-1 and the 200 W-087 pipe line project.

Waste Type: Chemical Release
Waste Description: The waste associated with this site was aluminum silicate. The aluminum silicate is probably from drilling mud.

Code: 200-W-18 **Classification:** Accepted
Names: 200-W-18; S Plant Project W-087 Aluminum Oxide Discovery **Reclassification:** Rejected (5/6/2004)
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**

Description: The pipe trench where the aluminum oxide was found has been backfilled with soil. A single, unmarked, steel post marks the location of the excavation. There is no visual evidence of aluminum oxide on the surface.

Location: The site is located west of 202-S (REDOX), on the west side of the dirt road running outside the REDOX exclusion area fence.

Release Description: On July 17, 1995, while digging a new pipe trench for Project 200 W-087, a layer of white material was seen in a pipeline excavation. It was found approximately 0.3 meters (one foot) below ground surface and was approximately 3 inches thick. The source of the aluminum oxide at this site is likely the 200-W-1 Mud Pit.

Related Sites/ Structures: The associated structures include 200-W-1 and the 200 W-087 pipe line.

Waste Type: Abandoned Chemicals
Waste Description: The sample results collected from this site showed the material was aluminum oxide and

Description: calcium. The aluminum oxide is probably from drilling mud

Code: 200-W-19 **Classification:** Not Accepted
Names: 200-W-19; Steam Line Asbestos Release **Reclassification:** None
Type: Unplanned Release **Start Date:** 1/1/1995
Status: Inactive **End Date:**

Description: The site is not marked or posted. It is under a lawn between the M0039 building and a sidewalk. The site is where asbestos covering a clean steam line was knocked to the ground and cleaned up by the next day.

Location: The release site is located approximately 37 meters (40 yards) west of the 2704S building.

Release Description: On August 30, 1995, a backhoe driver was driving under an aboveground steam line when his backhoe hydraulic arm struck the steam line. An area approximate 2 to 3 feet (0.6 to 0.9 m) in length, along the 10 inch (25 cm) line, was affected. This allowed a release of approximately 1180 cubic centimeters (72 cubic inches) of asbestos to the ground below.

Waste Type: Asbestos (friable)

Waste Description:

Code: 200-W-20 **Classification:** Accepted
Names: 200-W-20; T Plant Complex **Reclassification:** None
Type: Process Unit/Plant **Start Date:** 1/1/1944
Status: Active **End Date:**

Description: The T Plant Complex is enclosed within a 2.4 meter (8 foot) chain link fence. Facilities within the fence include the 221-T Canyon Building, the 2706-T Decontamination Facility, the 211-T Sump, the 214-T Storage Building, the 277-T Storage Building, the 2715-T Material Storage Building, the 291-T Ventilation Stack Complex and several small support buildings. The T Plant Complex is considered a RCRA Treatment and Storage Unit.

Location: The T Plant Complex is located inside the 200 West Area near the corner of Beloit Ave. and 23rd Street.

Release Description: Over time, several documented unplanned releases have occurred within the area now defined as the T Plant Complex. HAN-62372 DEL documents that a valving error released 2350 gallons of phosphoric acid to the ground in the 211-T area in November 1955.

Process Description: Currently, the T Plant Complex is a treatment and storage unit for dangerous and mixed waste. The primary mission of the facility is to decontaminate equipment and debris. Equipment is often decontaminated and repaired prior to being returned to service on the Hanford site. Additional activities include identification, verification, sampling, treatment and repackaging of dangerous and mixed waste and decontamination technology demonstrations. Within the T Plant complex, dangerous and/or mixed waste decontamination and treatment activities occur in the 221-T canyon, the 221-T railroad tunnel, the 2706-T building and support facilities incorporating various technologies to remove mixed waste contamination. Liquid waste generated from the decontamination process is collected and transferred to the 2706-T tank system or the 221-T tank system. From these tank systems, the waste is transferred to a treatment, storage/disposal unit capable of accepting this waste. Treatment of dry and liquid waste may include sorting, repackaging, neutralization, absorption and compaction. The 221-T

Related Sites/ Structures: The borrow pit is associated with the 216-S-10 Pond.

Code: 200-W-25	Classification: Not Accepted
Names: 200-W-25; 216-S-16 Borrow Pit	Reclassification: None
Type: Depression/Pit (nonspecific)	Start Date: 1/1/1984
Status: Inactive	End Date:

Description: The site is a shallow, scraped area that forms a semi-circle around the north and west edges of the stabilized 216-S-16 Pond. The site is mostly revegetated with crested wheatgrass and large patches of native plants.

Location: The borrow pit is located southwest of 200 West Area, outside the perimeter fence.

Process Description: Clean backfill material was taken from this area to backfill and stabilize the 216-S-16 Pond. No waste has been placed in this area.

Related Sites/ Structures: This borrow pit is associated with the 216-S-16 Pond.

Code: 200-W-26	Classification: Not Accepted
Names: 200-W-26; 216-S-17 Borrow Pit	Reclassification: None
Type: Depression/Pit (nonspecific)	Start Date: 1/1/1984
Status: Inactive	End Date:

Description: The site is an unmarked shallow scraped area located south of the stabilized 216-S-17 Pond. It is slowly revegetating.

Location: The borrow pit is located outside the south perimeter fence of the 200 West Area. It is south of the southern boundary of the stabilized 216-S-17 Pond.

Process Description: Clean backfill material was taken from this area to backfill and stabilize the 216-S-17 Pond. No waste was placed in this area.

Related Sites/ Structures: The borrow pit is associated with the 216-S-17 Pond.

Code: 200-W-27	Classification: Not Accepted
Names: 200-W-27; 216-S-19 Borrow Pit	Reclassification: None

Type: Depression/Pit (nonspecific) **Start Date:** 1/1/1980

Status: Inactive **End Date:**

Description: The area that was used for backfill material for the 218-W-2A stabilization is currently underneath the southern portion of the 218-W-5 Burial Ground. The borrow pit is no longer visible.

Location: The site was located west of Dayton Avenue and north of 23rd Street, west of the the 218-W-3 Burial Ground.

Process Description: Clean backfill material was removed from this borrow pit in 1980 and used to stabilize the surface of the 218-W-2A Burial Ground.

Related Sites/ Structures: This borrow pit was associated with the 218-W-2A Burial Ground.

Code: 200-W-32 **Classification:** Not Accepted

Names: 200-W-32; 216-Z-19 Borrow Pit **Reclassification:** None

Type: Depression/Pit (nonspecific) **Start Date:**

Status: Inactive **End Date:**

Description: The soil disturbance is no longer visible

Location: The borrow pit was located north of 16th Street, west of the 216-Z-20 Crib. The soil was taken from an area in the eastern part of the 218-W-4C Burial Ground. The exact location cannot be defined.

Process Description: Clean backfill material was taken from this area and used to stabilize the surface of the 216-Z-19 Ditch. No waste was placed in the borrow pit.

Code: 200-W-34 **Classification:** Not Accepted

Names: 200-W-34; 2607-WL; 272-WA Septic System North of 213W; Duplicate of 2607-WL **Reclassification:** None

Type: Septic Tank **Start Date:**

Status: Inactive **End Date:**

Description: This site is a duplicate of 2607-WL, which is also listed in WIDS as servicing the 272-WA Building and being north of that facility.

Related Sites/ Structures: The 2607-WL septic system services the 272-WA Building. The 200-W-34 septic system was entered into WIDS, but is a duplicate of 2607-WL septic system.

Waste Type: Sanitary Sewage

**Waste
Description:**

Code: 200-W-35 **Classification:** Accepted

Names: 200-W-35; 200-W-35-A Infiltration Test Site; 200-W-35-B Bentonite Slurry Test Site; 200-W-35-C Buried Garbage Can with Lid; Lysimeter Test Site; Various Sites North of 201-W **Reclassification:** Rejected (5/13/2008)

Type: Dumping Area **Start Date:** 1/1/1970

Status: Inactive **End Date:**

Description: During the late 1970's and early 1980's, the area north of 13th Street and west of Albany Ave. was used for testing various technology development studies. A 1995 Site Investigation visually identified a shallow excavated area, a pit covered with plywood, and a vertically buried garbage can with the lid at ground surface level. The sites are no longer visible because they were backfilled in 1997. They are not marked or posted.

Location: The sites are located inside the 200 West Area, in an empty field north of 13th Street and west of Albany Avenue. Access is via a dirt road north of the 201-W Fence.

Process Description: During the 1970's, the Atlantic Richfield (ARCO) and Rockwell Research Departments used this area for testing equipment and processes to support the waste management operations. This area was selected for testing because it was adjacent to the REDOX facility, where the Research Department offices were located, and because the area did not contain any contaminated facilities or vadose contamination.

Related Sites/ Structures: This site is associated with information contained in Subsite section of 200-W-35, 200-W-12 and 200-W-10.

Waste Type: Equipment

Waste Description: No hazardous or radiological material was used in any of the tests.

This Site has the Following SubSites:

Code: 200-W-35:1

Names: 200-W-35:1; 200-W-35-A Infiltration Test Site

Code: 200-W-35:2

Names: 200-W-35:2; 200-W-35-B; Bentonite Slurry Test Site

Code: 200-W-35:3

Names: 200-W-35:3; 200-W-35-C; Buried Garbage Can with Lid

Code: 200-W-35:1 **Classification:** Accepted

Names: 200-W-35:1; 200-W-35-A Infiltration Test Site **Reclassification:** Rejected (5/13/2008)

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site is a shallow excavation located east of the dirt road north of 201-W. It is approximately 10 by 20 meters (30 by 60 feet). A site visit in 1995 identified some aluminum pipes laying around the area. W.H. Price states that the site was used as an Infiltration Test Site to determine the infiltration capacity of new cribs prior to their construction.

The SubSite is Part Of:**Code:** 200-W-35**Names:** 200-W-35; 200-W-35-A Infiltration Test Site; 200-W-35-B Bentonite Slurry Test Site; 200-W-35-C Buried Garbage Can with Lid; Lysimeter Test Site; Various Sites North of 201-W**Code:** 200-W-35:2**Classification:** Accepted**Names:** 200-W-35:2; 200-W-35-B; Bentonite Slurry Test Site**Reclassification:** Rejected (5/13/2008)**Type:** Dumping Area**Start Date:****Status:** Inactive**End Date:****Description:** The Bentonite Slurry Test Site is located on the east side of the dirt road north of 201-W about half way between 201-W and the end of the road. It is a pit covered with a plywood cover and a circular hole cut in the plywood. W.H. Price states the site was used to develop a tool to sample the 361-Z Tank. Three drums were welded together and filled with a thick bentonite slurry and food coloring to simulate the contents of the 361-Z Tank. The test principal investigator (C.T. Webster) stated that no hazardous or radioactive materials were used in the test. This pit was backfilled with clean dirt on June 20, 1997.**The SubSite is Part Of:****Code:** 200-W-35**Names:** 200-W-35; 200-W-35-A Infiltration Test Site; 200-W-35-B Bentonite Slurry Test Site; 200-W-35-C Buried Garbage Can with Lid; Lysimeter Test Site; Various Sites North of 201-W**Code:** 200-W-35:3**Classification:** Accepted**Names:** 200-W-35:3; 200-W-35-C; Buried Garbage Can with Lid**Reclassification:** Rejected (5/13/2008)**Type:** Dumping Area**Start Date:****Status:** Inactive**End Date:****Description:** The buried garbage can is located east of the dirt road north of 210-W and west of the Bentonite Slurry Test Pit. It was not marked or posted. Conversations with W.H. Price, Ray Giddings and Steve Phillips did not reveal any information about its use. The Garbage Can was backfilled with clean dirt on June 20, 1997.**The SubSite is Part Of:****Code:** 200-W-35**Names:** 200-W-35; 200-W-35-A Infiltration Test Site; 200-W-35-B Bentonite Slurry Test Site; 200-W-35-C Buried Garbage Can with Lid; Lysimeter Test Site; Various Sites North of 201-W**Code:** 200-W-36**Classification:** Accepted**Names:** 200-W-36; EP 211-143; TK-SQ-143**Reclassification:** None**Type:** Storage Tank**Start Date:****Status:** Inactive**End Date:** 1/1/1969**Description:** The site is a single aboveground, horizontal tank on three concrete saddles. The tank is surrounded by steel post and chain labeled with "DANGER-Hard Hat and Safety Glasses Required" and "Radioactive Material Area" signs.**Location:** The tank is in the 211-T tank farm area, which is between 221-T and 2706-T.**Process** Originally the tank was a product tank that stored solutions used in reactor fuel dissolving

Process

Description: process. After T Plant ceased operation as an active process facility, the tank was used as a storage tank to temporarily hold 2706-T liquid decontamination waste until it could be sampled. The waste was then transferred to tanks in 221-T Building or to another location. The tank has not actively managed wastes since 1969. At that time a pipeline from 211-T Sump to 221-T Building was installed. Ten to eighteen inches of solids remain in the tank.

Related Sites/ The site is related to 2706-T, 221-T, 211-T Tank Farm.

Structures:

Waste Type: Chemicals

Waste Description: A video inspection showed no free liquids and about 25.4 to 45.7 centimeters (10 to 18 inches) of solids in the tank bottom. Samples of the solids were taken April 21, 1994 and showed several hazardous constituents (lead and mercury) at concentrations greater than dangerous waste levels. The tank contains low level radioactive material from decontamination activities at 2706-T.

Code: 200-W-37

Classification: Accepted

Names: 200-W-37; Buried Tygon Tubing Near 241-S-101

Reclassification: Consolidated (6/13/2002)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site is not separately marked or posted.

Location: The site is located just west of the 241-S-101 tank, inside 241-S Tank Farm.

Process Description: In Volume 2 of WHC-EP-0912, JD Anderson documented interviews with former Hanford workers. One of these interviews discusses flushing plugged transfer lines with hot water. The former employee states that in order to unplug one line in 241-S Tank Farm, a piece of heavy tygon tubing was attached to the pressure hose to allow the flush water to negotiate the turns of the transfer line.

Waste Type: Equipment

Waste Description: The equipment was radioactive tygon tubing.

Description:**The Site Was Consolidated With:**

Code: 200-W-96

Names: 200-W-96; Contaminated Soil at 241-S/SX/SY Tank Farm

Code: 200-W-40

Classification: Accepted

Names: 200-W-40; 292-T; Emission Control Lab; Stack Gas Sampling Building

Reclassification: None

Type: Laboratory

Start Date:

Status: Inactive

End Date:

Description: The site is a grey concrete block building. Tie back side of the building is surrounded by post and chain labeled "Contamination Area". Sign on building reads "Emission Control Laboratory 292-T". Surrounding area is gravel and cobble.

Location: The building is located in northeast portion of 200 West Area, within T-Plant Complex. It is about south of 291-T stack, north of 222-T building, and east of 221-T building.

Process Description: The 200-T building originally housed the 201-T stack gas sampling system and supported the

Process Description: 221-T off gas monitoring operations. When T plant was built it was not known what material would escape during the reprocessing of the irradiated fuel. Accordingly the stack was equipped with state of the art monitoring equipment, including scrubbers containing 5% soda ash solutions that the stack effluent was passed through. The solution was dried using refrigeration, and then counted to determine Xenon-133 activity. Extensive reviews of documentation remaining from T Plant operations has not located any documents that quantify the amount of material that was placed in the tanks, but very little emphasis was placed on waste management at that time and it is doubtful that any documents were kept. In 1966, a building addition was added to the existing structure to house a fuel element testing facility, operated by Battelle Northwest. During the lab upgrade, the two underground storage tanks were relocated from southeast of the original 292-T building to their present position, southeast of the 292-T building addition. Fuel failure analysis of irradiated fuel rods was conducted in 292-T in the 1960's and early 1970's. Irradiated N Reactor fuel rods were heated in an induction furnace until rupture or failure occurred. After the rupture occurred, the fuel was transported to the 300 area for further analysis. The fragments that remained in the oven were removed, and any material that remained on the oven surface was dissolved with nitric acid. It is doubtful that much if any of the aluminum clad was dissolved, since aluminum will not dissolve in nitric acid without the use of a catalyst. The solution of trace amounts of irradiated fuel and nitric acid was taken to 200 West Area and poured into the 292-T-TK-1 and 2 tanks through the risers. The solution in the tanks was then neutralized with sodium hydroxide. Neutralization caused the dissolved metals to precipitate and deposit in the tank bottoms.

Related Sites/Structures: The site is associated with 291-T, 221-T, 216-T-8, 200-W-140-PL pipeline and the 200-W-16 underground tanks.

Waste Type: Equipment
Waste Description: Building , equipment, underground lines
 Reported Date: October 9, 1995

Code: 200-W-41 **Classification:** Accepted
Names: 200-W-41; Abandoned Drums; Drums Found East of T Plant **Reclassification:** Rejected (5/13/2008)
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:** 1/1/1999
Description: In August 1996, the site was described as a single 190-liter (50-gallon) carbon tetrachloride drum and two 114-liter (30-gallon) Trysben (herbicide) drums. The drums showed no evidence of contaminating the surrounding soil. A hole was observed near the bottom of the carbon tetrachloride drum. A site investigation done in September 1996 found only two drums at this location. The 114-liter (30-gallon) Trysben weed killer drum was in good condition and was completely sealed. The drums were removed in September 1999.
Location: The site was located in 200 West Area approximately 200 to 300 meters (660 to 980 feet) east of T Plant, between Beloit and Albany Avenues and north of 23rd Street.
Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: The waste consisted of empty drums, removed in 1997. There was no evidence of leakage from the drums, and no stained soil under them. .

Code: 200-W-43 **Classification:** Accepted
Names: 200-W-43; 291-S Stack Sand Filter **Reclassification:** None

Waste Type: Solid
Waste Description: Using information found in PNNL document "Radionuclide Releases to the Atmosphere from Hanford Operations, 1944-1972" (PNWD 222 HEDR), a standard decay equation estimates the curies of radionuclides in the T Plant Sand Filter to be : 29 curies of Strontium-90, 33 curies of Cesium-137 and 4.1 curies of Plutonium-239 (or 66 grams) as of October 1994.

Code: 200-W-46 **Classification:** Accepted

Names: 200-W-46; 222-S Laboratory Room 4-E 90-Day Waste Accumulation Area; Satellite Accumulation Area **Reclassification:** Rejected (9/14/2000)

Status: Active **End Date:**

Description: This site is not a 90 Day Storage Area but is a Satellite Accumulation Area for Room 4E of the 222-S Analytical Laboratory.

Location: This SAA is in Room 4E of the 222-S Building.

Process Description: Maintenance waste and expired reagents and chemicals are held here.

Related Sites/Structures: This site is part of the 222-S Analytical Laboratory.

Waste Type: Chemicals

Waste Description: Maintenance waste and expired reagents/chemicals are held here.

Code: 200-W-47 **Classification:** Accepted

Names: 200-W-47; 211-T Storage Pad 90-Day Waste Accumulation Area **Reclassification:** Rejected (9/14/2000)

Type: Storage Pad (<90 day) **Start Date:**

Status: Inactive **End Date:**

Description: The 90 day storage area was removed when the T Plant Complex became a Treatment, Storage, and Disposal (TSD) facility. With the TSD Permit, mixed waste storage for the T Plant Complex was designated to be "a combination of paved and gravel surfaces and is surrounded by the fencing that encloses the 2706-T Building." An evaluation of the site in April 2000 showed no wastes stored in this area, but signs on the fence indicate that it is occasionally used for waste storage under the TSD Permit.

Location: The waste storage area is on the southwest side of the 2706-T Building.

Process Description: The T Plant Complex Part B Application lists the area surrounded by the fencing around 2607-T as a dangerous waste container storage area.

Related Sites/Structures: The site is part of the T Plant Complex TSD. Under the permit, mixed waste may be stored in both the 2607-TA Building (the former 200-W-50 site) and the area enclosed by the 2607-T fence (the former 200-W-47).

Code: 200-W-48 **Classification:** Accepted

Names: 200-W-48; 241-TX 90-Day Waste Accumulation Area **Reclassification:** Rejected (9/6/2000)

Type: Storage Pad (<90 day) **Start Date:**

Status: Inactive **End Date:** 1/1/1993

Description: The 241-TX Tank Farm 90-Day Waste Accumulation Area has been inactive since October 1993, per the 90-day inspection records maintained by Environmental Waste Operations at the 209-E Building. The site was a self-contained conex box with a spill berm.

Location: The 90-day pad was located approximately 23 meters (75 feet) west of the 241-TX Tank Farm in a fenced area.

Code: 200-W-49 **Classification:** Accepted

Names: 200-W-49; 222-S Laboratory Room 2-D 90-Day Waste Accumulation Area **Reclassification:** Rejected (9/14/2000)

Type: Storage Pad (<90 day) **Start Date:**

Status: Active **End Date:**

Description: The storage pad is located in Room 2D of the 222-S Analytical Laboratory, and holds solid and liquid mixed waste from laboratory sample analysis activities.

Location: The storage pad is in room 2D of the 222-S Laboratory.

Process Description: The pad holds solid and liquid mixed waste from laboratory sample analysis activities.

Related Sites/Structures: The storage pad is related to the 222-S Analytical Laboratory.

Waste Type: Chemicals

Waste Description: The pad holds solid and liquid mixed waste from laboratory sample analysis.

Code: 200-W-50 **Classification:** Accepted

Names: 200-W-50; 2706-T 90-Day Waste Accumulation Area **Reclassification:** Rejected (9/14/2000)

Type: Storage Pad (<90 day) **Start Date:**

Status: Inactive **End Date:**

Description: The 90 day storage area was removed when the T Plant Complex became a Treatment, Storage, and Disposal (TSD) facility. With the TSD Permit, mixed waste storage for the T Plant Complex was designated to be "a combination of paved and gravel surfaces and is surrounded by the fencing that encloses the 2706-T Building." An evaluation of the site in April 2000 showed no wastes stored in this area, but signs on the fence indicate that it is occasionally used for waste storage under the TSD Permit.

Location: The waste storage area is adjacent to the west end of the 2706-T Building.

Process Description: The 2706-T Building is used to decontaminate railroad equipment, buses, trucks, automobiles, road building equipment, and process equipment.

Related Sites/Structures: The site is part of the T Plant Complex TSD. Under the permit, mixed waste may be stored in both the 2607-TA Building (the former 200-W-50 site) and the area enclosed by the 2607-T fence (the former 200-W-47).

Code: 200-W-56 **Classification:** Accepted
Names: 200-W-56; Debris North of 221-U **Reclassification:** Rejected (12/21/2004)
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: An area of debris was identified during a 1997 RCRA Permit General Inspection tour. The site consists of a pile of dirt approximately 10 feet in diameter containing wire, fencing material, metal scrap, cable and grounding rods. The site is not marked or radiologically posted.
Location: The site is located approximately 150 yards north of 221-U.
Waste Type: Misc. Trash and Debris
Waste Description: Debris includes wire, fencing material, metal scrap, cable and grounding rods.

Code: 200-W-57 **Classification:** Not Accepted
Names: 200-W-57; Area West of 2714-U Fence; Excess Equipment Laydown Area Identified in RCRA General Inspection #200WFY97 Item #10 **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site had been two excess equipment laydown areas, located outside the fenced 2714-U facility. One area was adjacent to the U Plant Chemical Spur railroad track. The second area was located adjacent to the western edge of the T Hopper storage area fence. A RCRA General Inspection identified the material as an area needing to be addressed. During the RCRA field inspection on October 8, 1997, the site was discussed with Bill Osborne and Dave Baker of ERC. The equipment was in the process of being salvaged and or recycled. The material has now been removed and is now an empty gravel area.
Location: The laydown area was located outside of the fenced T-Hopper Storage Area, on the west side of the 2714-U Building.
Related Sites/ Structures: The site was adjacent to the 2714-U storage facility building (sitecode 200-W-104).
Waste Type: Equipment
Waste Description: The equipment included electric motors, miscellaneous piping, heavy equipment parts, metal screen, wood, fiberglass vessels, an open steel tank, and scaffolding. There does not appear to be material that could be considered a dangerous waste in the area.

Code: 200-W-60 **Classification:** Accepted
Names: 200-W-60; 284-W Brine Pit; 284-W Salt Dissolving Pit and Brine Pump Pit **Reclassification:** Rejected (4/20/2000)
Type: Sump **Start Date:** 1/1/1942
Status: Inactive **End Date:** 1/1/1995
Description: The brine pit is no longer visible. It was demolished into itself and backfilled with gravel in 1999. It is not marked or posted. The two salt dissolving pits each had inner dimensions of 4.3 meters (14 feet) long by 2.4 meters (8 feet) wide by 2.8 meters (9.25 feet) tall. They had a design high water line 2.4 meters (7.75 feet) from the pit bottom. An overflow slot connecting the two dissolving pits was located 0.3 meters (1 foot) above the high water line. The bottom of

each pit was filled with a 12.7 centimeter (5 inch layer) of 1.3 to 2.6 centimeter (1/2 to 1 inch) gravel topped by a 17.8 centimeter (7 inch) layer of 0.3 to 0.6 centimeter (1/8 to 1/4 inch) gravel. The dissolving pits each had a 2.4 meter (8 foot) by 0.9 meter (3 feet) opening at the top for receiving salt. Each pit has a capacity of 23,600 kilograms (52,000 pounds) of salt. The brine pump pit was located adjacent to the two salt dissolving pits. The pit was 3.3 meters (10.67 feet) long by 2.2 meters (7.33 feet) wide by 2.1 meters (7 feet) deep. It held two pumps and associated piping (all brass) for the brine system. The floor of the pump pit sloped toward a 46 by 46 by 46 centimeter (18 by 18 by 18 inch) sump in a corner.

Location: The brine pit was located southwest of the 284-W Powerhouse.

Process Description: The salt dissolving pits and brine pump pit were part of a single below-grade concrete structure that provided brine for the 284-W Powerhouse. The brine was used to regenerate the ion exchange demineralizers that were part of the powerhouse water treatment system. The brine was created by adding water to the salt in the dissolving pit. As the water passed through the salt, the solution became saturated. The brine passed through the layers of gravel which filtered out salt crystals and other particles. The filtered brine was then drawn off by a pipe connecting to the adjacent brine pump pit. A float valve was used to maintain the water/brine level.

Related Sites/ Structures: The site is associated with the 284-W Powerhouse.

Waste Type: Demolition and Inert Waste

Waste Description: The concrete structure was cleaned out, demolished, and buried in place.

Code: 200-W-61

Classification: Accepted

Names: 200-W-61; 284 Powerhouse Coal Ramp Washdown Pit; Miscellaneous Stream #471; 200 West Powerhouse Coal Ramp Washdown Pit

Reclassification: Rejected (4/20/2000)

Type: Depression/Pit (nonspecific)

Start Date:

Status: Inactive

End Date: 1/1/1995

Description: The pit is partially filled in with tumbleweeds and surrounded with metal fence posts and a light chain wire. It is adjacent to a concrete pad, which is next to the railroad track and coal off-loading chute.

Location: The washdown pit is west of the 200 West Powerhouse and coal ramp.

Process Description: The powerhouse coal ramp was washed down periodically. The washdown water was collected in three sumps. During the summer months, the sumps were pumped approximately two times per week, discharging the water into the washdown pit. During the winter months, the sumps were pumped two times per day.

Related Sites/ Structures: The pit is associated with the 284-W Powerhouse.

Waste Type: Water

Waste Description: The pit received water from the sumps that collected coal ramp washdown water.

Code: 200-W-62

Classification: Accepted

Names: 200-W-62; 200 West Powerhouse Coal Pile **Reclassification:** Rejected (6/18/2008)
Type: Depression/Pit (nonspecific) **Start Date:**
Status: Inactive **End Date:** 1/1/1995

Description: The ground surface is covered with remnants of coal. Very little vegetation is growing, only small tumbleweeds. The north side is bordered by a concrete wall. Near the wall is a wooden structure, about 4 meters (12 feet) square and 15 centimeters (6 inches) high, covering the hole used to feed coal to the conveyor belt.

Location: The pile was located west of the powerhouse and south of the coal ramp conveyor belt.

Process Description: Large piles of coal had been stored in this area to fuel the 284-W Powerhouse. The powerhouse was shut down in 1995. Most of the coal pile has been removed.

Related Sites/ Structures: The site is associated with the 284-W Powerhouse.

Waste Type: Demolition and Inert Waste
Waste Description: A waste determination for Anthracite (Anthrafil) was performed in 1994. A waste determination for bituminous coal dust was performed in 1996. Both waste streams were determined to be nondangerous.

Code: 200-W-65 **Classification:** Not Accepted
Names: 200-W-65; Abandoned Water System Pump Vault; Concrete Vault Northwest of WRAP; Water Pumping Station Vault **Reclassification:** None
Type: Control Structure **Start Date:**
Status: Inactive **End Date:**

Description: The structure is in the undeveloped land in the northwest corner of the 200 West Area. It is a concrete box measuring approximately 3 meters (10 feet) by 3 meters (10 feet) with a smaller concrete curbed structure rising from the center. There are two pipe penetrations and a drain in the floor of the box. A steel grate covers the top. There is an electrical conduit penetrating the wall of the structure and a concrete pump pad. It appears to be an old, abandoned water pumping station for irrigation or dust control.

Location: The site is located in the northwest corner of 200 West Area, approximately 0.46 kilometers (0.75 miles) northwest of the WRAP facility. It is adjacent to a gravel road (jeep trail).

Process Description: The structure appears to be part of a Pre-Hanford irrigation system or part of an early Hanford construction dust control system.

Waste Type: Misc. Trash and Debris
Waste Description: Concrete

Code: 200-W-66 **Classification:** Not Accepted
Names: 200-W-66; Oil Spill at JCI Annex Feeding 283-W/262-WC **Reclassification:** None
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:** 1/1/1998

Description: The contaminated soil was removed and the site has been backfilled to grade level with crushed gravel on 12/29/98. No visual evidence of diesel stained soil and no diesel fumes were observed a few days later, during an inspection on 1/4/99.

Location: The site is located between the 283W and the 284W buildings, just north of 20th street. The 283BA boiler annex fuel tank is located just north of the site.

Release Description: Diesel fuel is delivered to JCI 200 east and west boiler annexes by RH Smith Distributing. While delivering fuel to the 283W annex a faulty cam-lock on the dispensing hose at the tank trailer caused fuel to spill on the ground. The RH Smith delivery driver initially estimated the spill to be 3-5 gallons. Notification was made to RH Smith's main office as well as JCI's Operations Supervisor, Mr. Tim Cook. With the initial estimate being less than the required reporting quantity of 10 gallons, no further notifications were made. JCI Operations Supervisor and RH Smith management instructed personnel to apply absorbent to collect and dispose of spilled fuel. This initial estimate of the amount of fuel spilled proved misleading due to the snow and ice present on the ground. Over the weekend of 12/26/1998, a warming trend resulted in the snow and ice to dissipate. On Monday 12/28/1998 a JCI Operator identified diesel fuel still being present. The JCI Operator contacted Mr. Cook who then re-appraised the situation. Through this re-evaluation it was determined that approximately 30 gallons of diesel fuel spilled onto the ground, from the base of the annex fuel tank approximately ten feet southward. The entire area of the spill is located on JCI leased property.

Related Sites/Structures: The spill is related to the 283W-BA boiler annex fuel tank. The tank is periodically filled via tanker truck.

Waste Type: Soil

Waste Description: The waste is diesel contaminated soil. The type of diesel spilled was 70% Low Sulfur Diesel Dyed number 2 and 30% Low Sulfur Strove Dyed number 1. The contaminated soil was excavated and backfilled with clean fill to grade level by R.H. Smith Distributing. R.H. Smith Distributing has contracted White Shield Environmental of Grandview, WA to remediate the contaminated soil. White Shield Environmental has recommended the Alpha bioremediation process to treat the contaminated soil that was removed on 12/29/98.

Code: 200-W-68 **Classification:** Not Accepted

Names: 200-W-68; Historic Disposal Site; RCRA General Inspection Report 200WFY99 Item #3 **Reclassification:** None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site is a small area, measuring 4.6 by 3 meters (15 by 10 feet), that contains rusted electrical equipment. The material includes conduit, a light reflector, a space heater, a vent pipe, a little broken glass, and some pieces of charcoal. None of the equipment would have held liquids such as cooling oils or PCBs. One rock appears to have been fire cracked, but there is no discoloration of the soil. The vegetation at the site matches the surrounding area.

Location: The site is about 25 meters west of Albany Road and 130 meters north of 13th Avenue, and is visible from the road.

Waste Type: Misc. Trash and Debris

Waste Description: The wastes consist of pieces of rusted electrical equipment, with small amounts of broken glass and charcoal. None of the electrical pieces would have held liquids.

Code: 200-W-69 **Classification:** Accepted

Names: 200-W-69; 222-S Laboratory Complex**Reclassification:** None**Type:** Laboratory**Start Date:** 1/1/1951**Status:** Active**End Date:**

Description: The 222-S Laboratory Complex is made up of the following components, several of which have separate WIDS entries (such as the components of the Treatment, Storage, and Disposal (TSD) facility): - The 222-S Analytical Laboratory - The 222-S Dangerous and Mixed Waste Storage Area (DMWSA), a storage unit - The 219-S Waste Handling Facility, which contains the 219-S-101, 102, 103, and 104 storage tanks, - The 222-SA Standards Laboratory, - The 296-S-21 (active), 219-S-16 (active), 296-S-23 (active), and 296-S-13 (inactive) Stacks. The 222-S Complex buildings were constructed in 1950 and 1951 to provide analytical chemistry services for the Reduction-Oxidation (REDOX) Plant. Currently, the 222-S Complex supports a large array of facilities and programs on the Hanford Site with analytical chemistry services. The 222-S Laboratory is a two-story building in the southeast corner of the 200 West Area. The first floor is divided into three general areas. The west end holds the lunchroom, offices, and locker rooms, which are maintained free of radioactive and dangerous materials. The central section contains laboratories and service areas for work with radioactive and/or dangerous materials. Off the north side of the central section, on the outside of the building, is the 222-S Dangerous and Mixed Waste Storage Area. The east end, also called the multi-curie section, contains laboratories, hot cells, and service areas for work with radioactive samples. All first floor sinks, hood drains, drinking water fountains, equipment cooling water, and steam condensate from radioactive areas drain to the 207-SL Retention Basin. The basins are a non-radioactive, non-hazardous facility. Mixed waste effluents drain to the 219-S Waste Handling Facility. The second floor of the 222-S Laboratory contains the ventilation supply fans, supply and exhaust ductwork, ventilation system operation and control room, and storage areas. All floor drains, steam condensate overflow drains and the demineralized water system drains empty into the 207-SL Retention Basins. The 222-S basement contains service piping, vacuum pumps, the counting room areas, an instrument maintenance shop, and a scanning electron microscope. Effluents from the cold tunnel sumps are discharged to the 207-SL Retention Basins and effluents from the hot tunnel sumps discharge to the 219-S Waste Handling Facility. The supply water for the 222-S Laboratory consists of raw and sanitary water and steam. The raw water is primarily used in the first floor fire sprinkler system, and is less than 1 percent of the waste streams that discharge to the 207-SL Retention Basins. Sanitary water is used for all the other fire sprinkler systems, lab sinks, and hot cells. The sanitary water is estimated to contribute about 85 percent of the waste stream to the 207-SL Retention Basins, and steam condensate is the remaining approximately 15 percent. The 222-S Dangerous and Mixed Waste Storage Area is part of the 222-S Laboratory Complex TSD, number TS-2-I, and WIDS site code 222-SD. It is located on the north side of the 222-S Laboratory building. Also part of the TSD are Room 2B (site 200-W-76), Room 4E, and the 219-S Storage Tanks (WIDS codes 219-S-101, 219-S-102, and 219-S-103, which includes tank 104). The 219-S Waste Handling Facility, off the northeast side of the 222-S Laboratory Building, receives liquid mixed waste through hot disposal sinks in the 222-S Laboratory. The waste flows from sink and hot cell drains through all-welded, corrosion-resistant piping to corrosion-resistant tanks located in a below-ground concrete vault in the 219-S facility. The underground portions of the piping are double-encased stainless steel with leak detection to ensure containment and notification if a leak should occur. Pipe connections to the tanks are above maximum liquid levels to avoid potential leaks. The area above the vault is covered with a permanent enclosure and the operating gallery, located north of the vault, contains instrumentation and controls. Adjacent to the operating gallery is the sample gallery which contains a hood that is used for sample analysis during waste transfers. Wastes sent to tanks 101 and 104 are transferred to tank 102, which is a transfer point to the appropriate storage tank in the Double-Shell Tank System. After treatment in tank 102, the waste is transferred through a double encased fiberglass line to Tank Farms via the 244-S Double Contained Receiver Tank (DCRT). Overflows from tanks 101 and 102 are collected in sump 7; overflows from tank 104 are collected in sump 9; intrusion liquids

in Cell B are collected in sump 6; and leaks in the Operating Gallery are collected in sump 8. The 222-SA Standards Laboratory is a five-wide trailer southeast of the 222-S Laboratory. The 222-SA Standards Laboratory prepares non-radioactive standards for the 222-S Laboratory and other analytical laboratories and is also used for non-radioactive development work. Packaged waste generated from the 222-SA Standards Laboratory is non-radioactive, non-dangerous waste, and is accumulated in satellite areas before shipment to the Central Waste Complex. Laboratory sink drains in 222-SA are transferred to the 207-SL Retention Basins. The 296-S-21 and 296-S-16 Stacks handle both radioactive and non-radioactive emissions. The 296-S-21 Stack exhausts emissions from the 222-S Laboratory after passing through HEPA filtration. The 296-S-16 Stack exhausts emissions from tanks 101, 102, and 104 in the 219-S Waste Handling Facility after passing through a de-entrainment filter and HEPA filter. Both the 296-S-21 and 296-S-16 stacks are record sampled for periodic confirmatory measurements. The 296-S-23 stack exhausts emissions from the 219-S Sample Gallery Hood. It is operated intermittently during waste transfers and the periodic confirmatory measurement consists of a bi-annual non-destructive assay (NDA) of the HEPA filter.

Location: The 222-S Laboratory Complex is on the north side of 10th Street, west of Beloit Ave, in the 200 West Area. The laboratory complex is south of REDOX.

Process Description: The 222-S Laboratory was originally built to support the REDOX plutonium separation process operation in the 202-S facility. After the REDOX process shut down, the laboratory continued to support other Hanford project analyses.

Related Sites/ Structures: Associated Structures: WIDS site code 222-SD, the 222-S Laboratory Storage Pad, is currently listed as a separate site in WIDS. However, it is a part of the TSD site as described in the Part B Permit. Site codes 219-S-101, 219-S-102, and 219-S-103 (which includes tank 104), are stainless steel tanks in a below grade concrete vault at the 219-S Waste Handling Facility, and are also part of the 222-S Laboratory TSD. Room 2B of the TSD is WIDS site code 200-W-76. Site code 200-W-49 (222-S Laboratory Room 2-D 90-Day Waste Accumulation Area) is a rejected site in WIDS. Ninety-Day Waste Accumulation Areas are specifically exempt from classification as waste sites in TPA-MP-14. Site code 218-W-7, 222-S Vault, is a carbon steel burial vault southeast of the 222-S Building. It received dry, packaged laboratory and sampler waste from the 222-S Laboratory. Site code UPR-200-W-137 is a duplicate of 218-W-7. Site code 216-S-19, 222-S Lab Swamp, 216-SL-1, REDOX Lab Swamp, was open from 1952 to 1984, and received miscellaneous wastes from laboratory hoods and decontamination sinks in the 222-S Laboratory Building via the 207-SL Retention Basins.

Waste Type: Chemicals

Waste Description: The 219-S Waste Handling Facility receives low-level aqueous mixed waste generated by the 222-S Analytical Laboratory, and is either intermediate-or high-activity waste. The waste is designated as dangerous because of the characteristic of corrosivity. Liquid organic waste is not accepted in the 219-S Waste Handling Facility.

Chemicals from the 222-S Analytical Laboratory are outdated or off-specification and are both liquid and solid.

Nonradioactive dangerous waste includes chemicals from the 222-SA Standards Laboratory and nonradioactive off-specification chemicals from the 222-S Analytical Laboratory. This waste is regulated as dangerous waste because individual waste chemical characteristics can include: solid or liquid; reactive with water; ignitable; reactive to form toxic gases; oxidizer; cyanide or sulfide bearing; corrosive; and toxic.

Liquid organic waste contains both nonradioactive and radioactive organic components, and results from organic analyses of volatile, semivolatle, pesticide, and polychlorinated biphenyl compounds during daily laboratory operations.

Occasional waste includes mixed and nonradioactive dangerous waste generated during sample analysis such as rags, paper towels, and contaminated gloves; waste oil generated from equipment maintenance; and mercury-contaminated materials such as bulbs and thermometers.

Returned samples come from off-site laboratories. The unused portions of analyzed samples are returned to the generator (the Hanford Site)

Code:	200-W-70	Classification:	Accepted
Names:	200-W-70; 2731 Burning Pit; Old Burn Pit Southeast of Z Plant; 200 West Original Burn Pit	Reclassification:	Rejected (5/31/2001)
Type:	Burn Pit	Start Date:	1/1/1944
Status:	Inactive	End Date:	1/1/1949
Description:	The site is no longer visible, marked, or posted. It can be seen in an aerial photo from 1948, and Hanford drawing H-2-10011. Its is just outside the current Z Plant fenced area. The location is a flat, graveled parking area, containing the tile field for septic system 2607-WB.		
Location:	The burn pit was located southeast of the 231-Z Facility. It is just outside the Z Plant fenced area, east of 234-5Z. A portion of the 216-Z-1 Ditch is adjacent to this burn pit.		
Process Description:	The open pit was used by the construction forces for burning non-contaminated scrap lumber and miscellaneous debris.		
Waste Type:	Construction Debris		
Waste Description:	The pit received miscellaneous debris and scrap lumber during early 200 Area construction projects. In 2004, some transite material was identified. Transite is considered an asbestos-containing material. The asbestos is in a non-friable state.		

Code:	200-W-72	Classification:	Not Accepted
Names:	200-W-72; 200-ZP-1 Pump and Treat Unplanned Release	Reclassification:	None
Type:	Unplanned Release	Start Date:	1/1/2000
Status:	Inactive	End Date:	
Description:	There is no visual evidence of the release.		
Location:	The 200-ZP-1 Pump and Treat system equipment is located northwest of the 231-Z Building in the 200 West Area.		
Release Description:	On April 13, 2000, a line break at the 200-ZP-1 Pump and Treat system facility caused approximately 87,400 liters (23,000 gallons) of contaminated water to spill inside the building. Most of the water was contained within the building, but some leaked into the electrical vaults. The water was recovered with pumps and transported to Modu-tanks. The CERCLA Reportable quantity for this contaminant is 10 pounds. Only 3.5 parts per million or 0.7 pounds of carbon tetrachloride was calculated to be in the 23,000 gallons of water. Therefore, this was a non-reportable incident.		
Process Description:	The 200-ZP-1 Pump and Treat system is used to pump groundwater that is contaminated with carbon tetrachloride and treat it before returning it to the ground.		
Waste Type:	Water		

Waste Description: The waste was groundwater containing a total of 0.7 pounds of carbon tetrachloride.

Code: 200-W-74 **Classification:** Not Accepted
Names: 200-W-74; 90 Day Storage Area East Side of 622 F **Reclassification:** None
Type: Storage Pad (<90 day) **Start Date:** 1/1/2000
Status: Inactive **End Date:** 1/1/2000
Description: This is a duplicate of site 600-267; the site number was used in error. The pad, inside a metal shed, has been closed.
Location: The site was located on the east side of the 622 F Building (Weather Station).
Related Sites/Structures: Site 600-267 is the correct side code for this closed 90 Day Accumulation Area.

Waste Type: Barrels/Drums/Buckets/Cans
Waste Description:

Code: 200-W-76 **Classification:** Accepted
Names: 200-W-76; Room 2B 222-S Laboratory TSD **Reclassification:** None
Type: Storage **Start Date:** 1/1/1951
Status: Active **End Date:**
Description: The north end of Room 2B in the 222-S Laboratory is partitioned off as a Treatment, Storage, and Disposal (TSD) area using a locked accordion style gate to prevent unauthorized access.
Location: The site is located inside the 222-S Laboratory facility.
Process Description: The Room 2B TSD provides container storage of solid and liquid mixed waste until the waste can be transferred to another TSD unit. Hood 16, within Room 2B, is the introduction point for transfer of liquid mixed waste from containers to the 219-S Waste Handling Facility. Mixed waste exceeding personnel protection radiological levels during transfer are introduced into the 219-S Waste Handling Facility via drains in hot cells instead of Hood 16.
Related Sites/Structures: Room 2B is part of the 222-S Laboratory TSD, which also includes the 219-S Tanks, which are WIDS sites 219-S-101, 219-S-102, and 219-S-103 (site 219-S-103 includes both tanks 103 and 104) and the 222-S Dangerous and Mixed Waste Storage Area, which is WIDS site 222-SD.
Waste Type: Chemicals
Waste Description:

Code: 200-W-91 **Classification:** Accepted
Names: 200-W-91; Underground Radioactive Material Area Adjacent to the North Side of 241-U Tank Farm **Reclassification:** Consolidated (6/13/2002)
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**

Description: The site is a large, irregular shaped area. The area has been covered with clean gravel and posted with Underground Radioactive Material signs. The 2607-WUT sanitary tile field is located adjacent to the western edge of this stabilized zone. The area was surveyed with GPS in 2009. The size and shape of the posted area is larger than the area reported in 1995. The waste site was consolidated into 200-W-95.

Location: The site is located adjacent to the north fenceline of 241-U Tank Farm, west of Camden Avenue.

Release Description: The routine tank farm perimeter surveys were used to trace the radiological history of the contamination on the northeast corner of 241-U Tank Farm. Specks of contamination were documented on the May 1983 and May 1984 surveys, with contamination levels ranging from 500 to 20,000 counts per minute. In September 1986, the area was surrounded with radiation rope and posted with Surface Contamination Area signs. The Surface Contamination Area is documented on subsequent surveys through November 1994. On the May 1995 survey, the area is documented as an Underground Radioactive Material area.

Related Sites/ Structures: The site is associated with the 241-U Tank Farm and has been Consolidated with the 241-U Tank Farm contaminated soil sitecode 200-W-95.

Waste Type: Soil

Waste

Description:

The Site Was Consolidated With:

Code: 200-W-95

Names: 200-W-95; Contaminated Soil at 241-U Tank Farm; Contamination Migration Beyond the 241-U fence

Code: 200-W-103

Classification: Not Accepted

Names: 200-W-103; 201-W Concrete Silo

Reclassification: None

Type: Experiment/Test Site

Start Date:

Status: Inactive

End Date:

Description: The structure is a concrete silo. The silo is marked with painted lines, dividing it into rows and sections. The rows are labeled A, B, C, D, and E. The sections are labeled 1 through 10. Electronic sensing devices are embedded into some of the concrete sections. A white, cylindrical liner is standing next to the silo.

Location: The site is located in 200 West Area, on the north side of 13th Street near Albany Ave. It is inside the 201-W facility fence.

Process Description: The silo was constructed as a feasibility test for aboveground, dry waste storage. No waste was ever stored at this site. The test was observing the durability of the concrete silo and the steel liner as it was exposed to the elements over time. The silo has been abandoned. The electronic sensors embedded into the concrete are no longer functioning.

Waste Type: Demolition and Inert Waste

Waste Description: This was a test facility that did not receive any waste.

Description:

Code: 200-W-104

Classification: Accepted

Names: 200-W-104; 2714-U Building; 2714-U Foundation; UO3 Storage Warehouse

Reclassification: None

Type: Foundation **Start Date:**

Status: Inactive **End Date:** 1/1/2005

Description: The site was a metal building. The building had been posted with Contamination Area, Radioactive Material Area signs. The 2714-U and 275-UR buildings were demolished in 2005. The 2714-U foundation is posted with Underground Radioactive Material signs. (see sitecode 200-W-87)

Location: The building was located northwest of the 221-U canyon facility.

Process Description: The 2714-U Storage Facility had been used to store material related to the Uranium Trioxide operations occurring in 224-U and some items for the Plutonium Finishing Plant. Before being demolished, the main incoming power lines were disconnected at the building. The doors were locked and bird netting was placed at the entrance's on both sides of the building for pest control.

Waste Type: Soil

Waste Description: After the building was demolished in 2005, the foundation was posted with Underground Radioactive Material signs.

Waste Type: Equipment

Waste Description: The building had been used to store contaminated equipment related to the Uranium Trioxide operation. Two water shield doors (water drained) were also being stored for the Plutonium Finishing Plant facility along with some miscellaneous metal piping.

Code: 200-W-112 **Classification:** Accepted

Names: 200-W-112; Miscellaneous Stream #52; Steam Condensate **Reclassification:** None

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:** 1/1/1995

Description: The site is a 0.9 meter (3 foot) diameter, below ground, cement drain structure. An overhead, insulated pipe enters the top of the drain structure. The drain is currently located within a posted radiological Contamination Area.

Location: The drain is located approximately 1.8 meters (6 feet) south of the southwest corner of the 224-U building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 224-U facility.

Waste Type: Steam Condensate

Waste Description: The drain received non-contaminated steam condensate from the 224-U facility. The steam source has been abandoned.

Code: 200-W-113 **Classification:** Accepted

Names: 200-W-113; Miscellaneous Stream #54; North Steam Pit **Reclassification:** None

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:** 1/1/1995

Description: The drain structure is covered with a yellow metal lid. The lid is labeled with "North Steam Pit" and "Confined Space" signs. The site is surrounded with metal posts and chain.

Location: The drain is located approximately 4.5 meters (15 feet) from the northwest corner of the 224-U building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 224-U building.

Waste Type: Steam Condensate

Waste Description: The site received non-contaminated steam condensate. The steam source has been eliminated.

Code: 200-W-115 **Classification:** Accepted

Names: 200-W-115; Miscellaneous Stream #138; Steam Condensate MSS-003; 063 **Reclassification:** None

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:**

Description: The site is a 5.08 centimeter (2 inch) pipe and three 2.54 centimeter (1 inch) diameter pipes extending into a broken, 1.2 meter (4 foot) diameter cement french drain structure. The pipe is labeled as MSS-003.

Location: The drain is located northeast of the 221-U Building and is northeast of the 241-WR Vault.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion. This was a seasonal discharge.

Waste Type: Steam Condensate

Waste Description: The drain received non-contaminated steam condensate.

Code: 200-W-116 **Classification:** Accepted

Names: 200-W-116; Miscellaneous Stream #139; Steam Condensate MSS-TRP-004 **Reclassification:** None

from the flange and has a 2.5 centimeter (1 inch) diameter pipe extending to a hole in the ground, approximately 2 feet north of the cement drain structure.

Location: The site is located inside the 224-U facility fence, in the southeast corner of the fenced area. It is approximately 1.8 meters (6 feet) north of 16th Street.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste Description: The site received non-contaminated steam condensate. The source has been abandoned.

Code: 200-W-120 **Classification:** Accepted

Names: 200-W-120; Miscellaneous Steam Trap 008; Miscellaneous Stream #143 **Reclassification:** None

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:** 1/1/1998

Description: The site is a 1.8 meter (4 foot) diameter, cement drain structure. A 2.5 centimeter (1 inch) pipe extends from the flange of the overhead steam line to the drain structure. The site is labeled with a tag that identifies it as MSS-TRP-008.

Location: The site is a steam trap located outside the 224-U facility fence, on the south side of 16th Street.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste Description: The drain received non-contaminated steam condensate.

Description:

Code: 200-W-121 **Classification:** Accepted

Names: 200-W-121; Miscellaneous Steam Trap 009; Miscellaneous Stream #144 **Reclassification:** None

Classification: Accepted

Names: 200-W-122; Miscellaneous Steam Trap 014;
Miscellaneous Stream #145

Reclassification: None

Type: Injection/Reverse Well

Start Date:

Status: Inactive

End Date: 1/1/1998

Description: An overhead steam line crosses the railroad track leading to the REDOX facility. It was constructed approximately 20 feet above the track. A scaffold has been constructed at the steam trap location. A tag identifies this location as MSS-TRP-014. A 0,76 meter (2.5 foot) diameter, vitrified clay pipe drain structure is located below the steam line. A 2.54 centimeter (one inch) diameter pipe extends from the overhead steam line to the vitrified clay pipe french drain structure.

Location: The site is located south of 16th Street, southwest of the 221-U building. It is located adjacent to the railroad track that leads to the REDOX facility.

Process
Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste The site received non-contaminated steam condensate.

Description:

Code: 200-W-123

Classification: Not Accepted

Names: 200-W-123; Gravel Pit 35

Reclassification: None

Type: Depression/Pit (nonspecific)

Start Date:

Status: Active

End Date:

Description: The site is a large area of shallow excavations.

Location: The site is located south of 23rd Street and east of Dayton Ave. It is west of the 218-W-4A Burial Ground.

Process
Description: The site is used to provide clean backfill material for small excavations.

Waste Type: Soil

Waste The site is a source of clean backfill material. No waste is stored or deposited at this site.

Description:

Code: 200-W-124 **Classification:** Not Accepted (Proposed)**Names:** 200-W-124; PFP Stormwater Pond; Z-9 Pond **Reclassification:** None**Type:** Pond **Start Date:****Status:** Inactive **End Date:****Description:** The pond is no longer visible. The site is not marked or posted.**Location:** The pond was located at the end of a corrugated metal pipe, north and east of the 216-Z-9 crib.**Process Description:** Overflow effluent from the elevated water tank, inside the Z Plant fence, was connected to a 12 inch corrugated water line. Some stormwater drainage may have also contributed to the effluent. The pond developed at the terminus of the water line during the 1960's. The pond is visible in historical 200 West photographs dated 1963 and 1969. A drawing, dated 1971, states the 12 inch corrugated line is abandoned. The pond dried up after the line was blanked off. The effluent was originally rerouted to the 216-Z-11 ditch and later routed to the 216-Z-21 basin.**Waste Type:** Stormwater Runoff**Waste Description:** The pond area received stormwater and water tank overflow effluent.

Code: 200-W-133-PL **Classification:** Not Accepted**Names:** 200-W-133-PL; V682 Spare Line **Reclassification:** None**Type:** Direct Buried Tank Farm Pipeline **Start Date:** 1/1/1944**Status:** Inactive **End Date:****Description:** The site is a DUPLICATE of lines documented in 200-W-130-PL.**Location:** The pipeline is located inside the 241-T tank farm, but extends south of the 241-T fenceline.**Process Description:** The pipeline is considered a spare line. It is an 8.8 centimeter (3.5 inch) diameter, stainless steel pipeline that extends out of the 241-T-152 diversion box and is capped south of 241-T, beyond the tank farm fence.**Related Sites/ Structures:** The site is associated with 241-T-152 diversion box and 200-W-130-PL.

Status: Inactive	End Date:
Description: The site is a DUPLICATE of lines documented in 200-W-130-PL.	
Location: The pipeline is located inside and outside the 241-T Tank Farm fence.	
Process Description: Line V662 is a 7.6 centimeter (3 inch diameter), stainless steel spare pipeline. It is connected to the 241-T-151 Diversion Box. It was capped south of the diversion box, outside the tank farm fence.	

Related Sites/ Structures: Associated with 241-T-151 Diversion Box and 200-W-130-PL.

Code: 200-W-147-PL	Classification: Accepted
Names: 200-W-147-PL; Pipeline from 207-SL to 216-S-19 Pond	Reclassification: Rejected (10/19/2010)
Type: Radioactive Process Sewer	Start Date: 1/1/1952
Status: Inactive	End Date: 1/1/1984
Description: Due to the restructuring of Operable Units, as described in the Tentative Agreement for Central Plateau Cleanup, this pipeline has been split into segments (see 200-W-147-PL-A and 200-W-147-PL-B). The site is an underground 20 centimeter (8 inch) diameter vitrified clay pipe, extending from the 207-SL retention basin to the 216-S-19 pond.	
Location: This portion of the pipeline extends from the 207-SL basin to the Outer Area boundary. The majority of the original pipeline site is located south of the 200 West Area fence.	
Process Description: The pipeline carried waste from the 222-S and 202-S facilities to the 216-S-19 Pond via the 207-SL Retention Basin.	

Related Sites/ Structures: The pipeline is associated with the 216-S-19 Pond, 200-W-147-PL-A and 200-W-147-PL-B.

Code: 200-W-155-PL	Classification: Accepted
Names: 200-W-155-PL; Pipeline from 2904-S-160 Control Structure to 216-S-16 Ditch	Reclassification: Rejected (10/19/2010)
Type: Radioactive Process Sewer	Start Date:
Status: Inactive	End Date:
Description: Due to the restructuring of Operable Units, as described in the Tentative Agreement for Central Plateau Cleanup, this pipeline has been split into segments (see 200-W-155-PL-A and 200-W-155-PL-B). The waste site is an underground 61 centimeter (24 inch) diameter vitrified clay pipe. It extends from the 2904-S-160 Control Structure to the head end of the 216-S-16 Ditch.	

Location: The pipeline is located outside the 200 West Area perimeter fence, southwest of the 207-S Retention Basin.

Process Description: In 1954, the original 61 centimeter (24 inch) process sewer line (sitecode 200-W-152-PL) was plugged and the flow to the 216-S-17 Pond was abandoned. The effluent was directed to the 216-S-6 crib and later to the 216-S-16 Pond via the 2904-S-160 Control Structure. Flow could be directed to 216-S-6 crib at Manhole 8 via pipeline 200-W-156-PL.

Related Sites/ Structures: The site is associated with the REDOX cooling water effluent stream, the 2904-S-160 Control Structure, the 216-S-16 Ditch and Pond and the 216-S-6 crib.

Code: 200-W-189-PL **Classification:** Accepted

Connecting to TEDF System

Type: Radioactive Process Sewer **Start Date:**

Status: Active **End Date:**

Description: The waste site is multiple, active branches of underground vitrified clay pipe that originate at the 235-5Z, 232-Z, 242-Z, 236-Z and 291-Z buildings and the process sewer manholes.

Location: The process sewer extends south and east from the 234-5Z and supporting facilities. The active portion of the process sewer diverts to the Treated Effluent Disposal Facility (TEDF) pipeline near manhole Z8.

Process Description: The process sewer originally fed the 216-Z-1, 216-Z-11 and 216-Z-19 ditches. Later, it fed the 216-Z-20 ditch (see 200-W-207-PL-A). In 1981, the process sewer was reconfigured to accommodate the construction of the 232-Z building. Some of the original sections of process sewer piping were removed during the construction of the 232-Z building.

Many of the process sewer branches are active and were connected to the Treated Effluent Disposal Facility (TEDF) system in 1995. (see H-2-140332 and H-2-140336). Parts of the process sewer were lined before connecting to the TEDF system. Some branches of the sewer are not radiologically contaminated, but other portions are known to have carried radioactive waste.

The active process sewer was tied into the Treated Effluent Disposal Facility (TEDF) system in 1995 (see WIDS sitecode 600-291-PL) and by-passed the ditches. The effluent was redirected to the TEDF system at manhole Z8.

Related Sites/ This process sewer is associated with the TEDF pipeline (WIDS sitecode 600-291)

Structures:

Code: 200-W-211-PL **Classification:** Accepted

Names: 200-W-211-PL; 207-SL Retention Basin Sewer Pipelines; Pipelines from Boiler Annex and Pump Lift Station to 207-SL Basin; Retention Waste Sewer from 219-S and 222-S to 207-SL Basin **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Active **End Date:**

Description: The waste site is four underground effluent pipelines that feed the 207-SL Retention Basin (see subsites and site comment). The original feed line from 222-S laboratory to the 207-SL basin was a 20 centimeter (8 inch) vitrified clay pipeline and a 15 centimeter (6 inch) diameter vitrified clay line from 219-S. The VCP lines are encased in poured concrete. More recently, a 4 centimeter (1.5 inch) diameter carbon steel line from the boiler annex and a 5 centimeter (2 inch) diameter plastic pipe from a pump lift station were added and also feed the 207-SL basin.

Location: The 207-SL basin is located east of the 222-S laboratory. The three effluent lines enter the west side of the 207-SL basin.

Related Sites/ The pipelines are associated with the 222-S Laboratory, 219-S, the 222-S Boiler Annex and the **Structures:** 222-SA pump lift station.

This Site has the Following SubSites:

Code: 200-W-211-PL:1

Code: 200-W-233 **Classification:** Accepted
Names: 200-W-233; Plutonium Finishing Plant (PFP) Treatment Unit **Reclassification:** Closed Out (2/8/2005)
Type: Process Unit/Plant **Start Date:** 1/1/1996
Status: Inactive **End Date:** 1/1/1996

Description: The Plutonium Finishing Plant (PFP) Treatment Unit is a glovebox HA-20MB, located in room 235B in the 234-5Z building.

Location: The 234-5Z building is located inside 200 West Area, near the intersection of 19th Street and Camden Ave.

Process Description: Glovebox HA-20MB supported the cementation process. Various forms of mixed waste were treated with the cementation process. Waste was mixed into standard cement material with water to form a slurry. The slurry was placed into 3 liter (0.8 gallon) billet cans and allowed to harden, creating a stable waste form.

Closure Info: In 2005, the glove box was cleaned out and verified to be Clean Closed. The part A Permit was closed on 2/8/2005.

Code: 213-W	Classification: Accepted
Names: 213-W; 213-W Compactor Facility	Reclassification: None
Type: Process Unit/Plant	Start Date: 1/1/1985
Status: Active	End Date:
Description: The 213-W is a pre-engineered, self-framing structure originally designed as the Dry Waste Compactor Facility. The building contains three rooms: an entry room, a package inspection room, and the computer room. The entry room opens into the compactor room through an airlock. Vehicle doors open from the compactor room to the inspection room, and from the inspection room to the building exterior.	
Location: The 213-W Facility is north of the 272-WA Building and west of the 2401-W Building.	
Process Description: The Waste Compactor system was used to compact uncompressed low-level waste to approximately 10% of its original volume. The waste was compacted directly into steel burial boxes. Beginning in 1985, this process operated sporadically. Compactor operations ceased about 1994. The facility was transferred to 200 West Tank Farms in 1995. The 213-W Building is now used for equipment storage and occasionally to repair contaminated instruments.	
Related Sites/ Structures: Structures associated with the facility include the 213-W-1 tank, the container Products Corporation Model B60 compactor, the facility exhaust and HEPA system, sample and monitoring systems, and the other facilities making up the central waste complex.	
Waste Type: Equipment	
Waste Description: The unit was used to compact low-level dry waste and occasion repairs of contaminated instruments. Residual contamination on the equipment is expected.	

Code: 213-W-1	Classification: Accepted
Names: 213-W-1; 213-W-TK-1; 213-W Compactor Facility Retention Tank	Reclassification: None
Type: Storage Tank	Start Date: 1/1/1985
Status: Inactive	End Date: 1/1/1995
Description: The 213-W-TK-1 Retention Tank is a below grade steel tank. It was plumbed to the 213-W HVAC System, the 272-WA Service Garages, and the 213-W Compactor Room.	
Location: This tank is located east of the 213-W Compactor Facility, and north of the 272-WA Building.	
Process Description: The unit collected drainage from floor drains in the 213-W Compactor Room, and the 272-WA Service Garage. The tank also received heating ventilation and air conditioning condensate. Water was released from the tank if no radionuclides were found during analysis.	
Related Sites/ Structures: Structures associated with the tank include effluent drain lines, floor drains in the 272-WA Service Garages, the 213-W compactor room, and drains at the high-efficiency particulate air filter system.	
Waste Type: Water	
Waste Description: The unit was used to collect drainage water from 272-WA service garages, drainage from the compactor room floor, and condensate from the high-efficiency particulate air filter system. The unit had the possibility of containing radioactive wastes in the event that they were introduced into the process. The water was analyzed periodically for radioactive materials.	

After analysis, the water was released if no radioactive materials were present. The IMUST Checklist and Photo report, issued in April 1998, states the tank contains non-radioactive water.

Code: 218-W-4C ANNEX **Classification:** Not Accepted
Names: 218-W-4C ANNEX; Unused Portion of 218-W-4C Burial Ground **Reclassification:** None
Type: Burial Ground **Start Date:**
Status: Inactive **End Date:**
Description: The annex area looks like a barren field. The area designated for additional waste trenches in the western portion of the 218-W-4C Burial ground was never used.
Location: The 218-W-4C annex section is located directly south of the 234-5 building, north of 16th Street.
Process Description: The 218-W-4C burial ground and annex were designed to contain up to 65 trenches. The main burial ground was designed to include forty-eight trenches, orientated east to west. The burial ground annex was designed to include seventeen trenches, running north to south. The burial ground annex area has never been used.
Related Sites/Structures: The 218-W-4C Annex is associated with WIDS sitecode 200-W-242, which documents a small amount of debris.

Code: 218-W-6 **Classification:** Accepted
Names: 218-W-6; 218-W-6 Burial Ground **Reclassification:** Closed Out (12/8/2011)
Type: Burial Ground **Start Date:**
Status: Inactive **End Date:**
Description: The site had been delineated with light posts and chain. It is marked with signs that say "Danger - Keep Out - Authorized Personnel Only". The area had been designated as a RCRA burial ground, but never used for that purpose. It had been listed on the RCRA Part A Permit for the Low Level Burial Grounds. This waste site was administratively Closed Out in December 2011.
Location: The site is inside 200 West Area. The site extends south from 27th Street to north of the 218-W-1A Burial Ground and east to the 218-W-3AE Burial Ground.

Code: 2607-W2 **Classification:** Accepted
Names: 2607-W2 **Reclassification:** None
Type: Septic Tank **Start Date:** 1/1/1980
Status: Inactive **End Date:** 1/1/1994
Description: The 2607-W2 Septic Tank is surrounded by posts with no radiation warning signs. This system was taken out of service and formally abandoned in 1994. The drainfield lines have been cut and the septic tank was filled with soil. The drainfield had a capacity of 785 gallons (2,970 liters) per day. A gravity tie-line was installed to connect this small system to a collection that

serves 2607-W1.

Location: This unit lies southwest of the main 200 West Area guard gate and southeast of the 2704-W Building.

Process Description: The 2607-W2 Septic Tank and associated drain field were designed to accept sanitary sewer effluent from the 2709-W, the 2720-W and the 2701-WA Buildings.

Related Sites/ Structures: The 2607-W2 Septic Tank was associated with the 2709-W, the 2720-W and the 2701-WA Buildings.

Waste Type: Sanitary Sewage

Waste Description: The 2607-W2 septic system is currently inactive. This site was formally abandoned and filled with soil in 1994. Prior to 1994, this unit received sanitary sewer effluent at an estimated rate of 360 cubic feet (10.2 cubic meters) per day.

Code: 2607-W10 **Classification:** Accepted

Names: 2607-W10; MO-281 and MO-438; Septic Servicing 278-WA **Reclassification:** None

Type: Septic Tank **Start Date:** 1/1/1993

Status: Active **End Date:**

Location: The 2607-W10 septic system is located west of Dayton Ave. and south of 19th Street.

Process Description: 2607-W10 septic services the 278-WA, MO-281 and MO-438 buildings.

Code: 2607-W11 **Classification:** Accepted

Names: 2607-W11; Septic Servicing MO-720 **Reclassification:** None

Type: Septic Tank **Start Date:** 1/1/1993

Status: Active **End Date:**

Location: The 2607-W11 septic system is located west of Dayton Ave. and south of 19th Street.

Process Description: The 2607-W11 septic system services MO-720.

Code: 2607-W12 **Classification:** Accepted

Names: 2607-W12; Septic Servicing MO-721 and MO-743 **Reclassification:** None

Type: Septic Tank **Start Date:** 1/1/1993

Status: Active **End Date:**

Location: The 2607-W12 septic system is located west of Dayton Ave. and south of 19th Street.

Process Description: The 2607-W12 septic system services MO-721 and MO-743.

Code: 2607-W14 **Classification:** Accepted

Names: 2607-W14; WRAP Facility Septic; 2336 Bldg. **Reclassification:** None

Description: underground lines from connecting the tanks and drain field to the mobile offices they serviced.

Location: The septic tanks are south of MO-016 (200 West - Z Plant Area). The drain field is south of MO-939.

Related Sites/ Structures: The septic system serviced mobile offices MO-016, MO-015, MO-017, MO-939, MO-032, MO-031. These trailers are outside of the Z-Plant fence line.

Waste Type: Sanitary Sewage

Waste Description: The system received sanitary waste from mobile offices outside of Z Plant.

Closure Info: The septic system was abandoned per the requirements of Washington Administrative Code 246-272-1851. All septage inside the tanks was removed and the empty tanks were filled to eliminate void spaces. Per an agreement with the Washington Department of Health, the septic system lids were left in place.

Code: 2607-WWA **Classification:** Not Accepted

Names: 2607-WWA; 2607-WWA Septic System **Reclassification:** None

Type: Septic Tank **Start Date:** 1/1/1955

Status: Inactive **End Date:**

Description: This site does not exist as a separate site; it is likely an alias for 2607-WL.

Process Description: Septic Tank and drain fields are designed to accept and treat sanitary sewer effluent from associated structures.

Waste Type: Sanitary Sewage

Waste Description: The 2607-WWA Septic System was reported by Cramer (1987) to have received sanitary sewer effluent at estimated rate of 3.41 cubic meters (120.4 cubic feet) per day. However, this report is likely referring to 2607-WL.

Code: 2727-WA **Classification:** Accepted

Names: 2727-WA; 2727-WA SRE Sodium Storage Building **Reclassification:** Closed Out (2/22/1999)

Type: Storage **Start Date:** 1/1/1977

Status: Inactive **End Date:** 1/1/1999

Description: The 2727-WA building was constructed to store sodium from the Sodium Reactor Experiment (SRE) reactor. The unit is a prefabricated Butler-type metal building with a concrete floor. All of the SRE sodium storage containers have been removed. The building's maximum process design capacity for container storage was 132,000 liters (35,000 gallons). When used for sodium storage, the containers were stored on noncombustible pallets and occupied approximately one quarter of the floor space in the building.

Location: The 2727-WA building is located in 200 West area, north of 16th Street and just east of the rail line.

Waste Type: Chemicals

Waste Description: The sodium had been used as primary coolant in an experimental reactor and was slightly contaminated. A regulatory analysis of the sodium concluded that it was not a dangerous or mixed waste. The sodium was held in 158, 208-liter (55-gallon) steel containers.

Closure Info: February, 1995, the 158 sodium-filled 208-liter (55-gallon) drums were overpacked into 322-

liter (85-gallon) drums and transferred to the South Alkali Metal (SAM) Storage Modules in the 200 West Central Waste Complex.

Code: 232-Z **Classification:** Accepted

Names: 232-Z; 232-Z Building Foundation; 232-Z Incineration Facility; 232-Z Incinerator; 232-Z Waste Incineration Facility **Reclassification:** None

Type: Process Unit/Plant **Start Date:** 1/1/1959

Status: Inactive **End Date:** 1/1/1976

Description: The 232-Z above grade structures were demolished to slab on grade in July 2006. All penetrations through the floor slab were plugged with grout or a fire block material (low density silicone elastomer) prior to building demolition. After building demolition, the floor slab was painted with Polymeric Barrier System (PBS) fixative and then covered with a minimum of 6 inches of gravel. The gravel covered slab is posted with Underground Radioactive Material signs. The underground ventilation ducting from the 232-Z Building to the 291-Z Building was filled with a controlled density fill (i.e., grout). The 232-Z incinerator building had been a concrete block structure with a slightly sloped roof. The building was divided into areas devoted to processing, storage, change rooms, chemical preparation, ventilation, and utility distribution. The building had two stories at the north end and a single story over the remaining portions.

Location: The building was located adjacent to the south side of 2736-ZB.

Process Description: The 232-Z Facility was built to remove plutonium from contaminated solid wastes by incineration and leaching in preparation for plutonium recovery.

Related Sites/Structures: Structures associated with the facility include internal glove boxes, incinerators, and leaching equipment. The building is related to other plutonium recovery and processing facilities at Z Plant.

Waste Type: Chemicals

Waste Description: There is stabilized contamination on the building surfaces, including low levels of alpha contamination.

This Site has the Following SubSites:

Code: 232-Z:1
Names: 232-Z:1; Building Foundation; 232-Z Facility Concrete Slab

Code: 232-Z:2
Names: 232-Z:2; 232-Z Underground Ventilation Duct

Code: 232-Z:3
Names: 232-Z:3; 232-Z Underground Drain Line to 241-Z

Code: 232-Z:1 **Classification:** Accepted

Names: 232-Z:1; Building Foundation; 232-Z Facility Concrete Slab **Reclassification:** None

Type: Process Unit/Plant **Start Date:**

Status: Inactive **End Date:**

Description: The 232-Z above grade structures were demolished to slab on grade in July 2006. All penetrations through the floor slab were plugged with grout or a fire block material (low density

silicone elastomer) prior to building demolition. The slab was painted with Polymeric Barrier System fixative, covered with gravel and posted with Underground Radioactive Material signs.

The SubSite is Part Of:

Code: 232-Z

Names: 232-Z; 232-Z Building Foundation; 232-Z Incineration Facility; 232-Z Incinerator; 232-Z Waste Incineration Facility

Code: 232-Z:2

Classification: Accepted

Names: 232-Z:2; 232-Z Underground Ventilation Duct

Reclassification: None

Type: Process Unit/Plant

Start Date:

Status: Inactive

End Date:

Description: In 2006, the 60 and 91 centimeter (24 and 36 inch) diameter underground ventilation ducting from the 232-Z Building to the 291-Z Building was filled with a controlled density fill (i.e., grout).

The SubSite is Part Of:

Code: 232-Z

Names: 232-Z; 232-Z Building Foundation; 232-Z Incineration Facility; 232-Z Incinerator; 232-Z Waste Incineration Facility

Code: 232-Z:3

Classification: Accepted

Names: 232-Z:3; 232-Z Underground Drain Line to 241-Z

Reclassification: None

Type: Process Unit/Plant

Start Date:

Status: Inactive

End Date:

Description: The 7.6 centimeter (3 inch) diameter underground pipeline drained to the 241-Z facility tank D-6. Water that was removed from the buried three inch drain line was sampled. The water was generally measured at less than 10-3 Ci/mL alpha (M2300-06-010, 232-Z Building Final Slab-On-Grade Characterization Report).

The SubSite is Part Of:

Code: 232-Z

Names: 232-Z; 232-Z Building Foundation; 232-Z Incineration Facility; 232-Z Incinerator; 232-Z Waste Incineration Facility

Code: 234-5Z HWSA

Classification: Accepted

Names: 234-5Z HWSA; 234-5Z Hazardous Waste Storage Area

Reclassification: Rejected (9/14/2000)

Type: Storage Pad (<90 day)

Start Date: 1/1/1985

Status: Active

End Date:

Description: The unit consists of a portable steel building, similar to a conex box, with no windows and three doors that open to three internal bays. The conex box is located on an asphalt pad.

Location: The unit is located east of 234-5Z, along the inner security fence line, 15 meters (50 feet) east of the northeast corner of the 234-5Z Building (Z Plant).

Process Description: This unit provides a temporary staging area for hazardous wastes generated in the Plutonium Finishing Plant Complex.

Related Sites/ Structures: Structures related to this unit include the 234-5Z Facility and other facilities in the Plutonium Finishing Plant Complex that stage waste at the pad.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: The unit stores containerized hazardous waste. Examples of waste previously stored at the facility include: halogenated solvents, thinners, paints, laboratory and process chemicals, flammable liquids, polychlorinated biphenyls, and refrigerants.

Code: 2607-Z8

Classification: Accepted

Names: 2607-Z8

Reclassification: Rejected (5/31/2001)

Type: Septic Tank

Start Date:

Status: Inactive

End Date:

Description: WIDS site 2607-Z8 was described in Cramer (1987) as a septic tank and associated drain field. However, it likely does not exist.

Location: This septic system has been described as being located along the fence southeast of the 234-5Z Building.

Waste Type: Sanitary Sewage

Waste Description: According to the Hanford Site Waste Management Units Report (Cramer, 1987), this unit received sanitary sewer effluent at an estimated rate of 0.75 cubic meters (26 cubic feet) per day in 1987.

Code: 300 IFBD

Classification: Accepted

Names: 300 IFBD; 300 Area Interim Filter Backwash Disposal

Reclassification: Rejected (1/27/1999)

Type: Depression/Pit (nonspecific)

Start Date: 1/1/1987

Status: Inactive

End Date: 1/1/1987

Description: This site was a temporary disposal area for filter backwash from the 300 Area Filter Water Plant. There is a large, depressed area on the east side of the Gravel Pit 6 property that forms a natural basin. There is a moderate amount of rabbit brush and grasses growing on it. There are no definite, visible signs that the area was used for backwash disposal. However, there are some truck tire tracks and evidence of some grayish, silty sand on the surface in some areas of the natural basin.

Location: The disposal area is located inside the Gravel Pit 6 property boundaries, south of the 300 Area Vitrification Test Site and west of the 300 Area. It is on the west side of Route 4 South. The depressed area believed to be the disposal site is on the east side of the property.

Process Description: The area was used to dispose of filter backwash material for four months (January through April) in 1987. Filter backwash effluent was trucked to this area.

Waste Type: Water

Waste Description: The unit received approximately 2,460,000 liters (650,000 gallons) of effluent from backwashing filters at the 300 Area Filter Water Plant (315 Building). The backwash was 90% river water. The sediment in the backwash contained alum which is used as a coagulating agent prior to filtration. Analysis of the backwash has shown it to be nonhazardous.

Code: 300 PHWSA

Classification: Accepted

Names:	300 PHWSA; 300 Area Powerhouse Hazardous Waste Storage Area; 300 Area Powerhouse HWSA	Reclassification:	Rejected (1/27/1999)
Type:	Satellite Accumulation Area	Start Date:	1/1/1991
Status:	Inactive	End Date:	1/1/1995
Description:	The site was a hazardous waste storage area used to store nonradioactive solid waste. Currently, the site is an empty chain link fenced area.		
Location:	The unit is located near the southwest corner of the 384 Building adjacent to roll up door 3.		
Process Description:	The unit was used to stage nonregulated and hazardous material. Some of the material stored here included waste oil, lubricating oil, oil soaked rags and aerosol cans.		
Related Sites/ Structures:	The site was associated with the operation of the 384 Powerhouse.		
Waste Type:	Barrels/Drums/Buckets/Cans		
Waste Description:	When active, the unit staged nonregulated waste oil and water treatment chemicals. Other small quantities of hazardous waste were also stored.		

Code:	300 SE	Classification:	Accepted
Names:	300 SE; Solvent Evaporator; 300 Area Solvent Evaporator; 300 ASE	Reclassification:	Closed Out (6/27/1995)
Type:	Evaporator	Start Date:	1/1/1975
Status:	Inactive	End Date:	1/1/1985
Description:	The site was a treatment unit for radioactively contaminated spent solvents generated in the fuel fabrication process at the 300 Area. The waste solvents were treated by evaporation in a Brooks Load Lugger (i.e., tank, dumpster). The 300 Solvent Evaporator (300 ASE) lugger (Type A82; Series 3F) was 244 centimeters (96 inches) long, 165 centimeters (65 inches) wide at the top, 127 centimeters (50 inches) wide at the bottom, and 89 centimeters (35 inches) deep. The 300 ASE was constructed of carbon steel with a hinged aluminum sheet metal canopy over the top. The canopy (added in 1978) prevented entry of precipitation while allowing airflow across the top of the solvent. The canopy was hinged so that one end could be lifted for pouring the contents of solvent barrels into the cutout side of the evaporator.		
Location:	The site was located on a concrete pad and an adjacent graveled equipment area behind the 333 Building and next to the east end of the 334 Building.		
Release Description:	Although no formal spill report is known to exist, one spill is known to have occurred when a small hole developed in a fitting of the steam line (BHI-00012). Steam condensate collected in the evaporator until it overflowed. It was likely that the overflow spilled from the cutout side onto the northern edge of the evaporator area. It is estimated that very little, if any, solvent was released during this spill, as the bulk of the solvent being treated had a density greater than water and thus remained inside the evaporator.		
Process Description:	The 300 ASE was installed in the spring of 1976 and was a treatment tank (evaporator) that received barrels of accumulated solvent waste from degreasing operations associated with the N Reactor fuel manufacturing facility. Degreaser solvent barrels were routinely stored (up to 1 year) within about 6.1 meters (20 feet) of the evaporator until poured into the 300 ASE with the barrel lift/dumper. Small quantities of solvent (from the paint shop) and uranium-ethyl acetate-bromine solutions were poured by hand directly into the evaporator. Typical 300 ASE waste		

was composed of perchloroethylene, trichloroethylene, chloroform, ethyl acetate/bromine solution, paint shop solvents, and possibly used oil. Small amounts of uranium and alloys of copper, zirconium, and possibly zirconium/beryllium were present in the degreaser solvents as machining particulates. In 1985, the 300 ASE was phased out. The Brooks load lugger was dismantled between 1985 and 1986.

Waste Type: Chemicals

Waste Description: The unit received approximately 2,300 liters per year (600 gallons per year) of solvents and steam condensate. The solvents consisted mainly of spent trichloroethylene, perchloroethylene, 1,1,1-trichloroethane, and an ethyl acetate/bromine solution. Paint shop solvents that were potentially treated include methyl ethyl ketone, methylene chloride, and petroleum naphtha.

Closure Info: Sample results can be found in the field work section. The 300 ASE closure area consisted of two sub-areas located at the south side of the 333 East Concrete Pad. (1) a concrete sub-area about 15.2 meters (50 feet) long on the south portion of the original 333 East Concrete Pad that extends about 9.8 meters (32 feet) to the north and then tapers towards the original 10.2 centimeter (4 inch) diameter pad drain, and (2) an adjacent gravel/soil sub-area along the south edge of the concrete pad approximately 3.1 meters (10 feet) wide by 15.2 meters (50 feet) long.

Concrete core samples were collected and analyzed for the concrete pad sub-area. Since there are no known performance standards with which to evaluate concrete, soil cleanup levels were used per Ecology guidance. All detectable analytes were below the soil cleanup levels.

For soil samples collected and analyzed, cadmium, copper and lead were found in concentrations above the Hanford Site Background levels. The results for copper in the soil ranged from 26.8 to 109 milligrams per kilogram, well below the Model Toxics Control Act (MTCA) Method B cleanup level of 3,000 milligrams per kilogram. The MTCA Method A cleanup level was used for lead because data for the Method B cleanup level calculation were not available. The soil results for lead ranged from 9.4 to 101 milligrams per kilogram, well below the MTCA Method A cleanup level of 250 milligrams per kilogram. The one cadmium result of 1.0 milligram per kilogram, was below the MTCA Method A cleanup level of 2.0 milligrams per kilogram.

There are no post closure monitoring requirements for this site.

Code: 300 SSS	Classification: Not Accepted
Names: 300 SSS; 3607; 3707; 300 Area Sanitary Sewer System	Reclassification: None
Type: Sanitary Sewer	Start Date: 1/1/1944
Status: Active	End Date:
Description: The sewer system is comprised of underground sewer lines inside the 300 Area that connect to the City of Richland sewer system. Prior to 1996, the sewer was connected to septic tanks and sanitary leaching trenches located northeast of the 300 Area. The 300 Area Sanitary Sewer utilized gravity and pressure collection lines, septic tanks and leaching trenches. The original sewer system was constructed of concrete and clay pipes and was designated as the 3907 system. The system was connected to a tile field that was replaced, in 1951, by a septic tank and two leaching trenches. Additional septic tanks were added in 1975. The 300 Area Sanitary Trenches (WIDS Site 300-52) site includes two septic tanks and unlined trenches that were connected to the 300 Area Sanitary Sewer System. The 300 Area Sanitary Trenches (WIDS Site 300-52) is a "no action" site in the 300-FF-1 Operable Unit. On October 1, 1996 the 300 Area Sanitary Sewer System began to discharge to the City of Richland's sewage system. The pipeline to the 300 Area Sanitary Trenches was permanently isolated by welding a plate in place	

and filling manhole #6 with concrete.

Location: The system is located underneath the 300 Area. The sewer sampling station is located on the George Washington Way extension, south of the 300 Area. There are two lift stations. One is located northeast of the 337 Building and the other is northeast of the 306-E Building.

Process Description: The site receives sanitary waste from throughout the 300 Area. The 300 Area Sanitary Sewer utilizes gravity flow and lift stations to send sanitary waste to the City of Richland.

Related Sites/ Structures: Site associated with 300-276.

Waste Type: Sanitary Sewage

Waste Description: The sanitary sewer receives sanitary wastes from throughout the 300 Area.

Code: 300-12 **Classification:** Not Accepted

Names: 300-12; 325 Laboratory Diesel Fuel Tank **Reclassification:** None

Type: Storage Tank **Start Date:**

Status: Inactive **End Date:** 1/1/1992

Description: The unit is located at the northwest corner of the 325 Building. There was a single underground diesel fuel storage tank. It was taken out of service and removed (including accessible piping) in October, 1992. Sampling was performed at the time of tank removal (See Cleanup Activities Section). The site currently appears as a paved area between the building and air conditioning equipment. It can be distinguished from surrounding pavement by its newer appearance.

Related Sites/ Structures: This unit was associated with the 325 Building.

Waste Type: Storage Tank

Waste Description: The tank was used to store diesel fuel for an emergency generator located beside the 325 building. There are no known leaks or spills associated with this tank.

Code: 300-13 **Classification:** Not Accepted

Names: 300-13; 350 Building Release to Sanitary Sewer System **Reclassification:** None

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: The site is an unplanned release to the 300 Area Sanitary Sewer System. The site was discovered during routine surveillance and maintenance of the 350 Building Sanitary Sewer Lift Station. The lift station is a below grade sewage pump station accessible through a raised manhole, painted white and located in the grassy strip of land on the west side of the 350 Building between the security fence and the roadway. A gray electrical panel is located adjacent to and on the east side of the manhole. The panel houses the controls for the sewer lift pumps.

Location: The site is located northwest of the 350 Building and just south of the access roadway to the storage yard on the north side of the 350 Building. It can be identified by the electrical panel adjacent to and on the east side of the access cover for the station.

Process Description: The lift station is used to pump sanitary wastes into the 300 Area Sanitary Sewer System.

Description: Sewage is collected from 350 Building, 350A Building, 350B Building and pumped to a sewer tie-in just north of the lift station.

Related Sites/ Structures: The site is associated with the 300 Area Sanitary Sewer System, 350 Building, 350A Building, and 350B Building.

Waste Type: Sanitary Sewage

Waste Description: The site was sanitary sewage contaminated by latex paint.

Code: 300-14

Classification: Accepted

Names: 300-14; 331 Building Animal Waste Tanks Pit

Reclassification: Rejected (9/22/1998)

Type: Depression/Pit (nonspecific)

Start Date: 1/1/1974

Status: Inactive

End Date: 1/1/1977

Description: This site includes the unlined pit east of the building, a backwash storage tank, and six diversion chambers that are located north of the pit. Originally, the animal waste collection tanks were located in a pit just east of the 331-D Animal Waste Treatment Building. The pit is 28.0 meters (92 feet) by 22.3 meters (73 feet) and approximately 7.6 meters (25 feet) deep. The sides of the pit slope about 30 degrees. The tanks have been removed. Eight concrete tank pedestals remain at the bottom of the pit. A stairway leads to the bottom of the pit. A backwash storage tank remains between the 331-D building and the pit. Water was observed at the bottom of the pit. Six diversion chambers for the sewer system are located northwest of the pit.

Location: Using the Cypress Street entrance to the 300 Area, the site is located on the right side of the street within the 331 Complex.

Process Description: The 331-D Animal Waste Treatment Facility consists of a semi-high bay, prefabricated, metal Butler building erected on a concrete slab. It contained a 94,625 liters (25,000 gallon) per day capacity waste treatment plant that operated to chemically treat, mechanically flocculate and settle, and then gravity filter animal wastes. A sludge dryer also was installed to heat and dry 54.4 kilograms (120 pounds) per hour of sewage sludge product from the treatment facility and to produce a 65 to 100% waste material that could be buried in the 100 and 200 Area trenches. The animal waste collection tanks located in a pit just east of the 331-D building were associated with this process. This treatment facility was needed because hog hairs, sawdust, and undigested animal feed frequently plugged the unlined animal waste pit located along the Columbia River.

Related Sites/ Structures: The site is related to the Animal Waste Sewer and 331-D Complex.

Waste Type: Animal Waste

Waste Description: Animal waste from the 331 Complex were routed through the animal waste sewer to the 331-D animal waste treatment facility.

Code: 300-17

Classification: Not Accepted

Names: 300-17; 331 Building Trench; 331-D Ditch; Outfall A

Reclassification: None

Type: Ditch

Start Date:

Status: Active

End Date:

Description: The site is a ditch that runs from the southeast corner of the 331-D Building to the top of the

west bank of the Columbia River. The ditch is fed by an underground pipe which drains stormwater from the roadway between the north side of Building 331-C and the south side of Building 331. The open trench is piped to a culvert passing beneath a gravel roadway and the perimeter fence. The discharge is approximately 46 meters (150 feet) from the river. The bank is moderately sloped with natural vegetation. This outfall results from non-industrial sources. The site has a natural berm at the fence line. No erosion is evident on the sloping bank.

Location: The ditch is located in the 300 Area, in the southeast corner of the 331 Complex, between the 331-D and 331-E Buildings.

Process Description: The site collects sediment and runoff from storage yards and loading docks.

Waste Type: Stormwater Runoff

Waste Description: The waste is stormwater runoff from the roadway between the 331 and 331-C Buildings.

Code: 300-19

Classification: Accepted

Names: 300-19; 324 Building Sodium Removal Pilot Plant; 324 Sodium Removal Pilot Plant

Reclassification: Closed Out (6/9/1997)

Type: Process Unit/Plant

Start Date: 1/1/1979

Status: Inactive

End Date: 1/1/1987

Description: The Sodium Removal Pilot Plant consisted of a reaction vessel, a nitrogen gas supply, a steam supply, and equipment for decontamination studies. The reaction vessel was decommissioned and removed in 1991.

Location: The unit was located within room 146 of the 324 Building, Chemical Materials Engineering Laboratory.

Process Description: The unit has been inactive since 1987. From 1983 to 1987 the unit was used to clean and decontaminate test equipment, reactor components, and other sodium contaminated parts. Before 1983 the system was used to treat small amounts of alkali metals for research and development and to perform equipment decontamination.

Related Sites/Structures: Structures associated with the unit include the 324 Highbay, the highbay crane, plumbing, and pressure vessels.

Waste Type: Chemicals

Waste Description: Decontamination and research and development activities generated liquid effluents that contained radionuclides and sodium hydroxide. The sodium hydroxide was neutralized prior to discharging the solution to a crib.

Code: 300-21

Classification: Not Accepted

Names: 300-21; 333 Building Underground Limestone Tank

Reclassification: None

Type: Neutralization Tank

Start Date:

Status: Inactive

End Date: 1/1/1973

Description: The site was an underground storage tank that held limestone used to neutralize acid wastes. The Waste Acid Treatment System (WATS) Limestone Neutralization Tank leaked in 1973 and was removed.

Location: The tank was located east of the 333 Building and north of the 334 Tank Farm. The 334A

Building was built where the tank had been located. The site is within the 618-1 Burial Ground (WIDS Site 618-1).

Release Description: The release to the soil is described in the Releases Section. The release site (WIDS Site UPR-300-13) is a separate waste site.

Process Description: Prior to mid-1971, the majority of the concentrated chemical wastes from the 333 Building chemical tanks were transferred via polyvinyl chloride (PVC) drain lines in the pipe trench to this 14,380 liter (3800 gallon) plastic-lined, steel tank full of limestone. The waste etch acid solutions were sprayed over the top of the limestone and the neutralized acid waste drained from the bottom of the tank into the process sewer. Limestone was added to the top of the tank during the week as needed. The acid-limestone contact time was increased in 1971 by batch transfers to the tank to maintain at least a 12 hour holdup prior to draining to the process sewer. From late 1971 to August 1973, in an effort to further reduce chemical waste disposal within the 300 Area, the underground limestone neutralization tank was converted to a catch tank to collect and pump batches of waste etch acid to Tank 4 in the 334 Tank Farm. Tank 4 (WIDS Site 334 TFWAST), a 22,710 liter (6000 gallon) elevated tank, was used to store the waste acid solution and to transfer batches of the waste acid solutions to a neutralization tank (WIDS Site 313-TK-2) in the 313 Uranium Recovery Room. The 334-A Facility was built to replace the failed tank. The collection of batches of waste etch acids in the 334-A Facility catch tanks (WIDS Sites 334-A-TK-B and 334-A-TK-C) started in January 1975. The process for neutralization of the waste etch acids in the 333 waste acid neutralization tank continued from January 1975 until the 333 N Fuels Fabrication processes were shutdown in about 1988.

Related Sites/ Structures: The site is associated with the 333 Building process etch facilities and the associated drain lines (WIDS Site 300-219), Tank 4 in the 334 Tank Farm (WIDS Site 334 TFWAST), the 334-A Facility, and the process sewer. The site is also associated with UPR-300-13, a release to the soil of waste etch acid solution.

Waste Type: Equipment

Waste Description: The waste was a tank containing limestone used to neutralize acid waste. The tank was removed in 1973.

Code: 300-23	Classification: Accepted
Names: 300-23; 309-1 UST; PRTR Diesel Storage Tank	Reclassification: Closed Out (10/24/1996)
Type: Storage Tank	Start Date: 1/1/1959
Status: Inactive	End Date: 1/1/1969

Description: This site no longer exists as a waste site. The tank has been removed and the trench backfilled. Previously, this site was a tank that held diesel fuel used to power the Plutonium Recycle Test Reactor (PRTR) emergency generator located inside the 309 Building.

Location: The tank was located approximately 6.1 meters (20 feet) south of the 309 building and next to the main entrance of the 309 building.

Related Sites/ Structures: The associated structure was the Plutonium Recycle Test Reactor (PRTR), 309 Building.

Waste Type: Storage Tank

Waste Description: The waste was the abandoned underground storage tank (UST). Residual diesel fuel and water remained in the tank.

Closure Info: A site assessment was conducted following the guidance from the Washington State Department of Ecology, Guidance for Site Checks and Site Assessments for Underground

Storage Tanks. The assessment is described in Site Assessment Report for the 309-1 Underground Storage Tank (UST), correspondence control number 036527. The tank was excavated and examined for potential leaks. No discolored soil was observed. There was no groundwater in the tank excavation. Samples (Sampling Authorization Form - B96-145) were taken as follows: BOJ080, spoils pile east of excavation; BOJ081, spoils pile west of excavation; BOJ082, spoils pile west of excavation; BOJ083, bottom of excavation at elbow of supply line to building; BOJ084, south wall of tank, one foot below imprint in soil; BOJ085, bottom of tank, one foot below imprint in soil, BOJ086, bottom of tank, one foot below imprint in soil (duplicate); BOJ087, north wall of tank, one foot below imprint in soil; BOJ088, bottom of excavation at supply line penetration into building; BOJ089, bottom of excavation at return line penetration into building; BOJ090, sample blank. The full sample results can be found in the Hanford Environmental Information System (HEIS). The results of the site assessment indicated that a confirmed release of a regulated substance did not occur.

Code: 300-25 **Classification:** Accepted

Names: 300-25; 324 Building **Reclassification:** None

Type: Laboratory **Start Date:** 1/1/1966

Status: Inactive **End Date:**

Description: The 324 Building is a substantial concrete and steel structure. Portions of the Building are covered under a RCRA Closure Plan with on-going closure activities in progress. The 324 Building is divided into four integrated-but-separate primary work areas: the Engineering Development Laboratory-102 (non radioactive) or EDL-102, the Engineering Development Laboratory-146 (radioactive) or EDL-146, the radiochemical engineering cells (REC), and the Shielded Materials Facility (SMF). Additional facilities in the 324 Building include development laboratories, maintenance shops, and service areas. Within the 324 Building are controlled experimentation areas referred to as 'hot cells' with radiation shielding provided by thick concrete walls. To protect against releases of radioactive material from the hot cells to the environment, integral metal liners with sumps (i.e., without drains) were installed in the cells and tank vaults. Confinement of radioactive particulate matter within the shielded cells is provided by a directed air flow through high-efficiency particulate air (HEPA) filter ventilation system. The RCRA Closure Plan covers the REC portion of the building, including the hot cells, low level and high level vault tanks, the airlock and pipe trench. See DOE/RL-96-73, Rev. 1 (3-98) for additional details. In July of 1999, the Washington State Department of Ecology identified the following as areas of interest for this facility: - 324 Shielded Material Facility (SMF) South Cell - 324 Shielded Material Facility (SMF) East Cell - B-Cell (Hot Cell) - A-Cell (Hot Cell) - C-Cell (Hot Cell) - D-Cell (Hot Cell) - Hot Cell Airlock (Hot Cell) - High-Level Vault (4 tanks) - Low-Level Vault (4 tanks) - 324 Process Sewer System (WIDS site 300-15) - 324 Retention Process Sewer System (WIDS site 300-214) - EDL-102 (PNNL Vitrification Pilot) - High Bay (2 tanks with heels) - Room 146 (Fume hood - melter) - Room 3B, 3F (Laboratory and Rad Flume Hood), and Storage Vault - Waste Water Diverter System, Catch Tank and Ion Exchange Tank - HNO₃ Bulk Chemical Tank - West Side of Facility. The areas listed above that are within the boundaries of the TSD facility are: - B-Cell (Hot Cell) - A-Cell (Hot Cell) - C-Cell (Hot Cell) - D-Cell (Hot Cell) - Hot Cell Airlock (Hot Cell) - High-Level Vault (4 tanks) - Low-Level Vault (4 tanks).

Location: The 324 building is in the central part of the 300 Area, northeast of the 309 Building and immediately east of the 308 Building.

Release Description: On 11/16/10, a cone penetrometer (an enclosed pipe pushed into the soil by a hydraulic ram) was used to identify the presence of radioactive material in the soil approximately 3.5 feet beneath the 324 Building near the B-cell. A maximum radiation readings of 6,700 R/hr. was identified. The 324 Building is a Nuclear Category 2 facility, currently undergoing deactivation and decommissioning. The 324 Building was constructed in the 1960s to support materials and

chemical process research and development activities, and ceased research operations in 1996. The primary operational system remaining in the building is ventilation. In preparation for removal of B-cell, historical research and on-site investigation identified evidence of a potentially breached liner in the sump floor. A leak may have occurred at some point in the operational past of the cell. The 300 Area is posted as an Underground Radioactive Material (URM) Area. This event is being reported as a Management Concern due to the unexpected very high levels of radiation. (See sitecode 300-296)

Process Description: The 324 Building was designed and constructed to allow for a high degree of versatility in completing complex and varied experimentation on highly radioactive wastes developing approaches for waste treatment and storage activities. The building was designed as a single integrated facility for orderly progression of nonradioactive and radioactive development studies from laboratory or bench-scale to full engineering-scale pilot plant demonstrations. The facility houses radiochemical and radiometallurgical hot cells and laboratories. The facility supported several DOE/RL related initiatives for highly radioactive chemical processing and metallurgical engineering studies. As a result of residues and internal facility spills during the conduct of these activities, the facility contains areas with significant fixed and dispersible mixed waste contamination.

Related Sites/Structures: The 324 Building has been isolated from the RLWS by installing a blank in the diverter valve. The pipes going from Tanks 102 and 177 to the 324 RLWS were cut and capped. The main 324 pipe that connected with the 340 Facility pipe has been cut and capped. The 324 building is associated with Unplanned Release 300-296.

Waste Type: Equipment
Waste Description: Currently, the facility is undergoing deactivation to address radiological and chemical contamination remaining in the facility. The waste is contaminated equipment that is being removed from the facility, packaged, and transported to the 200 Area for burial.

Code: 300-26	Classification: Accepted
Names: 300-26; 384 Powerhouse #6 Fuel Oil Spill; Delivery Truck Spillage on Roads; Powerhouse Fuel Oil Spill	Reclassification: Rejected (1/27/1999)
Type: Unplanned Release	Start Date: 1/1/1991
Status: Inactive	End Date: 1/1/1991

Description: The site was an unplanned release. The area of the release was previously used as a coal pile for the 384 Powerhouse. The soil is stained dark from coal dust. There is no visible evidence of the #6 fuel oil spill in the area. On the south side of the site adjacent to Apple Street there is an Underground Radioactive Material sign, and a buried gas pipeline.

Location: The site is located on the east side of the 384 Powerhouse, just south of the 366 Fuel Oil Bunker, at the refueling area.

Release Description: After refueling of the 366 Fuel Oil Bunkers, an offsite vendor's fuel oil truck spilled #6 fuel oil during departure onto the gravel and paved road. The driver stated that he had left a siphon tube valve cracked open which released the fuel oil to the ground. The date of the spill was December 31, 1991.

Related Sites/Structures: The site is associated with the 384 Powerhouse and 366/366A Fuel Oil Bunkers (WIDS Site 300-6).

Waste Type: Oil
Waste Description: The waste is #6 fuel oil contaminated soil and gravel. The release occurred on December 31,

Description: 1991. The occurrence report does not contain an estimate of the volume. There is no information on the extent of the spill. The leak was not discovered until after the truck left the job site.

Code: 300-27 **Classification:** Accepted
Names: 300-27; Soil Contamination at 329 Biophysics Laboratory **Reclassification:** Rejected (2/12/1999)
Type: Unplanned Release **Start Date:** 1/1/1991
Status: Inactive **End Date:** 1/1/1991

Description: Radioactive contamination was found at the site during a routine survey on August 14, 1991. The site is an area of crushed rock gravel with no vegetation located near the outside wall of the 329 Building. There are no hazard postings at this location. There is no visible evidence of radioactive contamination that was removed from this site. A cement pad with a liquid argon tank has been constructed adjacent to the site.

Location: The contamination was found in soil just west of Door 12 on the northeast section of the 329 Building.

Release Description: During a routine radiation survey outside of the building on August 14, 1991, a Radiation Protection Technologist (RPT) found radioactive contamination levels of approximately 40,000 disintegrations per minute (dpm) beta-gamma in a one square foot area of soil. Pacific Northwest Laboratory (PNL) was unable to identify the source of the contamination. The contamination was not found during a prior survey in 1990. This site was found within several feet of the outer wall of the 329 Biophysics Laboratory. The source of the contamination is unknown.

Waste Type: Soil

Waste Description: The waste was contaminated soil that was later cleaned up.

Code: 300-30 **Classification:** Accepted
Names: 300-30; 3705 Photography Building **Reclassification:** Rejected (1/27/1999)
Type: Process Unit/Plant **Start Date:** 1/1/1963
Status: Active **End Date:**

Description: The 3705 Building is a rectangular, one-story concrete block building erected on concrete footings and a slab-on-grade concrete floor. A corrugated metal sided mechanical room penthouse has been erected on the building roof. The roof itself is flat and is covered with built-up tar and gravel. The building contains no windows. Interior partitions are either gypsum wall board on stud frames or movable metal. Utilities serving the building include sanitary water and sewer, compressed air, process water, and electricity. The building was connected to the process sewer, but all connections were capped when the building was remodeled, probably between 1988 and 1990. The capped process sewer connection for the silver reclamation process is located behind a sheet rock wall that has been marked with an identification sticker.

Location: The 3705 Photography Building is inside the 300 Area, just north of the Apple Street Gate. It is on the west side of Alaska Street.

Process Description: From 1963 through the early 1970's, the building was used to process personnel dosimetry badges and meters. Various radioactive sources were kept and used at the facility. In 1968, a 1.96 microcurie americium-241 source was found to be ruptured and the contamination was subsequently cleaned up (See Releases Section). Since the early 1970's, the facility has

provided photographic services, including still camera assignments, color slides work, contract printing, and black and white or color enlargements. Within the facility is the silver reclamation unit that is used to treat the spent photoprocessing chemicals to recover silver for recycling. During the silver reclamation process, liquids from film processing are run through a chemical recovery column (CRC) that precipitates out silver. The building use to be connected to the process sewer and the sanitary sewer. All process sewer connections were capped when the building was remodeled, probably between 1988 and 1990. The silver depleted liquid effluent produced from the silver reclamation process is a nonregulated, nonhazardous waste that is no longer discharged to the sanitary sewer. It is collected in 114 liter (30 gallon) drums and then sent offsite for disposal. The silver enriched CRC's are treated as recyclable material and periodically sent to a refiner for processing. Washwater and overflow from the developers is sent to the City of Richland sanitary sewer. Prior to 1998, this waste stream went to the 300 Area Sanitary Sewer Trenches (WIDS Site 300 SSS).

Related Sites/ Structures: The site is associated with the 300 Area Sanitary and Process Sewers (WIDS Sites 300 SSS and 300-15) and the 3746-D Silver Reclamation Process Facility (WIDS Site 3746-D SR).

Waste Type: Chemicals

Waste Description: The waste is spent photoprocessing chemicals. Prior to silver reclamation, the chemicals designate as a hazardous waste. After the silver reclamation, the solutions are nonregulated and nonhazardous. The treated solutions are disposed of offsite. The recovered silver is shipped offsite for recycling.

Additional waste is nondangerous/nonhazardous washwater and overflow from the film developers that goes to the City of Richland sanitary sewer system.

Code: 300-35	Classification: Accepted
Names: 300-35; 3706A Fuel Storage Tank	Reclassification: Closed Out (2/12/1999)
Type: Storage Tank	Start Date:
Status: Inactive	End Date:

Description: The site is an abandoned underground fuel storage tank. A 0.51 meter by 0.51 meter (1.7 feet by 1.7 feet) concrete block and sign (at the tank fill connection location) marks the location of the underground tank. The sign reads "EMPTY 300 GALLON UNDERGROUND DIESEL FUEL TANK LOCATED HERE. CONTACT MAINTENANCE Environmental Services South (376-7210) for information".

Location: The tank marker is located 1 meter (3.3 feet) from the south wall of the 3706-A Building and 6.1 meters (20 feet) west of the southeast corner of the building.

Release Description: A review of the facility operating history did not reveal any reported instances of diesel spills. It is anticipated that the normal trace amounts of diesel near the filler connection may be present.

Process Description: The underground diesel fuel storage tank was used to support emergency generator operations for heating, ventilation, and air conditioning (HVAC).

Related Sites/ Structures: The site is associated with the emergency generator.

Waste Type: Storage Tank

Waste Description: The waste is an abandoned underground fuel storage tank that was pumped out and closed in place.

Closure Info: The tank was pumped and closed in place. A message on 2/10/1995 from Ted Wooley of the Washington State Department of Ecology says "It appears that the information provided would allow exemption (e.g., abandonment or closure prior to December 22, 1988) under WAC 173-360." A second cc:mail on 3/15/1995 says that "After re-evaluating the data, Ecology agrees that the appropriate disposal steps were taken with the waste water collected. Moreover, closure of the tank in place can serve as final closure of the tank."

Code: 300-36 **Classification:** Not Accepted

Names: 300-36; 384 Powerhouse Oil Release to French Drain **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1995

Status: Inactive **End Date:** 1/1/1995

Description: The site was an unplanned release to a french drain. The french drain received condensate return from the steam heating system that went to the fuel oil bunkers. The french drain is a 0.65 meter (2.13 feet) diameter drain with a rust colored lid. Although gravel around the drain is slightly stained, it is most likely caused from normal steam condensate activity.

Location: The oil release was observed in a french drain located north of the 366 Pumphouse, just east of the railroad tracks.

Release Description: On August 2, 1995, a french drain north of the 366 Building was observed by operations personnel to be overflowing. When the employee lifted the drain lid, oil was noted floating on top of the water. Since the source of the water in the drain was condensate return from the oil bunker steam heating system, the oil indicated a tube bundle failure. Response included isolating the steam to the underground fuel oil bunkers and removing the oil contaminated rocks and soil. Oil in the french drain was also removed. Clean dirt was used to backfill the area where material was removed.

Process Description: The oil bunkers were heated with steam to keep the oil viscous enough to be pumped.

Related Sites/Structures: The release is associated with the french drain known as WIDS Site 300-123 (Miscellaneous Stream #342) and the 366/366A Fuel Oil Bunkers (WIDS Site 300-6).

Code: 300-39 **Classification:** Accepted

Names: 300-39; 309 Building Ex-Vessel Irradiated Fuel Storage Basin; 309 Building Irradiated Fuel Storage Basin; 309 Fuel Storage Basin **Reclassification:** None

Type: Storage **Start Date:** 1/1/1960

Status: Inactive **End Date:** 1/1/1974

Description: The Fuel Storage Basin is empty. All fuel handling and storage equipment has been removed. Gates, stoplogs and fixtures have been removed and all that remains are studs where the equipment was located. The basin has been covered with a plywood, sheet metal and metal grating cover supported by channel iron. This cover made it impossible to check the basin overflow drain system to see if they have been plugged. The Fuel Storage Basin is "L" shaped and may be described as having two sections. The largest section is the Fuel Storage Basin which runs north/south and was the first pit built; the pit is 40ft (12.2 m) long, 20 ft (6.1 m) wide and 34ft (10.4 m) below grade. The other section is the Loadout Facility which has two sections that run east/west and are smaller than the original basin and were built as the first basin reached capacity; one basin is 26 ft (7.9 m) long, 5 ft (1.5 m) wide, and 26 ft (7.9 m)

300 Area sanitary sewer, and WIDS Site 300-258, Abandoned Pipe Trench Between 334 Tank Farm and 306E. Contamination beneath this facility is documented as WIDS Site 300-256. Contamination beneath the adjacent 306W Metal Fabrication Development Building is documented as WIDS Site Code 300-33.

Code: 300-47 **Classification:** Not Accepted

Names: 300-47; Residual Hazardous Substances Northwest of 3708 Building **Reclassification:** None

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:** 1/1/1989

Description: During the demolition of the 3708 facility the 300-47 WIDS site location was removed. No visual evidence was found of potential contamination at the 300-47 site during removal of the 3708 building foundation concrete slab. The site was identified as two locations of potential contamination near the 3708 Building that resulted from tank leakage. The area around the 3708 Building is not currently posted for contamination and there is no evidence of underground tanks. The area is partially paved with asphalt, and otherwise surfaced in crushed gravel. There are no markers where the chemical tank and the oil tank were located.

Location: The site is located in 300 Area just off the northwest corner of the 3708 Building.

Release Description: No releases have been identified.

Process Description: The tanks were chemical holding tanks containing waste from floor, shower, and sink drains in the 3708 Building, and an underground oil storage tank.

Related Sites/ Structures: The two areas of potential contamination are associated with the 3708 Building.

Code: 300-55 **Classification:** Accepted

Names: 300-55; 307-D; 309 Rupture Loop Holding Tank; RLT-2; Rupture Loop Hold-Up Tank **Reclassification:** Rejected (2/24/1999)

Type: Storage Tank **Start Date:** 1/1/1960

Status: Inactive **End Date:**

Description: The tank was an underground storage tank, 12.2 meters (40 feet) in diameter and 3.05 meters (10 feet) tall with a sloping top.

Location: The Rupture Loop Holding Tank was located approximately 61 meters (200 feet) northeast of the 309 Facility and southwest of the 324 building.

Process Description: Liquid waste routed to this tank was sampled. If it was contaminated it was sent to the 340 Complex through a 7.6 centimeter (3 inch) underground pipeline. If the waste was not contaminated, it was diverted to the Columbia River via a 1 meter (3 foot) diameter outfall line.

Related Sites/ Structures: The site was related to the 309 Building, Rupture Loop Annex (Room 20), valve pit and piping. There were two piping runs that were connected to the tank. For contaminated material, a 7.6 centimeter (3 inch) pipe ran to the 340 Complex, and for uncontaminated material, a pipe ran to the Columbia River (See WIDS Site 300-257).

Waste Type: Equipment

Waste Description: The waste was a tank.

Description:

Code: 300-56 **Classification:** Accepted
Names: 300-56; 306-E 90-Day Waste Accumulation Area **Reclassification:** Rejected (1/27/1999)
Type: Storage Pad (<90 day) **Start Date:**
Status: Inactive **End Date:**
Description: The site is a steel storage container designed to contain hazardous materials or waste. The site was previously used as a 90 day waste storage area. The site is currently in use as a hazardous material storage area. Materials currently stored include laboratory chemicals, a 208 liter (55 gallon) drum for waste oil recycling, and 320 kilograms (700 pounds) of peanut butter (sludge simulant).
Location: The site is located approximately 20 meters (65 feet) north of the northeast corner of the 306E Building in the 300 area.
Release Description: The material was/is contained within a storage cabinet. No information has been provided related to any potential spills at the site.
Related Sites/ Structures: The site stores hazardous materials or waste from the 306E building.
Waste Type: Misc. Trash and Debris
Waste Description: The site received waste from the 306E building.

Code: 300-57 **Classification:** Accepted
Names: 300-57; 335 Building 90-Day Waste Accumulation Area **Reclassification:** Closed Out (12/15/1998)
Type: Storage Pad (<90 day) **Start Date:** 1/1/1994
Status: Inactive **End Date:** 1/1/1998
Description: The site is a small cinder block room addition on the west side of the 335 Building. The exterior door is locked and labeled "90 Day Storage Accumulation" and "Danger".
Location: The site is located in the southeast portion of 300 Area, east of the 324 Building.
Related Sites/ Structures: The site was related to the Fast Flux Test Facility (FFTF).
Waste Type: Equipment
Waste Description: The 90 Day Waste Storage Accumulation Area was used to store sodium contaminated piping and components after dismantling, prior to shipment for disposal.
Closure Info: The facility contact stated that the room was emptied on 9-30-98. There are no future plans to store waste in this area.

Code: 300-58 **Classification:** Accepted
Names: 300-58; 305B Steam Condensate Injection Well; Miscellaneous Stream #449 **Reclassification:** Rejected (9/2/1998)
Type: French Drain **Start Date:**
Status: Inactive **End Date:**

Description: The site is a french drain, identified as miscellaneous stream #449. The unit is a concrete pipe that is flush with the ground surface, and filled with cobbles and sand. No pipes to the drain are visible. The "Inventory of Miscellaneous Streams", Revision 3 says the site is inactive, source abandoned. The french drain could also drain stormwater from nearby asphalt roads in very heavy rain. The original purpose of the site was likely to have been used for steam condensate. The soil and rocks are rust stained showing evidence of its use as a steam condensate drain. In addition, a steam line is located over the site. Although stormwater may enter the site, it is not necessarily conveyed to it.

Location: The site is located 3.01 meters (10 feet) from the southwest corner of 305B Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate
Waste Description:

Code: 300-59	Classification: Accepted
Names: 300-59; 305 Building Steam Condensate; Miscellaneous Stream #417	Reclassification: Rejected (12/15/1998)
Type: Injection/Reverse Well	Start Date:
Status: Inactive	End Date: 1/1/1998

Description: The site was an injection well covered by a 1.29 meter (4.23 foot) metal lid. The lid was labeled "Confined Space." The lid was flush with the ground surface and is surrounded by soil and rocks. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: This site is located between the 305 Building and 305-BA.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: This site is associated with the 305 Building.

Waste Type: Steam Condensate
Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-60	Classification: Accepted
Names: 300-60; 303A Building Steam Condensate; F.D. #26; Miscellaneous Stream #339	Reclassification: Rejected (2/12/1999)

Type: Injection/Reverse Well

Start Date:

Status: Inactive

End Date:

Description: The site is described as an injection well that receives steam condensate. This stream site is on the east side of the 303A Building, near the northeast corner. A condensate return pipe extends from the building at this point. The area next to the building was dug up when an electrical system was installed, which would explain why there is no evidence of the site at this point. The "Inventory of Miscellaneous Streams," Revision 3, describes the site as active. However, the overhead steam line terminates and is capped at the north edge of the 3717B Building. 303A is posted "Radiation Area and Radioactive Material Area" and "Caution, Fissile Materials." The roof of 303A is posted "Contamination Area." 304 is posted "Fixed Contamination Area."

Location: The site is located east of the 303A Building and near the northwest corner.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the main 300 Area steam line.

Waste Type: Steam Condensate

Waste Description: When the site was active, the flow was less than 0.038 liters per minute (0.01 gallons per minute).

Code: 300-61

Classification: Accepted

Names: 300-61; 303B Building Steam Condensate; Injection Well #12; Miscellaneous Stream #444

Reclassification: Rejected (1/19/1999)

Type: Injection/Reverse Well

Start Date:

Status: Inactive

End Date:

Description: The site has been described as an injection well. No engineered structure is evident at the location described for this site. Two steam lines labeled HPD-TRP-011 and HPD-TRP-12 were found; both are described in the "Inventory of Miscellaneous Streams," Revision 3. These two lines descend from the overhead line and disappear into the ground. A third line from the overhead steam line is found just east of HPD-TRP-011 and -012. This third line is unlabeled and terminates open-ended approximately 10 centimeters (3.9 inches) above the base of the wooden pole that supports it. The ground surface in this area is covered by gravel. According to the "Inventory of Miscellaneous Stream," Revision 3, this site is inactive, source abandoned.

Location: The site is north/northeast of the northeast corner of 303B and northwest of the northwest corner of 3732.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is related to the 300 Area main steam line. The "Inventory of Miscellaneous Streams,"

Structures: Revision 3, relates this discharge to the 303B Building, but that relation appear to be based only on proximity since 303B never received steam.

Waste Type: Steam Condensate

Waste Description: When the site was active, the flow rate was less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-62

Classification: Accepted

Names: 300-62; 303C Building - Steam Condensate; Miscellaneous Stream #495

Reclassification: Rejected (9/2/1998)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site is two, 2.5 centimeter (1 inch) metal pipes from steam drain lines entering the ground at the base of the steam support structure. No engineered drain structure is visible. The miscellaneous streams report (Revision 3) says the stream has been eliminated because the source has been shut off. The site received steam condensate from the main header, HRD-TRP-007, -008.

Location: The drain is located in the northeast corner of the fenced area around 303C Building, at the southwest corner of Ginko and Wisconsin streets. The site is 8.3 meters (27 feet) from the north side of the 303C Building, at the base of steam line support poles.

Process Description: The site received steam condensate from steam lines passing by the 303C Building. Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control erosion.

Waste Type: Steam Condensate

Waste Description:

Code: 300-63

Classification: Not Accepted

Names: 300-63; 305B Building Stormwater Runoff; Miscellaneous Stream #458

Reclassification: None

Type: Injection/Reverse Well

Start Date:

Status: Inactive

End Date:

Description: The site is a 0.6 meter (2 foot) diameter concrete french drain, 0.5 meters (1.5 feet) deep, with a perforated steel plate cover, flush with the alley road. About 0.3 meters (1 foot) from the top is a 6 centimeter (3 inch) diameter drain pipe that goes toward the west. Construction drawings H-3-52655 and H-3-304714 sheet 2 show that the open bottom catch basin/french drain location is connected directly to the (300-15) process sewer pipeline.

Location: The french drain was on the south side of the 305B Building, at the edge of a gravel slope and the paved alley. The site is 6.2 meters (20.5 feet) south-southeast of the corner of 305B and the downspout for the roof stormwater runoff.

Process Description: The site appears to be just stormwater runoff.

Waste Type: Stormwater Runoff

**Waste
Description:**

Code: 300-64 **Classification:** Accepted

Names: 300-64; 303F Building Steam Condensate;
Miscellaneous Stream #352 **Reclassification:** Rejected (1/19/1999)

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:**

Description: The site is an HVAC steam condensate return to the WATS Pipe Trench (WIDS Site 300-224). The discharge goes into a rectangular concrete base covered by a 0.90 meter (2.95 foot) by 2.45 meter (8.04 foot) metal lid. Some of the concrete base appears to be rusty. The site is also surrounded by concrete. The lid is posted "Confined Space." There are three openings cut in the metal lid to allow pipes to pass through. An approximately 2.5 centimeter (1 inch) diameter metal pipe enters the middle opening. This pipe is labeled "P198" and appears to be electrical in nature. A second approximately 2.5 centimeter (1 inch) diameter metal pipe enters the south opening. There is a label on the wall next to this pipe that reads "NP-303F-01." This second pipe extends approximately 2 meters (6.6 feet) above the lid, makes a 90 degree turn away from 303F and terminates open-ended over one of the steam lines that enters the west wall of 303F. An approximately 10 centimeter (4 inch) diameter steam pipe and an approximately 2.5 centimeter (1 inch) diameter metal pipe enter the north opening. These two pipes extend down from the building's roof. According to John Remaize, the lines from the roof of 303F are HVAC and cooling lines. The lid does not fit tightly; there are openings between the lid and the concrete base. These openings could allow stormwater runoff from the 303F Building to enter. These opening also allow a limited view of the interior of the structure. Although it is difficult to see inside, the floor of the interior appeared to be dry during the October 29, 1998, walkdown. However, there also appeared to be more pipes inside than could be accounted for by those entering through the lid. Drawing H-3-304714, Sheet 2, shows the WATS and U-Bearing Pipe Trench (WIDS Site 300-224) enters/leaves WIDS Site 300-64 and connects to the 313 Building. The site is on the east end of a row of removable panels labeled "Radioactive Material, Internally Contaminated." 303F is posted "Fixed Contamination Area" and the 303F roof is posted "Contamination Area." According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: The site is located on the west side of the 303F Building, just south of the door.

**Process
Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

**Related Sites/
Structures:** The site is associated with the 303F Building.

Waste Type: Steam Condensate

**Waste
Description:** The site has been listed as inactive in all earlier versions of the Miscellaneous Streams. Comments in earlier versions indicate the site has not been active for some time. No flow rate or date for eliminating the source has been provided in any version of the Miscellaneous Streams document.

Code: 300-65 **Classification:** Accepted

Names: 300-65; 303J Building - Steam Condensate Mud Leg (Part of 300 Main Supply); Miscellaneous Stream #266 **Reclassification:** Rejected (9/2/1998)

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is a 0.35 meter (14 inch) diameter steel pipe in the ground, about 0.8 meters (2.5 feet) deep. The drain is covered with a steel plate with notches and holes for vents and two steam condensate pipes to enter. According to the miscellaneous streams report (Revision 3), the stream has been eliminated because the steam source has been shut off. Signs on the 303J Building say that it is a closed facility, and no material is stored inside.

Location: The french drain is located in the center of the south side of the 303J Building, about 5 centimeters (2 inches) from the wall.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate
Waste Description:

Code: 300-66 **Classification:** Accepted

Names: 300-66; 303J Building HVAC Condensate; Miscellaneous Stream #267 **Reclassification:** Rejected (9/2/1998)

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:**

Description: The site was an open concrete french drain. Two pipes exited from about the ceiling level of the 303J Building and discharge to the drain. The concrete drain was filled with sand and small rocks and it does not appear to have been used recently. The "Inventory of Miscellaneous Streams", Revision 3 lists the site as a steam condensate site. The responsible contractor believes the site to be an HVAC condensate drain (as it was listed in the previous "Inventory of Miscellaneous Streams", Revision 2).

Location: The site is immediately adjacent to the 303J Building, in the center of the north side.

Process Description: The Heating, Ventilation, and Air Conditioning (HVAC) system generates condensate on the coils from the air. The condensate is collected by the HVAC unit and it is drained to the french drain.

Related Sites/ Structures: The 303J Building has been closed and is vacant.

Waste Type: Water
Waste Description:

Code: 300-67 **Classification:** Accepted

Names: 300-67; Miscellaneous Stream #414; Steam Condensate from 300 Area Main Steam Header **Reclassification:** Rejected (12/15/1998)

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:** 1/1/1998

Description: The site was an injection well that received steam condensate. Two metal lids and the metal lid frame were visible. The lid frame measured 1.90 meters (6.23 feet) by 0.82 meters (2.69 feet) and is flush with the ground surface. The site is just east of an access manhole for the process sewers, which is labeled "Radioactive Material, Internally Contaminated." The "Inventory of Miscellaneous Streams," Revision 2, states when this injection well was in service, it overflowed to the process sewer. The 303B Building is posted "Fissile Materials," "Radiation Area and Radioactive Material Area," and "Fixed Contamination Area." The roof of the 303B Building is posted "Contamination Area." The 304 Building is posted "Fixed Contamination Area." This site is slightly down slope of the road to the north. There are small openings in the lid where stormwater runoff from the road may be able to enter the injection well. It does not appear as though runoff from the two buildings would be inclined to flow towards the site; the area between the buildings and the site is fairly level. The site is surrounded by gravel. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: The site is located northwest of 303B and northeast of the 304 Building, just south of the overhead steam line.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/Structures: The site is associated with the 300 Area main steam header.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-68 **Classification:** Accepted

Names: 300-68; 305 Building - Steam Condensate; Miscellaneous Stream #451; Pit U23 **Reclassification:** Rejected (12/15/1998)

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:** 1/1/1998

Description: The site is an injection well. The base of the injection well is constructed of corrugated metal and is covered by a 1.91 meter (6.27 foot) metal lid. The lid is approximately 30 centimeters (11.8 inches) above grade and is labeled "U-23" and "Confined Space." Two pipes enter the lid from the overhead steam lines. One of these pipes is approximately 20 centimeters (7.9 inches) in diameter and the other is approximately 6 centimeters (2.4 inches) in diameter. The site is surrounded by soil and gravel. The "Inventory of Miscellaneous Streams," Revision 3, says the site is inactive, source abandoned.

Location: The site is on the south side of the 305 building. It is just south and east of the entry door;

between the entry door and the metal stairwell.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 305 building.

Waste Type: Steam Condensate
Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-69	Classification: Accepted
Names: 300-69; 305 Building Steam Condensate; Miscellaneous Stream #415	Reclassification: Rejected (12/15/1998)
Type: Injection/Reverse Well	Start Date:
Status: Inactive	End Date: 1/1/1998

Description: The site was an injection well covered by a 0.74 meter (2.43 foot) metal lid. The lid is flush with the ground surface and is surrounded by metal grating resting on top of the soil and gravel. A small diameter, less than 2.5 centimeters (1 inch), metal pipe elbow extends approximately 20 centimeters (8 inches) from the building approximately 5 centimeters (2 inches) above the ground surface. The other end of the pipe disappears into the ground. This pipe is in line with the injection well's lid. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: The site is located just north of the northeast corner of the easternmost extent of the 305 Building. It is also just south of the fence surrounding the electrical substation.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: This site is associated with the 305 Building.

Waste Type: Steam Condensate
Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-70	Classification: Accepted
Names: 300-70; 305 Building Steam Condensate; Miscellaneous Stream #416	Reclassification: Rejected (12/15/1998)
Type: Injection/Reverse Well	Start Date:

Waste Type: Water
Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of HVAC condensate only.

Code: 300-72 **Classification:** Not Accepted
Names: 300-72; 308 Building Stormwater Runoff; Miscellaneous Stream #404 **Reclassification:** None
Type: Injection/Reverse Well **Start Date:**
Status: Active **End Date:**

Description: The site is an injection well that receives stormwater runoff from the surrounding area. The site is covered by a 0.66 meter (2.17 foot) metal lid with perforations. The lid is flush with the surrounding concrete. During the November 8, 1998, walkdown, water could be seen through the perforations in the lid. It had rained three days prior to the walkdown. Sand has washed down the truck ramp and has partially covered the lid. The "Inventory of Miscellaneous Streams," Revision 3, states "Disposal site within 300 feet of an active/inactive crib, ditch or trench." The site is within 91 meters (300 feet) of 316-3 Trench.

Location: The site is located in the southernmost of two truck ramps at the northeast corner of the 308 Building. It is located in the ramp with a roll-up door labeled "48."

Related Sites/Structures: The site is associated with the 308 Building.

Waste Type: Stormwater Runoff
Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow rate is less than 0.01 gallons per minute.

Code: 300-73 **Classification:** Not Accepted
Names: 300-73; 308 Building Stormwater Runoff; Miscellaneous Stream #405 **Reclassification:** None
Type: Injection/Reverse Well **Start Date:**
Status: Active **End Date:**

Description: The site is an injection well that received stormwater runoff from the surrounding area. The site is covered by a 0.18 meter (0.59 foot) metal grate. At the time of the November 8, 1998, walkdown, the site was surrounded by approximately 7 centimeters (2.8 inches) of sand and debris. The drain itself was also filled with sand and debris. It had rained three days prior to the walkdown. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. The document also states "Disposal site within 300 feet of an active/inactive crib, ditch or trench." The site is within 91 meters (300 feet) of 316-3 Trench.

Location: The site is located in the northernmost of two truck ramps at the northeast corner of the 308 Building. The site is in the truck ramp with the roll-up door labeled "46." It is set into a notch in the ramp's concrete.

Related Sites/Structures: The site is associated with the 308 Building.

Waste Type: Stormwater Runoff
Waste Description: When the site was active, the flow rate was less than 0.038 liters per minute (0.01 gallons per minute) of stormwater only.

Code: 300-74 **Classification:** Not Accepted
Names: 300-74; 308 Building Stormwater Runoff; Miscellaneous Stream #406 **Reclassification:** None
Type: Injection/Reverse Well **Start Date:**
Status: Inactive **End Date:**

Description: The site is an injection well that received stormwater runoff. The site has a concrete base and is covered by a 0.64 meter (2.10 foot) by 0.64 meter (2.10 foot) metal grate. A sign on the grate reads "Drains to R.P.S." Sand and gravel cover part of the concrete surrounding the grate. The top of the concrete is flush with the ground surface on its south and west sides. The north side is approximately 1 to 5 centimeters (0.4 to 2 inches) above the ground surface. The east side of the concrete rises above the asphalt surface of the truck ramp. At the time of the November 8, 1998, walkdown, the site was filled with water and water had pooled in the adjacent truck ramp. It had rained three day's prior to the walkdown. According to the "Inventory of Miscellaneous Streams," Revision 3, the site has been grouted. It is inactive and listed as, "Disposal Site Permanently Abandoned." The document also states "Disposal site within 300 feet of an active/inactive crib, ditch or trench." The site is within 91 meters (300 feet) of 316-3 Trench.

Location: The site is next to a truck ramp on the north side of the 308 Building, near the northwest corner of the building. It is located at the bottom of a short staircase from the truck ramp to the loading dock.

Related Sites/ Structures: The site is associated with the 308 Building. The 308 Building is inactive.

Waste Type: Stormwater Runoff
Waste Description: When the site was active, the flow rate was less than 0.038 liters per minute (0.01 gallons per minute) of stormwater only.

Code: 300-75 **Classification:** Accepted
Names: 300-75; 309 Building Stormwater Runoff and Chiller Water; Injection Well #20; Miscellaneous Stream #445 **Reclassification:** Rejected (1/19/1999)
Type: Injection/Reverse Well **Start Date:**
Status: Inactive **End Date:**

Description: The site is an injection well that received stormwater runoff and water from a chiller. The well is a concrete pipe covered by a 1.11 meter (3.64 foot) diameter metal lid. The top of the pipe is approximately 2.5 centimeters (1 inch) above grade. The lid is labeled "Confined Space." The site is surrounded by yellow safety posts and asphalt. John Remaize stated that the chiller has been removed. According to the "Inventory of Miscellaneous Streams," Revision 3, the drain has been permanently plugged and the stream has been routed to a process sewer. The document lists the site as inactive, "Source Permanently Abandoned."

Location: The site is located west of Door #11, which is the southernmost door on the west side of the south wing of the 309 Building.

Process Description: The chiller generated condensate on the coils from the air. The condensate was collected by the chiller unit and was drained to the injection well.

Related Sites/ Structures: The site is associated with the 309 Building.

Waste Type: Water
Waste Description: The waste was stormwater runoff and chiller water. When the site was active, the flow rate was less than 0.038 liters (0.01 gallons per minute).

Code: 300-76 **Classification:** Accepted
Names: 300-76; 306W Building Steam Condensate; Miscellaneous Stream #418 **Reclassification:** Rejected (9/2/1998)
Type: French Drain **Start Date:**
Status: Inactive **End Date:**

Description: The site is a french drain that is a concrete pipe almost flush with the ground surface. A 2.54 centimeter (1 inch) metal pipe drops from an overhead steam line and drains to the unit. Adjacent steam drain lines may also enter the unit, but any connecting pipes are below the rocks that come to within about 15.2 centimeters (6 inches) of the top of the drain. The drain is covered with a round steel plate with four vent holes and a notch for the metal pipe. The rocks appear to be discolored from rust. The "Inventory of Miscellaneous Streams", Revision 3, says the site is inactive, source abandoned. The site does not appear to be active, but discharge pipe(s) is (are) still present (assuming adjacent pipes also discharge to the unit)

Location: The site is on the west side of the 306W Building, about 5.5 meters (18 feet) west of the west wall and about 21.3 meters (70 feet) north of the southwest corner.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate
Waste Description:

Code: 300-77 **Classification:** Not Accepted
Names: 300-77; 309 Building Stormwater Runoff; Miscellaneous Stream #450 **Reclassification:** None
Type: Process Sewer **Start Date:**
Status: Inactive **End Date:**

Description: The site is a 10.16 cm (4 in) storm drain that empties into the process sewer 300-15 (H-3-13532).

Location: The site is located at the bottom of the stairwell on the north side of the west wing of the 309 Building. The stairwell is below door #8.

Related Sites/Structures: The site is associated with the 309 Building.

Waste Type: Stormwater Runoff
Waste Description: When the site was active, the flow rate was less than 0.038 liters per minute (0.01 gallons per minute) of stormwater only.

Code: 300-78 **Classification:** Accepted

Names: 300-78; Miscellaneous Stream #331; 300 Area Main Header Steam Trap (Southwest Corner of 313 Building) **Reclassification:** Rejected (2/12/1999)

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:**

Description: The effluent source to this structure was removed when the 313 building was demolished in 2004. The waste site is a rectangular shaped below grade concrete box that is covered with two steel plates. Seven pipes of various sizes entered the site from the 313 building. Standing water was observed in the bottom of the site. A concrete lined 6.7 meters long by 0.356 meters wide by 0.330 deep (22 feet long by 14 inches wide by 13 inches deep) trench extended from the site to the south. An opening at the south end of the trench was observed and may lead to the process sewer. This trench may be an overflow in the event the concrete box fills with water. Steel grating covers the top of the trench. A concrete pad surrounding the site is painted gray and posted as fixed radiological contamination.

Location: The waste site was located adjacent to the west side of the 313 building near the southwest corner.

Process Description: According to John Remaize (Point of Contact), the site drained HVAC condensate into the process sewer. It is not a french drain as previously suspected. The site is covered with rectangular steel hatch covers and is posted as a confined space.

Steam was produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste Description: When the site was active, the flow rate was less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only ("Inventory of Miscellaneous Streams"). This information differs from that provided by John Remaize (Point of Contact). According to Mr. Remaize the site received HVAC condensate.

Code: 300-79 **Classification:** Not Accepted

Names: 300-79; 313 Building Stormwater Runoff; Miscellaneous Stream #457 **Reclassification:** None

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:**

Description: The 313 building was demolished in 2004. The site is a 1.14 meter (44 inch) diameter drywell that received stormwater from six catch basins located to the south and the surrounding 313 Building Parking Lot area. The surrounding area is paved with asphalt and there is no known contamination within the drainage area. The drywell is 1.4 meters (55 inches) deep and is constructed of corrugated steel pipe. Water was observed at the bottom of the site.

Location: The site is located north of the 313 building.

Waste Type: Stormwater Runoff

Waste Description: The "Inventory of Miscellaneous Streams", Revision 3, states that the flow rate is less than 1.9

Description: liters per minute (0.5 gallons per minute) of stormwater runoff only.

Code: 300-81 **Classification:** Accepted
Names: 300-81; 321 Building Steam Condensate; **Reclassification:** Consolidated (2/12/1999)
Miscellaneous Stream #370
Type: Injection/Reverse Well **Start Date:**
Status: Inactive **End Date:**

Description: The drain is a 1.03 meter (3.3 foot) diameter concrete structure with a metal cover. The building source pipe is connected to the drain through the cover.

Location: The site is located on the northwest side of the 321 Building adjacent to Door #07.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is related to 321 Building. The 321 Building, also known as the Separation Building and Engineering Development Laboratory, provided facilities for hydraulic and mechanical research and development of reactor components. In the past, the building was used as a chemical pilot plant and also did research and development work for the REDOX Plant. A series of cells and tanks ran the entire length of the 321 Building in the south half and at a depth of 3.6 meters (12 feet) below grade. About 37 meters (120 feet) to the south of the building lay 4 underground tanks, each 14.8 meters (48.5 feet) long by 3.1 meters (10 feet) in diameter that were used to hold radioactive wastes. These tanks were located under the 323 Building. The facility is known to have had a number of releases associated with it. WIDS Site UPR-300-4 is an unplanned release associated with the 321 Building that is known to have contaminated the soil around the facility.

Waste Type: Steam Condensate

Waste Description: When the site was active, the flow rate was less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

The Site Was Consolidated With:

Waste Type: Water

Waste

Description:

Code: 300-86

Classification: Accepted

Names: 300-86; Miscellaneous Stream #524; 300 Area
South Parking Lot Stormwater Runoff

Reclassification: Rejected (12/15/1998)

Type: Depression/Pit (nonspecific)

Start Date:

Status: Active

End Date:

Description: The site is a basin approximately 2 meters (6.6 feet) deep that collects stormwater from the main 300 area south parking lot. A lawn has been planted within the basin, and two inlet pipes are visible at the northeast corner and the southeast corner of the site.

Location: The site is located in the southwestern portion of the 300 Area, northeast of the Cypress Street Gate and north of the 320 building.

Process Description: The site collects stormwater from the adjacent parking lot and discharges it to ground. The grass serves to filter and biodegrade potential pollutants prior to infiltration to the soil.

Related Sites/Structures: The site is associated with the 300 Area south parking lot. Drainage from sitecodes 300-103 and 300-104 was diverted to this parking lot drainage system in 2009 (per H-3-315180, sheet 1).

Waste Type: Stormwater Runoff

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow is less than 18.75 liters per minute (5 gallons per minute).

Code: 300-87

Start Date:

Status: Inactive

End Date:

Description: The site consists of the 324 building storm water drainage system as depicted on construction drawings H-3-56533 and H-3-302821. The site includes 3 catch basins and 1 drywell with all connecting piping features and cleanouts. The site includes the below grade pipe segments for collection of the northwest portion of the 324 building down spouts and one irrigation valve box and associated connecting piping to the catch basin. The site does not include the northeast side storm water collection system as depicted on H-3-307101 and described by WIDS site 300-94.

The site is a 0.65 meter by 0.47 meter (2.1 foot by 1.5 foot) grate in the asphalt parking area on the south side of the 324 Building. It is 3 meters (10 feet) south of the lawn.

Location: The drain is located 9 meters (30 feet) south of the 324 Building.

Related Sites/ Structures: The site was associated with the 324 Building.

Waste Type: Stormwater Runoff

Waste Description: When the site was active, the flow rate was less than 0.19 liters per minute (0.05 gallons per minute) of stormwater runoff only.

Code: 300-94

Classification: Not Accepted

Names: 300-94; 324 Building Stormwater Runoff; Miscellaneous Stream #711; 300-234

Reclassification: None

Type: French Drain

Start Date:

Status: Active

End Date:

Description: The site is a network of a drywell and a catch basin network installed to eliminate flooding on the east side of the 324 building. The drain and the catch basin are subsurface structures and are not visible. A 0.63 by 0.53 meter grate is visible in the gravel near the northeast corner of

the 324 Building. The building escort for the 10-26-98 site visit pointed out that there is an identical grate at the southeast corner of the building, with a concrete trough leading to it to help direct water flow. The second grate is approximately 9 meters (30 feet) south of the one on the northeast corner. The two grates are in line with each other, parallel to the east side of the building. A PVC inlet and outlet pipe is visible through the grates. The two grates appear to be connected and are assumed to be stormwater collection points for the drainage system.

Location: The drain is located approximately 21.3 meters (70 feet) north of the northeast corner of the 324 building. A surface grate is located 1.2 meters (4 feet) east of the 324 Building, adjacent to the exhaust ventilation fans.

Waste Type: Stormwater Runoff

Waste Description: The "Inventory of Miscellaneous Streams", Revision 3, states that the flow rate is less than 0.79 liters per minute (0.20 gallons per minute) of stormwater only.

Code: 300-95

Classification: Accepted

Names: 300-95; 324/336 Buildings Stormwater Runoff and Steam Condensate; Miscellaneous Stream #425

Reclassification: Rejected (1/19/1999)

Type: French Drain

Start Date:

Status: Active

End Date:

Description: The site is a french drain that receives stormwater runoff and steam condensate. All that can be seen of the site is an inset, 1.37 meter (4.49 foot) diameter, thin metal cover or lid. This cover is inset in a round concrete pad and appears to be bolted onto an underlying grate. The site is labeled "Confined Space." The site and concrete pad are higher in elevation than the surrounding gravel. No incoming or nearby pipes were visible during the November 20, 1998, walkdown.

Location: The site is due north of the west wing of the 337 Building, 24 meters (78.7 feet) southwest of the southwest corner of the 338 Building, 35 meters (114.8 feet) southeast of the southeast corner of the 336 Building and 130 meters (426.5 feet) east/southeast of the 324 Building.

Release Description: There were no known hazardous or radioactive releases from the steam condensate discharge.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 324 and 336 Buildings.

Waste Type: Steam Condensate

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow for stormwater runoff and steam condensate is less than 0.05 gallons per minute.

Waste Type: Stormwater Runoff

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow for stormwater runoff and steam condensate is less than 0.05 gallons per minute.

Code: 300-96 **Classification:** Accepted
Names: 300-96; 325 Building Steam Condensate; Miscellaneous Stream #707 **Reclassification:** Rejected (9/2/1998)
Type: Injection/Reverse Well **Start Date:**
Status: Inactive **End Date:**
Description: The site is a 132.1 centimeter (52 inch) diameter french drain constructed of concrete and covered with a steel lid. A 3.8 centimeter (1.5 inch) diameter pipe extends from the west wall of the 325 building to the french drain.
Location: The site is located on the west side of the 325 building.
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate
Waste Description:

Code: 300-97 **Classification:** Not Accepted
Names: 300-97; 325 Building Stormwater Runoff and Fire System Testing Water; Miscellaneous Stream #706 **Reclassification:** None
Type: French Drain **Start Date:**
Status: Active **End Date:**
Description: The site is a drain that is covered by a rusted perforated steel plate, 0.46 meters (1.5 feet) square. The site drains a small asphalt pad and a pipe coming out of bottom of the fire system shed. The drain cover plate appears to be sealed to the asphalt. Therefore, it was not possible to determine the depth of the site.
Location: The site is located on the southeast side of the 325 Building, 3.96 meters (13 feet) from the building, and adjacent to the fire system shed that is attached to the 325 Building.
Related Sites/Structures: Approximately, 12.2 meters (40 feet) south of the drain, a pipe exits out of a concrete wall onto the roadway. Another stormwater drain is at the bottom of the roadway. It was not possible to determine if 300-97 is attached to the pipe.

Waste Type: Stormwater Runoff
Waste Description:

Code: 300-98 **Classification:** Not Accepted
Names: 300-98; 325 Building South Stairwell Drain; Miscellaneous Stream #264; 300-229 **Reclassification:** None
Type: French Drain **Start Date:**
Status: Active **End Date:**

Description: stormwater from a leaky roof.

Location: The site is located inside the 325 Building south stairwell.

Waste Type: Stormwater Runoff

Waste Description: The site receives less than 0.038 liters (0.01 gallons) per minute of stormwater runoff.

Code: 300-99 **Classification:** Accepted

Names: 300-99; 325 Building Nitrogen Tank Blowdown Miscellaneous Stream #265; Injection Well #399-3 **Reclassification:** Rejected (9/2/1998)

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:**

Description: The site is not visible without entering the confined space under the compressed gas storage loading dock. The loading dock has skirting around it, and therefore, the site is not visible. A limited field walkdown was performed for this site. No access could be gained to the site.

Location: The site is located on the northeast corner of the 325 Building, under an elevated gas storage dock.

Waste Type: Water

Waste Description: The site received condensate blowdown from a liquid nitrogen tank. The tank has been removed.

Code: 300-100 **Classification:** Not Accepted

Names: 300-100; 325 Building Stormwater Runoff; Miscellaneous Stream #408 **Reclassification:** None

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site drains stormwater from the chiller pad to the ground. The drain is covered with a 68.6 centimeter by 61 centimeter (27 inch by 24 inch) steel grate. The site is 22.9 centimeters - 25.4 centimeters (9 inches - 10 inches) deep and contains water just below the grating.

Location: The site is located on the east side of the 325 building on the chiller pad.

Waste Type: Stormwater Runoff

Waste Description:

Code: 300-101 **Classification:** Accepted

Names: 300-101; 326 Building Stormwater Runoff and Steam Condensate; Miscellaneous Stream #409 **Reclassification:** Rejected (9/2/1998)

Type: Depression/Pit (nonspecific) **Start Date:**

Status: Active **End Date:**

Description: The site is a roadway drain, with a 0.4 meter by 0.5 meter (1.3 foot by 1.7 foot) rectangular perforated steel cover. The cover is visible, but the structure is full of sand and gravel. The site drains stormwater from a loading dock and a large area of asphalt parking space. A steel pipe 3.7 meters (12 feet) away, on the side of the building, appears to be the steam condensate drain.

Next to this pipe is a lock box that is marked with a "Radioactively controlled area" sign. The steam condensate component for this site has been routed to the sanitary sewer. According to the "Inventory of Miscellaneous Streams", Revision 3, the site is active for stormwater only. The disposal structure is a non-engineered structure.

Location: The site is on the east side of the 326 Building, below the loading dock, 1.3 meters (4.5 feet) from the dock. It is 3.7 meters (12 feet) northeast of the probable steam condensate drain line.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Stormwater Runoff

Waste Description: Waste is also reported to be steam condensate. Lock box next to possible steam condensate line is marked with a warning sign: "Radioactively controlled area." The materials loaded at the loading dock are unknown, but no spills or unplanned releases are known.

Code: 300-102 **Classification:** Accepted

Names: 300-102; 328 Building Steam Condensate; Miscellaneous Stream #353 **Reclassification:** Rejected (12/15/1998)

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:** 1/1/1998

Description: The site is an injection well that received steam condensate. The injection well is a 96 centimeter (38 inch) diameter structure with a heavy metal cover that has four holes in it. It is flush with the gravel surface surrounding it. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: The site is located on the north side of the 328 Building, just east of a roll up door entrance. The site is between a shed and the roll up door.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/Structures: The site is associated with the 328 Building.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-103 **Classification:** Not Accepted

Names: 300-103; 329 Building Stormwater Runoff; Miscellaneous Stream #422 **Reclassification:** None

Type: Sump **Start Date:**

Status: Inactive

End Date:

Description: The site is a storm drain covered with a 63.5 centimeter by 45.7 centimeter (25 inch by 18 inch) steel grating that drains stormwater from the surrounding area. There are no contamination postings near the site.

Location: The site is located near the southeast corner of the 329 building just off the loading dock.

Process Description: Additional research found that this location is actually a Catch Basin that was connected to the 300 Area Sanitary Sewer (300 SSS). Construction drawing H-3-304716 note 3C references the catch basin design type. The specifications for the WSDOT M21-01 Standard Plan B-1B Type 1P Parking Lot Catch Basin require that the catch basin be water tight. The stream was later re-routed to the Retention Process Sewer. Per drawing H-3-315180, sheet 1, the storm water was re-routed again in 2009 to the 300 Area South Parking Lot Stormwater Runoff (see sitecode 300-86).

Related Sites/ Structures: The stormwater run off is now associated with 300-86 drainage system.

Waste Type: Stormwater Runoff

Waste Description:

Code: 300-104

Classification: Not Accepted

Names: 300-104; 329 Building Stormwater Runoff; Miscellaneous Stream #546

Reclassification: None

Type: Sump

Start Date:

Status: Inactive

End Date:

Description: The site is a storm drain (catch basin) covered with a 63.5 centimeter by 45.7 centimeter (25 inch by 18 inch) steel grating that drains stormwater from the surrounding area. There are no contamination postings near the site.

Location: The site is located on the east side of the 329 building just off the loading dock.

Process Description: Additional research found that this location is actually a Catch Basin that was connected to the 300 Area Sanitary Sewer (300 SSS). Construction drawing H-3-304716 note 3C references the catch basin design type. Related Sites/ Structures: The stormwater run off is now associated with 300-86 drainage system.

Waste Type: Stormwater Runoff

Waste Description:

Code: 300-105

Classification: Accepted

Names: 300-105; 331 Building Steam Condensate; Miscellaneous Stream #513; Pit U1

Reclassification: Rejected (9/2/1998)

Status: Active

End Date:

Description: The site is a french drain constructed of concrete and covered with a steel lid. The drain has two 10.2 centimeter (4 inch) diameter pipes entering the drain at the bottom. Presumably, the site drains stormwater from drains located near two nearby entrances to the 331 building.

Location: The site is located on the west side of the 331 building near the kennels.

Waste Type: Stormwater Runoff

Waste

Description:

Code: 300-108

Classification: Not Accepted

Names: 300-108; 331 Building Stormwater Runoff;
Injection Well #37; Miscellaneous Stream #448

Reclassification: None

Type: French Drain

Start Date:

Status: Active

End Date:

Description: The site is a stormwater french drain that drains the surrounding paved area and roof drains from the 331 building at a low point. There is no known contamination within the drainage area.

Location: The site is located on the west side of the 331 building, and 12.5 meters (41 feet) south of the northwest corner of the building.

Waste Type: Stormwater Runoff

Waste

Description:

Code: 300-111

Classification: Not Accepted

Names: 300-111; 337 Building Stormwater Runoff;
Miscellaneous Stream #516

Reclassification: None

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site is a french drain; a round concrete pipe 0.7 meters (2.25 feet) in diameter, at least 1.2 meters (4 feet) deep. Water covers the bottom, so the total depth was not determined. The site drains stormwater from the asphalt alley way used to access the trash and recycled cardboard pickup containers, and provide pedestrian access to the 337 Building. The miscellaneous streams report says this site is a "non-engineered structure" and "deleted" but it does not appear to be either case.

Location: The site is on the east side of the 337 Building, north of the cafeteria, in an open alley way. The drain is 7 meters (23 feet) from the east door into the 337 Building.

Process The site received only stormwater runoff.

Description:

Waste Type: Stormwater Runoff

Waste

Description: Site receives only stormwater runoff.

Code: 300-112

Classification: Accepted

Names: 300-112; 340 P-3 Pump Pit; Miscellaneous

Reclassification: Rejected (1/15/1999)

Stream #428; Retention Process Sewer Pump Pit
#3 French Drain

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:** 1/1/1996

Description: The Pump Pit is an engineered structure with an entry hatch labeled "Non-Permit Confined Space". The drain is at the bottom of the pit. It has a perforated, circular cover that measures approximately 0.61 meters (2 feet) in diameter. The pumps and piping have been removed.

Location: The drain is located at the bottom of the Retention Process Sewer Pump Pit (P-3 Pump Pit). The pump pit is located at the southeast corner of the 307 Retention Basins.

Process Description: The drain received leakage and drainage from the pump. The pump was flushed with clean service water during routine freeze protection maintenance.

Waste Type: Water

Waste Description: When the site was active, it received flush water drainage and pump leakage. The source of the water was uncontaminated potable water. The flow rate was less than 0.038 liters (0.01 gallons) per minute.

Code: 300-113 **Classification:** Accepted

Names: 300-113; 340 Building Steam Condensate/ Water Heater Overflow; Miscellaneous Stream #341 **Reclassification:** Rejected (1/15/1999)

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:** 1/1/1996

Description: The drain is a 0.46 meter (18 inch) diameter metal pipe that extends slightly above grade. A 1.3 centimeter (0.5 inch) diameter pipe exits the building wall and terminates over the drain. The pipe is connected to a water heater overflow valve, that is inside the 340 Building. Before the steam utility was removed from the building, the drain received steam condensate.

Location: The drain is located at the southwest corner of the 340 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste Description: The site received steam condensate before the steam was shut off in the building. When the site was active (steam condensate), the flow rate was less than 0.038 liters (0.01 gallons) per minute. Currently, the site is set up to receive overflow from the water heater located inside the 340 Building. The flow rate for this activity is unknown. The effluent from the water heater is nondangerous/nonradioactive potable water.

Code: 300-114 **Classification:** Accepted

Names: 300-114; 340A Building Steam Condensate; Miscellaneous Stream #427 **Reclassification:** Rejected (1/15/1999)

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:** 1/1/1996

Description: Currently, there are no visual surface features. The drain area was backfilled with clean gravel when the steam system was removed from the building. The gravel over the drain is slightly darker than the other gravel in the area.

Location: The site is located east of the 340A building, adjacent to the chain link fence.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 340A Building.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.038 liters (0.01 gallons) per minute of steam condensate.

Code: 300-115 **Classification:** Not Accepted

Names: 300-115; 340B Building Backflow Preventer Emergency Drain; Miscellaneous Stream #426 **Reclassification:** None

Type: Injection/Reverse Well **Start Date:**

Status: Inactive **End Date:** 1/1/1996

Description: Currently, there are no visible surface features. The drain was covered with clean gravel when the source was abandoned in 1996. The gravel over the drain is slightly darker than the other gravel in the area. At least some component of the structure has been removed. The gravel would not cover the height of the exposed part of the structure. It may be that the lip of the structure was knocked into the drain or the entire drain may have been removed.

Location: The drain is located near the southeast corner of the 340B building.

Related Sites/ Structures: The site was related to the 340B Building and the service water backflow preventer.

Waste Type: Water

Waste Description: The drain would have received nondangerous/nonradioactive (potable) water in the event of a failure of the service water backflow preventer. There has been no known failure of the backflow preventer. Thus, this site would not have received any discharge.

Code: 300-116 **Classification:** Accepted

Names: 300-116; 3506A Building Steam Condensate; Miscellaneous Stream #381 **Reclassification:** Rejected (12/15/1998)

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is a french drain that is covered by a 0.48 meter (1.57 foot) by 0.48 meter (1.57 foot) square metal lid. This french drain appears to be constructed of concrete. The top is slightly depressed relative to the surrounding gravel. A pipe from the overhead steam line enters the

ground nearby. The pipe is labeled "HPD-TRP-057." According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: The site is located approximately 3.5 meters (11.5 feet) east of the north entry door of the 3506A Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3506A Building and steam trap, HPD-TRP-057.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-117

Classification: Accepted

Names: 300-117; 3506A Building Steam Condensate; Miscellaneous Stream #382

Reclassification: Rejected (12/15/1998)

Type: French Drain

Start Date:

Status: Inactive

End Date: 1/1/1998

Description: The site is a french drain that is constructed of concrete. The top of the drain is flush with the ground surface and is covered by two metal lids. Both lids are labeled "Confined Space." The west lid has a label saying "U-58." The east lid had "U58" written on it. A metal pipe, 0.1 meters (0.3 feet) in diameter and 0.24 meters (0.79 feet) in length, extends vertically from the west lid. This metal pipe appears to be a vent. It does not appear to extend into the cavity of the french drain. Two pipes from the overhead steam line enter the ground nearby. This site is surrounded by gravel and a metal safety barricade. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: The site is just west of the northeast corner of the 3506A Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3506A Building.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-118

Classification: Accepted

Names: 300-118; 3621D Building Steam Condensate; Miscellaneous Stream #700; Pit U-7 **Reclassification:** Rejected (12/15/1998)

Type: Valve Pit **Start Date:**

Status: Inactive **End Date:** 1/1/1998

Description: The site is a valve pit with a dirt floor. Steam condensate was discharged onto the floor of the pit. The pit has a square concrete base. It is at the bottom of a slope so the top of the concrete base ranges from 21 to 35 centimeters (8.3 to 13.8 inches) above the ground surface. The valve pit is covered by an inset, square metal lid that is 0.81 meters (2.66 feet) by 0.81 meters (2.66 feet). The lid is labeled "Confined Space" and "U-7." Three valves are visible nearby (MSS-V-337, MSS-V-030 and HPD-V-3041A). Two pipes approximately 3.5 centimeters (1.4 inches) in diameter extend from the concrete base, one on the south side and one on the west side. These two pipes then make a 90 degree turn and enter the ground. During the site walkdown, a ladder, pipes and valves were visible inside the drain. Condensation was visible on the bottom of the lid and moisture was visible on the pipes and valves inside the pit and closest to the lid. At least three valves and five pipes were observed inside the structure. Also visible was an underground area that opens up to the east of the inlet. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: The site is southwest of the northwest corner of the 3621D Building. It is outside the fence that surrounds the building. The 3621D building is located southeast of the intersection of Locust Street and George Washington Way.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is related to the 300 Area Condensate Return System.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.38 liters per minute (0.1 gallons per minute) of steam condensate only.

Code: 300-119 **Classification:** Accepted

Names: 300-119; 3621D Air/Condensate Blowdown Drain; 3621D HVAC Condensate; Miscellaneous Stream #401 **Reclassification:** Rejected (12/15/1998)

Type: Injection/Reverse Well **Start Date:**

Status: Active **End Date:**

Description: The drain had been an open corrugated metal pipe filled with rocks. The source pipe exited the building wall and with a 90 degree elbow to connect the pipe to the french drain. The building wall and the french drain rocks were stained with rust. The drain structure was removed when the 3621-D building was demolished.

Location: The drain is located adjacent to the east wall of the 3621-D building inside the fenced area. The 3621D building is located southeast of the intersection of Locust Street and the George Washington Way extension.

Related Sites/ Structures: The site is related to 3621D Building.

Structures:**Waste Type:** Water**Waste Description:** According to the "Inventory of Miscellaneous Streams", Revision 3, the site has potentially received hydrocarbons. The report documented the flow rate as less than 0.038 liters per minute (0.01 gallons per minute).**Code:** 300-120**Classification:** Accepted**Names:** 300-120; 3621D Air Driven Starter Motor Discharge Drain; 3621D Building Diesel Generator Cooling System Condensate; Miscellaneous Stream #402**Reclassification:** Rejected (12/15/1998)**Type:** Injection/Reverse Well**Start Date:****Status:** Active**End Date:****Description:** The site was a 0.9 meter (2.9 feet) diameter concrete structure with a metal grate cover. The unit was filled with rocks. Four pipes, one for each air starter motor, exited the west wall of the 3621D building near the foundation. The pipes teed into a larger aboveground line that runs south, parallel to the building wall. The line elbowed to the west and then down where it is attached to the grate. The grate and the rocks were stained with a black, oily substance. The drain structure was removed when the 3621-D building was demolished.**Location:** The drain is located approximately 1.2 meters (4 feet) from the west wall of the 3621D building. The 3621D building is located southeast of the intersection of Locust Street and the George Washington Way extension.**Waste Type:** Water**Waste Description:** The site receives air and small amounts of condensate from the air starter motors in the 3621D Building. The air and condensate may contain small quantities of oil.**Code:** 300-122**Classification:** Accepted**Names:** 300-122; 366 Building Fuel Oil Bunker Loading Station Steam Condensate; Miscellaneous Stream #344**Reclassification:** Rejected (12/15/1998)**Type:** French Drain**Start Date:****Status:** Inactive**End Date:** 1/1/1998**Description:** The site is a french drain that received steam condensate from the 366 Building fuel oil bunker loading station. Only a small portion of the french drain's pipe is exposed. It could not be ascertained whether the pipe was composed of clay or discolored concrete. The drain is covered with a 0.65 meter (2.13 foot) rusted metal cover and the soil and gravel surrounding the site appears to be discolored by rust. The top of the lid is 5 to 8 centimeters (2 to 3.1 inches) above ground surface. There are also granular ash deposits on the ground in the general area east/northeast of the 384 powerhouse. The ground surface surrounding the site is slightly depressed which could allow the pooling of stormwater. The site is less than a meter (3.3 feet) south of a line of posts labeled "Radiologically Controlled Area" that appears to surround the 3715 and 303E buildings. LPD-TRP-053, -057 and -058 are on a concrete pad at the northwest corner of the 366 Building. There is a black, tar-like residue on this pad. According to the "Inventory of Miscellaneous Streams," Revision 3, there was a potential for fuel oil to contaminate the discharge. The document also states the site is inactive, source abandoned.**Location:** The site is located southwest of the southwest corner of the 3715 Building and north of the northwest corner of the 366 Building.**Description:** Steam was produced from a water system that had been sent through a water softening system to

Process Description: remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: This site is associated with the 366 Building fuel oil bunker loading station.

Waste Type: Steam Condensate

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the site has the potential to be contaminated with fuel oil. When this site was active, the flow rate was less than 0.38 liters per minute (0.1 gallons per minute).

DynCorp has reviewed the site and stated the following. The dark stains in the photo appear to correlate to coal powder left over from the powerhouse. There were small piles of this material throughout the area. There was a potential for runoff of fuel oil because of the proximity of the fuel bunkers. However, no fuel oil stained soil was observed near the drain and there is no evidence of discharges to this site.

Code: 300-124	Classification: Accepted
Names: 300-124; 366 Building Fuel Oil Bunker Steam Condensate; Miscellaneous Stream #653	Reclassification: Rejected (12/15/1998)
Type: French Drain	Start Date:
Status: Inactive	End Date: 1/1/1998

Description: The site is a french drain that received steam condensate from steam lines on top of the 366 Building fuel oil bunker. The french drain's metal cover is the only part of the site that is visible; it is 0.33 meters (1.08 foot) in diameter. The top of the cover is approximately 5 centimeters (2 inches) above the ground surface. There is a slight depression on the southwest side of the site where stormwater could collect. The gravel and soil surrounding the site appears to be discolored by rust. LPD-TRP-054 is on a concrete pad by the southwest corner of 366 Building. There is a black, tar-like residue on this pad. According to the "Inventory of Miscellaneous Streams," Revision 3, there was a potential for fuel oil to contaminate the steam condensate. The document also states the site is inactive, source abandoned.

Location: The site is located off the southwest corner of the 366 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 366 Building fuel oil bunker.

Waste Type: Steam Condensate

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, there is a potential for fuel oil to contaminate the steam condensate. When this site was active, the flow rate was less than 0.038 liters per minute (0.01 gallons per minute).

DynCorp has reviewed the site and stated the following. The dark stains in the photo appear to correlate to coal powder left over from the powerhouse. There were small piles of this material throughout the area. There was a potential for runoff of fuel oil because of the proximity of the fuel bunkers. However, no fuel oil stained soil was observed near the drain and there is no evidence of discharges to this site.

Code: 300-125 **Classification:** Accepted

Names: 300-125; 3702 Building Steam Condensate; Miscellaneous Stream #346 **Reclassification:** Rejected (12/15/1998)

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site was a french drain that collected steam condensate. The previous location for the 3702 Building is currently a cobble-covered field. No evidence of the site remains. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive.

Location: According to the "Inventory of Miscellaneous Steams," Revision 3, the site was located west of the stairs on the north side of the former 3702 building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3702 Building, which has been demolished.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-126 **Classification:** Accepted

Names: 300-126; 3703 Building Steam Condensate; Miscellaneous Stream #431 **Reclassification:** Rejected (12/15/1998)

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site was a french drain that collected steam condensate. The previous location of the 3703 Building is currently a cobble and gravel covered field. No evidence of a french drain was visible during the site walkdown. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source permanently abandoned.

Location: According to the "Inventory of Miscellaneous Streams," Revision 3, the site was located at the south center of the 3703 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3703 Building, which has been demolished.

Waste Type: Steam Condensate
Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-127 **Classification:** Not Accepted

Names: 300-127; 3705 Building Stormwater Runoff; Miscellaneous Stream #410 **Reclassification:** None

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is a french drain located in a soil and gravel covered area. Nearby, a roof drain pipe can be seen extending down the outer wall of the 3705 Building into the ground. According to the "Inventory of Miscellaneous Streams," Revision 3, this french drain does not have surface access. No drain was visible during the site walkdown.

Location: The "Inventory of Miscellaneous Streams," Revision 3, states the site is located at the northeast corner of the 3705 Building.

Related Sites/ Structures: The site is associated with the 3705 Building.

Waste Type: Stormwater Runoff
Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow rate is less than 0.038 liters per minute (0.01 gallons per minute).

Code: 300-128 **Classification:** Not Accepted

Names: 300-128; 3705 Building Stormwater Runoff; Miscellaneous Stream #411 **Reclassification:** None

Type: French Drain **Start Date:**

Status: Inactive **End Date:** 1/1/1997

Description: The site is a french drain that collected stormwater runoff. According to the "Inventory of Miscellaneous Streams," Revision 3, the stream is "Not Active" and the "Disposal Site Permanently Abandoned." A roof drain was visible nearby which appeared to enter the 3705 Building; however, no french drain was visible during the site walkdown that could be associated with this roof drain.

Location: The "Inventory of Miscellaneous Streams," Revision 3, states the site was located at the northwest corner of the 3705 Building.

Related Sites/ Structures: The site is associated with the 3705 Building.

Waste Type: Stormwater Runoff
Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of stormwater runoff.

Code: 300-129 **Classification:** Not Accepted

Names: 300-129; 3705 Building Stormwater Runoff; Miscellaneous Stream #412 **Reclassification:** None

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is a french drain located in a cobble-covered area. A roof drain is visible nearby. According to the "Inventory of Miscellaneous Streams," Revision 3, this french drain does not have surface access. No drain was visible during the site walkdown.

Location: The "Inventory of Miscellaneous Streams," Revision 3, states the site is at the southeast corner of the 3705 Building.

Related Sites/ Structures: The site is associated with the 3705 Building.

Waste Type: Stormwater Runoff

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow is less than 0.038 liters per minute (0.01 gallons per minute).

Code: 300-130 **Classification:** Not Accepted

Names: 300-130; 3705 Building Stormwater Runoff; Miscellaneous Stream #413 **Reclassification:** None

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is a french drain that collects stormwater runoff. A roof drain is visible nearby. According to the "Inventory of Miscellaneous Streams," Revision 3, the french drain does not have surface access. No drain was visible during the site walkdown.

Location: The "Inventory of Miscellaneous Streams," Revision 3, states the site is at the southwest corner of the 3705 Building.

Related Sites/ Structures: The site is associated with the 3705 Building.

Waste Type: Stormwater Runoff

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow is less than 0.038 liters per minute (0.01 gallons per minute).

Code: 300-131 **Classification:** Accepted

Names: 300-131; 3706 Fire Sprinkler System Water; Miscellaneous Stream #515 **Reclassification:** Consolidated (1/19/1999)

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is a french drain that is the discharge point for fire sprinkler system water. The drain is a clay pipe with the outer diameter of 0.42 meters (1.38 feet) and is not covered by a lid. The top of the clay pipe is above grade except where moss is encroaching. The pipe appears to be filled with cobbles and rocks to within 0.3 meters (0.98 feet) of its top. The rocks and cobbles inside the drain appear rusty. Above the site are two capped metal ports labeled "Fire Department Connection." Below these ports, two metal pipes extend from the building and terminate with open ends above the drain. One of these pipes is approximately 5 centimeters (2 inches) in diameter and the other is approximately 2 centimeters (0.8 inches) in diameter.

During the October 26, 1998, walkdown, an opening in the side of the building for a third pipe was observed; this opening has not been plugged. The site is surrounded by sand, gravel and moss. The south side of the drain abuts the 3706 Building, which is posted "Fixed Contamination Area." The drain is within the footprint of the WIDS site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area.

Location: The site is located on the north side of the 3706 Building. It is approximately 5.5 meters (18 feet) east of door #06.

Release Description: There were no known hazardous or radioactive releases from this water discharge.

Related Sites/ Structures: The site is associated with the 3706 Building.

Waste Type: Water

Waste Description: The site receives drainage from the fire sprinkler system at a rate of less than 3.8 liters per minute (1 gallon per minute). Fire sprinkler water is exempt from permitting. However, based on past practice activities at the 3706 Building and potential releases to the soil column, the disposal structure and soil should be surveyed to determine if radioactive contamination is present. The disposal structure is immediately adjacent to the 3706 Building.

The Site Was Consolidated With:

Code: 300-46

Names: 300-46; Soil Contamination Surrounding 3706 Building

Code: 300-132

Classification: Accepted

Names: 300-132; 3706 Building Steam Condensate; Miscellaneous Stream #368

Reclassification: Consolidated (1/19/1999)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site has been described as a french drain that received steam condensate. During the November 18, 1998, walkdown, there did not appear to be an engineered structure at the site's location. The site appears to be a rock and cobble filled depression next to the 3706 Building. The depression is surrounded by soil-covered asphalt. The rocks and cobbles in the depression as well as the side of the 3706 Building appear to be rust stained. On the south side of Door #02, an approximately 10 centimeter (4 inch) diameter metal pipe exits the east side of the 3706 Building, turns and enters the ground. Forty centimeters (1.3 feet) to the east of this pipe is a concrete structure with a 0.66 meter (2.17 feet) by 0.66 meter (2.17 feet) metal cover. In addition to steam condensate, the site also appears to have received fire sprinkler system water. Four metal pipes terminate over the depression. Three of these four pipes exit the east side of the 3706 Building near a Fire Department Connection. An approximately 2 centimeter (0.8 inch) diameter metal pipe extends from the building 0.95 meters (3.1 feet) above the ground surface; an approximately 6 centimeter (2.4 inch) diameter metal pipe extends from the building 0.90 meters (3 feet) above the ground surface and an approximately 4 centimeter (1.6 inch) metal pipe extends from the building 0.8 meters (2.6 feet) above the ground surface. These three pipes terminate open-ended over the depression. The fourth pipe is approximately 8 centimeters (3.1 inches) in diameter and exits the building 3 to 4 meters (9.8 to 13.1 feet) above the ground surface. It could not be ascertained whether this pipe is still open or whether it had been plugged. There is a U-shaped section of 8 centimeter (3.1 inches) pipe attached to the east wall of the 3706 Building just below the Fire Department Connection; this section of pipe has open ends. According to John Remaize, the steam and fire water for the building are still active. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source

abandoned. The 3706 Building is posted "Fixed Contamination Area." The drain is within the footprint of the WIDS site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area.

Location: The site is on the east side of the 3706 Building, just north of door #02.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3706 Building.

Waste Type: Steam Condensate

Waste Description: When the site was active, the flow rate was less than 0.038 liters per minute (0.01 gallons per minute).

Reclassification: Consolidated (1/19/1999)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site is a french drain that used to receive steam condensate. The drain has a square concrete base with a 0.66 meter (2.17 foot) by 0.66 meter (2.17 foot) metal lid. What appear to be rust stains are on the lid and surrounding concrete. The remains of "FD 27" written in paint can be seen on the side of the building next to the site. There is also writing on the metal lid but it is illegible due to age. Two metal pipes, both approximately 3.5 centimeters (1.4 inches) in diameter, extend from the east side of the 3706 Building and enter the lid. A metal pipe elbow extends from the ground between the site and 3706. This pipe is approximately 5 centimeters (2 inches) in diameter and terminates open ended. A third steam pipe extends from the east side of the 3706 Building approximately 2.5 meters (8.2 feet) north of the site. This pipe terminates approximately 0.5 meters (1.6 feet) above the ground surface and appears to have been plugged. The site is surrounded by concrete and sand. The 3706 Building is posted "Fixed Contamination Area." The drain is within the footprint of the WIDS Site 300-46 which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: Located north of the former Health Service Center on the east side of 3706.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to

produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3706 Building.

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is a french drain that received steam condensate. The drain is a clay pipe with an outer diameter of 0.85 meters (2.79 feet). The drain is covered by a metal lid with some perforations. The site is surrounded by sand and gravel, some of which partially covers the lid. The upper lip of the clay pipe is breaking up. The top of the pipe is flush with the ground surface for approximately half of its circumference; the rest is 1 to 2 centimeters (0.4 - 0.8 inches) above the ground surface. Two roof drains are visible nearby; some stormwater runoff may be able to enter the drain. Two metal pipes extend from the 3706 Building approximately 3 meters (9.8 feet) west of the site and enter the ground. One pipe is approximately 5 centimeters (2 inches) in diameter and the other is approximately 12 centimeters (4.7 inches) in diameter. The "Inventory of Miscellaneous Streams," Revision 3, lists the site as inactive, source abandoned. The 3706 Building is posted "Fixed Contamination Area." The drain is within the footprint of the WIDS Site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area.

Location: The site is approximately 10 meters (32.8 feet) east of the westernmost entrance on the north side of the 3706 Building, and just west of Door #07.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site has been described as a french drain that received steam condensate. During the November 20, 1998, walkdown, an engineered structure could not be discerned. It could not be ascertained whether or not the condensate stream was active or not, but the overhead steam line

from 3706-BA, which is on the opposite side of Apple Street, to the 3706 Building did appear to be active - water was dripping from a valve labeled MSS-V-3706. The overhead steam line splits in two outside the 3706 Building. One of the lines enters the north side of the building and the other disappears into the sand. The latter is approximately 9 centimeters (3.6 inches) in diameter. There are pipes extending from the 3706 Building on either side of this site. John Remaize believes this site is actually located just west of the third window west of Door #06. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. The 3706 Building is posted "Fixed Contamination Area." The drain is within the footprint of the WIDS Site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area.

Location: The site is on the north side of the 3706 Building, just west of Door #06.

Reclassification: Consolidated (1/19/1999)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site is a french drain that received steam condensate. The drain is a clay pipe covered by a 0.77 meter (2.53 foot) diameter metal lid. The lid has perforations in it. The top of the clay pipe ranges from approximately 1 to 5 centimeters (0.4 to 2 inches) above grade. Inside, a metal pipe enters the north side of the drain and another enters the west side of the drain. There also appear to be unattached segments of pipe resting on the floor of the drain. What appears to be a green garden hose enters the drain through a break in the clay pipe. This hose is not connected to any source. There is not any discoloration on the outside of the drain or the surrounding area, but the interior of the drain and the pipes found there appear to be discolored by rust. During the November 11, 1998, walkdown, the interior of the drain appeared to be dry. The site is surrounded by gravel. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. The 3706 Building is posted "Fixed Contamination Area." The drain is within the footprint of the WIDS Site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area.

Location: The site is located in the middle courtyard of the 3706 Building. It is approximately 3 meters (9.8 feet) from the northeast corner of the courtyard.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3706 Building.

Structures.

Waste Type: Steam Condensate

Waste Description: When the site was active, the flow rate was less than 0.19 liters per minute (0.05 gallons per minute) of steam condensate only.

The Site Was Consolidated With:

Code: 300-46

Names: 300-46; Soil Contamination Surrounding 3706 Building

Classification: Accepted

Names: 300-140; 3706 Building Steam Condensate; Miscellaneous Stream #356

Reclassification: Consolidated (1/19/1999)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site is a french drain that received steam condensate. The drain is a concrete structure with the inner dimensions of 0.82 meters (2.69 feet) by 0.60 meters (1.97 feet) and is covered by a metal grate. The drain abuts the north wall of the 3706 Building. A second concrete structure abuts the drain to the north. This second structure is covered by a 0.66 meter (2.17 feet) by 0.66 meter (2.17 feet) metal lid. An approximately 10 centimeter (4 inch) diameter opening is visible on the north side of the drain, almost 0.6 meters (2 feet) from its top. Access to the process sewer is approximately 3.5 meters (11.5 feet) to the northeast of the site. It appears as though the drain received fire sprinkler system water in addition to steam condensate. Four metal pipes terminate open-ended over the drain's grate. An approximately 6 centimeter (2.4 inch) pipe extends from the north side of the 3706 Building 0.95 meters (3.1 feet) above the ground surface; an approximately 4 centimeter (1.6 inch) pipe extends from the building 0.6 meters (2 feet) above the ground surface; an approximately 2 centimeter (0.8 inch) pipe extends from the building 0.52 meters (1.7 feet) above the ground surface, and an approximately 3 centimeter (1.2 inch) pipe extends from the building 0.15 meters (0.5 feet) above the ground surface. All four pipes exit the building near a Fire Department Connection. The pipes entering the drain and the grate covering the drain appear to be discolored by rust. Approximately a meter to the east of the site, what appears to be an approximately 15 centimeter (5.9 inch) diameter steam pipe enters the ground. The lower 1.2 meters (3.9 feet) of this pipe appear to be of newer construction than the upper section; the upper section has rust marks from the wires that encircle it while the lower section doesn't. During the November 18, 1998, walkdown, there was standing water in the drain. The surface of the water was approximately 0.6 meters (2 feet) from the top of the drain. There had not been any rainfall for almost 2 weeks at that time. According to John Remaize, the steam and fire water for the building are still active. There is a 30 centimeter (11.8 inches) diameter clay pipe 4.3 meters (14.1 feet) east of the site. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. The 3706 Building is posted "Fixed Contamination Area." The drain is within the footprint of the WIDS Site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area.

Location: The site is located on the north side of the 3706 Building, near the northeast corner. The site is just east of Door #05.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added

to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3706 Building.

Classification: Accepted

Names: 300-141; 3706 Building Steam Condensate; Injection Well #29; Miscellaneous Stream #439

Reclassification: Consolidated (1/19/1999)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The french drain has been excavated and removed. The waste site was a french drain that received steam condensate. The drain appeared to be a concrete pipe with a 0.91 meter (3 foot) metal lid at grade level; however, the site is well obscured by sand and gravel. During the October 26, 1998, walkdown, the metal lid appeared to be ajar. There are two steam pipes entering the ground approximately 3 meters (9.8 feet) west of the site. One of these pipes is approximately 7 centimeters (2.8 inches) in diameter and the other is approximately 8 centimeters (3.1 inches) in diameter. There is also a metal pipe extending from the south side of the building next to the site. This pipe terminates approximately 1.8 meters (5.9 feet) above the ground surface and has been plugged. This third pipe is approximately 5 centimeters (2 inches) in diameter. The site is surrounded by sand and gravel. The 3706 Building was posted "Fixed Contamination Area." The drain was within the footprint of WIDS Site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. According to the "Inventory of Miscellaneous Streams," Revision 3, the french drain is inactive, source abandoned.

Location: The site was located on the south side of the 3706 Building, approximately 4.5 meters (14.8 feet) east of Door #01.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3706 Building and WIDS sitecode 300-46.

Waste Type: Steam Condensate

Waste Description: When the site was active, the flow rate was less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Description: The french drain has been excavated and removed. The waste site was a french drain that received steam condensate. The drain was an open clay pipe that abuts the south wall of the 3706 Building and is surrounded by asphalt and sand. The inner diameter of the top 7 centimeters (2.8 inches) of the pipe is 0.55 meter (1.80 feet). Below the top 7 centimeters (2.8 inches), the inner diameter is reduced to 0.44 meters (1.4 feet). The top of the pipe rises approximately 0.35 meters (1.1 feet) above the ground surface. The bottom of the drain is covered by debris. The top of the debris is approximately 0.7 meters (2.3 feet) below the top of the pipe. No pipes are visible entering the drain. However, there are two approximately 2.5 centimeter (1 inch) holes drilled into the side of the pipe. The clay around these holes as well as the interior of the pipe appear to be rust stained. An approximately 3 centimeter (1.2 inches) metal pipe exits the building 0.6 meters (2 feet) above the ground surface, makes a 90 degree turn and enters the ground approximately 0.6 meters (2 feet) east of the drain. Further east, on the opposite side of a wall extension, there is an approximately 5 centimeter (2 inch) metal pipe that exits the building approximately 0.45 meter (1.5 feet) above the ground surface and enters the ground. This second pipe is approximately 1.8 meters (5.9 feet) from the site and approximately 1 meter (3.2 feet) from a second clay pipe. This second clay pipe is approximately 0.75 meters (2.5 feet) in diameter. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. The 3706 Building is posted "Fixed Contamination Area." The drain was within the footprint of the WIDS Site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area.

Location: The drain was located on the south side of the 3706 Building near the southwest entrance door. It is approximately 3.5 meters (11.5 feet) east of Door #11

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is a french drain that receives steam condensate. The drain has a concrete base and is covered by a 0.66 meter (2.17 foot) by 0.66 meter (2.17 foot) metal lid. The site is surrounded by gravel and weeds. During the November 11, 1998, walkdown, the lid could not be removed. From the outside, there are no apparent steam lines entering the site. There are pipes extending from the south wall of the courtyard, but none near the drain. The 3706 Building is posted "Fixed Contamination Area." The site falls within WIDS Site 300-46 which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area.

Location: The site is located in the eastern courtyard of the 3706 Building. It is along the south wall of the courtyard, approximately 15.3 meters (50.2 feet) from the southeast corner.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3706 Building.

Waste Type: Steam Condensate

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow is less than 0.038 liters per minute (0.01 gallons per minute).

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is a french drain that received steam condensate. The drain is a clay pipe covered by a 0.85 meter (2.79 foot) diameter metal lid. The top of the clay pipe is approximately 0.3 meters (1 foot) above the ground surface. The lid has an opening allowing pipes to enter the drain. An approximately 2.5 centimeter (1 inch) metal pipe and an approximately 1.3 centimeter (0.5 inch) diameter clear, plastic hose enter the drain through this opening. The plastic hose is attached to what appears to be a steam line extending through an old window or other former opening in the west wall of the courtyard. This opening is 2 to 3 meters (6.6 to 9.8 feet) north of the site

and is currently boarded up. An approximately 5 centimeter (2 inch) diameter metal pipe exits the west wall of the courtyard, makes a 90 degree turn and enters the ground near the pipe. The clay pipe is broken, making removal of the lid unsafe. During the November 11, 1998, walkdown, the interior appeared dry when viewed through a break in the clay pipe. The site is surrounded by sand. The site falls within WIDS Site 300-46 which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: The site is located in the middle courtyard of the 3706 Building. It is approximately 8.5 meters (27.9 feet) north of the south entrance to the courtyard, abutting the west wall.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3706 Building.

Waste Type: Steam Condensate

Waste Description: When the site was active, the flow rate was less than 0.19 liters per minute (0.05 gallons per minute) of steam condensate only.

The Site Was Consolidated With:

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site is a french drain that received steam condensate. The drain is a clay pipe covered by a 0.78 meter (2.56 foot) metal cover. The lid is posted "Confined Space." The lip of the pipe is broken on its northeast side; this could allow stormwater runoff to enter. "FD 25" is written on the wall of the 3706 Building above the site. A metal pipe approximately 2.5 centimeters (1 inch) in diameter extends from the west side of 3706 just south of the site. This pipe exits the building approximately 3 meters (10 feet) above the ground surface and terminates approximately 15 centimeters (5.9 inches) after leaving the building. It was difficult to ascertain whether the pipe was plugged or not. The side of the building below this pipe appears to have rust stains. A second metal pipe approximately 2.5 centimeters (1 inch) in diameter extends from the south side of 3706, just around the corner from the site. This pipe leaves the building approximately 0.9 meters (3 feet) above the ground surface and disappears into the ground. The site is surrounded by soil and gravel. Moss is growing on the south side of the drain. The 3706 Building is posted "Fixed Contamination Area." The site falls within WIDS Site 300-46 which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. According to the "Inventory of

End Date:

Description: The site is a french drain that receives stormwater runoff. The drain is made of concrete and is covered by a 0.90 meter (2.95 foot) by 0.45 meter (1.48 foot) metal grate. The drain appears to be approximately 0.9 meters (3 feet) deep. An approximately 0.3 meter (1 foot) diameter metal pipe enters the eastern side of the drain. The site is surrounded by gravel and weeds. During the November 11, 1998, walkdown, the drain appeared to be dry, its bottom covered by debris. The 3706 Building is posted "Fixed Contamination Area." The site falls within WIDS Site 300-46 which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area.

Location: The site is located in the eastern courtyard of the 3706 Building. It is approximately 8 meters (26.2 feet) from the eastern wall, towards the center of the courtyard.

Release Description: There were no known hazardous or radioactive releases from this water discharge.

Related Sites/ Structures: The site is associated with the 3706 Building.

Waste Type: Stormwater Runoff

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow is less than 0.038 liters per minute (0.01 gallons per minute).

The Site Was Consolidated With:

Names: 300-148; 3706 Building Stormwater Runoff; Injection Well #22; Miscellaneous Stream #359
Reclassification: Consolidated (1/19/1999)
Type: French Drain
Start Date:
Status: Inactive
End Date:

Description: The site is described by the "Inventory of Miscellaneous Streams," Revision 3, as a french drain that collects stormwater runoff. The drain is an uncovered concrete pipe with an outer diameter of 0.9 meters (2.95 feet). The top of the pipe is flush with the ground surface on its southeast side while the northwest side is 7 centimeters (2.8 inches) above grade. The pipe appears to be filled with gravel and large rocks to within centimeters of its top. The drain is surrounded by gravel and soil. There is no evidence of a roof drain at this site. A 2.5 centimeter (1 inch) diameter metal pipe exits the west side of the building approximately 1.8 meters (5.9 feet) above the ground surface, makes a 90 degree turn towards the ground and terminates open-ended approximately 0.75 meters (2.5 feet) above the ground. The side of the drain closest to the 3706 Building, the gravel and rock between the building and the drain, as well as the side of the 3706 Building adjacent to the site all appear to be discolored by rust. The 3706 Building is posted "Fixed Contamination Area." The site falls within WIDS Site 300-46 which estimates

the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area.

Location: The site is located just west of the northwest corner of the 3706 Building.

Release Description: There were no known hazardous or radioactive releases from this water discharge.

Related Sites/ Structures: The site is associated with the 3706 Building.

Waste Type: Stormwater Runoff

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow is less than 0.038 liters per minute (0.01 gallons per minute). During the October 26, 1998, walkdown, the site appeared to be a steam condensate site as opposed to a stormwater site.

The Site Was Consolidated With:

Code: 300-46

Names: 300-46; Soil Contamination Surrounding 3706 Building

Code: 300-149

Classification: Accepted

Reclassification: Consolidated (1/19/1999)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site is a french drain that received steam condensate. The french drain is a concrete pipe covered with a 0.88 meter (2.89 foot) perforated metal lid. The lid is posted "Confined Space." The top of the pipe is 5 to 9 centimeters (2 to 3.5 inches) above the ground surface. A steam pipe enters the ground approximately 0.4 meters (1.31 feet) south of the site. The pipe is labeled "HPD-TRP-024" and "HPD-TRP-025." A 2.5 centimeter (1 inch) metal pipe is visible under the cover; it extends approximately 20 centimeters (7.9 inches) from the side of the concrete pipe and is in line with the steam pipe. The concrete pipe is 0.98 meters (3.2 feet) in length. The space below the concrete pipe appears to be filled with rocks and cobbles. During the October 27, 1998, walkdown, there was no evidence that the site was in use. The site is surrounded by asphalt, soil and gravel. The 3706A Building is posted "Fixed Contamination Area." The site falls within WIDS Site 300-46 which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: The site is 7.5 meters (24.6 feet) east of the 3706A east entrance door, under the overhead steam line.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 300 Area main steam line.

Waste Type: Steam Condensate
Waste Description: When the site was active, the flow rate was less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

The Site Was Consolidated With:

Description: The site is a french drain that is a clay pipe. The outer diameter of the pipe is 1.25 meters (4.10 feet). The pipe is covered by a metal lid which is labeled "Danger - Confined Space." The upper lip of the pipe is breaking up. The top of the pipe is flush with the ground surface for approximately one half of its circumference. The other half is 1 to 2 centimeters (0.4 to 0.8 inches) above the ground. The pipe is surrounded by soil and gravel. A pipe from the overhead steam line enters the ground nearby. This pipe is labeled "HPD-TRP-021." According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. Because of the broken lip on the pipe, the site may collect stormwater from the roadway.

Location: The site is located across Apple Street from the westernmost entrance on the north side of the 3706 Building. It is under the overhead steam lines.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3706 Building.

Waste Type: Steam Condensate
Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

The Site Was Consolidated With:

Code: 300-46
Names: 300-46; Soil Contamination Surrounding 3706 Building

Code: 300-151 **Classification:** Accepted
Names: 300-151; 3707B Building Steam Condensate; Miscellaneous Stream #327 **Reclassification:** Rejected (12/15/1998)
Type: French Drain **Start Date:**
Status: Inactive **End Date:**

Description: The site is a french drain that is a clay pipe 0.86 meters (2.82 feet) in diameter. The pipe is surrounded by asphalt and cobbles. The drain has an inset metal lid. A small diameter (approximately 2.5 centimeters or 1 inch) metal pipe enters the lid through an opening. Water was observed through this opening on a 10/13/98 visit to the site. At the time of the walkdown, the site was surrounded by a metal barricade. The label "HDP-TRP-009" mentioned in the "Inventory of Miscellaneous Streams," Revision 3, was not observed. The former location of the 3707B Building is currently home to electrical equipment and a Johnson Controls, Inc., air compressor. The "Inventory of Miscellaneous Streams," Revision 3, states that this site previously received steam condensate from the main steam line at pit U57 (300-152, stream #326), but now receives condensate from a Johnson Controls, Inc. air compressor.

Location: The site is located just north of the previous location of the 3707B Building. It is south of the two entry doors on the south side of the 3708 Building.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: Previously, the site was associated with the 3707B Building, which has been demolished. The site is currently associated with a Johnson Controls, Inc., air compressor.

Waste Type: Steam Condensate

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow is less than 0.038 liters per minute (0.01 gallons per minute).

Code: 300-152

Classification: Accepted

Names: 300-152; 3707B Building Steam Condensate; Miscellaneous Stream #326; U57

Reclassification: Rejected (12/15/1998)

Type: French Drain

Start Date:

Status: Inactive

End Date: 1/1/1996

Description: The site is a french drain. The base of this drain is constructed of corrugated metal and is covered by a 1.3 meter (4.27 foot) metal lid. The lid is labeled "Confined Space" and "U-57." The top of the lid ranges from 5 to 15 centimeters (2 to 6 inches) above grade. The site is surrounded by soil and gravel. The former location of the 3707B Building is currently home to electrical equipment and a Johnson Controls, Inc., air compressor. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: The site is located northeast of the previous location of the 3707B Building. It is 10 meters (32.8 feet) from the southeast corner of the 3708 Building, next to the overhead steam lines.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3707B Building, which has been demolished.

Waste Type: Steam Condensate

waste type: Steam Condensate

Type: French Drain **Start Date:**
Status: Inactive **End Date:** 1/1/1998

Description: The site is not an engineered structure. No pipe or lid was evident during the 10/13/98 walkdown. The ground surface is covered with soil and gravel. A pipe descending from the overhead steam line discharged directly onto the ground. At the time of the walkdown, the site was not labeled "HPD-V-015C" as described in the "Inventory of Miscellaneous Streams," Revision 3. However, the site is below a valve labeled "MSS-V-015." A small, shallow natural depression was observed just southwest of the discharge point. Stormwater runoff could collect in this depression. The former location of the 3707B Building is currently home to electrical equipment and a Johnson Controls, Inc., air compressor. The "Inventory of Miscellaneous Streams," Revision 3, says the site is inactive, source abandoned.

Location: The site is located at the northwest corner of the intersection of Apple St. and Wisconsin Street. It is below an overhead steam line.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to

produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3707B Building, which has been demolished.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-155

Classification: Accepted

Names: 300-155; 3707C Building Steam Condensate; Injection Well #24; Miscellaneous Stream #179

Reclassification: Rejected (12/15/1998)

Type: French Drain

Start Date:

Status: Inactive

End Date: 1/1/1996

Description: The site is a french drain that received steam condensate. The former location of the 3707C Building is currently a cobble-covered field. No evidence of the site remains. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive.

Location: According to the "Inventory of Miscellaneous Streams," Revision 3, the site was located near the center of the south side of the former 3707C building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3707C Building, which has been demolished.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.38 liters per minute (0.1 gallons per minute) of steam condensate only.

Code: 300-156

Classification: Accepted

Names: 300-156; 3707C Building Steam Condensate; Injection Well #23; Miscellaneous Stream #178

Reclassification: Rejected (12/15/1998)

Type: French Drain

Start Date:

Status: Inactive

End Date: 1/1/1996

Description: The site is a french drain covered by a 1.1 meter (3.61 foot) metal lid. The lid is labeled "Confined Space." The drain itself appears to be approximately half the diameter of the lid. Because of the size difference between the lid and the drain, it was difficult to get a good look inside the drain. The upper part of the drain appears to be made of bricks. The site is surrounded by gravel. A manhole labeled "Caution, Radioactive Material, Internally Contaminated" is approximately 2 meters (6.6 feet) to the northwest. This manhole is related to

the 300 Area Process Sewer System (WIDS Site 300-15). According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive.

Location: The site is located approximately 4 meters (13 feet) northwest of the northwest corner of the 3706 Building, and approximately 2 meters (6.6 feet) southeast of a manhole labeled "Radioactive Material, Internally Contaminated."

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3707C Building, which has been demolished.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.38 liters per minute (0.1 gallons per minute) of steam condensate only.

Code: 300-157

Classification: Accepted

Names: 300-157; 3707C Building Steam Condensate; Miscellaneous Stream #337

Reclassification: Rejected (12/15/1998)

Type: French Drain

Start Date:

Status: Inactive

End Date: 1/1/1996

Description: The site is a french drain that is a clay pipe. The upper lip of the clay pipe is breaking up. The drain is covered by a 0.76 meter (2.49 foot) metal lid. The drain is surrounded by a metal safety barricade and the area around the it is covered with cobbles. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive.

Location: The site is located approximately 12 meters (39.4 feet) west of the northwest corner of the 3706 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3707C Building, which has been demolished.

Status: Inactive **End Date:** 1/1/1996

Description: The site is a french drain that received steam condensate. The former location of the 3707C Building is currently a cobble-covered field. There is no evidence of a french drain in the location described for this site. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive.

Location: According to the "Inventory of Miscellaneous Streams," Revision 3, the site was on the west side of the former 3707C Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/Structures: The site is associated with the 3707C Building, that has been demolished.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-160 **Classification:** Accepted

Description: The site is a 68 centimeter (27 inch) drain with a perforated metal cover.

Location: The site is located approximately 4.5 meters (15 feet) from the northeast side of the 3707-D Building.

Waste Type: Stormwater Runoff

Waste Description: The site receives surface runoff from a paved area adjacent to the 3707D building. According to the "Inventory of Miscellaneous Streams," Revision 3, the flow is less than 0.038 liters per minute (0.01 gallons per minute).

Code: 300-163

Classification: Accepted

Names: 300-163; 3708 Building Steam Condensate; Miscellaneous Stream #423

Reclassification: Rejected (9/2/1998)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The french drain is a vitrified clay pipe buried vertically. The top is even with the ground surface and is covered with a metal lid. Two lines discharge into the drain.

Location: The site is located on the east side of the 3708 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste Description: The unit received steam condensate from the 3708 building.

Code: 300-164

Classification: Accepted

Names: 300-164; 3709 Building Steam Condensate; F.D. #3; Miscellaneous Stream #338

Reclassification: Rejected (12/15/1998)

Type: French Drain

Start Date:

Status: Inactive

End Date: 1/1/1998

Description: The site is a french drain that appears to be a concrete pipe and is covered by a 1.46 meter (4.79 foot) metal lid. The lid is labeled "Confined Space." The lid was not labeled "F.D. #3" as described by the "Inventory of Miscellaneous Streams," Revision 2. The lid is almost flush with the ground surface and is surrounded by asphalt. A metal pipe approximately 4 centimeters (1.6 inches) in diameter extends from the north side of the 3709 building and enters the ground approximately 1 meter (3.5 feet) from the edge of the drain.

Location: The site is located at the northeast corner of the 3709 building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3709 building.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-165

Classification: Accepted

Names: 300-165; 3709A Building Condensate; Miscellaneous Stream #347

Reclassification: Rejected (12/15/1998)

Type: Injection/Reverse Well

Start Date:

Status: Inactive

End Date: 1/1/1996

Description: The site is an injection well that received air compressor condensate. The site is a 0.5 meter (1.64 foot) diameter concrete structure with a heavy metal cover. There are two holes in the cover. During the 10/9/98 walkdown, there did not appear to be any water in the drain (observed through one of the holes in the cover).

Location: The site is located adjacent to the west wall of the 3709A Fire Station, just north of the southwest corner.

Related Sites/ Structures: The site is associated with the 3709A Building.

Waste Type: Water

Waste Description: The site received air compressor condensate. The "Inventory of Miscellaneous Streams," Revision 1, lists the flow rate as less than 0.038 liters per minute (0.01 gallons per minute). Revisions 2 and 3 of the document list the flow as 0 liters per minute (0 gallons per minute) because the stream was discontinued.

Code: 300-166

Classification: Accepted

Names: 300-166; 3709A Building Steam Trap; Miscellaneous Stream #355

Reclassification: Rejected (12/15/1998)

Type: Injection/Reverse Well

Start Date:

Status: Inactive

End Date:

Description: The site is an injection well that was originally used as a steam trap and later used for stormwater. The top of the drain is flush with the asphalt parking area. The site is covered with a 1.47 meter (4.82 foot) diameter steel lid with four holes in the cover. The lid is labeled "U-40" and "Confined Space."

Location: The site is located in the asphalt parking area on the south side of the 3709A Fire Station. It is near the southwest corner of the building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3709A Building.

Waste Type: Stormwater Runoff

Waste Description: In 2008, the stormwater from the roof of 3709A was rerouted to this drain.

Waste Type: Steam Condensate

Waste Description: When the site was originally used, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-167

Classification: Accepted

Names: 300-167; 3711 Building Steam Condensate; Miscellaneous Stream #343

Reclassification: Rejected (12/15/1998)

Type: French Drain

Start Date:

Status: Inactive **End Date:** 1/1/1997

Description: The site is a french drain that received steam condensate. A pipe from the overhead steam line enters the ground in the location described for this site. During the 10/14/98 site walkdown, no evidence of a drain was visible. Tags labeling the valves HPD-V-1001, HPD-V-5001, HPD-V-2001, and HPD-V-3001 were observed. There was not a tag for HPD-TRP-001, which was described in the "Inventory of Miscellaneous Streams," Revision 3. The area surrounding the descending steam pipe is covered with soft sand, which is deep in places. The sand could be obscuring evidence of the site.

Location: The site is located on the north side of the 3711 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3711 Building.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-168 **Classification:** Accepted

Names: 300-168; 3711 Building Steam Condensate; Miscellaneous Stream #433 **Reclassification:** Rejected (12/15/1998)

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is a french drain that is a concrete pipe. The pipe does not have a lid and appears to be filled with sand, cobbles and broken bricks. The top of the pipe, which is breaking up, ranges from 1 centimeter (0.4 inches) to 10 centimeters (4 inches) above grade. Three metal pipes approximately 2.5 centimeters (1 inch) in diameter extend from the 3711 Building. The open ends of these three pipes are poised over the top of the drain. A "Radioactive Material Area" is located approximately 5 meters (16.4 feet) to the east.

Location: The site is located on the south side of the 3711 Building, just west of the south entry door.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3711 Building.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-169	Classification: Accepted
Names: 300-169; 3712 Building Steam Condensate; Miscellaneous Stream #351	Reclassification: Rejected (1/19/1999)
Type: French Drain	Start Date:
Status: Inactive	End Date:
Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the site is a french drain that receives steam condensate at a flow rate of less than 0.38 liters (0.01 gallons) per minute. Based on a site inspection in June of 1997, the drain is composed of a 0.48 meter (1.57 foot) diameter metal culvert that abuts the east side of the 3712 Building. The culvert is uncovered and appears to be rust stained. The culvert appears to be filled with sand or other soil to within 0.50 meters (1.6 feet) of its top. A 3 centimeter (1.2 inch) diameter metal pipe enters the top of the culvert and intersects a horizontal pipe, making a T-intersection. This second pipe is oriented north-south. One end has a valve. The other end makes a 90 degree turn towards the 306 Building. The vertical pipe that enters the top of the culvert rises to just under the roof line of the 3712 Building where it continues north along the east side of the building, turns and travels west. At another T-intersection near the center of the north side, a short pipe extends downward and appears to be capped. The other segment continues in the towards the northwest corner of the building where it drops towards the ground surface. This pipe terminates open-ended 0.20 meters (0.66 feet) above the ground surface. During a November 1998 site inspection, the source of the steam condensate for this french drain came into question. Tracing out the lines, and verifying with drawing M-3901, Sheet 2, Revision 30, it was determined that the line into the french drain is actually a line from an abandoned helium system that ran between the 306 and 3712 Buildings. This line terminates open-ended. The drawing shows a gate valve to the atmosphere at the culvert on the east side of the building and at the northwest corner of 3712, plus a 2.5 centimeter (1 inch) gate valve near the center of the north side of 3712. It is believed that this site was mistakenly included in the miscellaneous streams inventory, and that is was in fact a purge point for the helium system. This site is located within a "Radiologically Controlled Area" posted around the 3712 Building. The 3712 Building is an active uranium metal storage unit, documented as WIDS Site 3712 USSA, and posted as "Caution Fissile Materials" and "Radiation Area and Contamination Area".	
Location:	The site is located on the east side of the 3712 Building, 16.3 meters (53.5 feet) south of the northeast corner.
Process Description:	Helium is a light noble gas. Releases of helium to the atmosphere would quickly dissipate with no expected reaction or contamination of the surrounding area.
Related Sites/ Structures:	The site is associated with the 3712 Building (WIDS Site 3712 USSA).
Waste Type:	Water
Waste Description:	According to the "Inventory of Miscellaneous Streams," Revision 3, the site received steam condensate with a flow rate less than 0.01 gallons per minute. According to technical personnel responsible for the site, this site was mistakenly identified as a miscellaneous stream site.
Waste Type:	Chemicals
Waste Description:	According to M-3901, sheet 2, revision 30, an abandoned helium line travels through this site, not a steam condensate line.

Code: 300-170	Classification: Accepted
Names: 300-170; 3712 Building Steam Condensate; Miscellaneous Stream #437	Reclassification: Rejected (2/24/1999)

Type: French Drain**Start Date:****Status:** Inactive**End Date:**

Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the site was a french drain that received steam condensate. The report identified the location as the north side of the 3712 Building directly next to the building. During the October 27, 1998 walkdown, a concrete pipe with a 1.0 meter (3.3 foot) metal lid was found at the top of a small slope approximately 13 meters (42.7 feet) northwest of the roll up door on the north side of 3712. The metal lid is not labeled. Based on previous experience with the location descriptions and coordinates in the "Inventory of Miscellaneous Streams," this structure seems to fit the description for this stream. The top of the concrete is above grade except where the surrounding cobbles are spilling over and partially covering the lid. Two metal pipes extend horizontally from the north side of 3712 Building 6 to 9 meters (20 to 30 feet) above the ground surface. One of these pipes appears to be capped; the other appears to be open-ended and approximately half the diameter of the capped pipe. Drawing M-3800, sheet 2, revision 20, shows a steam line running from approximately the center of the north side of the 3712 Building north to 3710A, which has since been demolished. A Johnson Controls, Inc., boiler house has been built north of the northeast corner of 3712. During the October 27, 1998, walkdown, the lid could not be lifted in order to verify whether or not this stream is still active. Another walkdown was done on February 17, 1999 for the purpose of lifting the lid on the site and taking a photograph. There are no pipes visible inside the drain. There is no evidence the drain is active. The concrete pipe is filled with large rocks to within a few inches below the metal cover. Nat Harden, DynCorp Electrical System Specialist was visited. He looked through the available service drawings for the location. Nat stated that he was fairly sure that this waste site was the french drain for the steam condensate from the 3710A Building (now demolished). He said that the 3710A Building steam supply was an overhead line that ran from the north side of the 3712 Building. Nat noticed that the steam line is shown as dashed (denoting an underground) line on the as-built drawings whereas it should be shown as an above ground line that has been removed. The waste site is not shown on any of the utility drawings that Nat had.

Location: The site is located approximately 13 meters (42.7 feet) northwest of the roll up door on the north side of 3712, at the top of a small slope. If the 3710A Building was still in place, this french drain would be located west of this Building.

Process Description: Steam was produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, it was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3712 or 3710A Building.

Waste Type: Steam Condensate

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow was less than 0.038 liters (0.01 gallons) per minute.

Code: 300-171**Classification:** Accepted

Names: 300-171; 3713 Building Steam Condensate and Stormwater Runoff; F.D. #7; Miscellaneous Stream #333

Reclassification: Rejected (12/15/1998)**Type:** French Drain**Start Date:**

Status: Inactive

End Date:

Description: The site is a french drain that currently receives only stormwater. It is a clay pipe covered by a 0.32 meter (1.05 foot) metal lid. The lid is perforated. The lid was not labeled F.D. #7 as described in the "Inventory of Miscellaneous Streams," Revision 2. The top of the drain is flush with the ground surface. The drain appears to be filled with soil to within 30 centimeters (11.8 inches) of the top of the pipe. The site is surrounded by soil and gravel. Soil is subsiding around the drain (see photos). According to the "Inventory of Miscellaneous Streams," Revision 3, the steam source has been shut off.

Location: The site is located at the northwest corner of the 3713 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3713 Building.

Waste Type: Stormwater Runoff

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow rate is less than 0.076 liters per minute (0.02 gallons per minute)

Waste Type: Steam Condensate

Waste Description: When the site was active, the flow rate for both steam condensate and stormwater runoff was listed in the "Inventory of Miscellaneous Streams" as less than 0.076 liters per minute (0.02 gallons per minute).

Code: 300-172

Classification: Accepted

Names: 300-172; 3713 Building Steam Condensate; Miscellaneous Stream #435

Reclassification: Rejected (12/15/1998)

Type: Injection/Reverse Well

Start Date:

Status: Inactive

End Date: 1/1/1998

Description: The site has been described as an injection well. The site is not covered by a lid and no engineered structure is evident. The surface is covered with cobbles and larger rocks. A portion of the cobbled area, approximately 0.4 meters (1.31 feet) in diameter, appears to be depressed. Stormwater runoff may be able to collect in this depression. The site is surrounded by soil and gravel. A pipe from the overhead steam line labeled "HPD-TRP-018" enters the ground just north of the site.

Location: The site is 8.9 meters (29.2 feet) southwest of the southwest corner of the 3713 building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3713 building.

Waste Type: Steam Condensate
Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-173 **Classification:** Accepted
Names: 300-173; 3713 Building Steam Condensate; Miscellaneous Stream #512 **Reclassification:** Rejected (12/15/1998)
Type: French Drain **Start Date:**
Status: Inactive **End Date:** 1/1/1998
Description: The site is a french drain covered by a 1.14 meter (3.74 foot) metal lid. The lid is flush with the ground surface and is labeled "Confined Space." A pipe extending from the overhead steam line enters the ground near the lid. The site is surrounded by soil and gravel.
Location: The site is located 12.5 meters (41 feet) southwest of the southwest corner of the 3713 building.
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3713 building.

Waste Type: Steam Condensate
Waste Description: When the site was active, it received less than 3.8 liters per minute (1.0 gallon per minute) of steam condensate only.

Code: 300-174 **Classification:** Accepted
Names: 300-174; 3713 Building Stormwater Runoff and Steam Condensate; Miscellaneous Stream #544 **Reclassification:** Rejected (12/15/1998)
Type: French Drain **Start Date:**
Status: Inactive **End Date:**
Description: The site was a french drain that currently receives stormwater. It is covered by a 0.94 meter (3.08 foot) metal lid. The lid is flush with the ground surface and is surrounded by gravel. A small diameter (< 2.5 centimeters [< 1 inch]) metal pipe extends from the building in line with the drain's lid. The pipe extends from the building approximately 1.75 meters (5.7 feet) above the ground surface, makes a 90 degree turn towards the ground, extends to within 0.25 meters (9.8 inches) of the ground surface and stops. The end of this pipe is open.
Location: The site is located on the east side of the 3713 Building, 8.7 meters (28.5 feet) south of the northeast corner.
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3713 Building.

Waste Type: Steam Condensate
Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow rate was less than 3.8 liters per minute (1 gallon per minute).

Waste Type: Stormwater Runoff
Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow rate is less than 3.8 liters per minute (1 gallon per minute)

Code: 300-176 **Classification:** Accepted
Names: 300-176; 3715 Building Steam Condensate; Miscellaneous Stream #678 **Reclassification:** Rejected (12/15/1998)
Type: Valve Pit **Start Date:**
Status: Inactive **End Date:** 1/1/1998

Description: The site is a rectangular valve pit with a dirt floor. Steam condensate was discharged onto the floor of the pit. The top of the concrete base is 5 to 15 centimeters (1.97 to 5.91 inches) above grade. The valve pit is covered by a metal lid 1.30 meters (4.27 feet) by 1.11 meters (3.64 feet). The lid is labeled "Confined Space" and "U-49." A steam pipe from the overhead line enters the ground just east of the site. The pipe is labeled "HPD-TRP-005." The site is surrounded by sand and asphalt.

Location: The site is located between the 3715 Building and the 303E Building, under the overhead steam line.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: This site is associated with the 3715 Building.

Waste Type: Steam Condensate
Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-177 **Classification:** Accepted
Names: 300-177; 3717 Building Steam Condensate; Miscellaneous Stream #330 **Reclassification:** Rejected (12/15/1998)
Type: Injection/Reverse Well **Start Date:**
Status: Inactive **End Date:** 1/1/1998

Description: The site is an injection well that received steam condensate. The site is a 90 centimeter (2.95 foot) diameter, concrete structure with a perforated metal cover. It is located adjacent to an overhead steam line, but there is no visible evidence of a steam pipe connecting to this drain. The drain is in a slight depression from the surrounding grade.

Location: The site is located approximately 5 meters (16.5 feet) from the southeast corner of the 3717 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3717 Building.

Waste Type: Steam Condensate

Waste Description: When the site was active, it received less than 0.038 liters per minute (0.01 gallons per minute) of steam condensate only.

Code: 300-178 **Classification:** Accepted

Names: 300-178; 3717 Building Steam Condensate; Miscellaneous Stream #329 **Reclassification:** Rejected (12/15/1998)

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is a french drain that is a clay pipe. The top of the clay pipe is 5 centimeters (2 inches) above grade. The drain appears to be filled with sand or soil to within 0.35 meters (1.15 feet) of the top of the pipe. The drain is covered by a 0.25 meter (0.82 foot) metal lid with perforations. There was no evidence of use observed during the 10/08/98 walkdown. The site is surrounded by soil and gravel.

Location: The site is located just east of the south entry door to the 3717 Building.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3717 Building.

Waste Type: Steam Condensate

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow rate is less than 0.038 liters per minute (0.01 gallons per minute).

Code: 300-179 **Classification:** Accepted

Names: 300-179; 3717 Building Steam Condensate; Miscellaneous Stream #324 **Reclassification:** Rejected (12/15/1998)

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: The site is a french drain that is a clay pipe. The upper lip on half of the pipe is broken;

therefore, the 0.39 meter (1.28 foot) metal lid doesn't seat properly. During the 10/8/98 walkdown, the site was surrounded by a metal safety barricade. During the same walkdown, it was observed that the pipe that descended from the overhead steam line was not labeled. The "Inventory of Miscellaneous Streams," Revision 3, states "HPD-TRP-022" is the steam trap associated with this french drain. The broken lip may allow stormwater runoff to enter this drain. The site is surrounded by soil and gravel.

Location: The site is located south of the southwest corner of 3717.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

End Date:

Description: The site is a french drain that is a clay pipe covered by a perforated metal lid. The lid is 0.77 meters (2.53 feet) in diameter and is missing a rectangular-shaped section along its edge. The pipe is surrounded by soil, gravel and concrete. The top of the pipe is approximately 1 centimeter (0.4 inches) above the ground surface. The pipe is filled with soil and cobbles to within approximately 0.4 meters (1.3 feet) of the top of the pipe.

Location: This site is located on the south side of the 3717 Building, approximately halfway between the south entry door and the east end of the building.

Related Sites/ Structures: This site is associated with the 3717 Building.

Waste Type: Stormwater Runoff

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow rate is less than 3.8 liters per minute (1.00 gallon per minute).

Code: 300-181

Classification: Accepted

Names: 300-181; 3717 Building Steam Condensate; Miscellaneous Stream #180

Reclassification: Rejected (12/15/1998)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site is a french drain covered by an eight-sided metal lid. The diameter of the lid ranges from 0.60 meters (1.97 feet) to 0.66 meters (2.17 feet) and it appears to have been welded shut

on one side. The site is surrounded by asphalt and concrete. A small area of concrete on the west side of the lid appears to have been excavated.

Location: The site is located on the east side of the 3717 Building, just east of the roll up door.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3717 Building.

Waste Type: Steam Condensate

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow rate is less than 0.038 liters per minute (0.01 gallons per minute).

Code: 300-182	Classification: Accepted

Type: French Drain	Start Date:
Status: Inactive	End Date:

Description: The site is a french drain with a square concrete base. The top of the base ranges from approximately 1 centimeter (0.4 inches) to 5 centimeters (2 inches) above grade. The drain is covered by a 0.66 meter (2.17 foot) by 0.66 meter (2.17 foot) square metal lid. The lid has the remains of a "Confined Space" label. The site is surrounded by gravel where it doesn't abut 3717B. Two pipes from the overhead steam line enter through the lid. A row of "Radiologically Controlled Area" signs run east to west approximately 5 meters (16.4 feet) north of the site. These signs seem to refer to the area around the 304 Building, which is immediately north of the site, and the 303A Building, which is northwest of the site. The door and concrete pad on the south side of 304 are labeled "Fixed Contamination." Although the ground between 3717B and 304 is fairly level, there appears to be enough of a slope to prevent water flowing from the 304 Building towards the site.

Location: The site is adjacent to the north side of the 3717B Building and south of the 304 Building.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3717B Building.

Waste Type: Steam Condensate

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow rate is less than 0.038 liters per minute (0.01 gallons per minute).

Code: 300-183 **Classification:** Accepted

Names: 300-183; 3718 Building Steam Condensate; F.D. #40; Miscellaneous Stream #340 **Reclassification:** Rejected (12/15/1998)

Type: French Drain **Start Date:**

Status: Inactive **End Date:** 1/1/1998

Description: The site is a french drain that received steam condensate. The drain is a clay pipe with an outer diameter of 0.89 meters (2.92 feet) and is covered by a metal lid. The top of the clay pipe is approximately 14 centimeters (5.5 inches) above grade. During the site walkdown, the site was surrounded by a metal safety barricade. It was also observed that the lid has some sort of white powdery buildup. The drain was not labeled "F.D. #40" as described in the "Inventory of Miscellaneous Streams," Revision 2. The site is surrounded by asphalt. It appears as though a section of asphalt between the site and the 3718 Building has been excavated. Four metal pipes extend from the south wall of the 3718 Building near the site. Two of these pipes, which are approximately 10 centimeters (3.9 inches) and 12 centimeters (4.7 inches) in diameter, exit the building within 1 meter (3.3 feet) of the ground surface make a 90 degree and disappear into the asphalt. The other two pipes exit the building approximately 3.0 meters (10 feet) above the ground surface. One makes a 90 degree turn towards the roof and the other makes a 90 degree turn towards the ground. Both appear to terminate open-ended above the ground.

Location: The site is located southeast of the southwest corner of the 3718 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/Structures: The site is associated with the 3718 Building.

Waste Type: Steam Condensate

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 2, the flow rate was less than 0.038 liters per minute (0.01 gallons per minute).

Code: 300-184 **Classification:** Not Accepted

Names: 300-184; 3718A Building Stormwater Runoff; Miscellaneous Stream #270 **Reclassification:** None

Type: Product Piping **Start Date:**

Status: Inactive **End Date:**

Description: Twin 10-centimeter (4-inch) galvanized pipes drain each of two roofs that slope into each other in the center of the building. The pipes are joined about 0.7 meters (2 feet) above the ground in a Y, and empty into a 14-centimeter (6-inch) PVC pipe. This pipe travels just under the ground surface for about 12.2 meters (40 feet) and exits from a railroad tie retaining wall. The stormwater then spills onto the ground between the road and retaining wall. The soils are very sandy and the water probably infiltrates without overland flow. While the miscellaneous streams report (Rev. 3) says that it is an injection well, there is no injection well; the stormwater runoff ultimately empties into a "non-engineered structure" (the bare ground).

Location: The site is located on the north side of the 3718A Building, in the center where the two sections of the building are joined.

Process Description: The wastes are only roof stormwater runoff.

Waste Type: Stormwater Runoff
Waste Description: The waste is stormwater runoff only.

Code: 300-185 **Classification:** Accepted
Names: 300-185; 3722 Building Steam Condensate; Injection Well #6; Miscellaneous Stream #436 **Reclassification:** Rejected (12/15/1998)
Type: French Drain **Start Date:**
Status: Inactive **End Date:** 1/1/1998

Description: The site is a french drain that is a metal pipe 0.74 meters (2.43 feet) in diameter. The top of the pipe is uncovered and flush with the ground surface. The pipe appears to be filled with gravel to within centimeters of the top. Stormwater runoff may be able to enter this drain from the surrounding area. Two lines from the overhead steam line enter the ground nearby. One line is associated with HPD-TRP-013 and the other is associated with HPD-TRP-014. The site is surrounded by gravel.

Location: The site is located approximately 7 meters (23 feet) off the northwest corner of the 3722 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3722 Building.

Waste Type: Steam Condensate
Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 2, the flow rate was less than 0.038 liters per minute (0.01 gallons per minute).

Code: 300-186 **Classification:** Accepted
Names: 300-186; 3730 Building Steam Condensate; Miscellaneous Stream #383 **Reclassification:** Rejected (9/2/1998)
Type: French Drain **Start Date:**
Status: Inactive **End Date:**

Description: The site is a steel grate 48.3 centimeters (19 inches) square with two pipes emptying into it. The pipes are uninsulated and are 3.2 centimeters (1.25 inches) and 4.4 centimeters (1.75 inches) outside diameter. The grate covers a sump that is approximately 0.76 meters (2.5 feet) deep. The apparent drain is approximately 0.46 meters (1.5 feet) from the bottom and leads back into the building (east). A cast iron elbow, 10.2 centimeters (4 inches) outside diameter, in the bottom of the sump does not appear to relate to the drainage. Note that "Inventory of Miscellaneous Streams", Revision 3 (Final Draft) lists the site "Active". According to the responsible contractor, the document is not correct, as the site is inactive.

Location: The site is near the southwest corner of the 3730 Building, approximately 30.5 centimeters (1

Location: The site is located on the northwest side of the 3730 Building, 0.76 meters (2.5 feet) west of the building, and 7.47 meters (24.5 feet) south of the northwest corner of the building.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

End Date:

Description: The site is a french drain that is a 10 centimeter (4 inch) metal pipe through the asphalt that surrounds the building. The pipe is about 0.75 meters (2.5 feet) deep. The downspout that enters it comes from the top half of the building, about 0.6 meters (2 feet) south of the swamp cooler. The "Inventory of Miscellaneous Streams", Revision 3, says the stream is active, but the building is posted as closed, and the drain is dry at the bottom. Note that "Inventory of Miscellaneous Streams", Revision 3 (Final Draft) lists the site as an active steam condensate drain. According to the responsible contractor, the document is not correct, as the site should be listed as an inactive steam condensate site.

Location: The french drain is in the center of the east wall of the 3731 Building, about 5 centimeters (2 inches) from the wall.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Type: French Drain **Start Date:**

Status: Inactive **End Date:** 1/1/1997

Description: The site is a french drain that received steam condensate from a quench tank. The drain appears to be made of concrete and is covered by a lid. The foundation of the 3732 Building has been posted "Fixed Contamination Area." Details of this drain have been obscured by the paint applied for this posting. The outer perimeter of the drain measures 1.2 meters (3.9 feet) by 1.2 meters (3.9 feet) and rises approximately 10 centimeters (3.9 inches) above grade. The lid measures 0.98 meters (3.22 feet) by 0.98 meters (3.22 feet). Where the edges of the lid are visible, it appears as though it has been sealed by the paint. A sign on the lid has been obscured by paint. The site is surrounded by gravel. While visiting an adjacent site on 11/2/98, it was noticed that the 3732 pad had been surrounded by post and chain since the previous walkdown. The barricade was labeled "Radiological Buffer Area" and "Radiologically Controlled Area."

Location: The site is located at the southwest corner of the 3732 foundation.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to

produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: This site is associated with the 3732 Building. All that remains of the 3732 Building is the foundation (300-245). The site is also associated with the soil contamination under the remaining foundation (300-48).

Waste Type: Steam Condensate

Description: The french drain is a 0.6 meter by 0.45 meter (2 foot by 1.5 foot) rectangular concrete pit with a perforated steel cover. About 15 centimeters (6 inches) from the top, a 10 centimeter (4 inch) pipe enters from the direction of the 3745A Building. The drain is at least 0.6 meters (2 feet) deep, with the bottom 15 centimeters full of water. The site will also act as a storm drain for the surrounding compacted graveled area and the nearby roof runoff drainspout. Old wiring conduit rises from the ground next to the drain and enters the drain on the east side. The drain is protected by a yellow steel pipe barricade. The "Inventory of Miscellaneous Streams", Revision 3 lists this stream as eliminated. The lines have been capped. The source has been routed to the process sewer. It is still active as a stormwater drain.

Location: The unit is west of the 3745A Building, 3.5 meters (11.5 feet) northwest of the northwest corner and roof downspout.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste Description: Site appears to still receive storm water runoff.

Code: 300-200

Classification: Accepted

Names: 300-200; 3745B Building Steam Condensate;
Miscellaneous Stream #379

Reclassification: Rejected (9/2/1998)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site is a square concrete pit, 1.2 meters (4 feet) on a side, covered with a solid steel plate. The site appears to be about 1 meter (3 feet) deep, with the bottom covered in water. A 10-centimeter (4-inch) iron pipe enters from the south side (from the 3745B Building) and another 10-centimeter (4-inch) pipe is lower, on the west side of the drain, barely extending into the drain. The "Inventory of Miscellaneous Streams", Revision 3 says the stream is eliminated.

The pipes have capped. The source has been routed to the process sewer. The water in the bottom is probably old, as there is no air circulation to evaporate the water. The site appears to be a concrete box with a concrete bottom and the steel lid would prevent evaporation.

Location: The unit is located on the north side of the 3745B Building, 1.8 meters (6 feet) north of the north wall, and 9 meters (30 feet) west of the northeast corner.

Process Description: The "Inventory of Miscellaneous Streams", Revision 3, lists the site as inactive, source eliminated. The source has been routed to the process sewer. This site received steam condensate only. Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste

Description:

Code: 300-201

Classification: Accepted

Names: 300-201; 3762 Building Steam Condensate; Injection Well #42; Miscellaneous Stream #491

Reclassification: Rejected (9/2/1998)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site is a 1 meter (3 foot) diameter concrete pipe in the gravel roadway. A 5 centimeter (2 inch) steel pipe comes in at the bottom, from the direction of the 3762 Building. The bottom of the drain is 0.5 meters (1.5 feet) deep, and covered with small rocks and sand. The drain is protected by a yellow steel barrier made of pipes, which has been bent by traffic over the years. The drain is covered by a galvanized steel plate with 4 vent holes. The "Inventory of Miscellaneous Streams", Revision 3, says the site is active. However, the 3762 Building is posted as a closed facility, and most (or all) of the old steam lines in the area have been abandoned, so the site may actually be inactive. The site status has been changed to inactive to reflect information provided by the responsible contractor.

Location: The site is located 5.3 meters (17.5 feet) east of the northeast corner of the 3762 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Tank (Water Tower) Overflow and Steam
Condensate

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site is a french drain that received steam condensate and overflow from a water tower. The drain has a square concrete base covered by two metal grates. The concrete base is approximately 1 meter (3.3 feet) deep. At the bottom of this reservoir is an opening approximately 11 centimeters (4.3 inches) in diameter. Inside the reservoir is a square metal plate held at an angle by two metal rods extending through the grates. Without this support, it appears as though the metal sheet would lay flat at the bottom of the reservoir and block the outlet pipe at the bottom. A metal pipe approximately 11 centimeters (4.3 inches) in diameter extends from the top of the water tower to just above the grates. Three pipes enter the northeast side of the reservoir approximately 0.4 meters (1.31 feet) from its top. The pipes terminate open-ended inside the reservoir. The site is surrounded by sand and cobbles.

Location: The site is located next to the southwest leg of the water tower south of the 3711 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the water tower south of the 3711 Building.

Waste Type: Water

Waste Description: The site received sanitary water from the water tower.

Waste Type: Steam Condensate

Waste Description: When this site was active, the flow rate was less than 0.038 liters per minute (0.01 gallons per minute).

Code: 300-215

Classification: Accepted

Names: 300-215; 300 Area South

Reclassification: Rejected (1/27/1999)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site is very large and includes many different features. Much of the site is covered with vegetation such as cheatgrass and sagebrush. Two major roads cross the site: George Washington Way Extension and George Washington Way to Stevens Drive. Many old road traces exist and one major gravel road bisects the site. A gravel pit, and construction materials dumping ground are located in the north section of the site, south of the 300 Area fence, and west of the George Washington Way extension. Vestiges of irrigation canals are found throughout the site. Groundwater monitoring wells are found throughout the site. There is also a drywell (purpose unknown) in the area. Recent debris includes windblown garbage and tumbleweeds. Some older material near an irrigation canal may pre-date Hanford (e.g. porcelain china, battery cores, cans, and glass). A large diameter buried water line installed in the early 1990s is present in the southern part of the site. Underground electrical, water, and telephone lines are present on the site.

Location: Road on the South, the Columbia River on the east, and the southern 300 Area fence line on the north.

Waste Type: Construction Debris

Waste Description: There is some construction debris in a dumping area. However, there does not appear to be any hazardous waste dumped in the area. Photograph #1 shows some small battery cores. This was a concern to the EPA and asked that they be picked up. As of February 9, 1999, the "Battery Cores" had been picked up and sent to the Centralized Consolidation/Recycling Center.

Code: 300-217

Classification: Not Accepted

Names: 300-217; 300 Area Laydown Yard

Reclassification: None

Type: Storage

Start Date:

Status: Active

End Date:

Description: The area is currently in use as a laydown area for construction materials. Construction materials observed at the site included Connex boxes, steel pipe, ladders, steel, plastic pipe, wood pallets, insulation material, and railroad ties. Several vehicles were also stored at the site. No wood utility poles were observed and no stains were observed on the soil from temporary storage of wood utility poles. Most material is stored off the ground on racks. An electrical structure is located in the northwest part of the site. The numbers on the structure are: C3X483 on the west side, C3X481 on the north side, and C3-24 on the south side. Four access manholes are present south of the structure. Three of the manholes are 1.22 meters (4 feet) in diameter and the fourth is 0.91 meters (3 feet) in diameter. A 1.22-meter (4-foot) square concrete structure with a metal lid is present about 15.24 meters (50 feet) south of the north side fence. Well 399-04-01 is present on the northeast corner of the site. A minor amount of blown-in paper was observed. A large borrow pit is found south of the site.

Location: The site is located in the 300 Area, southwest of the intersection of Cypress and George Washington Way Extension.

Waste Type: Equipment

Waste Description: There is no waste at this site. Waste that had been a concern to Ecology had been removed prior to the time that the site was entered into WIDS.

Code: 300-220

Classification: Not Accepted

Names: 300-220; Gravel Pit #7; Pit 7

Reclassification: None

Type: Depression/Pit (nonspecific)

Start Date:

Status: Inactive

End Date:

Description: The site is a manmade depression identified as Gravel Pit #7. The surface consists of sand and gravel with some cobbles, and a light vegetation cover of bunch grass and small sage. Trace fragments of concrete and asphalt can be found along the depression margins. Although it is included in the general radiologically controlled area north of the 300 Area, there are no site specific radiological postings.

Location: Gravel pit #7 is located north of 300 Area, northeast of the railroad tracks.

Related Sites/ Structures: The pit is related to Aluminum Shavings Area (Site Code 300-8).

Code: 300-222

Classification: Accepted

Names: 300-222; 384-W Brine Pit; 384-W Salt

Reclassification: Rejected (3/14/2002)

Dissolving Pit and Brine Pump Pit

Type: Sump **Start Date:** 1/1/1977
Status: Inactive **End Date:**

Description: The brine pit, a concrete underground storage pit, was cleaned out and filled with sand/gravel in May 1998. At the surface the structure measures 5.18 meters (17 feet) by 3.05 meters (10 feet). It was divided into two sections. The larger section is the salt dissolving pit, also called "brine pit" on drawings. This section held the salt that was dissolved to make the brine. A 3.8 centimeter (1.5 inch) stainless steel sprinkler pipe runs the length of the pit. A 3.8 centimeter (1.5 inch) PVC (polyvinyl chloride) brine return line enters the pit through its south wall. The bottom of the pit was covered with a 15 centimeter (6 inch) layer of gravel topped by a 15 centimeter (6 inch) layer of sand. Three 2.9 meter (9.5 foot) lengths of 10 centimeter (4 inch) transite tile pipe were located within the gravel layer. These three pipes connected through a dividing wall into the adjacent section. An overflow drain is located near the top of the structure. The salt dissolving pit is identifiable at the surface by its red metal cover. The smaller section is the brine pump pit, also called "tank" in drawings. A 5 centimeter (2 inch) PVC line exits the pit through its south wall. The brine pump pit is identifiable at the surface by its gray metal cover.

Location: The Brine Pit is located approximately 6 meters (20 feet) north of the west end of the 384 Powerhouse.

Process Description: The steam system used "soft" water. Water from the Water Filter Plant (315 Building) ran through a water softening process before going to the boilers. The brine was used to regenerate the ion exchange demineralizers in the water softeners. The brine was created by distributing raw water across the surface of the salt using the sprinkler pipe. As the water passed through the salt, the solution became saturated. The brine solution passed through the layers of sand and gravel which filtered out salt crystals and other particles. The filtered brine passed into the tile pipe and was discharged into the pump pit ready for use. Flow through the brine pit was achieved by the addition of new water into the salt dissolving pit and the removal of brine from the pump pit.

Waste Type: Abandoned Chemicals

Waste Description: Before it was cleaned out, the structure contained salt cake and/or brine, both of which may be designated as dangerous waste.

Code: 300-223 **Classification:** Accepted
Names: 300-223; 384 Powerhouse Fuel Oil Day Tanks #1 and #2 **Reclassification:** Closed Out (5/4/2004)
Type: Storage Tank **Start Date:** 1/1/1964
Status: Inactive **End Date:** 1/1/1998

Description: The site has been backfilled to grade. The site was backfilled on March 22, 2003 after the Day Tanks and surrounding contaminated soil had been removed. The tanks were carbon steel, underground storage tanks, positioned horizontally, in a north-south direction.

Location: The centers of the day tanks were located north of the north wall of the 384 Powerhouse. Day Tank #1 was the east tank and Day Tank #2 was the west tank.

Process Description: Fuel oil was pumped into the Day Tanks from the larger fuel oil bunkers. A heater in the Day Tanks kept the oil temperature at 120 degrees Fahrenheit. The oil was used to fuel the 384 Powerhouse boilers to create steam.

Related Sites/ Structures: 366/366A Fuel Oil Bunkers (WIDS Site 300-6), UPR-300-7 (closed out) and UPR-300-42.

Waste Type: Oil

Waste

Description:

Closure Info: On March 21, 1998, an offsite vendor removed the fuel from the 384 Fuel Bunker and associated day tanks. Some residual material remained in the tanks. In June of 1999, the tanks were removed, cleaned, and sold as scrap metal. A site assessment showed that diesel range organics and motor oils were found in almost all soil samples, and most were above the Model Toxics Control Act (MTCA) Method A cleanup levels of 200 milligrams per kilogram. Soils adjacent to the fill area of the tanks had the highest petroleum concentrations based on visual observations. No evidence of free product or petroleum saturated soil was found below the tanks. Visual inspection of the tanks indicated they were in good condition with no evidence of deterioration to the point that product would leak from them. The soil removed from the excavation was taken to Gravel Pit 9 for bioremediation (see 600-278). In September 1999, five verification samples were collected from the tank excavation and analyzed. The day tank excavation was backfilled to grade in March 2003.

Sampling of the tank residue and soil surrounding the excavation for an initial assessment, showed that petroleum hydrocarbons were present at levels above MTCA action levels. After consultation with Washington State Department of Ecology, the approach to cleanup was removal of contaminated soil until sampling documented that the remaining soils contained less than 200 parts per million total petroleum hydrocarbons (TPH).

Approximately 600 cubic meters of contaminated soil was removed from the site and taken to Pit 9 on the Hanford Site for bioremediation (sitecode 600-278). After visual and field screening indicated no contamination above cleanup levels remained in the excavation, five verification composite samples were collected and analyzed to confirm that cleanup levels had been met. One sample was collected from each of the sidewalls at about 1 meter (3 feet) above the base of the excavation and one from the floor of the excavation.

All results in the diesel range were below the MTCA Method A cleanup level of 200 mg/kg for petroleum contaminated soil. The TPH results showed a maximum of 230 mg/kg, with an arithmetic mean result of 168.2 mg/kg, below the cleanup level of 200 mg/kg. Per WAC 173-340-740(7)(d)(iii), Ecology has the regulatory discretion to select an appropriate method for analyzing the data. By closing out the site, Ecology is amenable to the use of the arithmetic mean as a measure of remediation success. On March 14, 2001, Ecology declared the sampling and analysis data acceptable and that the excavation could be backfilled.

Code: 300-225	Classification: Not Accepted

#771; Steam Trap 3G-U44; U44

Type: Valve Pit **Start Date:**

Status: Inactive **End Date:**

Description: The site is covered with a 173-centimeter (68-inch) diameter diamond plate steel cover. A square access hatch is located in the center of the cover. The below grade section is constructed of concrete with a dirt floor. The interior of the pit contains valves which released steam condensate to the floor. The site is labeled "U-44" and is posted as a "Confined Space."

Location: The site is located near the southeast corner of the 3746 Building.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate
Waste Description: Steam condensate was discharged to the floor of the pit. According to the "Inventory of Miscellaneous Streams," Revision 2, the flow was less than 0.038 liters (0.01 gallons) per minute of nondangerous/nonradioactive steam condensate.

Code: 300-235 **Classification:** Accepted
Names: 300-235; 3713 Building Storm Water Runoff and Steam Condensate; Miscellaneous Stream #766 **Reclassification:** Rejected (5/26/1999)
Type: French Drain **Start Date:**
Status: Inactive **End Date:**
Description: The site is a french drain that currently receives only stormwater. The drain is a concrete pipe that is covered by a 0.76 meter (2.49 foot) metal lid with perforations. The top of the pipe is flush with the ground surface and is surrounded by soil and gravel. The drain appears to be filled with soil to within approximately 0.7 meters (2.3 feet) of the top of the pipe. The upper 0.45 meters (1.5 feet) of the concrete pipe appear to be lined with some kind of a metal that is pulling away from the pipe. At least two, possibly three, metal pipes were observed extending into the side of the drain from the west. A small diameter (approximately 2.5 centimeters or 1 inch) pipe enters the side of the drain, makes a 90 degree turn and disappears into the floor of the drain. An approximately 5 centimeter (2 inch) open end pipe extends approximately 5 centimeters (2 inches) from the side of the drain. What appears to be a third pipe is covered with cobwebs that could not safely be removed. There are no pipes descending from the overhead steam line in the vicinity of the site. According to the "Inventory of Miscellaneous Streams," Revision 3, the steam source has been shut off.
Location: The site is located approximately 9 meters (29.5 feet) northeast of the northwest corner of the 3713 Building, under the overhead steam line.
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 3713 Building.

Waste Type: Steam Condensate
Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 2, the flow was less than 3.8 liters (1.0 gallons) per minute of nonhazardous/nonradioactive steam condensate. The site no longer receives steam condensate.

Waste Type: Stormwater Runoff
Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow is less than 3.8 liters (1.0 gallons) per minute of stormwater only.

Code: 300-236 **Classification:** Accepted
Names: 300-236; HPD-TRP-020; Miscellaneous Stream #772; Steam Trap 3G-U45; U-45 **Reclassification:** Rejected (5/26/1999)
Type: Valve Pit **Start Date:**

Status: Inactive**End Date:**

Description: The site is a valve pit that received steam condensate. The structure has a square concrete base with a 1.31 meters (4.30 feet) by 1.31 meters (4.30 feet) metal lid. The lid is labeled "U-45" and "Danger, Confined Space." The lid has a hatch that allows access to its interior. The top of the concrete base ranges from approximately 5 to 10 centimeters (2 to 4 inches) above the ground surface. The site is surrounded by sand and some gravel. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: The site is 10 meters (32.8 feet) southwest of the southwest corner of the 3719 Building. It is just east of the Apple Street Gate.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is related to the 300 Area steam line.

Waste Type: Steam Condensate

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 3, the flow was less than 0.04

liters (0.01 gallons) per minute of nondangerous/nonradioactive steam condensate.

Code: 300-237

Classification: Accepted

Names: 300-237; Miscellaneous Stream #773; Steam Trap HPD-TRP-010

Reclassification: Rejected (5/26/1999)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site is described as a french drain that received steam condensate. An engineered structure was not evident in the field. A steam pipe runs down from the overhead steam line and terminates open-ended centimeters above the ground surface. The pipe is labeled "HPD-TRP-010." There is some soil discoloration where the pipe terminates above the ground surface that appears to be rust stains. This discoloration is confined to a very small area. There is also some rust discoloration on the concrete base of the pole that supports the steam pipe. The site is surrounded by sand with some gravel. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: The site is located southeast of the southeast corner of the 303C Building, west of 3707D, on the west side of Wisconsin Street.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 300 Area steam line.

Waste Type: Steam Condensate

Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 2, the flow was less than 0.04 liters (0.01 gallons) per minute of nondangerous/nonradioactive per minute of steam condensate.

Code: 300-238 **Classification:** Accepted
Names: 300-238; HPD-TRP-016; Miscellaneous Stream #774; Steam Trap 3G-U24; U-24 **Reclassification:** Rejected (5/26/1999)
Type: French Drain **Start Date:**
Status: Inactive **End Date:**
Description: The site is a french drain that received steam condensate from an underground steam line. The drain is a concrete pipe covered by a 1.55 meter (5.09 foot) diameter metal lid. The lid is labeled "U-24" and "Danger, Limited Access/Confined Space." The site is surrounded by sand and gravel. The site or the nearby steam line are not labeled "HPD-TRP-016." According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.
Location: The site is located west/southwest of the southwest corner of the 305 Building, next to Alaska Street. It is just north of where the overhead steam line goes underground.
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ Structures: The site is associated with the 300 Area steam line.

Waste Type: Steam Condensate
Waste Description: According to the "Inventory of Miscellaneous Streams," Revision 2, the flow used to be less than 0.04 liters (0.01 gallons) per minute of nondangerous/nonradioactive steam condensate.

Code: 300-239 **Classification:** Accepted
Names: 300-239; HPD-TRP-058; Miscellaneous Stream #775; Steam Trap 3G-U26; U26 **Reclassification:** Rejected (5/26/1999)
Type: French Drain **Start Date:**
Status: Inactive **End Date:**
Description: The site is a french drain that received steam condensate. The drain appears to be a rust stained concrete pipe covered by a 0.61 meter (2.0 foot) diameter metal lid. The metal lid has some perforations and is labeled "U-26." The top of the pipe ranges from flush with the ground surface to approximately 2.5 centimeters (1 inch) above grade. The site is surrounded by sand and some asphalt. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.
Location: The site is located on the south side of the 3762 Building, at the bottom of the access ramp. The "Inventory of Miscellaneous Streams," Revision 3, erroneously locates the stream south of the 3762 Building.
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When

used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/ The site is associated with an underground steam line.

Structures:

Waste Type: Steam Condensate

Waste According to the "Inventory of Miscellaneous Streams," Revision 2, the flow was less than

Description: 0.038 liters (0.01 gallons) per minute of nondangerous/nonradioactive steam condensate.

Code: 300-240

Classification: Not Accepted

Names: 300-240; 314 Building Stormwater Drain;
Miscellaneous Stream #789

Reclassification: None

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site was a french drain that receives stormwater runoff. The drain appears to be constructed of concrete and is covered by a 0.64 meter (2.10 foot) metal grate. The grate is stamped "STD 42" and its edge seems to be sealed. The drain appears to be approximately 30 centimeters (1 foot) deep. The bottom is covered with sand and gravel. An approximately 10 centimeter (4 inch) diameter pipe enters the west side of the drain, makes a 90 degree turn towards the ground surface, and terminates with a screened opening. The top of the drain is flush with the ground surface, which is slightly depressed relative to the surrounding area. It appears as though the drain would collect runoff from the asphalt on the north side of 314 and from the gravel area southeast of 305B. During the December 17, 1998, walkdown, the inside of the drain appeared to be damp. The drain is surrounded by broken concrete, gravel and cobbles. The 314 Building is a closed facility. There is a similar structure west of this site, southeast of the southeast corner of 305B, south of the fenced area.

Construction drawings H-3-52655 and H-3-304714 sheet 2 show that the open bottom catch basin/french drain location is connected directly to the (300-15) process sewer pipeline.

Location: The site is approximately 17 meters west of the northeast corner of the 314 Building, just north of the asphalt.

Related Sites/ The site is associated with the area on the north side of the 314 Building.

Structures:

Waste Type: Stormwater Runoff

Waste According to the "Inventory of Miscellaneous Streams," Revision 3, the flow is less than 0.038

Description: liters (0.01 gallons) per minute of stormwater only.

Start Date:

Status: Active

End Date:

Description: The site is a horizontal metal culvert that protrudes from the ground in a gravel depression.

Code: 300-261 **Classification:** Accepted
Names: 300-261; 315 Filter Plant Process Sewer to River **Reclassification:** Rejected (5/26/1999)
Type: Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The sewer is constructed of a 0.61 meter (24 inch) vitrified clay pipe from the building to the river bank. A 0.8 meter (30 inch) corrugated steel flume (1/2 pipe) conveys the effluent down the riverbank and into the river. There is an active stormwater drain located on the west side of the road and due east of the outfall flume. This site has been identified as outfall 012 in DOE/EIS-0113.
Location: The 315 Filter Plant Process Sewer pipeline extends south easterly from the southeast corner of the 315 building towards 3906 Lift Station and then bends due east to the Columbia River.
Release Description: The effluent pipe inside the diversion box near the 315 building has been blanked off with plywood and filled in with concrete.
Process Description: The sewer conveyed water from the 315 basin overflow drains and the 315 filter backwash water to the river.
Waste Type: Water
Waste Description: The waste is a process sewer pipeline that received overflow and filter backwash from the 315 Filter Plant. Treatment chemicals included alum (aluminum sulfate), chlorine, and separan (a polyacrylamide -flocculent). The site no longer receives material from the 315 Filter Plant. It can receive stormwater.

Code: 300-264 **Classification:** Accepted
Names: 300-264; 327 Building; Demolished 327 Building; Postirradiation Testing Laboratory (PTL) **Reclassification:** None
Type: Foundation **Start Date:** 1/1/1953
Status: Inactive **End Date:**
Description: The 327 Building demolition occurred from April 2009 through August 2010. The basement remains as a posted Radioactive Contamination Area, to be addressed during final remediation and closeout actions.

The 327 Building is also known as the Postirradiation Testing Laboratory (PTL). During the facility stabilization and deactivation phase, radioactive material and contamination was removed and cleaned to allow for Decontamination and Decommissioning (D) activities. Many places in the building were posted as contamination and radiation areas. The facility was a one-story structure with a basement. The building had four major areas: 1) the Canyon, 2) the Transfer and Storage Area (also known as the Truck Lock), 3) the Northwest Storage Pad, and 4) the Basement.

The 327 Basement was separated into 3 areas. The north third was used to store supplies, idle equipment, cell plugs, and includes the SERF Cell storage. Legacy wastes (buckets with pieces of Transuranic Waste [TRU]) were staged in this area pending disposal. The middle of the basement housed the hot cell ventilation ductwork, HEPA filters for the hot cells, and the activated charcoal filtration system. The activated charcoal filtration system does not currently have filters installed because there are no programmatic or regulatory needs. An access hatch to a crawl space containing building steam pipes is also in this area. The south third of the

basement was separated from the rest of the basement by a wall. It included a cold equipment room, and hot and cold exhaust supply fans for the facility air inlet system supply. It also contained the Retention Process Sewer system diverter, stack monitoring system, stack base plenum and related equipment, vacuum air sampling system and pumps, and steam system components.

Location: The 327 Building is in the central part of the 300 Area, on the southwest corner of the intersection of California Street and Apple Street.

Release Description: Several unplanned releases and occurrences are recorded for the 327 Building. Occurrence reports over the previous decades showed fires and explosions in several of the Cells, contamination found outside of normal containment (to areas within the building, the outside atmosphere, and soils under the building), and the Retention Process Sewer Line improperly connected to the Process Sewer Line.

More recently, the fire suppression sprinkle line broke December 26, 1998. An estimated 57,000 to 76,000 liters (15,000 to 20,000 gallons) of water was released into the basement of the 327 building. A portion of the water collected in the elevator shaft. An estimated 946 liters (250 gallons) leaked into the soils under the building before the rest could be pumped to the 307 Facility. Analysis showed the water to be slightly radioactive.

Process Description: The laboratory (PTL) consisted of specially equipped, shielded, and ventilated Hot Cells and laboratories designed for physical and metallurgical examination and testing of irradiated fuels, concentrated fission products, and irradiated structural materials. The primary task was to determine the nature and causes of dimensional instability in fuel elements and the effects of irradiation stresses on pile materials. This involved destructive testing on extremely high-activity materials, including ruptured or failed fuel rods containing plutonium and fresh fission products. The irradiated fines generated by the work were swept up and treated as solid wastes, but powdery dusts were taken into air filters, ducts, and pipes.

Related Sites/ Structures: The floor drains from the Cells flowed into the 300 Area Radioactive Liquid Waste System (RLWS), which drained to the 340 Waste Handling Complex. A concrete access port to the RLWS valve pit was located in the parking lot on the southeast corner of the 327 building. The 327 RLWS piping is isolated from the 340 Facility by blind flanges (nuclear blank) in the southeast corner of the hot side basement. The building was later connected to the 300 Area Retention Process Sewer (WIDS sitecode 300-214) which drained to the 307 Retention Basins. The building was originally connected to the Retired Radioactive Liquid Waste System (300 Area RRLWS).

Waste Type: Equipment

Waste Description: Waste material was contained in the building ducts, filters, and piping. A 1995 assessment showed most gamma activity was due to Cesium-137, Cesium-134, Europium-154, and Cobalt-60. Approximately 170 grams (maximum) of plutonium was estimated to be in the ducts, piping and other locations in the building, with an additional 314 grams estimated to be in the cells.

Code: 300-266

Classification: Accepted

Names: 300-266; Soil Under 3728 Building Drain Pipe

Reclassification: Rejected (3/8/2001)

Type: French Drain

Start Date:

Status: Active

End Date:

Description: The site is soil below a 5-centimeter (2-inch) black plastic drain pipe on the southwest corner of the 3728 Building. In October, 1999, a white plastic bucket was placed under the drain pipe to catch any water draining out. The soil under the pipe is lightly graveled (as is the larger area

around the entire building), with some of the gravel directly under the pipe washed away. The soil is not discolored. No engineered structure was built as an injection well.

Location: The soil is at the southwest corner of the 3728 Building, in the 300 Area.

Process Description: The drain pipe is connected to a sink where containers are filled with de-ionized water. The de-ionized water system is also connected directly to the drain pipe, and contributes water to the pipe when the system undergoes maintenance. The water is site service water with trace amounts of sodium hypochlorite and hydrogen peroxide, used to disinfect the system.

Related Sites/ Structures: The 3728 Building is the source of the drain pipe.

Code: 300-267

Classification: Accepted

Names: 300-267; French Drain on Northeast Corner of 3728 Building, Miscellaneous Stream #829

Reclassification: Rejected (3/8/2001)

Type: French Drain

Start Date:

Status: Active

End Date:

Description: The drain structure has been removed and properly backfilled. The site was a concrete slab with a square pit at the end. The pit is 0.6 meters (2 feet) on a side, and filled with small pea gravel. A galvanized, 3.2-centimeter (1.25-inch) pipe comes from the building and enters the pit.

Location: The site is on the northeast corner of the 3728 Building.

Process Description: The french drain receives water from the HVAC system for the 3728 Building.

Related Sites/ Structures: The HVAC system for the 3728 Building is associated with the french drain. The 3728 Building is the ERC sample shipping facility.

Code: 300-271

Classification: Accepted

Names: 300-271; 324/327 Buildings 90 Day Storage Pad; HS-027

Reclassification: Rejected (9/14/2000)

Type: Storage Pad (<90 day)

Start Date: 1/1/1997

Status: Inactive

End Date: 1/1/2000

Description: The dangerous waste was kept in a connex box commercially manufactured for storing wastes. The box has a spill containment system in that the waste was stored on a grate at the level of the door threshold, and any spills would be contained under the grate so they could not spill out the door. The box is still in place, but is now used to store hazardous material intended for future use, such as roofing material, propylene glycol (trade name Dow Frost), and oils.

Location: This site was north of the 324 facility and west of the 3718E warehouse. It was within the 324 Building fenced and locked compound.

Process Description: The logbook for this pad shows only 6 entries for dangerous waste from the start date of October 31, 1997 to July 15, 1999. Materials stored there include absorbed gasoline, oils (possible contaminated with heavy metals), ice melt (sodium chloride), baking soda, toluene, and PCBs.

Related Sites/ Structures: This pad was used for hazardous and dangerous wastes from the 324 and 327 Buildings.

Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: Wastes stored at this 90 Day Pad include absorbed gasoline, oils (possibly contaminated with heavy metals), ice melt (sodium chloride), toluene, and PCBs.

Code: 300-272 **Classification:** Accepted
Names: 300-272; Underground Storage Tank Near the 377 Building **Reclassification:** Closed Out (11/4/2002)
Type: Storage Tank **Start Date:**
Status: Unknown **End Date:**
Description: The site was an underground storage tank in a gravel field. The tank was removed in 2002.
Location: The underground storage tank was located within the industrial boundary of the 300 Area southeast of the 377 Building and northwest of the intersection of Alaska Street and Ginko Street.
Process Description: The 11,356 liter (3,000 gallon) tank served as a gasoline fueling station until the 1960's. The dispensing pump was removed prior to 1968 and the tank was removed in 2002.

Waste Type: Oil
Waste Description: Upon initial investigation of the UST site, an odor of fuel oil or diesel was noted when the fill tube extending above the ground surface was opened. Subsequent sampling and analysis of the tank contents in December 2001 indicated the liquid to be water with the impurities listed in the WSCF Analytical Results Report (See Field Work entry).

Closure Info: The Site Assessment Results report states that the liquid removed from the tank consisted of water with impurities. The contents of the tank were sampled on December 17, 2001 and analyzed at the WSCF laboratory (see additional details under the "Field Work" tab). Excavation of the soil surrounding the UST, the pipe connecting the tank to the dispensing pump, and the concrete pad used to support the dispensing pump was completed in mid-January 2002. Removal of these components was then completed by January 25, 2002.

A total of 37 samples including QA samples were collected and analyzed for total petroleum hydrocarbons in both the diesel fuel and gasoline ranges. The samples, were collected from areas where contamination was most likely to have occurred (i.e. beneath the tank, below the bottom of the connecting pipe and below the bottom of the concrete pad used to support the gasoline dispensing pump). Although Grab Sample #9 and Duplicate #10 from the spoils pile revealed 13.1mg/kg TPH-DX (Total Petroleum Hydrocarbons Diesel) and Grab Sample #15 from beneath the concrete pad revealed 43.1 mg/kg TPH-DX, none of the samples had detectable levels of gasoline range petroleum hydrocarbons using method TPH-G and none had diesel fuel range petroleum hydrocarbons in excess of 100 ppm using method TPH-D, and therefore were below 173-340 WAC Method A cleanup levels.

No evidence of leaking or failure of the connecting pipe or the tank was observed.

Code: 300-278 **Classification:** Accepted
Names: 300-278; 331-C Storage Unit **Reclassification:** Closed Out (7/22/2011)
Type: Storage **Start Date:** 1/1/2006
Status: Active **End Date:**
Description: The 331-C Storage Unit is a one-story metal building with fenced exterior areas constructed in the early 1970s. Upgrades were completed in 2006 to meet requirements for storage of

dangerous waste. Dangerous wastes are stored in Room 1 of the 331-C building. WA780008967, Part 3 states the Dangerous Waste Permit Application Part A Form was closed on 7/22/2011.

Location: The unit is located within the southern portion of the 300 Area, south of the 331 complex, near the intersection of Docton and Denmark Ave.

Process Description: The unit is used for the collection, consolidation, packaging, storage and preparation for transport and disposal of dangerous waste. Varieties of small volume chemical wastes are generated by PNNL's research laboratory activities under contract to DOE. These wastes are brought to the 331-C Storage Unit and segregated by compatibility for storage in the unit until enough waste is accumulated to fill a labpack or bulking container, usually a 30 to 55 gallon drum. When a sufficient number of shipping containers of waste have accumulated, they are manifested for shipment, generally to permitted off-site recycling, treatment or disposal facilities.

Waste Type: Chemicals

Waste Description: The unit stores waste that may include acid, oxidizers and flammable materials

Code: 300-282

Classification: Accepted

Names: 300-282; Crib Near 3717-B Building

Reclassification: Rejected (6/8/2011)

Type: Crib

Start Date:

Status: Inactive

End Date:

Description: This feature consists of the historical location of temporary experimental autoclaves with a settling tank that was connected to a wooden French drain. (DDTS-Generated-3822).

Location: The site location is not exactly known, but the information suggests it was near the process and sanitary lines at approximately (E) 593809 and (N) 116037. This is close to the midpoint of the process sewer (300-15) and sanitary sewer lines (300 SSS) that run underneath the footprint of the 3717-B building. There are other lines that run close by and lie within 20 m (65 ft) of the given coordinates and could be the site of the contamination spread (DDTS-Generated-3822).

Process Description: In 1944, temporary experimental autoclaves were installed on this site employing a settling tank connected to a wooden French drain or crib. The existence of the buried drain or crib is not posted or indicated on 300 Area drawings. During excavation for the construction of the 3717-B building during October 23-24, 1950, contamination of up to 50 mrep per hour was found on an upright, protruding timbers and soil. The contaminated timbers were potentially part of the forgotten French drain or crib. The site was subsequently excavated, but it is not known if the site was cleaned to today's standards or if the settling tank was removed (DDTS-Generated-3822). The excavated soil was used to create a mound in the 300 West area (618-13).

Related Sites/ Structures: The 3717-B building was either constructed over the site or close to the site in 1950.

Code: 300-285

Classification: Not Accepted

Names: 300-285; Ten French Drains and Dry Wells in 300 Area; 300 Area Steam Condensate French Drains/Dry Wells

Reclassification: None

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: This site consists of 10 discrete locations and underlying soil of steam condensate French drains/drywells and their associated below grade piping components. The French drains/drywells were discovered during the Orphan Site Evaluation (OSE) historical review. Each of the facilities that the French drains/drywells are associated with, were identified and process or function of the buildings determined. Details of inlet pipes, and French drain/drywell size and construction details are provided when available. Field verification and photographs of the present site conditions were obtained.

See detailed descriptions for each drain in site comment.

Location: The french drains are located throughout the 300 Area. See detailed locations for each drain in site comment.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion. One drywell drained the stairwell landing of the first floor of the 314 building of rainwater.

Related Sites/ Structures: The drains are associated with the 301, 314, 315, 331, 335, 382, 3701-A and 3701-L Buildings.

Code: 303-K CWS

Classification: Accepted

Names: 303-K CWS; 303-K Contaminated Waste Storage

Reclassification: Closed Out (8/5/2002)

Type: Storage

Start Date: 1/1/1943

Status: Inactive

End Date: 1/1/2002

Description: The site has been demolished and clean closed as of July 22, 2002. The building site appears as a weedless gravel lot. The 303-K Facility included a former concrete and cinder block building with no windows, outdoor asphalt, concrete, and gravel storage areas, all surrounded by a six foot chain link fence. The building, which was torn down in 2001, had a cinder block east-west partition wall with a floor trench drain in the north room. The floor trench drain was sealed in 1988.

Location: The unit was located in the 300 Area on Ginko Street between the 313 and 314 Buildings.

Process Description: The main building was constructed in 1943 to store radioactive and mixed waste generated in the 300 Area. From 1943 to 1953, uranium and aluminum canned uranium was stored in the building. In 1953, the building was partitioned, floor trench drains and work benches were installed in the north room. In 1953 and 1978, outdoor storage pads (concrete and asphalt) were constructed to support the decontamination of aluminum reactor spacers until 1971. From 1953 to present, radioactive and mixed waste had been stored outside the building on the concrete, asphalt, and gravel pads. From 1971 to 1977, the north room was used for equipment decontamination and for storage. The interior walls were painted with a lead-based paint in 1977. Between 1977 and the fall of 1982 the unit was used to cure and test concreted billets of uranium chips and fines from the 304 Concretion Facility. Additional outdoor storage pads were installed in 1978 (asphalt) and in 1979 (concrete). From 1982 to 1986 the building continued to be used for equipment decontamination and storage. After 1986, the building was used to store containers of low-level radioactive waste and mixed waste.

Related Sites/ Structures: Structures associated with the 303-K Building include the other 303 Buildings, the 304

Related Sites/ Structures:	Building, the 333 Building, the 334-A Building, the 300 Area Waste Acid Treatment System, the exterior storage areas, and the process sewer system. The contaminated soil under and surrounding the facility was documented as WIDS site 300-251.
Waste Type:	Barrels/Drums/Buckets/Cans
Waste Description:	Since 1943, the building had been used to store various amounts of low-level radioactive wastes and mixed waste. Solids were stored outside, while liquids were contained inside the building. The mixed waste stored after January 1986 included: a. Neutralized solid waste for the unrecoverable uranium stream of the 300 Area Waste Acid Treatment System, b. Uranium contaminated metallic lead, c. Salt and sludge containers from beta and quench metal heat treatment furnaces, d. Uranium contaminated perchloroethylene, chloroform, and ethyl acetate, e. Beryllium/zircaloy-2 alloy chips and fines generated at the stepcut lathe, before and after concreting at the 304 Concretion Facility, f. Spent coolant from counterbore lathes in the 333 Building, g. Waste oil and hydraulic fluids that are known, or strongly suspected, to be contaminated with uranium, h. Salt crystals (copper fluorozirconate) from the bottom of the waste storage tanks in the 334-A Building, i. Acids (HNO ₃ , HF, and H ₂ SO ₄ mixtures) as a solution and sorbed on opal clay. There were no records of waste spills or leaks at the site. Note: Waste materials began being generated in 1943 with the construction and startup of this facility.
Closure Info:	Physical closure activities for the 303-K CWS were completed July 2002. Closure Certifications were prepared in accordance with the Washington Administrative Code (WAC) 173-303-610 and the approved 303-K Storage Facility Closure Plan, DOE/RL-90-04, Rev. 2A as amended by the Hanford Facility RCRA Permit, Part V, Chapter 14. The certifications attest that 303-K Storage Facility closure activities are complete and were performed in accordance with the approved closure plan. A Professional Engineer certified completion of closure on August 15, 2002. After closure activities were achieved and verified, Ecology-approved clean closure criteria for soils and structures. Ecology formally acknowledged the closure certification for the 303-K Storage Facility by letter, DOE/RL-02 RCA-0424, dated August 5, 2002.
	To complete the clean closure and in accordance with the closure plan, the entire 303-K Building was demolished. The rubble and excavated soil were designated and disposed of as low-level waste at the Hanford site Low Level Burial Grounds (LLBGs). After the site inspection, the soils were compacted and the site was backfilled with gravel.

Code:	304 CF	Classification:	Accepted
Names:	304 CF; 304 Concretion Facility	Reclassification:	Closed Out (11/30/1995)
Type:	Process Unit/Plant	Start Date:	1/1/1952
Status:	Inactive	End Date:	1/1/1995
Description:	The 304 Concretion Facility was designed and constructed in 1952. The main building is metal and rests on a concrete pad. The ceiling has exposed steel trusses (girders). The north and south ends of the building have sliding doors, and there are windows in the east side. Regular doors are located on the north and west sides. The building has no interior insulation or wallboard. Drainage to the process sewer is provided by a trench along the eastern wall, a sump along the western wall, a sink drain, and a floor drain. A metal change room was added on the east side of the building in 1972. The sliding metal doors are located in the north and west walls and a window is located on the east side of the change room. The walls and ceiling of this change room are insulated and covered by wallboard. There is a concrete pad on the north side of the building (WIDS Site 304 SA). During the history of the Facility, several exhaust and vent systems were used. The original system was composed of three roof vents powered by 58 cubic meters (2,050 cubic feet) per minute electric fans. This system was used from 1952 to the mid-1960's. The electricity was disconnected to the fans in 1971. When the building had furnaces for the melting of metals (1952 to the late 1950's), the furnace cooling air was exhausted		

through a 15.2 centimeter (6 inch) diameter exhaust pipe on the west side of the building. The exhaust pipe is still in place, but is sealed off in the sump (formerly a furnace pit). The first fume exhaust system was a 53.8 cubic meters (1,900 cubic feet) per minute Roto-clone exhauster and was used to exhaust acid and nitrogen oxide fumes from the nickel plating operations (late 1950's to mid-1960's). No monitoring capabilities existed on this exhaust system. The existing cyclone precipitator exhaust system replaced the plating operation exhaust system in 1971. Both exhausters were located on the concrete pad outside the east side of the building. The flow rate, manufacturer, and efficiency of the present cyclone exhaust system are unknown. The exhaust system was used to remove cement dust from the operator's work area when bags of cement were being emptied and the concrete mixer was in operation. After the air passed through the cyclone precipitator, it was discharged vertically approximately 3.66 meters (12 feet) above ground level. The discharge was sampled continuously for uranium particulates while the precipitator was in service. In addition to the exhaust systems described previously, the building contained a 939 square meters (10,000 square feet) per minute evaporative (swamp) cooler. Until approximately 1985, the swamp cooler was used to cool the building. The swamp cooler was located on the concrete pad outside the southeast corner of the building. The swamp cooler was removed in 1992. The Facility contains five drains that entered the process sewer. A floor drain near the cement mixer discharges to the sump where fines settled out. The sump has a removable screened standpipe, about 40.6 centimeters (16 inches) high, that overflowed into an underground drain line to the process sewer on the east side of the building. A water line discharged directly into the overflow pipe below the screen and was used when the concretion process was in operation. This flowing water (flow rate unknown) helped prevent the P-trap from plugging with concrete. Four other drains entered the main underground drain, including a drain from the east side floor trench, a drain from the sink in the southwest corner of the building, and overflow drain from the outside steam condensate quench sump on the east side of the building, and a drain from the swamp cooler on the exterior pad at the southeast corner of the building. The main underground drain slopes from the bottom of the sump to the process sewer. The elevation of the bottom of the main drain, where the drain passes under the east wall of the Facility, is about 116.1 meters (381 feet). The elevation of the bottom of the process sewer is about 115.5 meters (379 feet), and elevation of the Facility floor is about 117.7 meters (386 feet)

- Location:** The unit is located in the northwestern 300 Area on the south side of Ginko Street across from the 303-K, 314, and 313 Buildings.
- Release Description:** During concretion operations, the 304 Facility floor was washed down daily with water. Because the steel walls of the main building were not sealed to the concrete wall base until 1989, and there were numerous small holes in the walls, rinse water splashing against the steel walls might have carried contamination out of the building. In addition, there were no berms at the north and south doors to stop washdown water from leaving the building. The north fenced pad does not have a berm to contain spills or precipitation. The north sliding door normally was left open to allow forklift traffic for container transport. A billet fire in 1977 may have contributed to the spread of contamination within the building. In August 1977, high temperatures inside the 304 Facility (resulting from the failure of the cooling system) caused six concrete billets in 28.4 liter (7.5 gallon) containers to ignite. Uranium oxide and small amounts of zirconium oxide and copper oxide were formed by the burning billets. Cleanup water was drained through the drainage trenches into the process sewer. After the 1977 fire, concrete billets were cured initially in cold water cooling pans before being transported to the 303-K Facility where the final curing process took place.
- Process Description:** The 304 Concretion Facility consisted of a container storage area and a concretion system used to treat mixed waste and recyclable uranium scrap. The 304 Facility was in operation from 1952 to 1988. During this time, the following activities occurred: From 1952 to the late 1950's, the building was used as a pilot plant to fabricate aluminum-clad uranium cores by lead-dip canning process. From the late 1950's to the mid-1960's, the building was used as a pilot

plant to electroplate uranium with nickel. From the mid-1960's to 1971, the building was used to store engineering equipment and product chemicals. From 1971 to 1982 recyclable scrap uranium with zircaloy-2 and copper-silicon alloy chips and fines were concreted into billets. Beginning In 1977, the billets were cured in both the 304 Facility and 303-K Radioactive Mixed Waste Storage Facility (303-K Facility) before being shipped to Fernald, Ohio, for uranium recovery. From 1972 until 1986, beryllium/zircaloy-2 alloy and zircaloy-2 chips and fines were concreted in containers to reduce their ignitability. These containers were buried in the 200 Areas burial grounds. From 1975 to the spring of 1988, depleted uranium alloy chips and fines from Pacific Northwest Laboratory (PNL) were concreted into billets and returned to PNL for subsequent shipment to the 200 Areas burial grounds. In the spring of 1994, pyrophoric metal waste from dismantling of the 300 Area fuel processing equipment was concreted in drums to reduce ignitability. These drums were buried in a 200 Area burial ground. This is the final treatment activity planned for the 304 Facility. Waste treated in the 304 Facility was generated by processes in the 300 Area. The waste sources are summarized as follows. Beryllium/zircaloy-2 alloy and zircaloy-2 chips and fines that were stored temporarily at the 303-K Facility were concreted into containers to reduce their ignitability. From 1985, spent counterbore lathe coolant (an aqueous synthetic lubricant) from lathes in the 333 Building was stored at the 303-K Facility until it could be used as makeup water in the 304 Facility cement mixer during concretion of chips and fines. The coolant was a nonregulated material. The spent counterbore lathe coolant used for makeup water for concretion in the 304 Facility was Polar chip 350L, which was diluted with water 20 to 1. Besides uranium, copper-silicon alloy, zircaloy-2 alloy, and graphite particulate, the only other potential contaminant in the lathe coolant was AW Hydraulic Oil 32, used in the counterbore lathe. During concretion operations, the 304 Facility floor was washed down daily with water. Because the steel walls of the main building were not sealed to the concrete wall base until 1989 and there were numerous small holes in the walls, rinse water splashing against the steel walls might have carried contamination out of the building. In addition, there were no berms at the north and south doors to stop washdown water from leaving the building. The north fenced pad does not have a berm to contain spills or precipitation. The washing down of the floor is unlikely to have caused airborne contamination, because damp uranium saw fines and chips are too large and dense for easy air suspension. Uranium has a specific gravity of 18.9 and uranium oxides have a specific gravity of 7.3 to 10.9. Damp saw fines have a tendency to stick together and about 73 percent of new saw fines are greater than 100 mesh (150 microns). In addition, the cyclone precipitator was in operation at all times when the cement bags were emptied and the concrete mixer was in operation. During concretion operations, the north sliding door normally was left open to allow forklift traffic for container transport. A floor drain near the cement mixer discharged to the sump where fines settled out. The sump has a removable screened standpipe about 40.6 centimeters (16 inches) high that overflowed into an underground drain line to the process sewer on the east side of the building. A water line discharged directly into the overflow pipe below the screen and was used in the concretion process. This flowing water (flow rate unknown) helped prevent the P-trap from plugging with concrete, which happened at least twice during the operation of the 304 Facility. No radiation detectors were in the process sewer and no routine sampling of the process sewer from the 304 Building occurred. Sampling was done at the outflow from the combined 300 Area process sewer system. Once a year during the recyclable uranium concretion operation (1971 to 1982), a 3-day sample of the overflow pipe in the sump was taken to calculate a loss factor to the sewer for uranium chips and fines. The highly variable flow rate was calculated by adding a known dilute concentration of lithium nitrate (0.2 pound per gallon) at a known flow rate to the sump for a known sampling time. The change in lithium concentration and time would give the total volume of solution discharged from the sump. Until March 1975, all waste liquid chemicals in the fuels operation were discharged to the process sewer. Therefore, during the nickel-plating pilot plant operation (late 1950's to mid-1960's), waste chemicals from this operation in the 304 Facility would have entered the process sewer. Routine discharges of chemicals to the process sewer were terminated after March 1975. During concretion operations, the water that covered the uranium chips and fines, and 5 percent beryllium/zircaloy-2 chips in the incoming drums, were

drained into the process sewer after passing through the sump to settle out entrained solids. The water covering the chips and fines would have contained an unknown amount of cutting fluid from the lathe operations. Four different types of cutting fluids were used. In the summer of 1988, spent halogenated solvents consisting of perchlorethylene, 1,1,1-trichloroethane, and rinse water used in degreasing tanks in the fuels manufacturing process were stored at the 303-K and then moved to the 304 Facility for repackaging. Included in this repackaging effort was waste from the 300 Area paint and sign shop. Repackaging was accomplished by placement into new containers along with absorbent material. The containers were returned to the 303-K Facility. Handling and storage time for these spent solvents at the 304 Facility was less than 90 days. Ethyl acetate-bromine solutions generated from laboratory analysis work for uranium were occasionally mixed with the degreaser solvents. No spills were reported during this operation. It is recognized that several factors associated with operations may have resulted in contamination of the 304 Facility. These factors include use of the building to house pilot plants, concretion operations, the occurrence of a billet fire in 1977, repackaging of spent solvents and ethyl acetate-bromine solutions, and storage of spent counterbore lathe coolant inside the building and on the outside storage pad. One final concretion was run at the 304 Facility during the mid-1990's. This concretion run was used to treat and stabilize pyrophoric material generated during the final disassembly and removal of the fuels processing equipment. Prior to starting the final concretion run, all floor drains were to be plugged to prevent the entry of water. The concretion was done in the disposal containers to eliminate the need to use the cement mixer.

**Related Sites/
Structures:** Units associated with this site include the 304 Storage Area, the 300 Area Process Sewer, and internal process equipment.

Waste Type: Chemicals

**Waste
Description:** Radiological contamination (derived from building concretion and plating activities) on surfaces and in building piping may still be present. Hazardous wastes were addressed in the facilities RCRA closure plan.

The waste sources are described below.

Beryllium/zircaloy-2 alloy and zircaloy-2 chips and fines that were stored temporarily at the 303-K Facility were concreted into containers to reduce their ignitability.

From 1985, spent counterbore lathe coolant (an aqueous synthetic lubricant) from lathes in the 333 Building was stored at the 303-K Facility until it could be used as makeup water in the 304 Facility cement mixer during concretion of chips and fines. The coolant was a nonregulated material. The spent counterbore lathe coolant used for makeup water for concretion in the 304 Facility was Polar chip 350L, which was diluted with water 20 to 1. Besides uranium, copper-silicon alloy, zircaloy-2 alloy, and graphite particulates, the only potential contaminant in the lathe coolant was AW Hydraulic Oil 32, used in the counterbore lathe.

Once a year during the recyclable uranium concretion operation (1971 to 1982), a 3-day sample of the overflow pipe in the sump was taken to calculate a loss factor to the sewer for uranium chips and fines. The highly variable flow rate was calculated by adding a known dilute concentration of lithium nitrate 0.34 kilograms per liter (0.2 pounds per gallon) at a known flow rate to the sump for a known sampling time. The change in lithium concentration and time would give the total volume of solution discharged from the sump. No routine sampling of the process sewer from the 304 Building occurred.

Until March 1975, all waste liquid chemicals in the fuels operation were discharged to the process sewer. Therefore, during the nickel-plating pilot plant operation (late 1950's to mid-1960's), waste chemicals from this operation in the 304 Facility would have entered the process

sewer.

During concretion operations, the water that covered the uranium chips and fines, and 5 percent beryllium/zircaloy-2 chips in the incoming drums, were drained into the process sewer after passing through the sump to settle out entrained solids. The water covering the chips and fines would have contained an unknown amount of cutting fluid from the lathe operations. Four different cutting fluids were used.

In the summer of 1988, spent halogenated solvents consisting of perchloroethylene, 1,1,1-trichloroethane, and rinse water used in degreasing tanks in the fuels manufacturing process were stored at the 303-K Facility and then moved to the 304 Facility for repackaging. Occasionally, Ethyl acetate-bromine solutions generated from laboratory analysis work for uranium was mixed with degreaser solvents.

The maximum estimated inventory of containerized waste stored at the 304 Facility at any time was 40 containers. This total includes container sizes (not including overpacks) of 55, 30, and 7.5 gallons. Some of these containers contained labpacks, some were partially filled, and some were full. Up to 10 208 liter (55 gallon) containers could be concreted each day. An average of 9071.8 kilograms (20,000 pounds) of dangerous waste was concreted each year. The maximum amount stored inside was 2082 liters (550 gallons).

Closure Info: 304 CF and 304 SA were addressed as a group. The information below documents information for the group of sites.

The cleanup and closure strategy for the site was to decontaminate the interior of the 304 Building to remove known or suspected contamination, then to sample for the constituents of concern, and then to perform data analysis, with an evaluation to determine the required actions to meet closure criteria. Criteria for the 304 Concretion Facility was that the concentrations of potentially dangerous constituents treated, stored, or used not be present above the regulatory cleanup levels. If the potentially dangerous constituents are above action levels, then the evaluation was to determine the actions required. The evaluations could consider the type and extent to which the action levels were exceeded, and an assessment of health based risks. Generally, if the decontamination for dangerous constituents was not effective, the appropriate building section, floor, or pad was to be removed and properly disposed of as mixed waste. The radiological contamination at the 304 Concretion Facility was not addressed by the closure plan.

Phase I Decontamination was to vacuum to remove any loose contamination. Areas excluded from decontamination were the changeroom interior, all exterior surfaces of the 304 Building, and the exterior concrete and asphalt pads. All areas within the facility were vacuumed. No unusual incidents occurred.

Phase II decontamination was to damp wipe decontamination with a detergent solution to remove surface contamination. There were two areas that could not be decontaminated successfully, the sump and the trench. In both areas, the concrete on the sides and floor crumbled as it was wiped. The crumbling of the concrete prevented effective decontamination. There were approximately 75 millimeters (3 inches) of cement dust, sand, and chunks of semi-consolidated cement. The source of the sump material was the past concretion operations that used water to wash metallic fines and lose cement powder into the sump where the fines settled out. Both areas contained sampling points that were used to determine if any of the constituents of concern were present.

The facility connection to the Process Sewer is not part of the TSD (per the Closure plan).

Under Section 8.2 Postclosure Care of the 304 Concretion Facility Closure Plan (DOE/RL-90-03), the document states that the underlying soils and groundwater might have been

contaminated by waste generated during past practice operations in the 300 Area. All soil remediation will take place under the CERCLA remedial action process (WIDS Site 300-43). If the soil within the 304 Facility boundary is found to be contaminated from operations conducted in the 304 Facility, the 304 Facility will not be considered closed until the remediation under CERCLA is complete.

Code: 304 SA **Classification:** Accepted

Names: 304 SA; 304 Storage Area; 304 Building Storage Area **Reclassification:** Closed Out (11/30/1995)

Type: Storage **Start Date:** 1/1/1972

Status: Inactive **End Date:** 1/1/1986

Description: The 304 Storage Area is a concrete pad surrounded by asphalt on two sides.

Location: The unit is located in the northwestern 300 Area on the south side of Ginko Street across from the 303-K, 314, and 313 Buildings. The storage area is located on the north side of the 304 Building.

Process Description: The storage area was used to store potentially contaminated wastes generated in the fuel fabrication process.

Related Sites/Structures: The unit is associated with the 304 Concretion Facility (WIDS Site 304 CF).

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: No wastes are currently stored at the site. The area was previously used to store containers of potentially contaminated waste generated in the fuel fabrication process. The site was RCRA clean closed in 1995. Radiological contamination may be present on pad surfaces and in the surrounding soil.

Closure Info: 304 CF and 304 SA were addressed as a group. The information below documents information for the group of sites.

The cleanup and closure strategy for the site was to decontaminate the interior of the 304 Building to remove known or suspected contamination, then to sample for the constituents of concern, and then to perform data analysis, with an evaluation to determine the required actions to meet closure criteria. Code:	305-B SF	Classification:	Accepted
Names:	305-B SF; 305-B Storage Facility	Reclassification:	Closed Out (6/28/2007)
Type:	Storage	Start Date:	1/1/1978
Status:	Inactive	End Date:	
Description:	The 305-B Building is a one story frame and steel building with a basement. It was constructed in 1952 and modified in 1954. In January 1978, a two story high-bay was added for waste storage.		
Location:	The 305-B building is located in the northwest corner of the 300 Area, on Alaska Street, south of the 305 Building and north of 314. The storage areas were located in the basement and in the high bay area of the building.		
Process Description:	The 305-B facility was used to store, segregate, repackage, and sample hazardous and radioactive mixed waste generated by Pacific Northwest National Laboratory (PNNL) Research Laboratories in the 300 Area. Upon receipt at the 305-B Storage Facility, waste was placed in proper storage areas, depending on waste type and quantity. Dangerous waste was stored on the first floor, in the high bay area. Four storage cells were constructed in the high bay to segregate incompatible waste (Acids and Oxidizers, Poisons and CRV's, Caustics and WSDW and Organics). Non-flammable Radioactive Mixed Waste was stored in the basement of the original building. The area is capable of segregating wastes in four 7.6 meter by 7.6 meter (5 foot by 5 foot) stainless steel container pans. Flammable radioactive mixed waste could not be stored in the basement. Flammable material was stored in the east portion of the building in a 2.1 by 2.1 by 2.1 meter (7 foot by 7 foot by 7 foot) flammable liquid storage module. When a sufficient amount of waste has been accumulated, waste is transported to a permitted offsite treatment/disposal facility. Prior to use as a treatment storage and disposal facility, the unit housed two test reactors that operated from the mid 1950's until 1978.		
Related Sites/Structures:	The building is associated with waste generated from Research and Development operations (Pacific Northwest National Laboratory) PNNL in the 300 Area.		
Waste Type:	Barrels/Drums/Buckets/Cans		
Waste Description:	The site is currently used to store hazardous and mixed waste.		
Waste Type:	Chemicals		
Waste Description:	Chemical and radiological contamination may be present in and around the facility, due to the operation of the Physical Constants Test Reactor and the Thermal Test Reactor that operated in		

the building prior to 1978. In 1978 the building became a waste assembly area/satellite storage area for the 300 Area Research and Development facilities in the 300 Area. Hazardous and radioactive waste has been stored, repackaged and/or consolidated (mostly in 55 gallon drums) in the 305-B building high bay and basement. The designed storage capacity is 30,000 gallons.

Code:	307 RB	Classification:	Accepted
Names:	307 RB; 307 Retention Basins	Reclassification:	None
Type:	Retention Basin	Start Date:	1/1/1953
Status:	Active	End Date:	
Description:	The facility consists of four open, epoxy-coated, concrete basins. Each basin has a nominal 94,500 liter (25,000 gallon) capacity. The Retention Process Sewer (RPS) ties into the basins on the north side, passing through a sample pit northwest of retention basin #1. The 300 Area Process Sewer and the Radioactive Liquid Waste Sewer (RLWS) drain from the south side of the basins.		
Location:	The 307 Retention Basins are located directly south of the 340 Building and the 340 Vault. The basins are part of the 340 Complex. They are inside the 340 Complex fence.		
Process Description:	The retention basins are fed by the Retention Process Sewer (RPS) and currently discharge to the 300 Area Process Sewer. All facilities currently tied into the RPS are equipped with in-line beta-gamma detectors at diverter stations in the basement of each building. The 308 Building, now disconnected, did not have in-line detectors. In 1996, the diverter station in 326 was upgraded and took over duties for both the 326 and 329 Buildings. In the event that a detector trips the alarm, all RPS waste is routed to the Radioactive Liquid Waste Sewer (RLWS) by valves at the diverter station. Waste in the basin is then sampled. In the event that sampling detects basin waste above discharge limits, valves at the retention basins enable operations personnel to route basin effluent to the RLWS. Since 1995, retention waste below discharge limits is released to the 300 Area Treated Effluent Disposal Facility (TEDF). From 1975 to 1994, retention basin releases went to the 316-5 Process Trenches. From 1963 to 1975, it was released to the process ponds (WIDS Sites 316-1 and 316-2). From 1953 to 1963, retention waste below discharge levels was released to the 307 Trenches (316-3). With the retirement of the RLWS in 1998, waste above the discharge limits is held in the retention basins until it can be transported to the 200 Area double-shell tanks. Prior to 1998, waste above the discharge criteria was discharged to the RLWS and 340 Vault tanks. The waste sent to the 340 Vault tanks was transported by tanker truck or rail to the 200 Area for storage or disposal.		
Related Sites/Structures:	The 300 Area Process Sewer (WIDS Site 300-15), the Retention Process Sewer (RPS) (WIDS Site 300-214), the Radioactive Liquid Waste Sewer (RLWS) (WIDS Site 300 RLWS), Retired Radioactive Liquid Waste Sewer (RRLWS) (WIDS Site 300 RRLWS), and the 340 Complex (WIDS Site 340 Complex) are all associated with the 307 Retention Basin operations. Generating facilities tied into the RPS include the 324, 325, 326, 327, and 329 Buildings. The 308 Building was isolated from the system in 1996. The 325 Building will be the last facility to be isolated from the RPS.		
Waste Type:	Process Effluent		
Waste Description:	The Retention Process Sewer line and the 307 Retention Basin systems (the 3707-F control shack, the RPS sample pit, 307 Trench and RLWS diversion control, and other ancillary equipment) were installed to collect "potentially" contaminated liquids from the sinks, drains and sumps of the laboratory facilities. During FY98, 12 million liters (3 million gallons) of liquid was received by the retention basins; none was diverted to the Radioactive Liquid Waste Sewer (RLWS). Liquid effluents that meet process sewer discharge criteria are released to the process sewer. Waste that exceeds discharge limits is held until it can be transported to the 200 Area double-shell tanks. Prior to October 1, 1998, waste above discharge limits was diverted to		

the 340 facility holding tanks.

Code: 309-TW-1 **Classification:** Accepted
Names: 309-TW-1; 309 Holdup Tanks; 309-TW Tank #1 **Reclassification:** None
Type: Storage Tank **Start Date:** 1/1/1960
Status: Inactive **End Date:** 1/1/1973

Description: Tank 309-TW-1 is the northernmost tank in the 309 Holdup Tank System. All three tanks are located in a rectangular, underground concrete vault. A chain-link fence surrounds the site. Pumps, vents, piping, a valve box and the top of the concrete vault are visible above grade. The tanks are empty and the line to the sewer is capped. Residual contamination is present in the tanks and piping.

Location: The tank is located at the north end of a concrete vault northeast of the 309 Building.

Process Description: Contaminated liquid waste from the operation of the reactor was pumped to the holdup tanks prior to discharge to the radioactive liquid waste sewer.

Related Sites/Structures: Structures associated with the tank include the other two holdup tanks, the adjacent valve box, the 309 Building, and the 300 Area radioactive liquid waste sewer. WIDS Site 300-255 (309 Tank Farm Contaminated Soil) addresses the contaminated soil inside the 309 Tank Farm fence.

Waste Type: Process Effluent
Waste Description: The unit received aqueous nonhazardous radioactive wastes from the operation of the Plutonium Recycle Test Reactor. Residual contamination may be present in the empty tanks.

Code: 309-TW-2 **Classification:** Accepted
Names: 309-TW-2; 309 Holdup Tanks; 309-TW Tank #2 **Reclassification:** None
Type: Storage Tank **Start Date:** 1/1/1960
Status: Inactive **End Date:** 1/1/1973

Description: Tank 309-TW-2 is the center tank in the 309 Holdup Tank System. All three tanks are located in a rectangular, underground concrete vault. A chain-link fence surrounds the vault. Pumps, vents, piping, a valve box and the top of the concrete vault are visible above grade. The tanks are empty and the line to the sewer is capped. Residual contamination is present in the tanks and piping.

Location: The tank is located at the center of a concrete vault on the north east side of the 309 Building.

Process Description: Contaminated liquid waste from the operation of the reactor was pumped to the holdup tanks prior to discharge to the radioactive liquid waste sewer.

Related Sites/Structures: Structures associated with the tank include the other two holdup tanks, the adjacent valve box, the 309 Building, and the 300 Area radioactive liquid waste sewer. WIDS Site 300-255 (309 Tank Farm Contaminated Soil) addresses the contaminated soil inside the 309 Tank Farm fence.

Waste Type: Process Effluent
Waste Description: The unit received aqueous nonhazardous radioactive wastes from the operation of the Plutonium Recycle Test Reactor. Residual contamination may be present in the tanks.

Code: 309-TW-3 **Classification:** Accepted

Names: 309-TW-3; 309 Holdup Tank; 309-TW Tank #3 **Reclassification:** None

Type: Storage Tank **Start Date:** 1/1/1960

Status: Inactive **End Date:** 1/1/1973

Description: Tank 309-TW-3 is the southernmost tank in the 309 Holdup Tank System. All three tanks rest in a rectangular, underground concrete vault. A chain-link fence surrounds the vaults. Pipes and risers are visible above grade. The tanks are empty and the line to the sewer is capped. Residual contamination is present in the tanks and piping.

Location: The tank is located at the south end of a concrete vault on the northeast side of the 309 Building.

Process Description: Contaminated liquid waste from the operation of the reactor was pumped to the holdup tanks prior to discharge to the radioactive liquid waste sewer.

Related Sites/ Structures: Structures associated with the tank include the other two holdup tanks, the adjacent valve box, 309 Building, and the 300 Area radioactive liquid waste sewer. WIDS Site 300-255 (309 Tank Farm Contaminated Soil) addresses the contaminated soil inside the 309 Tank Farm fence.

Waste Type: Process Effluent

Waste Description: The unit received aqueous nonhazardous radioactive wastes from the operation of the Plutonium Recycle Test Reactor. Residual contamination may be present in the tank.

Code: 309-WS-1 **Classification:** Accepted

Names: 309-WS-1; PRTR Ion Exchange Vault; Reactor Ion Exchange Pit; 309 Plutonium Recycle Test Reactor Ion Exchanger Vault **Reclassification:** None

Type: Process Unit/Plant **Start Date:** 1/1/1961

Status: Inactive **End Date:** 1/1/1969

Description: The 309-WS-1 Vault is a below grade, reinforced concrete structure containing two levels. The vault has connecting piping to the dome. The upper (main vault) level housed the ion exchangers (IX) used for moderator cleaning, while the lower (resin disposal) level was used to store spent columns. The lower vault has been cleaned of debris, decontaminated and coated with a fixative paint. The upper vault was cleaned of debris and swept clean. Access to the upper vault is through shielding blocks and access to the lower vault is through two concrete plugs.

Location: The unit is located on the northeast side of the 309 Building containment dome.

Process Description: Prior to deactivation, the unit was used to remove contaminants from the heavy water and shield cooling systems.

Related Sites/ Structures: The 309 Plutonium Recycle Test Reactor (PRTR) Building is the only structure associated with the vault.

Waste Type: Chemicals

Waste Description: Following deactivation activities, residual radiological contamination and chemical contamination from the ion exchange resin may be present on surfaces in the vault. Contaminants of concern are cesium-137 and strontium-90. The rainwater (in the lower vault) and ion exchange columns were removed in 1995.

Code: 309-WS-2 **Classification:** Accepted

Names: 309-WS-2; Ion Exchange Vault; PRTR Rupture Loop; RLAIIX; Rupture Loop Annex Ion Exchange Loop Vault; Rupture Loop Ion Exchange Pit **Reclassification:** None

Type: Process Unit/Plant **Start Date:** 1/1/1960

Status: Inactive **End Date:** 1/1/1969

Description: The 309-WS-2 Ion Exchange Vault (RLAIIX) is an underground, reinforced concrete structure. The unit is divided into five stalls. Four stalls held horizontally configured ion exchange columns, while the fifth stall is covered by a steel plate. A drain in the fifth bay discharged to a sump in Room 20 of the 309 Building. A rain cover has been installed over the top of the vault to prevent water from entering the vault.

Location: The unit is located off of the northwest side of the 309 Containment Dome.

Process Description: The ion exchange columns were used to remove contaminants and fission fragments from the light water coolant.

Related Sites/Structures: The Fuel Element Rupture Test Facility, the Rupture Loop Annex (also known as Room 20), and the 309 Plutonium Recycle Test Reactor Building are associated with the unit.

Waste Type: Equipment

Waste Description: Stabilized radiological contamination is present on vault surfaces. Contaminants of concern are transuranics, cesium-137 and cobalt-60. Prior to stabilization, survey reports indicate radiological contamination levels were as high as 70,000 disintegrations per minute per square centimeter beta-gamma and 28,000 disintegrations per minute per square centimeter alpha and with contact dose rates up to 2.5 rem per hour. After cleanout and stabilization, contamination levels were less than 1,000 disintegrations per minute per square centimeter beta-gamma, less than background (3 counts per minute) alpha, and a dose rate of less than 0.5 millirem per hour.

Code: 309-WS-3 **Classification:** Accepted

Names: 309-WS-3; 309 Brine Tank **Reclassification:** None

Type: Storage Tank **Start Date:** 1/1/1960

Status: Inactive **End Date:** 1/1/1969

Description: The unit has been backfilled, and grass has been planted above the tank. The Brine Tank is a below grade, rectangular concrete structure with two chambers. Access/loading ports were installed on the top of the tank. Inside the tank, four perforated transite pipes ran the length of the main chamber. The pipes were suspended in a gravel filter bed and covered by a layer of sand. The second chamber acted as a holding tank.

Location: The unit is located below grade, off the southwest corner of the 309 Building.

Process Description: The unit has been backfilled and is inactive. During use the container held salt that was slurried and pumped through plastic pipes to three brine tanks located in the basement of 309 Building. These tanks supplied process water used to cool several small heat exchangers for the reactor.

Related Sites/Structures: Structures associated with this unit include the brine tanks in the 309 Building basement, the reactor heat exchange systems, and the liquid transfer lines.

Waste Type: Chemicals

Waste Description: The unit stored brine salt to be used by the process water/brine tanks within the basement of the 309 Building.

Related Sites/ Structures: Structures associated with the tank include 311-TK-40, the 303-F Building, the Pipe Trench, the 300 Area Waste Acid Treatment System equipment in the Uranium Recovery Room of the 313 Building, and the 340 Facility.

Waste Type: Chemicals

Waste Description: The unit received waste solutions consisting of neutralized liquid from the nonrecoverable uranium stream and filtrate from processing of the uranium-bearing waste stream. The tank was used to decant liquid waste.

Closure Info: The site has been clean closed under the 300 Area WATS Partial Closure in 2001. It is covered under a RCRA Part A Permit Application, and the closure plan was filed with Ecology in 1990. A Decontamination and Decommissioning Plan has been issued for Phase III closure of the 300 Area Waste Acid Treatment System which includes this tank. Tank 311-TK-50 will remain in place after closure. It has been decontaminated in-place to a 'clean debris surface' standard. The stainless steel jacket and insulation will be removed to allow full inspection. The insulation will be sampled based on visual observations (of worst case matrix). Residue samples from tank TK-50 along with samples of the liquid/sludge drained from the piping and the pumps and filters (which were located in the 303-F Building) were used to characterize the tank TK-50 subsystem. The liquids which contained 8% solids had a pH of 10.4. ICP lab results for both liquids and solids samples reported less the regulatory limit (see WAC 173-303-090, Toxicity Characteristic List) for all RCRA metals. Similarly, the sample of solids was determined by TCLP to have less than the regulatory limit for all RCRA metals. A dried sample of process residue from inside tank TK-50 was analyzed and shown to be non-corrosive, contained no beryllium and included less than the regulatory limit for RCRA metals. A sample of the filter element contained in the upstream in-line filter housing was removed and sent to the lab for analysis. This information will be used to determine disposal or applicable WATS Phase III waste. The constituents contained in the filter element are expected to have been indicative of the materials processed during the final WATS operations, which were all managed in tank TK-50. The sample of the filter element was determined by TCLP to have less than the regulatory limit for all RCRA metals, a pH of 7.42, no detectable beryllium and no detectable PCBs.

Code:	313 CENTRIFUGE	Classification:	Accepted
Names:	313 Centrifuge; 313 CENTRIFUGE; 300 Area WATS	Reclassification:	Closed Out (12/6/2001)
Type:	Process Unit/Plant	Start Date:	1/1/1985
Status:	Inactive	End Date:	1/1/1997
Description:	This site has been clean closed under the 300 Area Waste Acid Treatment System (WATS) Partial Closure. The centrifuge was removed in 1997 and disposed of as low level solid waste.		
Location:	The centrifuge was located in the Uranium Recovery Room in the southern end of the 313 Building in the 300 Area.		
Process Description:	The centrifuge was installed in 1985 to reduce the solids content of the final neutralized waste prior to trucking out to the 200 Areas for disposal. Neutralized acid waste was pumped from 313-TK-2 through the centrifuge to 313-TK-11 and then via piping in the pipe trench to the waste storage tanks 311-TK-40 and 311-TK-50 in the 311 Tank Farm. The centrifuge solids were drummed and sent to 303-K for storage prior to burial as low-level solid waste. As needed, the stored waste solutions in Tanks 40 and 50 were recycled through in-line filters in the 303-F Building and back via the pipe trench to the Uranium Recovery Room in the 313 Building for additional solids removal. The 313 Centrifuge and the 313 Filter Press were both used during such recycle activities.		

Related Sites/ Structures: Structures associated with the unit include transfer lines, 313-TK-2, 313-TK-11, the 313 Filter

until pumped from the 313 Building to a 15,100 liter waste storage loadout tank (TK 40) in the 311 Tank Farm via piping in the pipe trench. The filter press was periodically opened to scrape the sodium diuranate solids from the canvas filter cloth on each filter press frame. The solids were put into 114 liter (30 gallon) drums and transferred to the 303-K Building (see 303-K CWSF) for storage pending shipment off-site for uranium recycle.

Related Sites/ Structures: Structures associated with the unit include the U-Bearing Acid storage tanks (TK 3 and TK4), the Caustic Feed Tanks (TK5 and TK6), the Neutralization and Precipitation Tank (TK7), the Filter Press Feed Tank (TK8), and the Filtrate Storage Tanks (TK 9 and TK-10) in the Uranium Recovery Room of the 313 Building, the neutralized liquid effluent storage and load-out tank (TK 40) in the 311 Tank Farm, and the 303-K Contaminated Waste Storage Facility. The 300 Area Waste Acid Treatment System Pipe Trench and the Process Sewer supported the operation of the 313 Filter Press. Contaminated soil under this facility is site UPR-300-38.

Waste Type: Chemicals

Waste Description: The unit treated recoverable and nonrecoverable uranium-bearing waste acid by separating solid and liquid phases. Residual radiological and chemical contamination may be present.

Closure Info: This site has been clean closed.

In December 1996, a Decontamination and Inspection Plan was issued for Phase 1 closure of the 300 Area Waste Acid Treatment System. The equipment in the Uranium Recovery Room in the 313 Building including the 313 Filter Press was removed and buried as low level solid waste in the 200 Area in 1997. During the Phase 1 work, the contaminated areas of the floors in the Uranium Recovery Room were cleaned by scabbling. A few small floor cracks, some exposed acid brick, and one construction joint connected to the soil beneath the facility were identified prior to performing the decontamination and inspection outlined in the plan for Phase 1 closure activities. Ecology completed an inspection of the cleaned site in October 1997 and agreed that removal was done in accordance with this plan. A RCRA closure plan was issued in 1990 for the 300 Area Waste Acid Treatment System which included the Uranium Recovery Operations in the 313 Building, with revisions in 1996 and 1999.

Code: 313 URO	Classification: Accepted
Names: 313 URO; Uranium Recovery Operations; 313 Uranium Recovery Operations	Reclassification: Closed Out (2/12/1999)
Type: Process Unit/Plant	Start Date: 1/1/1954
Status: Inactive	End Date: 1/1/1997
Description: In 1997, the 313 Uranium Recovery Operation process equipment and piping were removed and the concrete surfaces scabbled and decontaminated. Past practice sub-floor contamination remains to be addressed as well as the potential for some minor RCRA contributions to subfloor contamination.	
Location: The unit is located along the north wall of the Uranium Recovery Room in the south end of the 313 Building.	
Release Description: See the WIDS site that describes the unplanned releases (WIDS Site UPR-300-38) associated with this area. All of the RCRA/CERCLA releases identified for the soils in this area will be addressed as part of UPR-300-38. Also see WIDS Site UPR-300-44 which involved a leak in a section of the process sewer line that was detected in January 1985. This leak in the process sewer line downstream from the 313 URO could have allowed uranium-bearing waste spills to have reached the ground beneath the process sewer. Also see WIDS Site UPR-300-45, a waste transfer line leak to the pipe trench between the 313 URO and the 303-F Building. Because the pipe trench bottom has holes in it, this site leaked to the soil column.	

Process Description: The 313 Uranium Recovery Operations (URO) processed uranium-bearing acid wastes from the fuel fabrication processes to recover uranium for recycle. U-bearing acid wastes were received from the 313 Fuels Operations until 1971. From 1961 until shutdown in 1987, U-bearing waste acid solutions were transferred from tank TK-24 in the 333 Building to two outside storage tanks on the west side of the 333 Building. The U-bearing waste acid was pumped from the outside storage tanks via the pipe trench to the 313 Building tanks TK-3 and TK-4 in the Uranium Recovery Room. The uranium was recovered by precipitation and filtration. U-bearing acid waste was metered into TK-7 where sodium hydroxide (from Tanks 5 and 6) was added to neutralize the acid and precipitate uranium as sodium diuranate. The basic slurry was collected in tank TK-8 and pumped through a plate and frame filter (see 313 FP) to remove the uranium. The filtrate was collected in tanks TK-9 and TK-10 for storage and pumping to the 311 Tank Farm via the Pipe Trench. Periodically, the uranium solids were scraped off the removable canvas filter cloth into 30-gallon drums. The drums were taken to the 303-K Facility for storage pending off-site shipment for uranium recycle.

Related Sites/Structures: Facilities associated with the uranium recovery operation include two U-bearing Acid Waste storage tanks located outside the west wall of the 333 Building (flushed and disconnected), U-Bearing Waste Acid Storage tank (333-TK-24) inside the 333 Building (flushed and disconnected), the 311 Tank Farm (sodium hydroxide supply tank and the neutralized acid waste storage tanks TK-40 and TK-50, both flushed and disconnected), the 303-F Building (pumps, in-line filters, piping removed), and the Pipe Trench that contains piping which connected the 313 URO to the other facilities and processes and to the Process Sewer. Tanks 313-TK-5 and 313-TK-6 contained sodium hydroxide used in the neutralization and precipitation process.

Waste Type: Equipment

Waste Description: The equipment contained uranium-bearing acid wastes from fuel fabrication processes that were used to treat and recover uranium. All contaminated equipment was removed from the facility.

Closure Info: Tanks TK-5, TK-9, TK-10, and the filter press (WIDS Site 313 FP) are shared equipment with the Waste Acid Treatment System (WATS). This equipment was removed under a Decontamination and Inspection Plan for Phase 1 WATS closure activities. Ecology inspected the 313 WATS area in October 1997 and concurred that the work was completed in accordance with the Phase 1 Plan. All other 313 URO equipment was also removed in 1997.

Code: 313-TK-2	Classification: Accepted
Names: 313-TK-2; 300 Area Waste Acid Treatment System; 313 Waste Acid Neutralization Tank	Reclassification: Closed Out (12/6/2001)
Type: Neutralization Tank	Start Date: 1/1/1975
Status: Inactive	End Date: 1/1/1997

Description: This site has been clean closed under the 300 Area WATS partial closure in 2001. The 313-TK-2 Neutralization Tank was removed in 1997. The tank was part of the 300 Area Waste Acid Treatment System. The vertical, stainless steel, cylindrical tank was located within a bermed area with other uranium recovery and acid treatment equipment.

Location: The unit was installed inside a bermed area near the southwest interior corner of the 313 Building.

Process Description: From 1973 to 1988, Tank 313-TK-2 was used to neutralize chemical waste acid solutions with sodium hydroxide (caustic). The waste acid originated in zircaloy etching tanks in the 333 Building fuels fabrication process which was periodically batched out to spent acid storage tanks in the 334-A Facility. The waste acid was pumped through transfer lines (300-219) in the Pipe Trench (300-224) to Tank 313-TK-2 for neutralization. The neutralized etch waste in 313-

TK-2 was pumped in piping via the Pipe Trench to Tank 311-TK-40 in the 311 Tank Farm.

Related Sites/ Structures: Structures associated with this site include 334-A Building Tank Farm, the 311 Tank Farm, Tanks 311-TK-40 and 311-TK-50, the 313 Uranium Recovery Room, the 313-Centrifuge, the 303-F Facility, and the Pipe Trench (300-224), all of which are components of the 300 Area Waste Acid Treatment System.

Waste Type: Chemicals

Waste Description: The unit treated uranium-bearing acid waste by neutralization. Prior to removal of the tank, a precipitate cake was present in the bottom of the tank.

Closure Info: This site has been clean closed. A RCRA closure plan was issued in 1990 for the 300 Area Waste Acid Treatment System which included the Uranium Recovery Operations in the 313 Building. Revision 1 of the RCRA closure plan was submitted to Ecology in March 1996. Tank 313-TK-2 was removed in 1997 in accordance with the Decontamination and Inspection Plan for Phase 1 closure of the 300 Area Waste Acid Treatment System. Ecology inspected the cleanup site in October 1997 and concurred that the work was done in accordance with the D&IP Phase 1 plan.

Code: 315 RSDF **Classification:** Accepted

Names: 315 RSDF; 315 Retired Sanitary Drain Field **Reclassification:** Rejected (1/27/1999)

Type: Drain/Tile Field **Start Date:** 1/1/1950

Status: Inactive **End Date:** 1/1/1978

Description: The 315 RSDF is an abandoned septic tank and drain field. The location shown by maps and drawings is not marked in the field. The site is covered with a surface of gravel and cobbles and no vegetation. There are manhole covers with protective posts located in close proximity to the abandoned septic tank/drain field.

Location: The site is located in the eastern portion of the 300 Area, northeast of the 315 Water Filter Plant.

Process Description: The 315 RSDF received sanitary waste that originated in the 315 Water Filter Plant.

Related Sites/ Structures: The site was associated with the 315 Water Filter Plant Sanitary Sewer.

Waste Type: Sanitary Sewage

Waste Description: The unit received unknown amounts of sanitary wastes from the 315 Water Filter Plant.

The authors of the 300-FF-2 Operable Unit Technical Baseline Report speculated that water treatment chemicals may have been discharged to the site, but no supporting documentation for this has been found. According to Jim Day, Dyncorp Water Utilities and Support Services, the only chemicals used at the facility were alum (nonhazardous) and chlorine gas.

Code: 323 TANK 1 **Classification:** Accepted

Names: 323 Tank 1; 321 Building Underground Waste Tanks; 321 Tank Farm #3 **Reclassification:** None

Type: Storage Tank **Start Date:** 1/1/1944

Status: Inactive **End Date:**

Description: The 323 Tank 1 is not visible or accessible. It is encased in concrete with a minimum of 1 foot thickness to an outside surface. The tank (waste site) is a carbon steel horizontal tank on the

west side of three other (identical) tanks encased in a large block of concrete. The top of the concrete block was used as the floor for the installation of the 323 Building (lower level) in 1958. The embedded tank originally had two 4 inch diameter and one 20 inch diameter pipe nozzle connections from the top of the tank through the concrete surface. None of these pipe nozzles are presently visible. 323 Tank 1 is the westernmost tank of the four tanks in the concrete encasement beneath the 323 Building. The 323 Building is posted "Authorized Personnel Only." The roll-up door on the east side of the building is posted "Radioactive Material Area, Entry Requirements: Radiological Worker 1 Training (If Unescorted)" and "Caution, Overhead Areas Are Not Routinely Surveyed. Contact Radiological Control Prior To Entry. The 323 Building lower level is crowded with mechanical and thermal test equipment. Process cooling water drain trenches in the concrete floor drain to a sump which discharges to the area process sewer.

Location:	The site lies beneath the 323 Building, in the west central portion of the 300 Area.
Release Description:	According to BHI-00012, contamination in the soil surrounding the four tanks is possible. According to WHC-MR-0388, the soil around and beneath the four tanks and the tanks themselves are very contaminated with mixed wastes. Analyses of liquid and sludge samples from Tank 4 in 1987 reported uranium and aluminum in significant quantities. These contaminants would have been introduced during the period the tanks were used to support the 321 Building chemical process development operations prior to 1967. The source of reports that thorium was associated with the waste in the underground waste tanks may have been with reference to the disposal of lab waste solutions from the 3706 Building. In 1944, the "hot" sinks in the 321 Building laboratories were connected to the underground tanks to eliminate sources of fission activity and product contamination of the 300 Area pond. At the same time, it was planned to dispose of active waste from the 3706 laboratories by collecting the wastes in individual containers and emptying them into the "hot" sinks in the 321 Building. Thorium was used during process development tests in the 3706 Building laboratories. According to operating personnel contacted, thorium was not used in the 321 Building process development tests.
Process Description:	The carbon steel tank received neutralized uranium-bearing process waste and/or basic aluminum cladding contaminated waste solutions from the 321 Building, primarily from cold and hot pilot tests for the bismuth phosphate chemical separations process from 1944 to about 1946. Some neutralized uranium-bearing waste solutions were received from the 321 Building Tank Farm during the pilot plant tests for the REDOX process. Lesser quantities of process wastes containing fission products, uranium, plutonium, and laboratory chemicals were routed to the tank from the "hot sinks" in the 321 Building laboratories from 1944 to about 1954 during the development of the Bismuth Phosphate, Redox, Uranium Metal Recovery, PUREX, RECUPLEX, and Thorex processes and from lab scale tests on medical isotope extraction processes. Beginning in late 1944, "hot" wastes from the 3706 Building laboratories were carried to the 321 Building for disposal via the "hot sinks" to prevent contamination of the 300 Area Ponds.
Related Sites/ Structures:	The tank is associated with three other identical tanks in the same concrete encasement, the 323 Building (formerly the 321-A Building), the 321 Building, and the 3706 Building labs by way of the hot sink drains in the 321 Building labs.
Waste Type:	Process Effluent
Waste Description:	The tank received neutralized uranium-contaminated water and/or basic aluminum cladding waste solutions from reprocessing research and development activities in the 321 Building and the 3706 Building (via the hot sink drains in the 321 Building laboratories), including those related to bismuth phosphate chemical separations, REDOX, Uranium Metal Recovery, PUREX, RECUPLEX, the Thorex program, and medical isotope extraction. The tank was emptied in 1952 or 1953.

Code:	323 TANK 2	Classification:	Accepted
Names:	323 Tank 2; 321 Building Underground Waste Tanks; 321 Tank Farm #3	Reclassification:	None
Type:	Storage Tank	Start Date:	1/1/1944
Status:	Inactive	End Date:	
Description:	<p>The 323 Tank 2 is not visible or accessible. It is encased in concrete with a minimum of 1-foot thickness to an outside surface. The tank (waste site) is a carbon steel horizontal tank, one of four identical tanks encased in a large block of concrete. The top of the concrete block was used as the floor for the installation of the 323 Building (lower level) in 1958. The embedded tank originally had two 4-inch diameter and one 20-inch diameter pipe nozzle connections from the top of the tank through the concrete surface. None of these pipe nozzles are presently visible. 323 Tank 2 is the second tank from the west side of the concrete encasement beneath the 323 Building. The 323 Building is posted "Authorized Personnel Only." The roll-up door on the east side of the building is posted "Radioactive Material Area, Entry Requirements: Radiological Worker 1 Training (If Unescorted)" and "Caution, Overhead Areas Are Not Routinely Surveyed. Contact Radiological Control Prior To Entry. The 323 Building lower level is crowded with mechanical and thermal test equipment. Process cooling water drain trenches in the concrete floor drain to a sump which discharges to the area process sewer.</p>		
Location:	<p>The site lies below the 323 Building, in the western portion of the 300 Area.</p>		
Release Description:	<p>According to BHI-00012, contamination in the soil surrounding the four tanks is possible. According to WHC-MR-0388, the soil around and beneath the four tanks and the tanks themselves are very contaminated with mixed wastes. The source of reports that thorium was associated with the waste in the underground waste tanks may have been with reference to the disposal of lab waste solutions from the 3706 Building. In 1944, the "hot" sinks in the 321 Building laboratories were connected to the underground tanks to eliminate sources of fission activity and product contamination of the 300 Area pond. At the same time, it was planned to dispose of active waste from the 3706 laboratories by collecting the wastes in individual containers and emptying them into the "hot" sinks in the 321 Building. Thorium was used during process development tests in the 3706 Building laboratories. According to operating personnel contacted, thorium was not used in the 321 Building process development tests.</p>		
Process Description:	<p>The carbon steel tank received neutralized uranium-bearing process waste and/or basic aluminum cladding contaminated waste solutions from the 321 Building, primarily from pilot tests for the bismuth phosphate chemical separations process from 1944 to about 1946. Some neutralized uranium-bearing waste solutions were received from the 321 Building Tank Farm during the pilot plant tests for the REDOX process. Lesser quantities of process wastes containing fission products, uranium, plutonium, and laboratory chemicals were routed to the tank from the "hot sinks" in the 321 Building laboratories from 1944 to about 1954 during the development of the Bismuth Phosphate, Redox, Uranium Metal Recovery, PUREX, RECUPLEX, and Thorex processes and from lab scale tests on medical isotope extraction processes. Beginning in late 1944, "hot" wastes from the 3706 Building laboratories were carried to the 321 Building for disposal via the "hot sinks" to prevent contamination of the 300 Area Ponds.</p>

Waste Type:	Process Effluent		
Waste Description:	<p>The tank received neutralized uranium-contaminated water and/or basic aluminum cladding waste solutions from reprocessing research and development activities in the 321 Building and</p>		

the 3706 Building (via the hot sink drains in the 321 Building laboratories), including those related to bismuth phosphate chemical separations, REDOX, Uranium Metal Recovery, PUREX, RECUPLEX, the Thorex program, and medical isotope extraction. The tank was emptied in 1952 or 1953.

Code: 323 TANK 3	Classification: Accepted
Names: 323 Tank 3; 321 Building Underground Waste Tanks; 321 Tank Farm #3	Reclassification: None
Type: Storage Tank	Start Date: 1/1/1944
Status: Inactive	End Date:

Description: The 323 Tank 3 is not visible or accessible. It is encased in concrete with a minimum of 1-foot thickness to an outside surface. The tank (waste site) is a carbon steel horizontal tank, one of four identical tanks encased in a large block of concrete. The top of the concrete block was used as the floor for the installation of the 323 Building (lower level) in 1958. The embedded tank originally had two 4-inch diameter and one 20-inch diameter pipe nozzle connections from the top of the tank through the concrete surface. None of these pipe nozzles are presently visible. 323 Tank 3 is the third tank from the west side of the concrete encasement beneath the 323 Building. The 323 Building is posted "Authorized Personnel Only." The roll-up door on the east side of the building is posted "Radioactive Material Area, Entry Requirements: Radiological Worker 1 Training (If Unescorted)" and "Caution, Overhead Areas Are Not Routinely Surveyed. Contact Radiological Control Prior To Entry. The 323 Building lower level is crowded with mechanical and thermal test equipment. Process cooling water drain trenches in the concrete floor drain to a sump which discharges to the area process sewer.

Location: The site lies beneath the 323 Building, in the western portion of the 300 Area.

Release Description: According to BHI-00012, contamination in the soil surrounding the four tanks is possible. According to WHC-MR-0388, the soil around and beneath the four tanks and the tanks themselves are very contaminated with mixed wastes. The source of reports that thorium was associated with the waste in the underground waste tanks may have been with reference to the disposal of lab waste solutions from the 3706 Building. In 1944, the "hot" sinks in the 321 Building laboratories were connected to the underground tanks to eliminate sources of fission activity and product contamination of the 300 Area pond. At the same time, it was planned to dispose of active waste from the 3706 laboratories by collecting the wastes in individual containers and emptying them into the "hot" sinks in the 321 Building. Thorium was used during process development tests in the 3706 Building laboratories. According to operating personnel contacted, thorium was not used in the 321 Building process development tests.

Process Description: The carbon steel tank received neutralized uranium-bearing process waste and/or basic aluminum cladding contaminated waste solutions from the 321 Building, primarily from pilot tests for the bismuth phosphate chemical separations process from 1944 to about 1946. Some neutralized uranium-bearing waste solutions were received from the 321 Building Tank Farm during the pilot plant tests for the REDOX process. Lesser quantities of process wastes containing fission products, uranium, plutonium, and laboratory chemicals were routed to the tank from the "hot sinks" in the 321 Building laboratories from 1944 to about 1954 during the development of the Bismuth Phosphate, Redox, Uranium Metal Recovery, PUREX, RECUPLEX, and Thorex processes and from lab scale tests on medical isotope extraction processes. Beginning in late 1944, "hot" wastes from the 3706 Building laboratories were carried to the 321 Building for disposal via the "hot sinks" to prevent contamination of the 300 Area Ponds.

Related Sites/ Structures: The tank is associated with the 323 Building, the 321 Building, and the 3706 Building by way

Structures: of the 321 Building hot sink drains.

Waste Type: Process Effluent

Waste Description: The tank received neutralized uranium-contaminated water and/or basic aluminum cladding waste solutions from reprocessing research and development activities in the 321 Building and the 3706 Building (via the hot sink drains in the 321 Building laboratories), including those related to bismuth phosphate chemical separations, REDOX, Uranium Metal Recovery, PUREX, RECUPLEX, the Thorex program, and medical isotope extraction. The tank was emptied in 1952 or 1953.

Code: 323 TANK 4 **Classification:** Accepted

Names: 323 Tank 4; 321 Building Underground Waste Tanks; 321 Tank Farm #3 **Reclassification:** None

Type: Storage Tank **Start Date:** 1/1/1944

Status: Inactive **End Date:** 1/1/1987

Description: The 323 Tank 4 is a horizontal, cylindrical, underground carbon steel tank. The tank has rounded ends. The concrete enclosure around the tank includes a drain trench below the length of the tank which empties into a concrete sump at the south end. The sump was used for tank leak detection. The tank is the easternmost tank in a series of four tanks that lie in a concrete enclosure beneath the 323 (321-A) Building. Pearson (1987) issued an inspection report which included a photo of the open access to the tank through the modified center manhole. The 323 Building is posted "Authorized Personnel Only." The roll-up door on the east side of the building is posted "Radioactive Material Area, Entry Requirements: Radiological Worker 1 Training (If Unescorted)" and "Caution, Overhead Areas Are Not Routinely Surveyed. Contact Radiological Control Prior To Entry."

Location: The underground tank is located beneath the 323 Building, in the western portion of the 300 Area.

Release Description: According to BHI-00012, contamination in the soil surrounding the four tanks is possible. According to WHC-MR-0388, the soil around and beneath the four tanks and the tanks themselves are very contaminated with mixed wastes.

Process Description: Between 1944 and 1945, the tank received neutralized uranium-bearing wastes from cold and hot bismuth phosphate pilot tests in the 321 building. Between 1945 and 1953, the tank received neutralized uranium-contaminated water and/or basic aluminum cladding waste solutions from reprocessing research and development activities in the 321 Building and the 3706 Building (via the hot sink drains in the 321 Building laboratories), including those related to bismuth phosphate chemical separations, REDOX, Uranium Metal Recovery, PUREX, RECUPLEX, the Thorex program, and medical isotope extraction. Between 1945 and 1953, the tank may have received uranium-contaminated water and acid solutions from reprocessing research and development activities in the 321 Building, including those related to bismuth phosphate chemical separations, REDOX, PUREX, RECUPLEX, the Thorex program, and medical isotope extraction. Between 1968 and 1987, the tank received waste from the 323 Building, including the hot cell drain, the cleanup box drain and overflow from the process water sump. The tank has not received waste since 1987.

Related Sites/Structures: The tank is associated with the 321 Building and the process sewer. It is also associated with the 323 hot cell, the cleanup box and the process water sump.

Waste Type: Process Effluent

Waste Description: Between 1945 and 1953, the tank received neutralized uranium-contaminated water and/or basic aluminum cladding waste solutions from reprocessing research and development

activities in the 321 Building and the 3706 Building (via the hot sink drains in the 321 Building laboratories), including those related to bismuth phosphate chemical separations, REDOX, Uranium Metal Recovery, PUREX, RECUPLEX, the Thorex program, and medical isotope extraction. The tank was emptied in 1952 or 1953. Between 1968 and 1987, the tank received waste from the 323 Building, including the hot cell drain, the cleanup box drain and overflow from the process water sump. The tank has not received waste since 1987. In 1987, the tank contained liquid and sludge. Significant uranium and aluminum was detected, but no thorium was detected in either the liquid or the sludge. The uranium and aluminum contamination would have entered the tank prior to 1967.

Code: 325 WTF **Classification:** Accepted

Names: 325 WTF; 325 Hazardous Waste Treatment Units; 325 Waste Treatment Facility **Reclassification:** None

Type: Process Unit/Plant **Start Date:** 1/1/1953

Status: Active **End Date:**

Description: The 325 Waste Treatment Facilities (WTF) consist of two sections. The first section, the shielded analytical laboratory, is located in Rooms 32, 200, 201, 201A, 202, and 203. The second section includes the hazardous waste treatment units, located in Rooms 520, 527A, and 528. All facilities are part of the 325 Building. The building is constructed of welded steel framework covered with fluted steel insulated panels. The first and second floors are steel deck, topped with concrete and vinyl. The roof is steel deck topped with tar and gravel.

Location: The 325 Waste Treatment Facilities are located in the 325 Building. The shielded analytical laboratory is located on the west side of the 325 Building. The hazardous waste treatment unit is located on the northeast side of the 325 Building.

Process Description: Mixed waste treatment in the shielded analytical laboratory includes the following processes: pH adjustment, ion exchange, evaporation, precipitation and solvent extraction, solids washing, phase separation, and solidification. The shielded analytical laboratory processes are conducted as small, bench-scale operations. Treatment processes conducted in the hazardous waste treatment units include: pH adjustment, ion exchange, carbon absorption, oxidation/reduction, evaporation, precipitation/filtration, phase separation, catalytic destruction, and solidification.

Related Sites/Structures: Structures associated with this unit include other 325 Laboratories, the 300 Area Process Sewer, 300 Area Radioactive Liquid Waste Sewer, the Physical and Chemical Treatment Test Facilities, the Thermal Treatment Test Facilities, and the Biological Treatment Test Facilities.

Waste Type: Chemicals

Waste Description: The waste treatment facilities treated radioactive mixed wastes generated in research and development activities. The 325 Waste Treatment Facility also served to test and evaluate the effectiveness of various waste treatment technologies.

Code: 331-C HWSA **Classification:** Accepted

Names: 331-C HWSA; 331-C Low Level Radioactive Storage Area; 331-C Hazardous Waste Storage Area **Reclassification:** Rejected (9/2/1998)

Type: Storage Pad (<90 day) **Start Date:** 1/1/1972

Status: Inactive **End Date:** 1/1/1996

Description: The former 331-C HWSA is now a steel building and fenced laydown yard that is currently in use as a refrigeration maintenance shop, material storage area, laydown yard and radioactive

waste storage area. The 331-C building is divided into three sections. The southern portion of the 331-C building is currently empty. The mid section of the building is in use as a equipment and material storage area. The northern portion of the building is in use as a refrigeration maintenance shop. The maintenance shop contains a satellite accumulation area for the storage of used oil [less than 208 liters (55 gallons)]. On the east side of the building, a radioactive waste storage area was observed under the roofed area. In addition, several 208 liter (55 gallon) drums of propylene glycol was stored under the roofed area. The fenced laydown area contains equipment.

Location: The 331-C HWSA was located approximately 100 meters south of the 331 building inside 331-C, and in the storage yard on the east side of 331-C.

Release Description: No known spills or releases have been reported from this site.

Process Description: The 90-day storage pad was originally set up under RCRA for the management of hazardous waste generated from animal research in the 331 complex. In the late 1960's, 1500 dogs were exposed to either strontium-90 or radium-226. As the dogs died, their bones and tissues were tested for the movement and accumulation of isotopes. All bones and tissues were preserved in ethanol and saved for 30 years.

Related Sites/ Structures: The unit was related to the research and development activities in the 331 Complex.

Waste Type: Animal Waste

Waste Description: The site stored dog bones and tissues contaminated with strontium-90 and cesium-137 stored in 70% ethanol solution, nitric acid, formalin and regulated empty containers. Hardcopy waste disposal records, waste verification, waste inventory, packing slips, characterization summaries, offsite shipment, waste specification, land disposal notification and certification, waste manifest records are available for this site. (See hardcopy WIDS file). It appears that most of the waste disposed of onsite went to 218-W-4C and 218-W-5 Burial Grounds in the 200 West Area.

Waste Type: Misc. Trash and Debris

Waste Description:

Code: 332 SF	Classification: Accepted
Names: 332 SF; 332 Storage Facility; 332 Hazardous Waste Storage Area; 332 Interim Holding Facility; 332 Packaging Test Facility	Reclassification: Closed Out (4/21/1997)
Type: Storage	Start Date: 1/1/1984
Status: Inactive	End Date: 1/1/1997

Description: The 332 Storage Facility was constructed as a less than 90 day storage facility. The building is a prefabricated, insulated metal structure erected on concrete footings. It is outfitted with explosion proof lighting, heating, and electrical outlets, as required for Uniform Building Code class H buildings, to permit the unrestricted storage of flammable and explosive materials. The floor is sloped toward an exterior wall sump fitted with a sump pump. Fireproof storage cabinets, a hood, and shelving were installed for dangerous waste storage. The building also includes a heater, fire alarm system, and alarm transmitter. The structure's outer dimensions are 6.1 meters (20 feet) by 6.1 meters (20 feet). A concrete slab extends 4.6 meters (15 feet) from the west side of the building. The slab is edged with a 15 centimeter (6 inch) curb to provide secondary containment and is surrounded by a 1.8 meter (6 foot) fence to prevent unauthorized access. The facility's storage design capacity was less than 6,800 liters (1,800 gallons) of

material.

Location: The building is located north of the 300 Area Sanitary Trenches (300-52) and east of 618-2.

Waste Type: Chemicals

Waste Description: The facility was used for the temporary storage (<90 day) of flammable and explosive materials.

Code: 333 ESHTSSA **Classification:** Accepted

Names: 333 ESHTSSA; 333 East Side Heat Treat Salt Storage Area **Reclassification:** Consolidated (2/12/1999)

Type: Storage **Start Date:** 1/1/1964

Status: Inactive **End Date:** 1/1/1987

Description: This waste site has been incorporated into the 618-1 Burial Ground waste site. The 333 ESHTSSA is an inactive storage area. The site included various locations inside the 333 fence where heat-treat salts were stored. It is now an open paved area near the southeast corner of the 333 Building. Several areas of the asphalt pavement have been painted over and posted fixed radiological contamination (WIDS Site UPR-300-17).

Location: The site includes waste stored in the fenced area east of the 333 Building in the northern part of the 300 Area. The heat-treat salts were stored on the paved area near the southeast corner of the building or in the adjacent area located over a portion of the 618-1 Burial Ground.

Process Description: The site was used to store containers of solidified heat-treat salt waste from the fuels fabrication facility.

Related Sites/ Structures: The site is associated with operations in the 333 Building. The site is also associated with the 618-1 Burial Ground since it is located adjacent to and possibly over the southwest corner of the Burial Ground.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: This area is no longer used for storing hazardous wastes. In the past, it stored containers of solidified waste heat-treat salts from the Fuels Fabrication Facility. The waste consisted of sodium chloride, potassium chloride, sodium nitrate, and potassium nitrate. Approximately, thirty to fifty 208-liter (55-gallon) drums accumulated each year.

The Site Was Consolidated With:

Code: 618-1

Names: 618-1; Solid Waste Burial Ground No. 1; 300 Area Burial Ground No. 1; 318-1

Code: 333 LHWSA **Classification:** Accepted

Names: 333 LHWSA; 333 Laydown Hazardous Waste Storage Area; 333 Laydown HWSA **Reclassification:** Consolidated (2/12/1999)

Type: Storage Pad (<90 day) **Start Date:** 1/1/1971

Status: Inactive **End Date:**

Description: This waste site has been consolidated into the 618-1 Burial Ground waste site. The 333 LHWSA is a concrete and asphalt pad on the east side of the 333 Building. The unit is within the 333 Building fence, and a second locked fence surrounds the unit. The white conex box in this unit is the location of the present 90-day waste storage area. Currently this conex box is empty. The yellow boxes on the opposite side of the area contain low level radioactive waste.

Location: The unit is located east of the 333 Building, within the fence of the 333 Building. The 333

Building is in the northern part of the 300 Area.

Process Description: The area inside the fence was originally a material laydown area. Now this area contains wastes that are segregated into a 90-Day Storage Pad for hazardous wastes and a Radioactive Material Area for low level radioactive waste storage.

Related Sites/ Structures: The unit is related to the 333 Building Operations. This site is located over the 618-1 Burial Ground.

Waste Type: Misc. Trash and Debris

Waste Description: The fixed contamination area, i.e., concrete and asphalt, that was the result of storing radioactive materials in the past will be addressed as part of 618-1 Burial Ground. The Burial Ground underlies the 333 LHWSA.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: The area typically contains corrosive and toxic metal wastes.

The Site Was Consolidated With:

Code: 618-1

Names: 618-1; Solid Waste Burial Ground No. 1; 300 Area Burial Ground No. 1; 318-1

Code: 333 WSTF

Classification: Accepted

Names: 333 WSTF; 333 WSWOT; 333 West Side Tank Farm; 333 West Side Uranium Bearing Acid Tanks; 333 West Side Waste Oil Tank

Reclassification: Interim Closed Out

Type: Storage Tank

Start Date: 1/1/1972

Status: Inactive

End Date:

Description: The site is an above grade tank farm containing three cylindrical tanks that stand upright within a concrete containment basin. The containment basin is attached to the outside wall of the 333 Building. One of the tanks is labeled "Non Contaminated Waste Oil - Flashpoint 455 degrees F." The two other tanks are labeled "Uranium bearing acid." The concrete containment basin is 6 meters (19.7 feet) by 4.2 meters (13.8 feet) with a depth of 0.4 meters (1.3 feet). Asphalt pavement surrounds the basin and the west side of the building. On this pavement there is a sign posting fixed radioactive contamination.

Location: The tank farm is located on the west side of the 333 Building, in the northern part of the 300 Area.

Process Description: The Waste Oil Tank temporarily stored oil from the extrusion press sump prior to shipment off site. When in use the process accumulated between 1892 and 3785 liters per year (500 to 1000 gallons per year). The Uranium Bearing Acid tanks temporarily stored spent acid from the 333 Building uranium acid etch process tanks. The spent acid was pumped from these storage tanks to the Uranium Recovery Operations (WIDS Site 313 URO) process in the 313 Building where the acid was treated for uranium recovery and recycling.

Related Sites/ Structures: The tanks are associated with operations in the 333 Building.

Waste Type: Oil

Waste Description: The Waste Oil Tank was used for storage of oil from the extrusion press sump. It was verified that the oil did not contain polychlorinated biphenyls and was not ignitable prior to removal. No known releases have been reported.

Waste Type: Chemicals
Waste Description: The Uranium Bearing Acid tanks stored spent acid containing uranium. The uranium was a recoverable asset for recycling.

Code: 333-TK-11 **Classification:** Accepted
Names: 333-TK-11; 333 Chromium Treatment Tank 2; 333 West Side Storage Tank for Uranium Bearing Acid **Reclassification:** Closed Out (12/6/2001)
Type: Storage Tank **Start Date:** 1/1/1961
Status: Inactive **End Date:** 1/1/1998

Description: This site has been clean closed under the 300 Area Waste Acid Treatment System (WATS) partial closure. 333-TK-11 was removed in 1998. It was a square uncovered metal tank. The unit was connected to the 300 Area Waste Treatment System by a polyvinyl chloride (PVC) drain line.

Location: The tank was located inside the 333 Building, west of the Pipe Trench.

Process Description: From 1983 to 1987, Tank 11 was used to treat waste acid by reducing chromium (VI) to chromium (III). The waste acid was drained to the 334-A Facility Storage Tanks.

Related Sites/Structures: The unit was related to the 333 fuel fabrication activities and the 300 Area Waste Acid Treatment System.

Waste Type: Chemicals
Waste Description: The tank was used to store spent etch acids (nitric and sulfuric acid with uranium in solution). The unit was also used to treat metal-bearing waste acids by reducing chromium (VI) to chromium (III).

Closure Info: This site has been clean closed. Tank 333-TK-11 was removed in 1998 pursuant to the Phase II Decontamination and Inspection Plan. Ecology inspected the cleanup site in August 1998. Ecology concurred that the work was done to the plan.

Code: 333-TK-7 **Classification:** Accepted
Names: 333-TK-7; 333 Chromium Treatment Tank 1; 333 West Side Storage Tank for Uranium Bearing Acid **Reclassification:** Closed Out (12/6/2001)
Type: Storage Tank **Start Date:** 1/1/1961
Status: Inactive **End Date:** 1/1/1998

Description: This site has been closed out. Tank 333-TK-7 was removed in 1998. Tank 333-TK-7 was a square, uncovered metal tank. The unit was connected to the 300 Area Waste Acid Treatment System by a polyvinyl chloride drain line. The tank was last used in 1987.

Location: The tank was removed in 1998; it was located inside the 333 Building, west of the pipe trench.

Process Description: From 1983 to 1987 the tank was used to treat waste acid by reducing chromium (VI) to chromium (III). The waste acid was drained via piping in the Pipe Trench to the tanks 334-TK-B and 334-TK-C in the 334-A tank pit.

Related Sites/Structures: The unit was related to tank 311-TK-11, the 333 fuel fabrication facility, the Pipe Trench, the 334-A Building and Tank Farm, and the 300 Area Waste Acid Treatment System (WATS).

Waste Type: Chemicals
Waste Description: The tank was used to store spent etch acids (nitric and sulfuric acid with uranium in solution). The unit was later used to reduce chromium (VI) to chromium (III) in metal-bearing waste acids.
Closure Info: This site was clean closed under the 300 Area WATS partial closure in 2001. The tank was removed pursuant to Phase II of the Decontamination and Inspection Plan. The tank removal site was inspected by Ecology in August, 1998 and written concurrence of the work done was received in September 1998.

Code: 334 TFWAST **Classification:** Accepted
Names: 334 TFWAST; Tank 4; 334 Tank Farm Waste Acid Storage Tank **Reclassification:** Closed Out (12/6/2001)
Type: Storage Tank **Start Date:** 1/1/1971
Status: Inactive **End Date:** 1/1/1988

Description: This site has been clean closed. The tank was taken out of service in 1986 and removed in 1988. The tank was a 27,710 liter (6000 gallon) Koroseal-lined mild steel tank. It was a vertical cylindrical tank installed on the upper level of the 334 Tank Farm structure, about 8 feet (2.4 meters) above ground level.

Location: The tank was the north elevated tank in the 334 Tank Farm, located on the east side of the 333 Building.

Release Description: See UO-86-01. At about 2200 hours on January 2, 1986, acid was found leaking from the waste acid storage tank (#4) located in the 334 Tank Farm. The leak drained to the process sewer which discharged to the 300 Area process trenches. The waste acid was pumped to another tank and at about 0100 hours on January 3, 1986, 60 gallons of 50 percent caustic was added to the process sewer. The pH meter strip chart for the 333 Building waste water indicated that an unusually low pH first occurred at about 1800 hours and by 0200 hours the pH readings in the waste water stream was back to normal. The pH did not get low enough during the event to trip the pH meter alarm. No acid spilled to the ground; it was all contained within the bermed concrete pad beneath the 334 Tank Farm which drained to the process sewer. Inspection of the tank indicated that the waste acid had corroded through the (Koroseal lined, mild steel) tank in several places about 10 percent down from the top of the tank. The operating staff reported that to the best of their knowledge since Tank 4 was placed in service about ten years earlier, it had never been filled the level at which failure occurred until this event

Process Description: Tank 334 TFWAST (TK-4) in the 334 Tank Farm was first used in 1973 to store the waste acid for the 300 Area Waste Acid Treatment System while waste acid storage tanks TK-B and TK-C were installed in the 334-A Building. After that time, TK-4 was used for emergency storage during periods when the acid neutralization equipment in the 313 Building was not in operation. When tank TK-4 was filled in January 1986, a leak developed near the top of the tank. The tank was drained at that time and removed in 1988.

Related Sites/Structures: The tank was related to the 334 Tank Farm, the 333 N Fuels zircaloy fuel etching process, the 300 Area Waste Acid Treatment System, and the Process Sewer.

Waste Type: Chemicals
Waste Description: The unit was intermittently used to store waste acids containing nonrecoverable uranium from the fuel fabrication process.
Closure Info: This site has been clean closed under the 300 Area Waste Acid Treatment System (WATS) partial closure. The 334 Tank Farm Waste Acid Storage Tank 4 was removed in 1988. The superstructure which held tank TK-4 will be decontaminated as required during the Phase 3

closure activities for the 300 Area Waste Acid Treatment System. The RCRA Closure Plan for the 300 Area Waste Acid Treatment System was submitted to Ecology in June 1990; Revision 1 of the closure plan was submitted in March 1996, and Revision 2 in July 1999.

Code:	334-A-TK-B	Classification:	Accepted
Names:	334-A-TK-B; 334-A Waste Acid Storage Tank 1	Reclassification:	Closed Out (12/6/2001)
Type:	Storage Tank	Start Date:	1/1/1975
Status:	Inactive	End Date:	1/1/1998
Description:	This site has been clean closed. The tank was removed in 1998. The horizontal 7570 liter (2000 gallon) tank was a high-density polyethylene tank resting on a steel saddle. The tank was one of three tanks in a 3 meter (10 foot) deep concrete pit below the 334-A Building. A cover has been installed over the pit and the cover sealed.		
Location:	The unit was located in the 334-A Tank Pit, east of the 333 Building.		
Process Description:	The tank stored spent etch acid from the 333 Building fuel fabrication process. Spent acid was drained from the 333 Building etch tanks (8 tanks with a total capacity of 7551 liters (1995 gallons) to Tank 334-A-TK-B via a 10.1 cm (4-inch) diameter PVC line (see 300-219) in the Pipe Trench (see 300-224). The waste acid was stored until treated by the 300 Area Waste Acid Treatment System. The waste acid was pumped via a 5.1 cm. (2-inch) diameter PVC line in the Pipe Trench to the 313-TK-2 neutralization tank in 313 Building. Spills from the tank into the concrete pit were contained and recovered. A spill alarm in the pit alerted operating personnel. No record was found of any contamination released outside the 334-A boundaries.		
Related Sites/Structures:	The unit is associated with the 334-A-TK-C, the 334-A Tank Pit, the 334-A Building, the Pipe Trench, the 333 Building etch tanks, the 300 Area Waste Acid Treatment System (WATS), and 300-21.		
Waste Type:	Chemicals		
Waste Description:	The unit was removed in 1998. It received waste acids from the fuel fabrication process. The waste contained nonrecoverable uranium, hydrofluoric, nitric, sulfuric, and chromic acids, and various metals.		
Closure Info:	This site was clean closed under the 300 Area WATS partial closure. Tank TK-B was removed in 1998 as part of the cleanup activities pursuant to the Decontamination and Inspection Plan issued for Closure Phase 2. The cleaned site was inspected by Ecology on August 25, 1998. Ecology verified that the Phase 2 work was performed in accordance with Ecology's "Clean Closure Guidance Document" method of a clean debris surface and later provided final approval of the Phase 2 closure.		

Code:	334-A-TK-C	Classification:	Accepted
Names:	334-A-TK-C; 334-A Waste Acid Storage Tank 2	Reclassification:	Closed Out (12/6/2001)
Type:	Storage Tank	Start Date:	1/1/1975
Status:	Inactive	End Date:	1/1/1998
Description:	This site has been clean closed. The tank was removed in 1998. The horizontal 7570 liter (2000 gallon) tank was a high-density polyethylene tank resting on a steel saddle. The tank was one of three tanks in a 3 meter (10 foot) deep concrete pit below the 334-A Building. A cover has been installed over the pit and the cover sealed.		
Location:	The unit was located in the 334-A Tank Pit, east of the 333 Building.		
Process	The tank stored spent etch acid from the 333 Building fuel fabrication process. Spent acid was		

Description: drained from the 333 Building etch tanks (8 tanks with a total capacity of 7551 liters (1995 gallons) to Tank 334-A-TK-C via a 10.1 cm (4-inch) diameter PVC line (see 300-219) in the Pipe Trench (see 300-224). The waste acid was stored until treated by the 300 Area Waste Acid Treatment System. The waste acid was pumped via a 5.1 cm. (2-inch) diameter PVC line in the Pipe Trench to the 313-TK-2 neutralization tank in 313 Building. Spills from the tank into the concrete pit were contained and recovered. A spill alarm in the pit alerted operating personnel. No record was found of any contamination released outside the 334-A boundaries.

Related Sites/ Structures: The unit is associated with the 334-A-TK-B, the 334-A Tank Pit, the 334-A Building, the Pipe Trench, the 333 Building etch tanks, and the 300 Area Waste Acid Treatment System.

Waste Type: Chemicals

Waste Description: The unit was removed in 1998. It received waste acids from the fuel fabrication process. The waste contained nonrecoverable uranium, hydrofluoric, nitric, sulfuric, and chromic acids in solution bearing metals in solution.

Closure Info: Tank TK-C was removed in 1998 as part of the cleanup activities pursuant to the Decontamination and Inspection Plan issued for Closure Phase 2. The cleaned site was inspected by Ecology on August 25, 1998. Ecology verified that the Phase 2 work was performed in accordance with Ecology's "Clean Closure Guidance Document" method of a clean debris surface and provided tentative approval of the Phase 2 closure. The site was clean closed as part of the 300 Area WATS partial closure in December 2001.

Code: 335 & 336 RSDF	Classification: Accepted
Names: 335 & 336 RSDF; 335 & 336 Retired Sanitary Drain Field	Reclassification: Rejected (2/12/1999)
Type: Drain/Tile Field	Start Date: 1/1/1973
Status: Inactive	End Date: 1/1/1978

Description: The 335 and 336 RSDF is a below grade waste site consisting of a septic tank and drainfield that have been abandoned in place. Only a riser from the septic tank is visible in the field. There is no evidence of a drainfield. The riser is a concrete pipe with an inner diameter of 20.5 centimeters (8.1 inches) covered by a metal grate. The riser is surrounded by metal posts and its top is approximately 18 centimeters (7.1 inches) above grade. The riser is 5.4 meters (17.7 feet) west of the manhole shown on M-3904, sheet 14, that is currently connected to the sanitary sewer. The area around the riser is sandy with some gravel and cobbles. Immediately south of the septic tank is a chained off area that is surrounded by metal posts and plastic chain. Inside the fenced off area are pipes, tanks, old equipment, and concrete and asphalt debris. There are no signs labeling the site or the adjacent chained off area.

Location: The site is located south of the southwest corner of the 335 Building.

Process Description: The unit disposed of sanitary waste generated in the 335 and 336 Buildings.

Related Sites/ Structures: The site was associated with the 335 and 336 Sanitary Waste Systems. The 335 and 336 Buildings were constructed to house experimental equipment for the study of the properties of sodium and the behavior of mechanical components to be operated in a sodium environment in support of FFTF development (through the late 1970's).

Waste Type: Sanitary Sewage

Waste Description: The unit received unknown amounts of sanitary wastes from the 335 and 336 Buildings.

Code: 340 CHWSA **Classification:** Accepted
Names: 340 CHWSA; 340 Complex Hazardous Waste Storage Area; 340 Complex HWSA **Reclassification:** Rejected (1/15/1999)
Type: Storage Pad (<90 day) **Start Date:**
Status: Inactive **End Date:**
Description: According to 340 Complex personnel, hazardous waste was staged for less-than-90-day storage at various locations throughout the 340 Complex yard. This includes a small concrete pad to the northeast of 340B, and the asphalt pad to the west of the 340 Building.
Location: Waste was staged at various locations inside the 340 Complex Yard.
Release Description: Per Bob Haggard, WMH Environmental Compliance Officer, there is no evidence of an actual or potential for a hazardous substance release.
Process Description: Hazardous waste was stored for less than 90 days at various areas throughout the 340 Complex yard.
Related Sites/ Structures: This storage area staged wastes related to 340 Complex operations.
Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: This area is no longer used to stage hazardous waste.

Code: 350 HWSA **Classification:** Accepted
Names: 350 HWSA; 350-D Hazardous Waste Staging Area; 350 Building Hazardous Waste Storage Area **Reclassification:** Rejected (2/24/1999)
Type: Storage Pad (<90 day) **Start Date:** 1/1/1982
Status: Active **End Date:**
Description: The 350 Hazardous Waste Staging Area is inside the 350-D Building and on an asphalt pad in front of the building.
Location: The staging area is located in the northeast corner of the fenced 350 Compound.
Process Description: The staging area is used to temporarily store hazardous wastes. Combustible liquids and PCB containing waste are stored inside the building. Used oil is stored in a 300-gallon (1140-liter) tank behind the 350-D Building. Other waste is stored on the pad in front of the building.
Related Sites/ Structures: The unit is associated with the 350 Plant and Operations Facility.
Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: Typically, the area stores corrosive chemicals, used oils and PCB-contaminated oils. Oil containing PCBs from old ballasts is stored inside the 350-D building along with combustible liquids.

Code: 3712 USSA **Classification:** Accepted
Names: 3712 USSA; 3712 Building Uranium Scrap **Reclassification:** Interim Closed Out (8/16/2011)

Storage Area; 3712 Fuels Warehouse; 3712
Uranium Scrap Storage Area

Type: Storage **Start Date:** 1/1/1961

Status: Active **End Date:**

Description: This site has been remediated. The 3712 USSA was an active uranium metal storage unit. The building was a steel frame structure with metal siding and a metal roof. The unit had a concrete floor and foundation. There were "Radiologically Controlled Area" signs posted along the east side of the 3712 Building, just east of the railroad tracks. The "Radiologically Controlled Area" signs continue around the north side of the building. The building had four roll-up doors - one each on the north and south sides of the building and two on the west side. Signs next to the north roll-up door read "Caution, Fissile Materials," "Caution, Radiation Area And Contamination Area, Entry Requirements: Personnel Dosimeter (TLD), Radiological Work Permit (RWP)," and "No Uranium Enriched Above 1.25 Nor Any Other Fissile Material Allowed In This Facility." The posting by the east walk-in door was the same as the north roll-up door except the "Caution Radiation Area And Contamination Area" sign was replaced by a "Radiological Buffer Area" sign. The posting by the south roll-up door was similar to the north roll-up door, with some additions - "Stop! No Visitors, No Entry Without Management And ACES Approval" and "Contact HPT Prior To Entry 376-3311." There were no "Caution, Radiation Area And Contamination Area" posting by the south door. The "No Uranium Enriched Above 1.25" sign was appended by the phrase "Without Prior Approval Of Facility Supervisor." There were large concrete blocks outside the north roll-up door on the west side of 3712. The blocks were placed far enough away from the building to allow some access to this door. Posting by this door was not reviewed during the November 24, 1998, walkdown. A pair of metal pipes exit the east side of 3712 near the southeast corner and enter a square concrete structure (see photo). There is a process sewer manhole northeast of the northeast corner of the building. Drawing M-3904, sheet 2, revision 24, shows two underground process sewer lines running under the 3712 Building where they converge and continue towards the northeast.

Location: The unit was located on the east side of the 313 Building, south of 3720 and west of 306W.

Process Description: The building had been used to store uranium fuel elements, fuel fabrication components, and uranium scraps from the 313 and 333 fuel fabrication efforts.

Related Sites/ Structures: The unit is associated with the fuel manufacturing that occurred in the 313 and 333 Buildings.

Waste Type: Chemicals

Waste Description: The unit is used to store uranium fuel elements, components for fuel fabrication, concrete billets of ignitable uranium chips and fines, and uranium scrap. Contamination resulting from the 1979 and 1985 fires may be present in or on building surfaces.

Closure Info: Demolition of the above-grade 3712 Building structure was completed in January 2006 and remedial action of the 3712 USSA waste site, including the 3712 Building slab and foundation, was performed between June 3 and 15, 2010. The waste site was excavated to a depth ranging from approximately 1.0 m (3.3 ft) to 1.5 m (4.9 ft) below ground surface, resulting in approximately 999 bank cubic meters (1,307 bank cubic yards) or 2,167 metric tons (2,388 U.S. tons) of building slab and foundation debris and soil disposed at the Environmental Restoration Disposal Facility (ERDF) in the 200 Area of the Hanford Site. All material was direct loaded from the excavation; therefore, no waste staging piles were created. No overburden soil stockpiles are associated with the waste site. A post-excavation radiological survey for gamma and beta activity was conducted following the completion of remedial action to confirm that waste site excavation was complete. No elevated gamma activity was detected nor was elevated beta activity detected. A post-excavation civil survey for the excavation has been completed.

A geophysical investigation was not conducted at the 3712 USSA waste site because the 3712 Building concrete slab was in place at the start of the remediation activities.

Code: 3713 PSHWSA **Classification:** Accepted
Names: 3713 PSHWSA; 3713 Paint Shop Hazardous Waste Satellite Area **Reclassification:** Rejected (1/27/1999)
Type: Satellite Accumulation Area **Start Date:** 1/1/1984
Status: Inactive **End Date:** 1/1/1987
Description: Until 1987, the site was a hazardous waste satellite accumulation area. Today, the site is a concrete pad surrounded by a fiberglass and wood fence. There is a drain in the center of the pad. Items stored in this area include nonhazardous materials, such as ladders, hoses, and pipe. Currently, the 3713 Building is being used as a carpenter's shop.
Location: The site is outside the southeast door of the 3713 Building.
Process Description: The unit was used to temporarily store small quantities of hazardous waste.
Related Sites/Structures: The site was associated with the 3713 Paint Shop. The building is now the 3713 Carpentry Shop.
Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: Hazardous wastes have not been accumulated at this facility since the paint shop was moved. The area contained small quantities of miscellaneous waste solutions. The waste was derived from paint shop operations.

Code: 3713 SSHWSA **Classification:** Accepted
Names: 3713 SSHWSA; 3713 Sign Shop Hazardous Waste Satellite Area **Reclassification:** Rejected (1/27/1999)
Type: Satellite Accumulation Area **Start Date:** 1/1/1984
Status: Inactive **End Date:** 1/1/1987
Description: Until 1987, the site was a hazardous waste satellite accumulation area. It is no longer in existence. No evidence of the satellite accumulation area is apparent.
Location: The staging area was located outside the north entrance of the 3713 Building.
Process Description: The staging area accumulated small quantities of nonsolvent waste from sign shop operations.
Related Sites/Structures: The unit was associated with the 3713 Sign shop. The 3713 Building is currently a carpenter's shop.
Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: Hazardous wastes are no longer staged at this facility. The area accumulated miscellaneous small quantities of nonsolvent waste solutions from sign shop operations.

Code: 3718-F BS **Classification:** Accepted
Names: 3718-F BS; 3718-F Burn Shed **Reclassification:** Closed Out (8/1/1998)
Type: Process Pit **Start Date:** 1/1/1968
Status: Inactive **End Date:** 1/1/1998

- Description:** removed and all that remains is the concrete pad which it shared with other sites related to the 3718-F Alkali Metal Treatment and Storage Facility. The 3718-F Burn Shed was a 3.0-meter by 3.7-meter (10-foot by 12-foot) sheet metal enclosure with a 2.4 meter (8-foot) wide roll-up door. Small stirring ports and windows were placed on the north and west sides. To the east of the burn shed was a fume scrubber through which the gaseous emissions from the burning were processed. The burn shed and fume scrubber were connected by overhead ductwork. The burn shed and fume scrubber were built on a concrete pad. The pad was bermed on the north and south and sloped to the east. A channel on the east side routed any drainage to a floor drain which discharged to the process sewer.
- Location:** The unit was located in the 300 Area, east of the 324 Building. It shared a common fence with the 3717C, 335, 335A, and 336 Buildings. The burn shed was located on a concrete pad adjacent to the east side of the storage building (3718-F SF).
- Process Description:** When the facility was used, alkali metals were placed in burn pans, surrounded by fuel, and ignited with a torch inserted through a stirring port. The molten metals were stirred to allow for complete combustion. A water fog was then applied to the metals, completing the oxidation process. Effluents were neutralized and discharged to the process sewer.
- Related Sites/ Structures:** The unit is associated with the adjacent fume scrubber, the storage building (3718-F SF), and the treatment tanks (3718-F TT1 and 3718-F TT2).
- Waste Type:** Chemicals
- Waste Description:** Wastes treated at the unit included: sodium, lithium and sodium-potassium alloys. After burning, the remaining wastes would have consisted of alkali metal oxides and carbonates. Small quantities of reactive laboratory waste may also have been treated. All wastes have been removed.
- Closure Info:** 3718-F BS, 3718-F SF, 3718-F TT1 and 3718-F TT2 were addressed as a group. The information below documents information for the group of sites.

All structures associated with the 3718-F Alkali Metal Treatment Facility were removed during September 1996 and May 1998.

On February 24, 1998 it was agreed that DOE would perform a voluntary action to remove the drainage sump structure with from which the PCB contaminated sample was taken and to conduct soil sampling in the vicinity of the structure. Initial sampling was performed on March 17, 1998 to determine the levels of PCB's. Cleanup activities occurred between May 1, 1998 and May 6, 1998. During this time, three drain structures were removed. The drain to the process sewer at the northeast corner of the treatment pad was removed and the line connecting to the process sewer was plugged. The two drain sumps for the fume scrubber were removed as a unit because they were connected together with a metal brace. One drain sump was found to be open to soil at the bottom. The two structures were resting on an aluminum plate covered with a white encrustation (later determined to be corroded aluminum). All discolored soil was removed and drummed. Sampling of the drummed soil and the soil beneath the aluminum plate was performed.

Code: 3718-F SF	Classification: Accepted
Names: 3718-F SF; 3718-F Storage Facility; 3718-F Alkali Metal Treatment Facility	Reclassification: Closed Out (8/4/1998)
Type: Storage	Start Date: 1/1/1968
Status: Inactive	End Date: 1/1/1989
Description: The 3718-F Storage Facility consisted of a single-story building, an adjoining loading pad, and	

a concrete treatment pad. The storage building has been removed and all that remains is the concrete pad, which it shared with other sites related to the 3718-F Alkali Metal Treatment and Storage Facility. The 3718-F Storage Facility was designed and constructed in 1968, and redesigned and modified in 1973. The building, which measured 6.1 meters by 14.6 meters (20 feet by 48 feet), was constructed on a concrete pad. The gabled ends, roof, and siding were corrugated steel. The building had electric lights, electric space heaters, and two window air conditioning units. The northern half of the building was used as a storage area and the southern half was used as a work area. A concrete loading pad measuring 3.7 meters by 6.1 meters (12 feet by 20 feet) was located at the south end of the building. The 15-centimeter (6-inch) thick concrete treatment pad measuring 7.2 meters by 14.6 meters (25 feet by 48 feet) adjoined the east side of the building. A burn shed and fume scrubber (3718-F BS) and two treatment tanks (3718-F TT1 and 3718-F TT2) were located on the pad. The north and south ends of the pad are bermed and the pad slopes to the east. Along the east edge is a 7.6-centimeter (3-inch) wide by 7.6 centimeter (3-inch) deep trench. The trench was connected to a floor drain which discharged to the process sewer system. This design was intended to prevent runoff onto the surrounding soils.

Location: The unit was located in the 300 Area, east of the 324 Building. It shared a common fence with the 3717C, 335, 335A, and 336 Buildings.

Process Description: The 3718-F Storage Facility was used to store high purity alkali metals and alkali metal alloys to be used in laboratories. Before 1985, solutions from the treatment tanks were drained onto the concrete pad through a valve in the bottom of the tanks. The spent reagents would flow across the pad to the trough and from the trough to the 300 Area Process Sewer. Beginning in 1985, all spent alcohol solutions were packaged in approved containers and handled as dangerous waste. The used water continued to be drained to the process sewer until 1987 when the use of the treatment tanks was discontinued.

Related Sites/ Structures: The unit was associated with a burn shed and fume scrubber (3718-F BS) and two treatment tanks (3718-F TT1 and 3718-F TT2).

Waste Type: Chemicals

Waste Description: Hazardous wastes are no longer stored in this facility.

The wastes stored at the facility while in use consisted of sodium, lithium, and sodium alloys. Cleaning agents used within the treatment tanks and discharged to the concrete pad included water, methanol, isopropanol, and 2-butoxy ethanol (trade name Dowanol). Reaction products contained within the solutions included alkali oxides, alkali carbonates, and alkoxides (strong organic bases).

During cleanup, polychlorinated biphenyl (PCB) Aroclor 1254 contamination from an unknown source was identified in soil samples.

Closure Info: 3718-F BS, 3718-F SF, 3718-F TT1 and 3718-F TT2 were addressed as a group. The information below documents information for the group of sites.

All structures associated with the 3718-F Alkali Metal Treatment Facility were removed during September 1996 and May 1998.

On February 24, 1998 it was agreed that DOE would perform a voluntary action to remove the drainage sump structure with from which the PCB contaminated sample was taken and to conduct soil sampling in the vicinity of the structure. Initial sampling was performed on March 17, 1998 to determine the levels of PCB's. Cleanup activities occurred between May 1, 1998 and May 6, 1998. During this time, three drain structures were removed. The drain to the process sewer at the northeast corner of the treatment pad was removed and the line connecting to the process sewer was plugged. Code: 3718-F TT1	Classification: Accepted
Names: 3718-F TT1; 3718-F Treatment Tank 1	Reclassification: Closed Out (8/4/1998)
Type: Storage Tank	Start Date: 1/1/1968
Status: Inactive	End Date: 1/1/1998

Description: The 3718-F Treatment Tank 1 (3718-F TT1) was a tank used to clean equipment contaminated with alkali metals by reacting the metals with alcohol. The tank has been removed and all that remains is the concrete pad which it shared with other sites related to the 3718-F Alkali Metal Treatment and Storage Facility. 3718-F TT1 was a long, narrow tank constructed of 0.3-centimeter (1/8-inch) stainless steel. The tank had a hinged solid cover and was supported by eight metal legs spaced in pairs at intervals along its length.

Location: The unit was located in the 300 Area, east of the 324 Building. It shared a common fence with the 3717C, 335, 335A, and 336 Buildings. The tank was located on a concrete pad adjacent to the east side of the storage building.

Process Description: Equipment contaminated with alkali metals was cleaned in an alcohol bath in the tank. The alcohol bath was used for confined quantities of sodium because the sodium-alcohol reaction was slower and easier to control. The reaction process took up to several days to complete, depending on the amount of sodium on the component and the presence of tight crevices which would minimize the surface area available for reaction. The reaction of the alkali metals with alcohol produced alkoxides, strong organic bases. Alcohols used in this process included methanol, isopropanol, and 2-butoxy ethanol (trade name Dowanol). Before 1985, solutions from the treatment tanks were drained onto the concrete pad through a valve in the bottom of the tanks. The spent reagents would flow across the pad to the trough and from the trough to the 300 Area Process Sewer. Beginning in 1985, all spent alcohol solutions were packaged in approved containers and handled as dangerous waste. The used water continued to be drained to the process sewer until 1987 when the use of the treatment tanks was discontinued.

Related Sites/ Structures: Structures associated with the unit include the other treatment tank (3718-F TT2), the burn shed and fume scrubber (3718-F BS), and the storage shed (3718-F SF).

Waste Type: Chemicals

Waste Description: Hazardous wastes are no longer treated in the tank. Wastes treated at the tank included sodium, lithium, and sodium-potassium alloys. Cleaning agents used within the treatment tank included methanol, isopropanol, and 2-butoxy ethanol (trade name Dowanol). The reaction products were alkoxides (strong organic bases).

Closure Info: 3718-F BS, 3718-F SF, 3718-F TT1 and 3718-F TT2 were addressed as a group. The information below documents information for the group of sites.

All structures associated with the 3718-F Alkali Metal Treatment Facility were removed during September 1996 and May 1998.

Code:	3718-F TT2	Classification:	Accepted
Names:	3718-F TT2; 3718-F Treatment Tank 2	Reclassification:	Closed Out (8/4/1998)
Type:	Storage Tank	Start Date:	1/1/1968
Status:	Inactive	End Date:	1/1/1998
Description:	The 3718-F Treatment Tank 2 (3718-F TT2) was a tank used to clean equipment contaminated with alkali metals by reacting the metals with water. The tank has been removed and all that remains is the concrete pad which it shared with other sites related to the 3718-F Alkali Metal Treatment and Storage Facility. 3718-T TT2 was a 430-gallon (1,630-liter) tank constructed of 0.3-centimeter (1/8-inch) stainless steel. The tank was topped by a hinged screen cover.		
Location:	The unit was located in the 300 Area, east of the 324 Building. It shared a common fence with the 3717C, 335, 335A, and 336 Buildings. The tank was located on a concrete pad adjacent to the east side of the storage building.		
Process Description:	Equipment contaminated with alkali metals was cleaned in a water bath in the tank. The water was only used for small quantities of unconfined alkali metal because of the violence of the reaction. The reaction produced alkali metal hydroxides. Before 1985, solutions from the treatment tanks were drained onto the concrete pad through a valve in the bottom of the tanks. The spent reagents would flow across the pad to the trough and from the trough to the 300 Area Process Sewer. Beginning in 1985, all spent alcohol solutions were packaged in approved containers and handled as dangerous waste. The used water continued to be drained to the process sewer until 1987 when the use of the treatment tanks was discontinued.		
Related Sites/ Structures:	Structures associated with the unit include the other treatment tank (3718-F TT1), the burn shed and fume scrubber (3718-F BS), and the storage shed (3718-F SF).		
Waste Type:	Chemicals		
Waste Description:	Hazardous wastes are no longer treated in the tank. Wastes treated at the tank included sodium, lithium, and sodium-potassium alloys. Water was used as the cleaning agent and the reaction products were alkali metal hydroxides.		
Closure Info:	3718-F BS, 3718-F SF, 3718-F TT1 and 3718-F TT2 were addressed as a group. The information below documents information for the group of sites.

Type:	Process Unit/Plant	Start Date:	1/1/1984
Status:	Inactive	End Date:	1/1/1996
Description:	The 3746-D Silver Recovery unit is a piece of equipment located in the 3746-D Building, a Quonset hut. The electrolytic portion of the silver recovery unit is present, however, the ion exchange columns are not. The recovery unit is currently inactive. A large white basin drains into the sanitary sewer system and is the only drain in the building. This drain is not part of the 3746-D Silver Recovery equipment.		
Location:	The unit is located inside the 3746-D Building. The 3746-D Building is on the west side of Alaska Street, next to the 3705 Building.		
Process Description:	The unit was used to recycle corrosive, silver-bearing photochemical wastes generated by Pacific Northwest National Laboratory Photo Processing Operations. Silver-bearing liquid was run through an electrolytic unit to remove the majority of the silver. The depleted liquid was run through an ion exchange column to remove more silver. From 1984 to 1992, process effluent was discharged to the sanitary sewer. During this time period, the effluent was tested against discharge limits. Until 1992, effluent that was within discharge limits was poured down a sanitary drain. From 1992 through September 1996, effluent was shipped off site. The unit has been inactive since October 1, 1996, when Lockheed Martin Services, Inc., took over photographic operations.		
Related Sites/Structures:	The unit is associated with the 3746-D Building, and the Lockheed Martin Services, Inc. photo-processing operations.		
Waste Type:	Chemicals		
Waste Description:	Corrosive silver containing waste photochemicals used to be processed to reclaim silver. During 1993, 7,721 liters (2,040 gallons) of photochemical waste was processed to recover 209.2 kilograms (1,139.686 troy ounces) of silver.		

Code:	400 FD1A	Classification:	Accepted
Names:	400 FD1A; 4717 Reactor Service Building HVAC Condensate; Injection Well #1A; Miscellaneous Stream #14; 400 Area French Drain 1A	Reclassification:	Rejected (12/15/1998)
Type:	French Drain	Start Date:	1/1/1979
Status:	Active	End Date:	
Description:	The unit is a 1.5 meter (5 foot) long, 1.2 meter (4 foot) diameter concrete or vitrified clay pipe filled with gravel. It is in a vegetation-free, gravel covered field south of the 403 Building and cannot be identified visually. The site is not located in a depression or a contaminated area.		
Location:	The site is located between the 403 and 4703 Buildings, about 10.1 meters (33 feet) west of waste site, WIDS Site Code 400 FD1B.		

Process Description: The Heating, Ventilation, and Air Conditioning (HVAC) system collects condensate from the air on the coils of the unit. The condensate is collected by the HVAC unit and drained to the french drain.

Related Sites/ Structures: The site is associated with the 4717 Reactor Service Building.

Waste Type: Water

Waste Description: Reports conflict about effluents received by the unit which may have received demineralizer backwash; Heating, Ventilation, and Air Conditioning (HVAC) system condensate from the 4717 Facility Reactor Service Building; and/or water and detergents. The flow rate is less than 0.038 liters per minute (0.01 gallons per minute).

Code: 400 FD1B

Classification: Accepted

Names: 400 FD1B; 4703 Building (FFTF Control Building) HVAC Condensate; Injection Well #1B; Miscellaneous Stream #15; 400 Area French Drain 1B

Reclassification: Rejected (12/15/1998)

Type: French Drain

Start Date: 1/1/1979

Status: Active

End Date:

Description: The unit is a 1.5-meter (5-foot) long, 1.2-meter (4-foot) diameter concrete or polyvinyl chloride (PVC) pipe filled with gravel. It is in a vegetation free, gravel covered field and cannot be identified visually. The site is not located in a depression or contaminated area.

Location: The site is located south of the 403 Building and approximately 10 meters (33 feet) east of WIDS Site 400 FD1A.

Process Description: The Heating, Ventilation, and Air Conditioning (HVAC) system collects condensate from the air on the coils of the unit. The condensate is collected by the HVAC unit and drained to the french drain.

Related Sites/ Structures: The site is associated with the 4703 Building (FFTF Control Building).

Waste Type: Water

Waste Description: Reports conflict about effluents discharged to this unit which may receive sump water; Heating, Ventilation, and Air Conditioning (HVAC) condensate from the 4703 Building; and/or water and detergent solutions. The flow rate as less is less than 0.038 liters per minute (0.01 gallons per minute).

Code: 400 FD2

Classification: Accepted

Names: 400 FD2; 4621E Building HVAC Condensate and Stormwater; Injection Well #02; Miscellaneous Stream #16; 400 Area French Drain 2

Reclassification: Rejected (12/15/1998)

Type: French Drain

Start Date: 1/1/1979

Status: Active

End Date:

Description: The unit is a 1.5-meter (5-foot) long, 1.2-meter (4-foot) diameter concrete or polyvinyl chloride (PVC) pipe filled with gravel. The above ground portion is a 0.9 meter (3 foot) long, 15.2

centimeter (6 inch) diameter rusted metal pipe capped with a metal plug and surrounded with landscaping rocks and shrubs. The site is not located in a depression or contaminated area.

Location: The site is located 3.05 meters (10 feet) south of 4710 Building and 6.1 meters (20 feet) east of that building's southwest corner. It is 7.6 centimeters (3 inch) north of a paved sidewalk.

Process Description: The site receives both stormwater runoff and Heating, Ventilation, and Air Conditioning (HVAC) condensate. The HVAC system collects condensate from the air on the coils of the unit. The condensate is collected by the HVAC unit drained to the french drain.

Related Sites/ Structures: The site is associated with the 4621E Building.

Waste Type: Water

Waste Description: Reports conflict about effluents discharged to this unit. It may have received stormwater; and Heating, Ventilation, and Air Conditioning (HVAC) system condensate from the 4621E Auxiliary Equipment Building; and/or water and detergent solutions. The "Inventory of Miscellaneous Streams", Revision 3, lists the sources as stormwater and potable water. This document lists the flow rate as less than 0.038 liters per minute (0.01 gallons per minute).

Status: Active

End Date:

Description: The unit is a 1.5-meter (5-foot) long, 1.2-meter (4-foot) diameter concrete or vitrified clay pipe filled with gravel. The above ground portion is two rusty metal pipes. One is 0.61 meters (2 feet) long and 8.9 centimeters (3.5 inches) in diameter. The other is 0.91 meters (3 feet) long and 11.4 centimeters (4.5 inches) in diameter. Each pipe is capped with a metal plug. The unit is surrounded by four 1.2-meter (4-foot) high yellow metal posts and is in a gravel-covered, vegetation-free field.

Location: The site is located 14.6 meters (42 feet) east of the southeast corner of the 408-A East Dump Heat Exchanger (DHX) outside the protected area fence.

Waste Type: Stormwater Runoff

Waste Description: The site receives stormwater from the 408-A Dump Heat Exchanger (DHX). The flow rate is less than 0.038 liters per minute (0.01 gallons per minute).

Code: 400 FD4

Classification: Accepted

Names: 400 FD4; 491E Heat Transport Building Stormwater and HVAC Condensate; Miscellaneous Stream #18; 400 Area French Drain 4

Reclassification: Rejected (12/15/1998)

Type: French Drain

Start Date: 1/1/1979

Status: Active

End Date:

Description: The unit is a 1.5-meter (5-foot) long, 1.2-meter (4-foot) diameter concrete or vitrified clay pipe filled with gravel. The above ground portion is a 0.91 meter (3 foot) long, 11.4-centimeter (4.5-inch) diameter, rusted metal pipe protruding from the middle of a gravel-covered field. It is surrounded by four 1.2-meter (4-foot) tall yellow metal posts. Each of the posts has had a 20-

centimeter (8-inch) diameter PVC (polyvinyl chloride) pipe measuring 2.0 meters (6 feet 8 inches) in length placed over it. The white PVC pipes have been marked with three horizontal, yellow stripes.

Location: The site is located approximately 44 meters (144.3 feet) southeast of the 491-E building and approximately 19 meters (62.3 feet) north of the 4713A building.

Process Description: The site receives both stormwater runoff and Heating, Ventilation, and Air Conditioning (HVAC) condensate. The HVAC system collects condensate from the air on the coils of the unit. The condensate is collected by the HVAC unit and drained to the french drain.

Related Sites/ Structures: The site is related to the 491-E Building.

Waste Type: Water

Waste Description: Reports conflict about effluents discharged to this unit. It may receive dilute condensate; floor drain effluent and effluent from the 491-E Heat Transport Building consisting of stormwater from the roof of HTS-E, condensate from the building's Heating, Ventilation, and Air Conditioning (HVAC) system, rheostat water, and non-regulated quantities of sodium carbonate. The "Inventory of Miscellaneous Streams", Revision 3, lists the streams as HVAC condensate and storm water. The flow rate is less than 0.038 liters per minute (less than 0.01 gallons) per minute.

Code: 400 FD5

Classification: Accepted

Names: 400 FD5; 408 South Building Stormwater and Condensate; Injection Well #05; Miscellaneous Stream #19; 400 Area French Drain 5

Reclassification: Rejected (12/15/1998)

Type: French Drain

Start Date: 1/1/1979

Status: Active

End Date:

Description: The unit is a 1.2-meter (4-foot) diameter 1.5-meter (5-foot) long concrete or polyvinyl chloride (PVC) pipe filled with gravel and located in a gravel and cobble covered field. The visible portion of the unit is two rusted metal stand pipes. On pipe is 38.1-centimeters (15 inches) tall by 11.4 centimeters (4.5 inches) in diameter and the other is 15.2 centimeters (6 inches) tall by 20.3 centimeters (8 inches) in diameter. Surrounding the unit are two 1.2-meter (4-foot) tall yellow metal posts. Both stand pipes have a metal cap.

Location: The site is located 39.6 meters (130 feet) south of the 408-C West Dump Heat Exchanger (DHX) and southwest of the Reactor Containment Building. This location is on the west side of the 491W Heat Transport Building.

Process Description: The site receives both stormwater runoff and heat exchanger condensate from the 491W Heat Transport Building. The heat exchanger system collects condensate from the air on the coils of the unit. The condensate is collected by the heat exchanger unit and drained to the french drain.

Related Sites/ Structures: The site is related to the 408 South Building and the 491-W Heat Transport Building.

Waste Type: Water

Waste Description: Reports conflict about effluents discharged to the unit, which may receive stormwater; dump heat exchanger effluent; and rheostat water containing non regulated quantities of sodium carbonate from the 408-B Dump Heat Exchanger (DHX) and the 491-W Heat Transport Building; condensate from building air cooling systems, solutions of water and detergent. The "Inventory of Miscellaneous Streams", Revision 3 lists the streams as heat exchanger

condensate and stormwater. This document states that this stream receives the heat exchanger condensate formerly routed to Miscellaneous Stream #20 (WIDS Site Code 400 FD6). The document lists the flow rate as less than 0.08 liters per minute (0.02 gallons per minute).

Code: 400 PPSS

Classification: Accepted

Names: 400 PPSS; 4608 Percolation Pond; 4608B Control Structure and Process Sewer Sampling Site; 4904 Process Sewer Main; 4904 Process Sewer System; 400 Area Process Pond and Sewer System

Reclassification: None

Type: Pond

Start Date: 1/1/1979

Status: Active

End Date:

Description: This site is the 400 Area Secondary Cooling Water (400 Area Process Sewer). The unit consists of underground piping, a control structure, and two percolation ponds known as 4608B and 4608C. The control structure, located near the 4607 Sanitary Sewer septic tank, is a corrugated metal building. A 30.5 centimeter (12 inch) main pipeline carries effluent from the 400 Area to the control structure, then northeast to the percolation ponds. Five 15.2 centimeter (6 inch) diameter pipes discharge process water from the four contributing facilities (see Process Description) into the main pipe (two pipes from FMEF, and one pipe each from the other three facilities). The ponds are 30.5 meters (100 feet) long, 15.3 meters or 23 meters (50 feet or 75 feet) wide, and 1.2 meters (4 feet) deep. The process sewer pipeline empties into a diversion box that is built into the wall that separates the two ponds. Each pond is connected to the diversion box by a 35.6 centimeter (14 inch) vitrified clay pipe. The ponds are enclosed by an 2.4 meter (8 foot) chain-link fence that has an unlocked, open gate. Each pond appears as a vegetation covered area that is recessed 1.2 to 1.8 meters (4 to 6 feet). The sampling location for the process sewer is contained in the flow metering hut (4608B) located just north of the northern fence line of the 400 Area. The following is a list of source contributors and their status. Numbering/naming conventions, e.g., FMEF-352, 36B, 4M-92-00240/M are specific to facility locations, systems, and Engineering Change Notice/Work Package within the FFTF Complex. Note that some of the original source contributors have been plugged or bermed to prevent cooling water from entering the process sewer.

Location: The site is located approximately 610 meters (2000 feet) north, northeast of the 400 Area.

Process Description: There are four facilities in the 400 Area that contribute to the 400 Area Secondary Cooling Water (400 Area Process Sewer). Fast Flux Test Facility (FFTF) The FFTF is a sodium-cooled test reactor that was used for nuclear research. The reactor's high neutron flux level and neutron energies allowed accelerated testing of fuels and materials. The reactor operated from 1980 to April 1, 1990, when it was ordered into standby status by the U. S. Department of Energy (DOE). In a December 15, 1993 memorandum, the DOE directed its Richland Operations Office to initiate action to place the FFTF in a radiologically and industrially safe shutdown condition. The processes that contribute to the 400 Area Process Sewer are the auxiliary system cooling towers and a batch discharge. The cooling towers reduce the heat generated in the equipment supporting the FFTF auxiliary systems. There is no contact between the piping of the cooling towers and any radioactive liquid, waste, or nuclear materials in the reactor. Adjacent to the cooling tower pad is a building containing water treatment equipment, water quality monitoring instrumentation, and process control for blowdown valves associated with the cooling towers. This system is adjacent to the reactor containment and service buildings within the 400 Area Property Protection Area. Fuels And Materials Examination Facility (FMEF) The FMEF was designed and constructed as a secure, multistoried structure with the capability of handling low and high exposure radioactive materials. Because of program and funding changes, most of the specialized equipment was never installed and radioactive material has never been introduced into the FMEF. The FMEF currently is used for administrative offices. The processes that contribute to the 400 Area Process Sewer are the auxiliary systems cooling towers and batch discharges from the 36B system and the 36D system. Originally, the 36D system was intended to contain radioactive waste. However, with the change in mission for the FMEF, this system has not been used for holding radioactive waste. Engineering documents have been formally changed to reflect the correct status of the 36D system. The cooling system at the FMEF is also a non-contact cooling water system similar to the unit for the FFTF. Maintenance and Storage Facility (MASF) The MASF, located in the 400 Area Property Protection Area, consists of a main building and a two story service wing. The purpose of MASF is to provide maintenance, repair, and storage areas for radioactive and/or specialized maintenance equipment used in support of the FFTF or other onsite activities. The contributors to the 400 Area Process Sewer are floor and equipment drains located in the bay

area. Batch discharges from the large diameter cleaning vessel (LDCV) and bearing cooling water from mitigation pump test runs also are discharged to the process sewer. 481-A Water Pumphouse The 481-A Water Pumphouse was constructed to provide space for a diesel driven fire pump and two sanitary water pumps. An equipment drain associated with sanitary water pump packing leakage contributes to the 400 Area Secondary Cooling Water. The discharges for each facility are described below. Fast Flux Test Facility (FFTF) The FFTF has one continuous discharge from the cooling towers, which is non-contact cooling water, and one batch discharge, which is condensate from the heating and ventilation (H&V) units. The cooling tower continuous stream is composed of tower sump blowdown (for conductivity control) and sump overflow. The cooling towers provide cooling to the Cooling Water System, which in turn provides cooling to the following various auxiliary systems, incontainment chill water system, excontainment chill water system, radioactive argon processing system and contaminated air processing system, Mobiltherm lite cooling system, and the liquid rheostat cooling system. These auxiliary cooling systems, cool systems that directly support operation of the reactor plant, and the interim decay and storage (IDS) vessel and are explained in greater detail in the following. A portion of the sodium contained in the reactor vessel is routed to a cold trap (CT), through the reactor overflow line (part of the reactor sodium level control system), for removal of impurities. The CT is cooled by a sodium potassium eutectic metal (NaK) system that, in turn, is cooled by an oil system containing Mobiltherm lite oil. The Mobiltherm cooling system is cooled by the Cooling Water System. The Mobiltherm cooling system has been drained of oil and the oil has been removed from the site. Cooling water is blocked from the Mobiltherm/cooling water heat exchanger by closed valves. This portion of the cooling water system is no longer active. The reactor is cooled by three liquid sodium loops with each loop consisting of a primary and a secondary loop. Each primary and secondary loop contains a main circulating pump to provide motive force for the liquid sodium coolant. Each pump has a liquid rheostat in series with the field windings to control the speed of the pump. The liquid rheostat contains sodium carbonate (3,407 liters) in a 2 to 3 percent weight solution. Because of the heat generated in the rheostat, the sodium carbonate solution must be cooled. Cooling water is applied to a liquid rheostat/cooling water heat exchanger (one per rheostat) to remove the heat generated during operation. The rheostats are located in air atmosphere cells in the heat transport buildings of FFTF. The rheostats do not come into contact with any form of radioactive contamination or field. The IDS vessel contains liquid sodium that is circulated to remove the decay heat from expended fuel elements stored in the vessel. The sodium loop is cooled by the NaK loop, which in turn is cooled by a Mobiltherm cooling system. The Mobiltherm cooling system has been drained of oil and the oil has been removed from the site. Cooling water is blocked from the Mobiltherm/cooling water heat exchanger by closed valves. This portion of the cooling water system is no longer active. The radioactive argon processing system (RAPS) processes radioactive argon used a cover gas for the reactor. The contaminated air processing system (CAPS) processes the inert gas (nitrogen) used in cells that contained primary system sodium. The RAPS and CAPS compressors are cooled by the RAPS and CAPS cooling water system. This system removes the heat of compression and motor heat from the compressors. The RAPS and CAPS cooling water system is cooled by the Cooling Water System through the RAPS and CAPS/cooling water heat exchanger. The RAPS and CAPS cooling water system has been shut down, although the system still contains the ethylene glycol/water solution. The inert cells containing primary sodium coolant are cooled by inert gas blowers. The blowers take a suction on the inert cells and discharge the gas through a heat exchanger and return the gas to the cell. Incontainment chill water cools the inert gas blowers, using an ethylene glycol solution. The chill water is 'chilled' by use of Freon cycle chillers. The chillers are cooled by the cooling water system. The cells outside of containment are cooled by various H&V units. The H&V units are cooled by excontainment chill water using an ethylene glycol solution. The chill water is 'chilled' by use of Freon cycle chillers. The chillers are cooled by the cooling water system. All the cooling water systems (A-G) contain a 40 percent solution of ethylene glycol that is routed to the cooling towers. The cooling towers are galvanized steel, closed-loop evaporation cooling through cooling coils in the cooling towers. Water is sprayed over the coils as air is blown up through the cooling coils to the

recirculated ethylene glycol solution. The eight cooling towers each have a sump capacity of 7,570 liters (2,000 gallons). The water in the cooling tower sumps is treated chemically with a biocide (Dearborn 702), a microbiocide (sodium hypochlorite), and a scale inhibitor (Dearborn 878). Scale formation is created by the increasing concentration of naturally occurring salts (typically calcium carbonate) resulting from the evaporation process of the cooling towers. The electrical conductivity of the water in the sumps is monitored and when the conductivity approaches 1,200 micromhos, automatic valves open to discharge water. This allows the addition of fresh water to lower the conductivity to approximately 900 micromhos. Fuel and Materials Examination Facility (FMEF) The FMEF has four routine contributors, three discharges from the FMEF cooling towers and one from the pressure relief valve drain to the process water supply system in the mechanical contributors, 36B system and the 36D system. The 36D system originally was intended to contain radioactive waste. However, with the change in mission for the FMEF, this system has not been used for its intended purpose. Waste water from the fire testing system and a lunchroom sink are the only discharges to the 36D system. Both systems contain two 22,712 liter tanks, the 36B system tanks are fiberglass and the 36D system tanks are stainless steel. Both systems have overflow systems and recirculating lines. The 36B system can discharge to either the process sewer or the 36D system. A computer automatically shifts valves to the other tank when one tank is full. At this time, a technician secures a sample from the full tank and the sample is analyzed as required in the sampling and analysis plan. With approval of the analysis results, 12,113 liters (maximum of the pumping system) are discharged to the process sewer. The 36D system operates similar to the 36B system except the contents only can be sent to the liquid waste loadout room. Presently, a fire hose is connected to the line in the liquid waste loadout room and the contents are sent to the barrel washer pad, which is connected to the process sewer. Each system would discharge no more than once every three months. The three cooling towers at the FMEF are identical to the cooling towers located at the FFTF and are operated under the same conditions. The same Dearborn chemicals are added to the water in the FFTF and FMEF cooling towers.

Maintenance and Storage Facility (MASF) The MASF has one routine contributor to the process sewer from the process equipment room air compressor. Two infrequent contributors are from the LDCV and bearing cooling water from mitigation pump test runs. These vessels currently are being used for the testing of new pumps. Water is added to the LDCV and discharged from the vessel to control the heat generated by the pumps. Testing occurs on an irregular basis, but no more frequently than once per month. The discharge to the Process Sewer is monitored for radioactive contamination by an online monitor. Should radiation be detected, a diversion valve opens to discharge the process sewer water into the MASF radioactive waste system. The Process Sewer is protected from cross-contamination by a check valve downstream of the diversion valve and by piping elevation differences. The radioactive liquid waste system is a gravity drain system located about 1.22 meters below the process sewer.

481-A Pumphouse The 481-A Pumphouse has one routine contributor associated with water pump packing leakage from the sanitary water pumps. The other drains have moats around the drains to prevent accidental discharge.

- Related Sites/ Structures:** Primarily, the site is associated with underground piping (known as the 4904 Process Sewer System), 4608-B Control Structure and Process Sewer Sampling Station, and two percolation ponds (4608-B and 4608-C).
- Waste Type:** Process Effluent
- Waste Description:** The process sewer, which empties into the process ponds, is for discharge of water from cooling systems and nonsanitary drains and sumps in the 400 Area facilities, including the Fast Flux Test Facility (FFTF). Water from the FFTF and FMEF cooling towers contains nonregulated quantities of algicides and other treatment chemicals, including a biocide (Dearborn 702), a microbiocide (sodium hypochlorite), and a softening agent (Dearborn 878). Chemicals used for secondary cooling water testing (Dearborn Code 550, 562, 595, 899, 904) are also present in unregulated quantities. Effluent flow varies from approximately (10 gallons per minute) in

winter months to approximately (50 gallons per minute) in peak summer months.

The following waste streams are produced from each of the listed processes.

Process Name	Waste Stream Name
1. FFTF Cooling Water	Cooling Water System
2. FMEF Cooling Water	Cooling Water System
3. FFTF Containment H & V	Moisture Condensate from Ambient Air
4. FMEF Containment H & V	Moisture Condensate from Ambient Air
5. Paint Shop Spray	Filter Water from H & V
6. MASF Large Diameter Cleaning Vessel	Pump Water for Testing of Mitigation Pump
7. MASF Bearing Cooling Water	Bearing Cooling Water from Pump Test Runs
8. FMEF Retention Water	System 36B
9. FMEF Waste System	System 36D

Notes:

The water used in the cooling towers is recycled through the system 2.5 times or until the conductivity reading has reached 1,200 umhos. The chemical containers for the cooling tower treatment are rinsed out and the rinsate is added to the cooling tower sump.

The FFTF and FMEF recycle lubricants offsite.

The total water usage at the site is 471,232.5 liters per day (124,500 gallons per day) (average) and 727,477 liters per day (192,200 gallons per day) (maximum). The water source is a Hanford Site well designated as a drinking water well (Well 499-S1-8J).

Code: 400 RFD	Classification: Not Accepted
Names: 400 RFD; 400 Area Retired French Drains	Reclassification: None
Type: French Drain	Start Date:
Status: Inactive	End Date:
Description: The sites cannot be positively described, although most french drains in the 400 area are 1.5 meter (5 foot) long, 1.2 meter (4 foot) diameter concrete or vitrified clay pipes filled with gravel.	
Location: The site(s) are purported to be located in various locations within the 400 area.	
Waste Type: Water	
Waste Description: The retired french drains received unknown amounts of water used during construction for washing components prior to installation. The combined hazardous chemical inventory for the drains reportedly includes 40 kilograms of sodium dichromate. Based on reviews of available technical information, this information has not been substantiated.	

Code: 400 RSP	Classification: Accepted
Names: 400 RSP; 400 Area Retired Sanitary Pond	Reclassification: Rejected (12/15/1998)
Type: Pond	Start Date: 1/1/1972
Status: Inactive	End Date: 1/1/1979
Description: This site was one component of a sanitary sewer system that supported the temporary facilities during construction of the FFTF. The site was a sanitary sewer pond that has been backfilled and is not visible. It currently appears as a vegetation-free, cobble-covered area. Originally, the site was 152 meters (500 feet) long and (152 meters) (500 feet) wide. Three square unlabeled manholes that provided access to the sanitary sewer pipelines (now abandoned in	

place) are located in the area and each manhole is adjacent to two 9 meter (3 foot) high metal posts.

Location: The site is located west of the 4706 building.

Related Sites/ Structures: The site was related to Portable Sanitary Sewage Treatment Plant (retired) (WIDS Site 400-9), sanitary sewer pipelines that remain in place, and retired septic tanks.

Waste Type: Sanitary Sewage

Waste Description: The unit received 45,420 liters (12,000 gallons) per day of aqueous wastes from a portable sanitary sewage treatment plant that was located several hundred feet away from the pond. Nonhazardous sludges were taken offsite for disposal while the plant and pond were operating.

Code: 400 RST	Classification: Accepted
Names: 400 RST; 400 Area Retired Septic Tanks	Reclassification: Rejected (1/27/1999)
Type: Septic Tank	Start Date: 1/1/1979
Status: Inactive	End Date: 1/1/1983

Description: Three septic tanks are shown on drawing H-4-152051 and are listed as inactive waste disposal units in the Hanford Site Waste Management Units Report. There are no signs to mark the septic tanks. Surface features in the locations indicated on the drawing include two steel manhole covers near the southeast portion of 4702. One lid was partially covered with gravel. It is bolted down in the center and has perforated holes around its perimeter. The second manhole cover is posted with a "Danger: Limited Access, Confined Space, Class II" sign. On the east side of the center wing of 4702 Building is a 0.6 meter (2 foot) square concrete pad with a white 10 centimeter (4 inch) diameter PVC vent pipe protruding from the center. On the west side of the 4702 Building is a steel manhole that is surrounded by four yellow posts. It is also posted with a Confined Space, Class II sign. South of this manhole (on the west side of 4702 Building) is another 0.6 meter (2 foot) square concrete pad with a white 10 centimeter (4 inch) diameter PVC vent pipe protruding from the center.

Location: The tanks are located on the south and west sides of the 4702 Building. The building is surrounded by vegetation-free, cobbles. Two tanks are on the south side of the building and one is on the west side near the northwest corner of 4702. The first tank is located approximately 40 feet (12.2 m) west of the southeast wing of the 4702 building. The second tank is located approximately 5 feet (1.5 m) east of the building's central wing. The third tank is located approximately 5.5 meters (18 feet) west of 4702 and east of the 4734-D building.

Waste Type: Sanitary Sewage

Waste Description: The units received unknown amounts of sanitary wastes from office buildings.

Code: 400 SBT	Classification: Not Accepted
Names: 400 SBT; Cooling Tower Overflow Trench; 400 Area Retired Sand Bottom Trench; 400 Area Sand Bottom Trench	Reclassification: None
Type: Trench	Start Date: 1/1/1979
Status: Inactive	End Date:

Description: A concrete-lined trench 61 meters (200 feet) long, 1 meter (3 feet) wide, and 0.3 meters (1 foot) deep, covered with steel grating. The site collects overflow water from the 483 Cooling Tower pad and directs it to the process sewer. There is no known contamination or postings at the site.

Location: The site is located north of the 483 Cooling Tower concrete pad running in an east to west

direction. BHI-00012, Rev. 00, Figure 4-34, 300-FF-2 Operable Unit Technical Baseline report, shows the cooling tower overflow trench approximately 0.9 meters (3 feet) from the building.

Related Sites/ Structures: The site is related to the 483 Cooling Towers and process sewer.

Waste Type: Water

Waste Description: The 400 Area Sand Bottom Trench reportedly received an unknown amount of non-hazardous cooling tower blowdown. Site personnel state that the Cooling Tower Overflow Trench continues to receive non hazardous blowdown, also known as secondary cooling water. Secondary cooling water contains non-regulated quantities of a biocide, a microbiocide, and a softening agent. Chemicals used for secondary cooling water testing are also present in non regulated quantities.

Code: 400 SS

Classification: Accepted

Names: 400 SS; 4608 Sanitary Sewer; 4608 SS; 400 Area Sanitary Sewer

Reclassification: Rejected (1/27/1999)

Type: Septic Tank

Start Date: 1/1/1983

Status: Inactive

End Date: 1/1/1998

Description: The unit is a septic tank with a 11,355 liter (3000 gallon) capacity. The surface features of the septic tank were two fiberglass manhole covers. One of the manhole covers was posted with a "Danger: Confined Space" sign. The area is covered by vegetation.

Location: The septic tank is located southwest of FMEF and the MO-353 office trailer, outside the security fence. The site is inside (east end) an area enclosed by a light weight post and chain. The chained area measures 30.5 by 36.6 meters (100 feet by 120 feet).

Process Description: The septic system was installed to service the mobile office trailers located south of FMEF, the Fuels and Materials Examination Facility (FMEF).

Related Sites/ Structures: The septic system was associated with Trailers MO-353, MO-378, MO-379, and MO-908.

Waste Type: Sanitary Sewage

Waste Description: Site personnel report the unit may have received waste from the T-100, T-101, T-102, T-103, T-104, T-105, T-106, T-107, T-108, and T-109 trailers. The tank received 2,839 liters (750 gallons) of sanitary waste each day. Effluent from this septic tank was discharged to the 4608 Sanitary Tile Field.

Closure Info: The tank was abandoned in June 1998. No samples were taken because the tank serviced only office trailers.

Code: 400 STF

Classification: Accepted

Names: 400 STF; 4608 Sanitary Tile Field; 4608 STF; 400 Area Sanitary Tile Field

Reclassification: Rejected (1/27/1999)

Type: Drain/Tile Field

Start Date: 1/1/1983

Status: Inactive

End Date: 1/1/1998

Description: The sanitary tile field is located within and at the west end of a vegetation-covered area that is bounded by steel posts and barricade chain. The 4608 Sanitary Sewer septic tank (400 SS) is on the east end of the chained area. The chained area is posted with a blue-and-white sign that

reads "No Vehicles--Septic Field." The tile field has no surface features.

Location: The tile field is located in the southwest corner of the 400 Area, outside the security fence. It is inside an area bounded by light weight post and chain that measures 30.5 meters (100 feet) by 36.6 meters (120 feet) .

Related Sites/ Structures: The tile field is associated with the 400 SS septic tank (WIDS Site 400 SS) and the office trailers MO-353, MO-378, MO-379, and MO-908. The mobile office trailers are now unoccupied.

Waste Type: Sanitary Sewage

Waste Description: The unit received liquid wastes from the 4608 Sanitary Sewer septic tank. Site personnel report the tank and tile field may have received wastes from the T-100, T-101, T-102, T-103, T-104, T-105, T-106, T-107, T-108, and T-109 trailers.

Code: 400-1

Classification: Accepted

Names: 400-1; 400-1 Dump Site

Reclassification: Rejected (12/15/1998)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site is an area of soil mounds containing waste material. The mounds vary in content from backfill material (soil and rocks) to chunks of concrete, red volcanic landscaping rocks, metal piping, rebar, chunks of asphalt, and signs. The mounds are from 0.6 to 1.5 meters (2 to 5 feet) high. Some are partially covered with natural vegetation. The entire site is raised approximately 1.5 meters (5 feet) above the perimeter road that surrounds the 400 Area.

Location: The site is located near the northeast corner of the 400 Area, outside the perimeter fence. It is approximately 69 meters (228 feet) from the fence corner.

Waste Type: Construction Debris

Waste Description: The site contains piles of soil, concrete and rubble, a small amount of miscellaneous materials such as traffic markers and landscape rocks, and a few pieces of concrete asbestos board. Approximately 6 half 208 liter (half 55 gallon) drums (cut in half) are also present.

Code: 400-2

Classification: Not Accepted

Names: 400-2; Concrete Batch Plant

Reclassification: None

Type: Process Unit/Plant

Start Date: 1/1/1972

Status: Inactive

End Date:

Description: The site is a vegetation-free, cobble-covered area that is surrounded by a 2.4-meter (8-foot) high chain-link fence. A concrete building foundation is located at the southwest corner of the fenced area, with rebar and wooden supports protruding from its surface. Several material staging areas contained raw materials for the concrete production. They are open ended, concrete walled bins, located near the building foundation. There is a metal lined pit inside the fenced area that has been used to train employees to use fire extinguishing equipment.

Location: The site is located just north of the perimeter road that runs along the 400 Area's north side, and east of several railroad tracks.

Related Sites/ Structures: The site was associated with the construction of the FFTF.

Code: 400-3

Classification: Not Accepted

Names: 400-3; Miscellaneous Stream #732; 400 Area Drainage Trench; 400 Area Storm Drain Outfall Trench; 400 DT

Reclassification: None

Type: Trench

Status: Active

Description: This trench emerges just north of the perimeter road, at the northeast corner of the 400 Area, and travels north-northeast for approximately 90 meters (300 feet). The sides of the trench are covered with cobblestones, and the bottom is covered with cobblestones and sand. At its starting point near the perimeter road, the trench is 9 meters (30 feet) wide and 6 meters (20 feet) deep. There is no obvious end to the trench, as it narrows down and eventually becomes an area of disturbed vegetation.

Location: The trench is located west of the 400-1 dump site, at the northeast corner of the perimeter of the 400 Area..

Waste Type: Stormwater Runoff

Waste Description: Site personnel report that the unit receives storm runoff from various drains throughout the 400 Area. The Inventory of Miscellaneous Streams Report (DOE/RL-95-82) states this trench receives less than 0.038 liters per minute (0.01 gallons per minute) of stormwater runoff.

Code: 400-4

Classification: Accepted

Names: 400-4; Suspected Burial Ground (East of FFTF)

Reclassification: Rejected (12/3/1998)

Type: Burial Ground

Status: Inactive

Description: The site visit done in 1994 to support the 300-FF-2 Operable Unit Technical Baseline Report indicated the site appeared to possibly be a closed burial ground that had been covered with soil. Large mounds of soil are located on the north side of a flat area that measures approximately 30 by 15 meters (100 by 50 feet). The soil has been mounded approximately 3 to 6 meters (10 to 20 feet) above the surrounding terrain. Vegetation on the mound is sparse. In 1994, some waste, such as a glove and an electrical cable, were partially visible.

Location: The site is located northeast of the 400 Area.

Waste Type: Misc. Trash and Debris

Waste Description: A small amount of visible surface debris. A glove and an electric cable.

Code: 400-5

Classification: Accepted

Names: 400-5; Septic Tank or Cistern

Reclassification: Closed Out (12/3/1998)

Type: Septic Tank

Status: Inactive

Description: Prior to 1998, a concrete pipe emerged from the ground approximately 6 meters (20 feet) north of a building foundation. The pipe had an inside diameter of 0.6 meters (2 feet) and was loosely covered with a wooden cover. It dropped approximately 4.6 meters (15 feet) into a concrete or concrete-lined circular vault. On September 16, 1998, the site was backfilled with sand slurry. It is currently surrounded by "Caution" tape.

Location: The site is located north of the perimeter road that runs along the north side of the 400 Area, on the outside of the perimeter fence.

Process: The 300-FF-2 Technical Baseline report states the vault may have been a septic tank or cistern

Description: used in the 1970's during the construction phase of the 400 Area. The Limited Field Investigation Report indicates the adjacent building foundation may have been a testing laboratory for testing concrete cores. The small structure that is also located in this vicinity is assumed to have been a sample preparation and concrete curing room. Remnants of concrete cores were observed around the building foundation and the cistern. At the time the samples were taken, a hose was inside the tank that may have been used to pump out the contents when the operation was abandoned. The floor of the tank contained sand and animal nesting material.

Code: 400-6 **Classification:** Accepted

Names: 400-6; Material Dumping Area (North of FFTF); Material Dumping Area and Building Foundation **Reclassification:** Rejected (12/3/1998)

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site consists of a building foundation, sidewalks, and construction and demolition debris. The concrete building found is approximately 23 meters (75 feet) long and 7.6 meters (25 feet) wide. A portion of the building remains standing. That portion is made of painted concrete blocks with a corrugated metal roof. The floor slopes to a centered drain. Lumber at the site indicates that the rest of the building may have been of wood construction.

Location: The site is located north of the perimeter road that runs along the north side of the 400 Area, outside the perimeter fence.

Process Description: During the 300-FF-2 Limited Field Investigation (1995), a closer inspection of the area determined the building foundation was a testing laboratory for concrete cores. The small structure is assumed to have been a sample preparation and concrete curing room. There are numerous remnants of concrete cores around the area.

Related Sites/Structures: A cistern or septic tank is located within this area, adjacent to the building foundation. It is listed in the WIDS Database as sitecode 400-5.

Waste Type: Construction Debris

Waste Description: Debris scattered randomly at the site includes glass, metal, bricks, and wood from the building; wooden pallets; chunks of concrete; metal scraps; concrete core samples; and other construction materials. Surplus concrete and asphalt were also poured in an area at the north end of the site.

Code: 400-7 **Classification:** Accepted

Names: 400-7; 4607 Sanitary Sewer; 4607 Sanitary Sewer Septic Tank; 4607 SS; 4607 SSST **Reclassification:** Rejected (1/27/1999)

Type: Septic Tank **Start Date:** 1/1/1978

Status: Inactive **End Date:** 1/1/1997

Description: The unit is surrounded by an 2.4 meter (8 foot) high chain-link fence that is topped with three strands of barbed wire. The gate is unlocked and open. The top of a concrete structure with six metal access hatches is located on the west side of the fenced area. The hatches are marked with "Confined Space" signs. The septic tank inlet, which appears to be a circular concrete tank, is located approximately 3 meters (10 feet) from the south end of the concrete structure, just outside of the fence. Hanford Drawing, H-4-38162, Civil Drawing Index Plot Plan, shows the various components of the system. They are the 4607 Septic Tank (WIDS Site 400-7, 4607 Leaching Field (WIDS Site 400-12), 4607 Sanitary Sewer Lagoon (WIDS Site 400-11). Note that this drawing shows the percolation ponds that belong to the process sewer system (WIDS

Site 400 PPSS).

Location: The septic tank is located north of the 400 Area perimeter road, outside the fence. It is just west of the access road to the 4608-B and C Percolation Ponds.

Related Sites/ Structures: The site is associated with underground lines, including the 4903 Sanitary Sewer Main, that runs throughout the 400 Area. The 4607 Sanitary Tile Field (WIDS Site 400-12) and the 4607 Sanitary Sewer Lagoon (WIDS Site 400-11) are also associated with this septic tank.

Waste Type: Sanitary Sewage

Waste Description: Site personnel report that this unit receives all sanitary wastes from 400 Area buildings except the wastes from a few trailers serviced by the 4608 Sanitary Sewer. The tank was designed to handle a flow rate of 230,000 liters per day (60,000 gallons per day). Reported flow rates include 23,000,000 liters per year (6,000,000 gallons per year), 57,000 liters per day) 15,000 gallons per day, 42,000 to 49,200 liters per day (11,000 to 13,000 gallons per day) of effluent, and 87,400 liters per day (23,100 gallons per day) of "influent and effluent." From 1978 to 1986, effluent was discharged through an underground 20 centimeter (8 inch) PVC pipe to the 4607 Sanitary Tile Field.

Code: 400-8

Classification: Accepted

Names: 400-8; Construction Material Dumping Area (North of FFTF)

Reclassification: Rejected (12/3/1998)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: Currently, the dumping area appears as a field that is a partially covered with vegetation and strewn with debris. The debris consists primarily of construction and demolition waste. There are no boundaries to clearly define the size of the dumping area.

Location: The site is located north of the perimeter road that runs along the 400 Area's north side. It is northwest of the 405 Reactor building.

Related Sites/ Structures: The site was associated with the construction of the FFTF.

Waste Type: Construction Debris

Waste Description: Material dumped at the site includes tires, concrete rubble, metal fencing, rebar, metal grating, sheet metal, piping, and metal scraps.

Code: 400-9

Classification: Accepted

Names: 400-9; 400 Area Retired Portable Sanitary Sewer Treatment Plant; 400 RPSSTP

Reclassification: Rejected (12/3/1998)

Type: Sanitary Sewer

Start Date: 1/1/1972

Status: Inactive

End Date: 1/1/1979

Description: The site was a temporary sanitary sewage treatment plant. There is no visible evidence from the surface of the underground lines that remain in place, the removed treatment plant, or the backfilled pond.

Location: The site is located just east of the 4701-C Guard Station site.

Related Sites/ Structures: 400 Area Retired Sanitary Pond and Underground Lines Associated with the 400 Area Retired Portable Sanitary Sewage Treatment Plant.

Waste Type: Sanitary Sewage

Waste Description: treatment plant was transferred through underground lines to the pond, which was located just west of the current 4706 Building site. An unknown amount of that effluent leaked from sanitary sewer manholes and the outfall prior to late 1975 or early 1976. Nonhazardous sludges from the treatment plant were hauled offsite for disposal.

Code: 400-10 **Classification:** Not Accepted

Type: French Drain **Start Date:** 1/1/1979

Status: Active **End Date:**

Description: The site is a french drain. The visible portion is a 38 centimeter (15 inch) tall metal pipe, 10 centimeters (4 inches) in diameter. On two sides are 20.32 centimeter (8 inch) tall metal bars that are connected by a cross member. The drain is surrounded by four 1.2 meter (4 foot) tall yellow steel posts and is in the middle of a gravel covered field. The pipe is capped with a metal plug that has a raised square on top.

Location: The drain is located approximately 52.4 meters (172 feet) south of the 408C West Dump Heat Exchanger (DHX), and (21.3 m) west of the 408B South Dump Heat Exchanger (DHX), and southeast of WIDS Site 400 FD5. This location is west of the 453B switch gear pad and south of the 402 Building.

Related Sites/ Structures: The site is related to the 453-B Switch Gear Pad.

Waste Type: Stormwater Runoff

Waste Description: The unit receives stormwater from the 453-B Switchgear Pad. The flow rate is less than 0.038 liters per minute (0.01 gallons per minute).

Code: 400-11 **Classification:** Accepted

Names: 400-11; 4607 Sanitary Sewer Lagoon; 4607 SSL; 400 Area Wetlands **Reclassification:** Rejected (1/27/1999)

Type: Pond **Start Date:** 1/1/1986

Status: Inactive **End Date:** 1/1/1996

Description: The site is a sanitary sewer lagoon that is currently dry. It has been backfilled and vegetated with grasses. The north and west sides are slightly depressed, but the south and east sides slope upward to the surrounding terrain. The adjacent terrain is covered with sagebrush and tumbleweeds. Signs are still present around the perimeter of the lagoon that state "Treated Sewage". Shortly after the 4607 Sanitary Sewer and the 4607 Sanitary Tile Field began operating in 1978, sanitary effluent began surfacing in the location of the drain field and overflowing into a natural depression nearby. In 1986, the drain field failed completely, causing effluent to overflow through a manhole and enter the depression through a drainage ditch. A valve pit diversion box was subsequently installed to divert the waste stream to the natural depression. It became known as the 4607 Sanitary Sewer Lagoon and the 400 Area Wetlands. The lagoon was deepened, a berm was constructed around it. The existing drainage ditch was backfilled.

Location: The lagoon is located northeast of the 4607 Sanitary Sewer septic tank (400-7) and southwest of the 4608-B and C Percolation Ponds (400 PPSS).

Related Sites/ Structures: The lagoon was associated with the 4607 Sanitary Sewer (WIDS Site 400-7), 4607 Sanitary

Tile Field (WIDS Site 400-12), and the 4903 Sanitary Sewer Main.

Waste Type: Sanitary Sewage

Waste Description: From 1986 to 1996, all sanitary effluent from the 4607 Sanitary Sewer has been discharged from the septic tank to the lagoon. Reported flow rates include 23,000,000 liters per year (6,000,000 gallons per year) in 1987, 57,000 liters per day (15,000 gallons per day) in 1989, 42,000 to 49,200 liters per day (11,000 gallons per day to 13,000 gallons per day) in 1992, and 87,400 liters per day (23,100 gallons per day) of influent and effluent in 1993. The theoretical combined evapotranspiration and percolation rate of the pond, based upon the 1993 flow rate is 187 liters per square meter per day (4.6 gallons per square foot per day).

Code: 400-12

Classification: Accepted

Names: 400-12; 4607 Sanitary Tile Field; 4607 STF; 4608A Leaching Field; 4608A Sanitary Sewer Leaching Field

Reclassification: Rejected (1/27/1999)

Type: Drain/Tile Field

Start Date: 1/1/1978

Status: Inactive

End Date: 1/1/1986

Description: There are no visible surface features to identify this tile field. The tile field consisted of perforated 10 centimeter (4 inch) diameter PVC pipe that discharged sanitary effluent by gravity. The pipe sloped 0.25 meters for every 30.5 meters (3 inches for every 100 feet) of length. The tile field was filled with 0.3 meters (3 feet) of gravel and was covered with "untreated building paper." Approximately 490 meters (1,600 feet) of PVC pipe connected the tile field with the 4607 Sanitary Sewer septic tank. Per Curt Clement, Dyncorp, the drain/tile field was abandoned in-place years ago when it originally failed. The tie-in has been plugged.

Location: The tile field was located north of the 400 area, outside the security fence and west of the fenced 400 Area Process Ponds.

Process Description: Effluent discharged from the septic tank through an underground PVC pipe to the 4607 Sanitary Tile Field. Numerous problems were encountered with the tile field. Septic tank effluent repeatedly surfaced in the area of the tile field and overflowed into a natural depression nearby (site code 400-11). In 1986, the drain field failed completely, causing effluent to overflow through a manhole and enter the depression through a drainage ditch. A valve pit diversion box was installed to permanently divert the waste stream to the depression.

Related Sites/Structures: The tile field is associated with the 4607 Sanitary Sewer (WIDS Site 400-7), 4607 Sanitary Sewer Lagoon (WIDS Site 400-11), and 4903 Sanitary Sewer Main.

Waste Type: Sanitary Sewage

Waste Description: The 4607 Sanitary Sewer received all sanitary wastes from 400 Area buildings except the wastes from a few trailers serviced by the 4608 Sanitary Sewer. Between 1978 and 1986, the tile field received liquid effluent from the 4607 Sanitary Sewer septic tank. The tank may have received effluent at a rate of 23,000,000 liters per year (6,000,000 gallons per year) in 1987, 57,000 liters per day (15,000 gallons per day) in 1989, 42,000 to 49,200 liters per day (11,000 to 13,000 gallons per day) in 1992, and 87,400 liters per day (23,100 gallons per day) in 1993.

Code: 400-13

Classification: Accepted

Names: 400-13; Waste Dumping Site (East of FFTF)

Reclassification: Rejected (12/15/1998)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site is a dumping area. Debris has been dumped in several areas, scattered over an area

occupying approximately 1.2 hectares (3 acres). One of the dumping areas was possibly fenced in the past, since two corners are framed by wooden posts with fallen fence rails and chicken-wire fencing.

Location: The site is located northeast of the 400 Area, on the east side of a dirt access road. The unit is accessible by a dirt road that begins at the northeast end of the Fast Flux Test Facility (FFTF) Visitor Center parking lot.

Related Sites/ Structures: The site is believed to be related to the construction of FFTF.

Waste Type: Misc. Trash and Debris

Waste Description: Tree limbs, bags of leaves, and other debris are scattered in several locations along the east side of the dirt access road. Additional areas further away from the road contain fire bricks, black rubber gloves, metal buckets, rusted tin cans, broken glass jars, electrical wiring, metal mesh screening, caulking guns, wood scraps, large chunks of building concrete, semi-circular wooden wall sections, and other waste materials.

Code: 400-14

Classification: Accepted

Names: 400-14; Burn Pit (East of FFTF)

Reclassification: Rejected (12/15/1998)

Type: Burn Pit

Start Date:

Status: Inactive

End Date:

Description: The 1994 site visit that supported the 300-FF-2 Technical Baseline Report stated the site was a large burn pit containing some visible, fire-scarred debris at the east end. Blown-in tumbleweeds were piled within the pit and some natural vegetation had begun to grow along the pit's walls. The unit's appearance indicated it has not been used for some time.

Location: The site is located northeast of the 400 Area, outside the facility fence. The pit is east and southeast of a waste dumping area (WIDS Site Code 400-13), and is southeast of a suspected burial ground (WIDS Site Code 400-4). The unit is accessible by a dirt road that begins at the northeast end of the Fast Flux Test Facility Visitor Center parking lot.

Waste Type: Misc. Trash and Debris

Waste Description: Fire-scarred metal mesh screening, rags, wood scraps, and fire bricks are visible within the pit, particularly at its east end.

Code: 400-15

Classification: Not Accepted

Names: 400-15; Diesel Fuel Tank Fitting Leak

Reclassification: None

Type: Unplanned Release

Start Date: 1/1/1986

Status: Inactive

End Date: 1/1/1994

Description: The site was a petroleum unplanned release, discovered during the removal of two fuel tanks 400-FS-40 and 400-FS-4. One tank held diesel fuel and one tank held unleaded gasoline.

Location: The release site is located in the southwest corner of the 400 Area Fire Station (4704-S) parking lot.

Process Description: The tanks served as unleaded gasoline and diesel fuel storage tanks for the 400 Area fire station. The tanks, which were installed in 1986, were double-wall fiberglass construction. Each had a capacity of 1,892.5 liters (500 gallons). Prior to excavation of the two tanks, a site check was performed, which did not reveal any evidence of surficial contamination. The general condition of the fueling station was clean and appeared to be well maintained. Excavation for removal of the tanks was initiated on 5/9/1994. Removal of the concrete pad

covering the tanks revealed hydrocarbon staining around both pump lines. No staining was evident above the tank structures. Inspection of the tanks after removal indicated that the integrity of both tanks was good. In addition, there was no indication from the tank wall surfaces or the soil directly around the tanks that leakage had occurred. Once the tanks were removed, soil samples were collected for laboratory analysis from the tank excavations, the spoils piles, and the soil around the pump piping. Excavation of the soil was initiated by the subcontractor who was removing the storage tanks. This excavation resulted in the removal of the contaminated soil at the site. The soil contamination found under the tanks and pump island were cleaned up and safely stored for later treatment. Soil samples were obtained and sent for independent laboratory analysis. The completion date for this activity was 5/25/1994. By August 1994, the 15.2 meter (50 foot) long and 9.1 meter (30 foot) wide tanks were removed. The excavation pit had been backfilled nearly to grade with clean soil and covered with gravel. All signs, barricades, and piles of soil had been removed.

Related Sites/ Structures: The site was related to tanks 400-FS-40 and 400-FS-41 and the 400-39 bioremediation pad.

Waste Type: Oil

Waste Description: Two empty underground tanks were unearthed and moved from this site on May 10, 1994. One of the tanks had held diesel fuel, and the other had held unleaded gasoline. The soil underneath was discovered to have been contaminated with fuel. Approximately, 400 cubic yards of contaminated soil was excavated and removed to a bioremediation pit. Maximum soil concentrations were 4,500 parts per million (milligrams per kilogram) and 660 parts per million (milligrams per kilogram) for diesel and gasoline respectively. The soil sampling results indicated that at a depth of (30 feet), gasoline concentration was less than 20 parts per million and the diesel concentration was less than 50 parts per million. These limits were below the regulatory limits of WAC 173-340. As a result, the hole was backfilled with clean soil.

Code: 400-16

Classification: Accepted

Names: 400-16; 4831 Flammable Storage Facility; 4831 FSF

Reclassification: Rejected (12/3/1998)

Type: Storage

Start Date:

Status: Inactive

End Date:

Description: The unit is a yellow, corrugated metal building and a fenced concrete pad to the south. The pad is 6.1 meters (20 feet) wide and 15.2 meters (50 feet) long, surrounded by a 1.8 meter (6 foot) high chain-link fence with a locked gate. The building is about 6.1 meters (20 feet) high, 6.1 meters (20 feet) wide, and 15.2 meters (50 feet) long. A walk-in door and a roll-up door, located on the south side of the building, allow access from the building to the fenced area.

Location: The building borders a portion of Texas Street's east end, and is south of the 4831 LHWSA.

Process Description: The building is used to store flammable or combustible products, including lubricants and alcohols.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: In 1994, signs indicated that the fenced area contains nonregulated empty drums, nonregulated waste, and used oil. No hazardous chemicals were stored on the outdoor pad. In 1998, all nonregulated waste containers were removed from the outdoor concrete pad. This pad is no longer used for nonregulated waste or empty containers. The building is used to store flammable or combustible products including lubricants and alcohols.

On 9/8/1998, the facility and nonregulated waste storage pad were walked down by Mr. T. A.

Dillhoff (FFTF Environmental Compliance Officer). There was some rust staining on the concrete pad, but no evidence of any chemical leakage

Code: 400-17 **Classification:** Accepted

Names: 400-17; Buried Construction Waste Area; Buried Construction Waste Area #1 **Reclassification:** Rejected (12/15/1998)

Type: Burial Ground **Start Date:** 1/1/1977

Status: Inactive **End Date:** 1/1/1979

Description: The site is a burial ground. The area shown on SK-4-81543 as a construction waste burial ground is partially covered by the 4843 Building and the 4843 Laydown Area. There is no visible evidence of a burial ground at this location. Areas surrounding the 4843 facilities appear as vegetation-free, gravel-covered fields.

Location: The site is located northwest of the 451-B Substation and FMEF. It is partially underneath the 4843 Building and the 4843 Laydown Area.

Related Sites/ Structures: The site is associated with the construction of the Fast Flux Test Facility (FFTF).

Waste Type: Construction Debris

Waste Description: Site employees report that construction wastes were buried in this unit from "about 1977" to "about 1979."

Code: 400-18 **Classification:** Accepted

Names: 400-18; Buried Construction Waste Area; Buried Construction Waste Area #2 **Reclassification:** Rejected (12/15/1998)

Type: Burial Ground **Start Date:** 1/1/1972

Status: Inactive **End Date:** 1/1/1974

Description: The site is a burial ground. The area shown on SK-4-81543 as a construction waste burial ground is partially covered by the 4831 Flammable Storage Facility. There is no visible evidence of a burial ground at this location. The area is now a vegetation-free, gravel-covered field.

Location: The site is located northeast of the 451-B Substations and FMEF. It is partially underneath the 4831 Flammable Storage Facility and the 4831 Laydown Hazardous Waste Storage Area (4831 LHWSA).

Related Sites/ Structures: The site is associated with the construction of the Fast Flux Test Facility (FFTF).

Waste Type: Construction Debris

Waste Description: Site employees report that construction wastes were buried in this unit from "about 1972" to "about 1974."

Code: 400-19 **Classification:** Accepted

Names: 400-19; 400-30; 440 Building 90-Day Waste Accumulation Area; Hazardous Waste Temporary Storage Facility **Reclassification:** Rejected (12/15/1998)

Type: Storage Pad (<90 day) **Start Date:** 1/1/1993

Status: Active

End Date:

Description: This facility consists of a tan-painted clearspan steel structure on a concrete pad. The structure's south, west, and north sides consist of steel siding, and its east side consists of 2.4 meter (8 feet) high metal chain-link fencing with two locked gates. It has a weather tight, zinc-coated steel roof with skylights and a full length roof vent. A 13 centimeter (5 inch) high and 15 centimeter (6 inch) wide concrete containment berm runs along the east side of the foundation. The facility's southeast corner is a fenced-off area, designated on drawings as a "Spill Cleanup Equipment Area," that is 3.0 meters (10 feet) long and 2.9 meters (9.67 feet) wide. Its concrete floor is raised about 15 centimeters (6 inches) from the building foundation. A section of this area is used to store clean empty drums for use as waste containers.

Location: The site is located south of the 4713-C Building and within the FFTF protected area fence.

Related Sites/ Structures: This unit replaced the 4831 LHWSA in December 1993.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: The 4831 LHWSA was used to stage oils and other hazardous wastes, including solvents and ethylene glycol. Empty drums that had previously held cooling water treatment chemicals, such as the acutely hazardous Endcor 4690, were also staged at the site. The 440 HWTSE (WIDS Site Code 400-19) replaced the 4831 LHWSA as the 400 Area's less-than-90-day storage area for hazardous wastes. In August 1994, the main portion of the facility contained a white box, labeled "Spill Kit," along with wooden crates and metal cabinets. The "Spill Cleanup Equipment Area" contained several 208 liter (55 gallon) drums.

Description: The site was listed as a french drain located under Altitude Valve Pit T-58. This site is the source location for WIDS Site 400 FD10A. Stormwater runs into the drain at the bottom of the stairs and is routed to the french drain, 400 FD10A.

Location: The Altitude Valve Pit T-87 is located beneath the 482-B Water Storage Tower.

Related Sites/ Structures: The site is associated with the 482-B Water Storage Tower, Water Storage Tank T-87, and WIDS Site 400 FD10A.

Code: 400-22 **Classification:** Not Accepted
Names: 400-22; Altitude Valve Pit T-330 French Drain; Miscellaneous Stream #30 **Reclassification:** None
Type: French Drain **Start Date:**
Status: Active **End Date:**
Description: The site was listed as a french drain located under Altitude Valve Pit T-330. No french drain exists at this location. The waste stream discharges directly to the process sewer. A drain was visually identified by opening the hatch cover and seeing a drain located in the southeast corner of the pit. Water was observed on the floor of the pit. The site is located within a confined space preventing further description of the site at the time of the inspection.
Location: The 482-C Water Storage Tower and the T-330 Altitude Valve Pit are located north of the 481-A building and west of the 4713-D building.
Related Sites/ Structures: The site is associated with the 482-C Water Storage Tower and the T-330 Water Storage Tank.

Code: 400-23 **Classification:** Accepted
Names: 400-23; 480-A Pump House French Drain; Miscellaneous Stream #34; Well Pump P-14 French Drain **Reclassification:** Rejected (12/3/1998)
Type: French Drain **Start Date:**
Status: Active **End Date:**
Description: The site is a square opening in the concrete floor of the 480-A Pumphouse. The site receives leakage from the P-14 Pump. An open 10.2 centimeters (4 inch) diameter pipe was observed at the bottom of the site. The site was dry at the time of the inspection.
Location: The 480-A pumphouse is located northeast of the 4713-C building, and northwest of the 437 building. The site is located inside the pumphouse.
Process Description: The 400 Area receives raw water from groundwater wells. Normally, Well 499-S1-8J is the active well that supplies raw water to the water storage tanks (T-330, T-87, T-58). Pump P-16 is associated with Well 499-S1-8J and by changing the valve positions, water can be pumped to any of the three water storage tanks. Groundwater wells, 499-SO-8 and 499-SO-7, and their associated pumps, P-14 and P-15 respectively, serve as backup water supply to the 400 Area.
Related Sites/ Structures: The site is associated with the 480-A Pumphouse, Well 499-SO-8, Pump P-14 and the Water Storage Tanks (T-330, T-87, and T-58). Pump P-16 is associated with WIDS Site Code 400-25, Pump P-15 is associated with WIDS Site Code 400-24, and Pump P-14 is associated with WIDS Site Code 400-23.
Waste Type: Water
Waste Description: The french drain receives pump packing leakage from the P-14 well pump. The normal flow rate is 0.038 liters per minute (0.01 gallons per minute).

Code: 400-24 **Classification:** Accepted
Names: 400-24; Miscellaneous Stream #35; Well Pump P-15 French Drain **Reclassification:** Rejected (12/3/1998)

Related Sites/ Structures: The site is associated with the 480-B Pumphouse, Well 499-SO-7, Pump P-15 and the Water Storage Tanks (T-330, T-87, and T-58). Pump P-16 is associated with WIDS Site Code 400-25, Pump P-15 is associated with WIDS Site Code 400-24, and Pump P-14 is associated with WIDS Site Code 400-23.

Waste Type: Water

Waste Description: This french drain receives groundwater well water leakage from pump P-15. The flow rate for this french drain is less than 0.038 liters per minute (0.01 gallons per minute).

Code: 400-25

Classification: Accepted

Names: 400-25; Miscellaneous Stream #36; Well Pump P-16 French Drain

Reclassification: Rejected (12/3/1998)

Type: French Drain

Start Date:

Status: Active

End Date:

Description: The site is an active french drain constructed of concrete and covered with a steel lid. There is no known contamination at the site, and there were no postings. The site is actively receiving water. The water level in the french drain was 0.46 meters (1.5 feet) deep at the time of the inspection (10/5/1998).

Location: The french drain is located northwest of the 4713-D building and east of the P-16 Pump House.

Process Description: The 400 Area receives raw water from groundwater wells. Normally, Well 499-S1-8J is the active well that supplies raw water to the water storage tanks (T-330, T-87, T-58). Pump P-16 is associated with Well 499-S1-8J and by changing the valve positions, water can be pumped to any of the three water storage tanks. Groundwater wells, 499-SO-8 and 499-SO-7, and their associated pumps, P-14 and P-15 respectively, serve as backup water supply to the 400 Area.

Related Sites/ Structures: The site is associated with the 480-D Pumphouse, P-16 Pump, Well 499-S1-8J, and the Water Storage Tanks (T-330, T-87, T-58). Pump P-16 is associated with WIDS Site Code 400-25, Pump P-15 is associated with WIDS Site Code 400-24, and Pump P-14 is associated with WIDS Site Code 400-23.

Waste Type: Water

Waste Description: The french drain receives groundwater well pump packing leakage from the P-16 pump. The well is used to supply drinking and process water for the 400 Area. The flow rate is less than

0.038 liters per minute (0.01 gallons per minute).

Code: 400-26 **Classification:** Not Accepted
Names: 400-26; 451-A Substation and B/N Plant French Drain **Reclassification:** None
Type: French Drain **Start Date:** 1/1/1979
Status: Active **End Date:**
Description: This site consists of two drains located in the bottom of Electrical Manhole #1. These drains remove stormwater.
Location: Electrical Manhole #1 is located in the southeast corner of the 451 Substation.
Related Sites/Structures: The site is associated with the 451-A Substation and 400 Area B/N Plant.
Waste Type: Stormwater Runoff
Waste Description: This unit receives intermittent discharges of stormwater from the 451-A Substation and the 400 Area B/N plant. It has a normal flow rate of zero.

Code: 400-28 **Classification:** Not Accepted
Names: 400-28; FFTF Dichlorodifluoromethane Releases **Reclassification:** None
Type: Unplanned Release **Start Date:**
Status: Active **End Date:**
Description: The sites are "fugitive airborne emissions" from eight centrifugal chiller units at the Fast Flux Test Facility (FFTF). These units are used to provide cooling for personnel and equipment. Each chiller unit contains up to 3,000 pounds of dichlorodifluoromethane.
Release Description: The refrigerant dichlorodifluoromethane, or R-12, has reportedly been released in airborne emissions from the eight chiller units at the Fast Flux Test Facility (FFTF). Approximately, 1000 pounds of refrigerant are released each year (Dahl -1991). In Fiscal Year 1998, the R-12 refrigerant in all eight chillers was replaced with R-134A, which is nonhazardous and non-ozone depleting.
Waste Type: Chemicals
Waste Description: The waste released was dichlorodifluoromethane, R-12, refrigerant. In Fiscal Year 1998, the R-12 refrigerant was replaced by R-134A. This information was reported by the FFTF Technical Point of Contact.

Code: 400-29 **Classification:** Not Accepted
Names: 400-29; FFTF PCB Containing Transformers **Reclassification:** None
Type: Control Structure **Start Date:**
Status: Active **End Date:**
Description: The sites are the 19 electrical transformers within the Fast Flux Test Facility (FFTF) complex containing polychlorinated biphenyls (PCBs). All of the transformers are/were located within buildings or on the roof of buildings. Five of the transformers have been removed and disposed of in accordance with Toxic Substances Control Act (TSCA) regulations.
Location: All of the 19 transformers were located within the Fast Flux Test Facility (FFTF) Complex. 14

of the transformers remain in place at the FFTF Complex. 5 of the transformers have been removed.

Release Description: Past releases from the transformers "involved limited seepage from sample ports due to improperly installed fittings" (WHC-EP-0475-1). Additionally, some routine operations result in the release of small amounts of PCBs to the environment. The exact locations of the leakage are unknown, and it is unknown whether or not all 19 transformers were involved. WHC-EP-0475-1 states 0.0 pounds as the quantity of chemical released per year for these 19 transformers. All seepage and drips were cleaned up when discovered.

Waste Type: Oil

Waste Description: The waste is transformers containing polychlorinated biphenyl oils (Type is Askarel).

This Site has the Following SubSites:

Code: 400-29:1

Names: 400-29:1; Transformer X-5

Code: 400-34 **Classification:** Not Accepted
Names: 400-34; Miscellaneous Stream #733; Northwest Surface Water Drainage Ditch **Reclassification:** None
Type: Ditch **Start Date:** 1/1/1982
Status: Inactive **End Date:**
Description: A surface water drainage system made of a series of ditches and culverts is shown on drawing H-4-155518 and on H-4-150029. The ditch is shown to be northwest of the 437 building, measuring approximately 700 feet in length and exiting the northwest corner of the 400 Area. It

was determined that this drainage ditch was never constructed.

Location: The ditch was supposed to be located outside of the northwest corner of the 400 Area perimeter fence.

Code: 400-35 **Classification:** Not Accepted

Names: 400-35; Miscellaneous Stream #734; Southwest Surface Water Drainage Ditch **Reclassification:** None

Type: Ditch **Start Date:** 1/1/1982

Status: Active **End Date:**

Description: A surface water drainage system exits the southwest section of the 400 Area. This system collects surface water runoff from the area west of the Reactor Area. The system is a series of underground culverts and exposed, cobble ditches. It measures approximately 2750 feet in length. It exits the southwest corner of the reactor, area near the 4790 Patrol Headquarters building, as an underground pipeline. It turns south for approximately 229 meters (750 feet) along Grant Ave. It exists the security fence and runs along the FMEF parking area. It then turns to the west along Alabama Blvd. until it reaches the desert southwest of 400 Area.

Location: This drainage system is located partly inside and partly outside the southwest section of the 400 Area.

Waste Type: Stormwater Runoff

Waste Description: The unit collects storm water runoff from the west section of the 400 Area Reactor Area.

Code: 400-39 **Classification:** Accepted

Names: 400-39; 400 Area Bioremediation Pad; 400 Area Soil Cell **Reclassification:** Rejected (11/22/2004)

Type: Surface Impoundment **Start Date:** 1/1/1994

Status: Inactive **End Date:**

Description: The site is a bermed, mound of soil with a visible plastic liner. It is marked with a sign that says Keep Out- Petroleum Contaminated Soil.

Location: The site is located east of the 4704-S building.

Process Description: Remediation of the soil from the diesel tank leak (see sitecode 400-15) was accomplished using aeration/bioremediation in accordance with the June 21, 1994 letter provided by the State of Washington Department of Ecology (Ecology). The contaminated soil was placed in a plastic lined, bermed bioremediation pit, located 61 meters (200 feet) west of the tank excavation site. Fertilizer, water, and bacteria were added to the soil. More fertilizer and water were added daily, and the soil was tilled under for aeration. The bioremediation process was estimated to take 45 to 90 days.

Waste Type: Oil

Waste Description: The bioremediation pad contains petroleum contaminated soil that was found when the fire station fuel tanks 400-FS-40 and 400-FS-41 were removed (see sitecode 400-15).

Code: 400-40 **Classification:** Accepted

Names: 400-40; 403 Building Fuel Storage Facility **Reclassification:** None

(FSF); 4718 ISA; 400 Area Interim Storage Area (ISA); 400 Area Waste Management Unit

Type: Storage

Start Date:

Status: Active

End Date:

Description: The 400 Area Waste Management Unit consists of two parts. The Fuel Storage Facility (FSF) is a one level reinforced concrete substructure covered by a steel frame, metal sided high bay building. The 400 Area Interim Storage Area (ISA) is a 156 by 75 meter (513 by 247 foot) fenced area with perimeter lighting.

Location: The two parts of the 400 Area Waste Management Unit are located in the northeast portion of the 400 Area. Both are north and east of the reactor building.

Process Description: The 403 Fuel Storage Facility (FSF) is capable of storing various types of mixed waste, but as of the effective date of the Part A Permit, only two steel boxes containing sodium contaminated Core Component Pots (CPP) are stored in the 403 FSF. The concrete pad in the fenced Interim Storage Area had been used for dry cask storage, but will not necessarily be used for storing additional mixed waste management.

This Site has the Following SubSites:

Code: 403 FD **Classification:** Accepted

Names: 403 FD; 403 French Drain; Discharge Point from the 403 Building; Miscellaneous Stream #37; 400 Area Drain Discharge from 403; 400 Area French Drain Discharge from 403 **Reclassification:** Rejected (12/15/1998)

Type: Injection/Reverse Well **Start Date:** 1/1/1979

Status: Active **End Date:**

Description: Previously, this discharge point was mistakenly described as a french drain. A 1996 site visit has confirmed that the discharge point is a pipe exiting the northeast side of the 403 Building. The effluent follows an asphalt trough to a drain in the pavement. The pavement drain is part of the 400 Area Stormwater Collection System (reference H-4-38972 and H-4-158520).

Location: The site is located on the east side of the 403 Building, just south of the northeast corner.

Process Description: Heating, Ventilation, and Air Conditioning (HVAC) condensate and other liquids flow to a sump inside the 403 building. A sump pump pumps the liquid through the pipe that exits the building.

Related Sites/ Structures: The site is related to the 403 Building and the 400 Area

Waste Type: Water

Waste Description: The unit may receive, or may have received air washer blowdown, Heating, Ventilation, and Air Conditioning (HVAC) system condensate, and stormwater from the 403 building, as well as janitorial solutions of water and detergents. The site has been removed from the active list of the "Inventory of Miscellaneous Streams", Revision 3, because the site does not discharge to an engineered disposal unit. The site is part of the 400 Area Stormwater Collection System.

Code: 427 HWSA **Classification:** Accepted

Names: 427 HWSA; 427 Building Fuel Cycle Plant Hazardous Waste Storage Area; 427 Building Fuels and Materials Exam. Facility HWSA **Reclassification:** Closed Out (12/3/1998)

Type: Satellite Accumulation Area **Start Date:** 1/1/1985

Status: Inactive **End Date:**

Description: Currently, the site described as the active Reusable Oil and Empty Drum Storage Area appears as a concrete pad approximately 9.1 meters (30 feet) long and 4.6 meters (15 feet) wide surrounded by a 2.1 meter (7 foot) high chain link fence with a locked gate.

Location: The site was located north of the 427 Building and 4.6 meters (15 feet) inside the Fuels and Materials Examination Facility (FMEF) perimeter fence.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: The FMEF hazardous waste engineer indicates the Reusable Oil and Empty Drum Staging Area is used to stage containers of oils and lubricants, as well as empty drums. One report describes the 427 HWSA as a staging area for oils and lubricants. That description fits the Reusable Oil and Empty Drum Staging Area. However, another report states that the 427 HWSA was used as a staging area for ethylene glycol and ammonium hydroxide.

Code: 437 MASF **Classification:** Accepted

Names: 437 MASF; 400 Area Maintenance and Storage Facility; 437 Maintenance and Storage Facility **Reclassification:** Closed Out (9/11/2003)

Type: Maintenance Shop **Start Date:** 1/1/1982

Status: Active **End Date:**

Description: MASF consists of a main building and a two-story service wing. It is a large concrete and rust-colored corrugated metal siding building (See photo #2). DOE/RL-88-21 shows the Dangerous Waste Permit Application was Closed on 9/11/2003.

Main Building

The above grade portion of the main building is constructed of structural steel shapes. The first 3.05 meters (10 feet) elevation of the above grade exterior walls is made of 30.5 centimeters (12 inch) thick precast concrete panels containing 10.2 centimeters (4 inches) of sandwiched insulation. The remaining exterior walls above the 3.05 meter (10 foot) elevation are steel panels. Roof construction is a factory Mutual Class 1 rated insulated metal deck. The building substructure, including all the below grade cells, is concrete.

The building is designed and constructed to seismic Zone 2 requirements and wind pressure of 25 pounds per square foot.

The concrete lower exterior building wall panels were established by designed to maintain external radiation levels less than 0.2 mrem/h in accordance with DOE Standards for Radiation Protection (Chapter XI of DOE Order 5480.1).

The main building is divided equally into high and low bay sections with heights of 32 meters (105 feet) and 14.9 meters (49 feet). The entire area within the facility is serviced by a 60 ton overhead bridge crane with a 10 ton auxiliary hoist. The high bay section is serviced by a 200 ton overhead bridge crane with a 25 ton auxiliary hoist and includes repair/maintenance floor space and six below grade shielded cells for specialized storage, sodium cleaning, and maintenance services. The high bay also includes a Cask Decontamination and Maintenance Facility (CDMF) to clean and reconfigure the T-3 Shipping Casks. The low bay section includes storage, staging floor space, and the Decontamination Areas I and II shielded enclosure for low level decontamination of small tools, components, and miscellaneous equipment. The low bay also includes a Contaminated Equipment Repair Shop (CERS) for repair of decontaminated Interim Examination and Maintenance (IEM) Cell components. A 10 ton monorail hoist in the low bay supports the Decontamination Areas for handling components/equipment transported to and from the Decontamination Areas. A Shielded Cell Transfer Cask (SCTC), the SCTC air bearing carriage assembly, and the associated support structure are used for equipment transfers into and out of Decontamination Areas through the 1.01 meter (40 inch) diameter ceiling port.

Crane controls for the 200 ton crane, the 60 ton crane and the 10 ton monorail are from individual manual pendants. Protective interlocks are incorporated into the crane control circuits to prevent interference of the 200 ton, 60 ton crane, or the 10 ton hoist.

The two story service wing is physically separated from the main building by a concrete/concrete block structural wall, fire wall, and shield wall. The process equipment room, process control room, personnel support areas, health physics office, and main lobby are located on the first floor of the service wing. Personnel support areas include the monitoring room, clothing issue, change rooms, and lavatories. Two 18,925 liters (5,000 gallon) stainless steel radioactive waste storage tanks are located in a concrete shielded cell beneath the process equipment room.

Service Wing

The second floor of the service wing includes the mechanical equipment room, office space, and lunch/conference room. The mechanical equipment room contains the heating, ventilating, and air conditioning (HVAC) equipment including the air handling unit, return air fan, return air HEPA filters, and the energy recovery unit.

The loadout facility, attached to the west end of the service wing is a concrete shielded enclosure that is physically separated from the service wing by a concrete shield wall. The loadout facility is used for the transfer of radioactive liquid waste from the radioactive waste storage tanks to Hanford Site tank cars for transportation to the site disposal facilities.

Support Services

A railroad spur comes from the FFTF west track and extends through the main building, terminating at the north end of the building. A second railroad spur is provided from the loadout facility to the FFTF main track north of the MASF.

Separate water supply lines are installed from the 400 Area water system to the building to provide both fire and sanitary water services. All post indicator valves in the fire water supply piping are supervised circuit valves.

A 13.8 kV underground feeder and duct bank is installed from Substation 451-B to the MASF outdoor substation transformer which provides a 480/277-V, 3-phase, 4-W, 60 Hz building electrical service.

Low voltage drawout switchgear is used for distribution and control of building power. Each power circuit breaker has a solid state tripping device for either delayed, instantaneous, or ground fault tripping characteristics. Motor loads are fed from a motor control center. Lighting, receptacles, and other loads are fed from panelboards.

The facility is surrounded by a grounding grid. All building steel and equipment are connected to the grid. The instrumentation system uses a separate analog system that ties directly into the FFTF analog ground grid.

The MASF has a lightning protection system.

Sanitary water and fire protection water are supplied from separate mains to the building. A reduced pressure backflow preventer assembly is installed between the sanitary water and process water systems to protect the sanitary water supply.

The sanitary sewer collects effluent waste from the sanitary fixtures and floor drains in the personnel support areas. The process sewer collects nonradioactive liquid from all areas of the facility. The primary source of nonradioactive water discharged to the process sewer is the sodium removal system.

All contaminated liquid waste in the facility is discharged into radioactive liquid waste tanks. The stored radioactive liquid waste is transferred to a railroad tank car in the loadout facility for disposal.

The Heating, Ventilation and Air Conditioning (HVAC) System supports all areas of the facility. The direction of air flow, pressure differentials and duct arrangement minimize the potential spread of contamination or the accumulation of inert gas, and potentially contaminated areas are maintained negative with respect to the outside atmosphere.

The MASF HVAC System consists of a supply air system, a return air system, and an exhaust air system. All recirculated air or exhaust air from the facility passes through a bank of HEPA filters, and the filtered air is isokinetically sampled and continuously monitored for radioactive contamination

- Location:** The site is located in the northeast corner of the 400 Area, 152 meters (500 feet) north of the Fast Flux Test Facility (FFTF) complex, and west of the railroad track serving the FFTF Reactor Containment Building.
- Process Description:** MASF is a multipurpose service center that supports the specialized maintenance and storage requirements of the 400 Area facilities. MASF provides the capability for sodium film removal, decontamination, repair, and storage of nonfuel components and hardware for the Fast Flux Test Facility (FFTF), Fuel Storage Facility and other major 400 Area facilities. Work in the MASF includes handling items that are radioactive due to neutron activation and items that are contaminated with pyrophoric sodium metal (liquid). Transuranic materials, in the form of fuel, are not permitted in the building.

- Waste Type:** Chemicals
- Waste Description:** The chemicals to be handled in MASF are of a typical industrial nature. These include organic acids for decontamination and caustic solutions and inorganic acids for regenerating demineralizer resins. The chemicals will be handled in fume hoods and areas appropriately vented and exhausted through a scrubber, demister, dryer and HEPA filters. Caustic rinse water from sodium cleaning operations will be present in the sodium cleaning vessels and piping systems.

- Waste Type:** Process Effluent
- Waste Description:** This facility is currently being used for the decontamination of radioactive and/or sodium contaminated FFTF equipment, the repair of contaminated manipulators from the FFTF Reactor Containment Building, the staging of large pieces of equipment to be stored, repaired, or tested; and the temporary storage of low level radioactive solid and liquid wastes prior to shipment.

Radioactive liquids are generated in the sodium cleaning vessel operation and Decontamination Areas. All radioactive liquids from the cleaning vessels and Decontamination Areas discharge into the radioactive waste tanks. The radioactive liquid in the tank(s) can be transferred to a liquid waste tank car in the shielded loadout facility for disposal. The capability to transfer radioactive liquids from the cleaning vessels directly to the tank car is also provided. All liquid can be discharged from the tank car through a filter to remove radioactive particles. To minimize the potential for spillage during loadout, overflow lines are provided from the tank car to the radioactive waste tanks. In the event of spillage, a collection basin in the floor also drains back to the waste tanks. The loadout facility is isolated during filling operations to minimize personnel exposure. Personnel exits are located at the north and south ends of the facility for rapid egress if required. The facility is maintained at a negative pressure with respect to the atmosphere to prohibit any inadvertent release of contaminants to the environs.

Components or equipment containing a sodium film or small residual deposits of sodium can be transported to MASF for disposition. All sodium wetted components can be handled in inerted casks or containers and stored in inerted vessels in below grade cells. All sodium wetted components can be cleaned prior to repair/maintenance or other disposition.

This Site has the Following SubSites:

- Code:** 437 MASF:1
Names: 437 MASF:1; HVAC
- Code:** 437 MASF:2
Names: 437 MASF:2; Protective Systems

switchover from the operating to the idle pump is provided in the event of pump or system malfunction. Suitable interlocks prevent the simultaneous operation of heating and cooling systems. Self-contained HEPA filters, with prefilters, are installed as close as practical to the source of potential contaminants to minimize contamination of duct work. HEPA filters are tested at HEHF prior to installation, in place prior to system operation, and at least every two years thereafter. The HEPA filters are installed as single units or manifolded in filter banks and can be changed out as individual units without shutting down the HVAC System. Differential pressure gages are installed across HEPA filters to indicate filter loading. High differential pressure alarms are located on the HVAC control panel for all HEPA filters in the facility, except the CDMF filters. The HVAC air flow control panel and temperature control panel are located in the mechanical equipment room. The HVAC air flow control system can be operated in a manual or automatic mode. The temperature control system operates in the automatic mode. Any off-normal condition will alarm at the HVAC control panel and the process control room panel. All potentially contaminated areas are maintained at a negative pressure with respect to the environment and with respect to adjacent less contaminated areas to minimize the spread of potential contamination. Low range, high sensitivity differential pressure instrumentation provides indication and annunciation to the HVAC control panel, for those areas where contamination potential is greater. In addition, local alarm and indication are provided for those areas of greatest potential for contamination. Smoke detectors are installed in the HVAC return and in selected exhaust ducts upstream from HEPA filters, and these initiate an alarm at the fire alarm control panel (FACP) if smoke is detected in the HVAC exhaust or return ducts. In the event of a smoke/fire alarm, the supply fan automatically shuts down. The return air recirculation damper to AH-I closes, and the return air is exhausted from the building. Both the return and exhaust fans will continue to operate to exhaust smoke from the facility. An indicated radiation level above a preset limit in the return or exhaust duct isokinetic sampling and radiation monitoring system will initiate a visible and audible alarm in the process control room to alert personnel to the off normal condition. An assessment of the cause of the alert alarm condition will be made to determine the need and nature of the required corrective action. In the event that the indicated radiation levels in either the return or exhaust duct exceeds the preset high-alarm limit, the HVAC system supply, return and exhaust fans and dampers will automatically shut down (regardless of smoke/fire alarm conditions) to preclude any potential release of radioactive contamination to the environment or dispersal of contaminants to other areas of the facility. The isokinetic sampling monitor alarm setpoints are established in accordance with applicable requirements. The isokinetic radiation monitoring panel is located in the mechanical equipment room, adjacent to the HVAC control panels.

Description: Instrumentation and Control System The instrumentation control system (ICS) provides integrated control and instrumentation for the process system. The sodium removal, nitrogen, steam, contaminated waste, process water, process sewer, and demineralized water are subsystems of this system. Selected process system components located in administratively controlled areas are monitored and controlled in the process control room. The process control panel has visible and audible alarm annunciators. The process control operator takes corrective action for alarm conditions. For key parameters, backup automatic action is initiated if the operator fails to respond to the alarm condition. Alarm windows are grouped by systems to aid

the operator in quickly identifying the problem and facilitating corrective action. **Fire Protection System** The MASF fire protection system is designed in accordance with Fire Zone 3, Type II N requirements of the Uniform Building Code. The repair and storage area is classified as a Group B, Division 4 occupancy and the two-story service wing as a Group B, Division 2 occupancy. The wet pipe sprinkler system and fire detection/alarm system are designed and installed in accordance with National Fire Protection Association (NFPA) requirements, for ordinary hazard, Group 2 occupancy. All equipment and devices have the Factory Mutual Engineering Corporation approval or are listed for the use intended by the Underwriters Laboratory, Inc. Fire protection system alarm devices are zoned and arranged to provide a local fire alarm and fire zone identification at the fire alarm control panel (FACP). HVAC duct smoke detectors initiate an alarm at the FACP in the event of smoke detection. All FACP alarms are transmitted directly to the Hanford Site central fire station. The system also detects any trouble condition such as an inoperative alarm circuit, a closed post indicator valve or a normal power failure and transmits a trouble signal to the FACP and the central fire station. Hose stations are installed in the repair and storage area in accordance with NFPA requirements. **Radiation Monitoring System** A radiation monitoring system provides radiation surveillance throughout the facility and alarms in the event of above normal radiation levels. The radiation monitoring system consists of remote area monitors, continuous air monitors, and fixed room air samplers. All liquid and gaseous effluents are monitored to prevent releases of radioactivity to the environment. The local area gamma-radiation monitors visibly and audibly alarm locally and process radiation monitors alarm in the process control room in the event that radiation levels exceed pre-established radiation limits. Hand and shoe counters are installed at all established exits from potentially contaminated areas to control the possible spread of contamination to other building areas. **Oxygen-Deficient Atmosphere** The principal inert gas present in the MASF is nitrogen, although an argon inerted component cask or container may be shipped to MASF providing the possibility that argon gas could also be present in the facility. Oxygen deficiency monitors are located in confined areas such as the mechanical service tunnel, Large Diameter Cleaning Vessel (LDCV) cell, test cell, Decontamination Areas I and II, and all stairwells where an oxygen deficient atmosphere might occur. The monitors provide an audible and visible alarm. HVAC supply and exhaust ducting is arranged to ensure maximum circulation to prevent the accumulation of nitrogen or argon gas in confined areas. **Breathing Air System Alarms** Visible and audible alarms are provided at each breathing air station to indicate low air pressure and compressor trouble. The process control room has audible and visual alarms for low pressure, high compressor temperature and loss of alarm power. **Door Annunciators** Limit switches are located at all exterior personnel doors, with the exception of the main lobby door and the process equipment room personnel door. The limit switches indicate that a door is opened and that the contamination control boundary may have been compromised. The limit switches initiate a visible and audible alarm in the process control room. **Emergency Lighting** Battery powered emergency lights are strategically located throughout facility and in all stairwells and at exits to permit safe egress from the building in the event of a power failure.

Description: Decontamination Areas I and II The Decontamination Area shielded enclosure in the main building contains two separate shielded areas, Decontamination Area I and Decontamination

Area II. Surface contaminated articles such as tools, small valves, and mechanical components are cleaned and packaged for storage, disposal, or repair. A 5 ton monorail is provided for material handling in the Decontamination Areas. Operation of the 5 ton monorail in both Decontamination Areas is by radio control. Decontamination Area I is used for semi-remote or spray cleaning and hands-on spray cleaning of contaminated equipment using hot or cold water, steam, and suitable detergents. Two shield windows are installed in the Decontamination Area I shield walls. Work stations, which include all penetrations necessary for the semi-remote spray cleaning of equipment, are provided at each window location. Access to Area I is through a 1.01 meter (40 inch) diameter port in the ceiling via the Shielded Cell Transfer Cask (SCTC). A 1 ton jib crane and electric hoist are provided on the west wall of Decontamination Area I to relocate equipment to a position clear of the 1.01 meter (40 inch) ceiling port, allowing "turn key" operation. A door from Area II to Area I allows equipment and personnel access. Interim Examination and Maintenance (IEM) Cell equipment transfers to and from Decontamination Area I are accomplished using the SCTC, the SCTC Air Bearing Carriage Assembly, and the associated support structure located outside and over the Decontamination Area I cell. The SCTC consists of a shielded cask, an 8 ton hoist and cover assembly, a gas system for cask inerting and purging, and a closure valve. The SCTC is lifted by an overhead crane from the Maintenance Equipment Transport System to the Air Bearing Carriage Assembly and then moved via the carriage to a position over the Decontamination Area I 1.01 meter (40 inch) diameter ceiling port. The carriage is a platform with four air cushion pads and a control system for the air pads. To support the carriage and the SCTC, a support structure is provided that contains support beams between the overhead crane access area and the Decontamination Area I ceiling port. Area I shielding limits all adjacent areas to the design radiation level of 0.2 mrem/h for a maximum 10 R/h point source deposited on the surface of equipment. This point source approximates a 1 curie cobalt-60 equivalent activity deposit which is the maximum projected source to be handled in Decontamination Area I. Decontamination Area II provides the necessary services for hands-on cleaning and maintenance operations of small mildly contaminated parts. A 1.01 meter (40 inch) diameter ceiling port is provided in the ceiling to permit transfer of contaminated articles from the IEM Cell transfer container into Decontamination Area II. This area has a large ultrasonic cleaner, a sink with fume hood, worktable, safety shower, a solid waste compactor, service sink, and floor space for repair, packaging, and unpackaging components. The ultrasonic cleaning tank, worktable, and solid waste compactor are equipped with fume hoods. Hood exhausts discharge into the Area II HVAC exhaust duct. Large equipment double doors and a personnel airlock are also provided for access into Decontamination Area II. Decontamination Area II can process components/ equipment with measurable radiation levels up to 20 mrem/h at 1 foot from the component. This point source approximates a 2 millicurie cobalt-60 equivalent activity deposit on the surface of equipment. As the above analysis showed that this activity was the maximum projected source to be handled in Decontamination Area II, Area II shielding has been designed to maintain the design radiation levels in adjacent areas below the design radiation level of 0.2 mrem/h while processing components/equipment with the above stated radiation levels.

Description: Below Grade Cells The below grade cells within the high bay areas are concrete shielded enclosures, approximately 12.5 meters (41 feet) deep, and include two inert vessel cells, a large

diameter cleaning vessel (LDCV) cell, a small diameter cleaning vessel (SDCV) cell, and an air and test cell. Equipment access is from above by removing the shielded floor plugs used to cover the cells. The 200 ton and 60 ton crane support these cells. The below grade cell shielding maintains the radiation levels below 0.2 mrem/h radiation to adjacent areas. The worst case component allowed to be stored or serviced in each cell is an instrument tree in the inert vessel and LDCV cell, six reflectors in the SDCV cell, and an intermediate heat exchanger in the air and test cell). The instrument tree and reflectors experience a maximum neutron flux from the FFTF core. The Intermediate Heat Exchanger (IHX) is subjected to the maximum corrosion product deposition from the primary coolant loops of the FFTF. Source strengths for these components are provided in the facility design criteria. The maximum allowable radiation levels from the cells to the adjacent areas are 2 mrem/h in the mechanical service tunnel and below-grade cells and 0.2 mrem/h in the stairwell and above-grade high-bay area. Inert Vessel Cells The inert vessel cells each contain a carbon steel vessel that provides controlled inert storage atmosphere for large sodium-wetted components prior to sodium film removal and for components that have been cleaned, repaired, and are ready for reuse. LDCV and SDCV Cells The LDCV and SDCV cells contain the cleaning vessels for sodium film removal from sodium-wetted components. The LDCV and SDCV cleaning vessel design pressures are 20 psig. The vessels have been designed and fabricated to the ASME Boiler and Pressure Vessel Code. The LDCV has been hydrotested to 43 psig; the SDCV has been hydrotested to 30 psig. Air and Test Cell The air and test cell provides an area for maintenance and storage of large components, such as a primary pump, secondary pump, or an intermediate heat exchanger, after sodium removal. Radioactive Waste Tank Cell The radioactive waste tank cell is a shielded concrete enclosure located beneath the process equipment room. The cell contains two 18,925 liters (5,000 gallons) stainless steel tanks for the storage of radioactive liquid waste. The tanks were tested in accordance with the ASME Boiler and pressure Vessel Code, Section VIII, Division 1. Design pressure of the tanks is 45 psig; hydrostatic test pressure is 67.5 psig. The cell shielding is based on the maximum source strength of the radioactive liquid stored in the tanks and has been designed to maintain the radiation levels in the process equipment room below the design radiation level of 0.2 mrem/h. The source strength used in the design calculation is provided in the facility design criteria.

Description: The Cask Decontamination and Maintenance Facility (CDMF) is an unshielded, air atmosphere glovebox located in the high-bay area. The CDMF operates at a negative pressure with a once-through HEPA filtered air flow. The CDMF provides radiological containment for cleaning operations and inspections under T-3 Cask's license. Both supply and exhaust air is filtered. Hands-on decontamination is done inside the glovebox enclosure using a water rinse system and special cask unloading, scraping, and inspection tools. The rinse water from the T-3 Cask is filtered in the CDMF adapter before it enters the Contaminated Liquid Waste System. The CDMF is serviced by a small 1/4 ton bridge crane and electric hoist that comply with all requirements for Hanford hoisting and rigging. CDMF was fabricated and helium-leak tested per HWS-12111, Amendment 1. The glovebox is equipped with an alarm for loss of negative pressure and a fire detector.

Description: The Contaminated Equipment Repair Shop (CERS) provides the necessary services for hands-on repair and maintenance operations of Interim Examination and Maintenance (IEM) Cell components that have been decontaminated. The CERS is located in the low bay area and is operated at a negative pressure. The shop contains work tables and maintenance tools and is equipped with an overhead sprinkler system. The work tables have local HVAC exhaust drops. A 1 ton monorail and electric hoist services the CERS work tables and a 4 ton electric hoist is housed in a penthouse on the roof of the CERS. The CERS is accessed through two large equipment doors and a personnel airlock. A ceiling equipment access hatch is also provided. A pair of seal tubes over the large double doors are used for manipulator retesting. Electrical penetrations are provided for contaminated IEM Cell TV equipment repair.

Description: Sodium Removal System The sodium removal system consists of the large diameter and small diameter cleaning vessels, fluid/gas supply systems, a vacuum pumping system, water recirculation system, gas recirculation system, and drain and vent systems. Because of the piping system design, only one cleaning vessel can be used at any one time. The cleaning process consists of recirculating a water vapor/nitrogen mixture (WVN) while venting gas to

remove hydrogen. The reaction rate is controlled by monitoring the hydrogen concentration and adjusting the steam concentration as required to maintain the sodium reaction. The WVN process is continued until the moist circulating gas has completely reacted with the sodium film, as indicated by the hydrogen analyzer. The WVN process is then discontinued, and the vessel is slowly filled with hot demineralized water while the N₂ flow is continued and the hydrogen gas is monitored. After a suitable recirculation period, the water is drained, followed by additional rinses as required to ensure that all sodium hydroxide has been rinsed from the item, as indicated by the pH meter. A two-stage filter, with a removal efficiency of 98% (for 0.5 millimeter particles) is included in the water recirculation system to remove radioactive particulate contaminants from the circulating water. After completion of the rinse cycle, the article is dried by recirculating warm dry nitrogen through the system. The gas recirculation system includes a gas cooler to remove moisture and a gas heater to reheat the gas to system temperature. The vessel may also be partially evacuated to facilitate the removal of moisture from the component. Because of the small volume of the SDCV, the gas phase is a single pass through the vessel and through the scrubber/demister, dryer, and HEPA filters to the HVAC exhaust. A two stage filter in the water recirculation system is installed in a separate shielded enclosure in the LDCV cell. The expected maximum radiator level of the filter is 80 rem/h within the shielded enclosure. The entire filter assembly, including filter housing, is designed for remote disconnection and removal from the system. Filter piping connections are remotely operated, band type connections and valves are provided with reach rods to permit all required filter removal operations external to the shield enclosure. The filter removal from the enclosure will be accomplished using the FFTF solid waste cask (equipped with electrically operated internal grapple). After filter removal, filter replacement is manually accomplished in the shielded enclosure. Gas Analyzer System A gas analyzer system is provided to monitor oxygen, hydrogen, and moisture during the sodium cleaning process. The gas analyzer monitors the oxygen concentration in the cleaning vessel to ensure an inert atmosphere for sodium-wetted components and detects any air in-leakage to the vessels. The oxygen analyzer is capable of detecting oxygen concentrations of <0.25% to 5% by volume. At a preset high oxygen concentration limit, the flow of steam is automatically cut off, and additional nitrogen is introduced until the oxygen concentration is within specification. The gas analyzer monitors the hydrogen concentration to control the sodium removal process and to protect against potentially explosive concentrations in the cleaning vessels. The gas analyzer is capable of detecting hydrogen concentrations in the range of ><0.25% to 5% by volume. At a preset high hydrogen concentration limit, steam flow automatically stops and full nitrogen flow is initiated. The gas analyzer monitors the moisture concentration of both the nitrogen/steam injection and the process system nitrogen gas to control reaction rates and to indicate the end point of the drying process. The instrument is capable of detecting and indicating moisture concentrations in the range of 0.5% to 25% by volume. The instrument indication is used to control the nitrogen/steam ratio and to monitor the drying process. Process Sewer Nonradioactive process water from the cleaning vessel is pumped directly to the process sewer. The water is monitored for pH and radioactivity in the sodium cleaning system prior to discharge to the process sewer. Additionally, a liquid monitor in the process sewer system continually checks the discharged water for radioactivity. A removable spoolpiece is provided as a cross connect to the contaminated liquid waste system. The spoolpiece is only installed when the discharge water meets the requirements of the concentration guides in DOE Order 5480.1, Chapter XI. In the event that the discharge water does not meet minimum standards for draining to the process sewer, the water will be automatically diverted to the radioactive waste tanks. Contaminated Liquid Waste System/Contaminated Gas Vent System All contaminated liquid waste will be discharged directly to the radioactive waste tanks. During discharge of contaminated liquid waste to the radioactive waste tanks, the removable spoolpiece (cross-connect between the process sewer and the contaminated liquid waste system) is removed to prevent potential release of contaminated liquid waste to the process sewer. Pipe connections are blanked off with blind flanges when the spool piece is not installed. The contaminated liquid waste in the radioactive waste storage tanks is pumped directly to a railroad tank car in the loadout facility for transport to an appropriate disposal area. All major

contamination sources are filtered prior to entering the Contaminated Liquid Waste System. The ultrasonic cleaner in Decontamination Area II has a 20 micrometer in line cartridge filter. The floor drains in Decontamination Areas I and II have 50 micrometer cloth bag filters in metal strainer baskets. The adapter drain basket on the Cask Decontamination and Maintenance Facility has a polyester filter pad insert. These filters minimize the contamination buildup in the Contaminated Liquid Waste System drain lines and storage tanks. In addition, the storage tanks can be flushed and recirculated during the loadout operation to minimize radiation buildup in the tank cell. All contaminated gas is vented through a scrubber/demister/ dryer and HEPA filter system prior to release to the

The SubSite is Part Of:

Code: 437 MASF

Names: 437 MASF; 400 Area Maintenance and Storage Facility; 437 Maintenance and Storage Facility

Code: 4713-B FD

Classification: Accepted

Names: 4713-B FD; 4713-B French Drain; Miscellaneous Stream #33
Reclassification: Rejected (12/3/1998)

Type: French Drain

Start Date: 1/1/1979

Status: Active

End Date:

Description: The unit is a pipe that is 1.5 meters (5 feet) long and 61 centimeters (24 inches) in diameter. The pipe is constructed of concrete and is filled with gravel. The pipe is buried vertically, extends above grade 15.2 centimeters (6 inches) and is covered by a metal grating. Three parallel metal pipes emerge horizontally from the east side of the 4713 Building, then bend 90 degrees downward and end approximately 0.3 meters (1 foot) above the metal grating.

Location: The site is located about 1.22 meters (4 feet) east of 4713B.

Process Description: The site is associated with waste water discharges (miscellaneous stream #33) from the 4713B Maintenance Building. In 1996, the sink was disabled to prevent discharge of gray water (waste water excluding sewage) to the french drain. Remaining inputs are infrequent discharges from the 4713B fire sprinkler system and eyewash station.

Related Sites/ Structures: The site is related to the 4713B Protected Area Maintenance Building.

Waste Type: Water

Waste Description: In 1987, the site received approximately 3,785 liters (1,000 gallons) of waste water from lunchroom sinks. In 1988, the french drain received only intermittent discharges and had a normal flow rate of zero. The "Inventory of Miscellaneous Streams", Revision 3, states that the employee sink water and drinking fountain supply have been shut off. The eyewash station is still an active source. Routine maintenance discharges will be covered under ST 4508 (when it is approved by Ecology). The current flow rate (1998) is less than 0.038 liters (0.01 gallons) per minute.

Code: 4713-B HWSA

Classification: Accepted

Names: 4713-B HWSA; 4713-B Hazardous Waste Storage Area
Reclassification: Rejected (12/3/1998)

Type: Storage Pad (<90 day)

Start Date: 1/1/1980

Status: Active

End Date: 1/1/1993

Description: The site consists of a 6.1 meters (20 foot) long and 6.1 meters (20 foot) wide concrete pad that

is used as a satellite accumulation area. Metal cabinets, 208 liter (55 gallon) drums and a wooden storage box were located on the pad in May, 1994.

Location: The site is located on the west side of the 4713-B building mechanical shop on a 6.1 meters by 6.1 meters (20 foot by 20 foot) concrete pad.

Related Sites/ Structures: The site is associated with the 4713B Maintenance Building.

Waste Type: Misc. Trash and Debris

Waste Description: The site was used as an accumulation area to store waste in cabinets and drums. The wastes were small quantity items related to FFTF maintenance activities. Wastes included fluorescent bulbs, incandescent bulbs, mercury vapor lamps, hazardous rags, solvents, suspected PCB-containing ballasts and capacitors, non PCB containing ballasts and capacitors, persistent carcinogens, and printed circuit boards, and miscellaneous equipment.

Code: 4713-B LDFD

Classification: Accepted

Names: 4713-B LDFD; 4713-B Loading Dock French Drain; Miscellaneous Stream #469

Reclassification: Rejected (12/3/1998)

Type: French Drain

Start Date:

Status: Active

End Date:

Description: The site is a circular metal grate located in an asphalt paved area east of the 4713-B loading dock. The site sits in a small depression. The site appears to be a stormwater access point to the 400 Area surface drainage system. It does not appear to be a ground disposal site.

Location: The site is located about 23 meters (75 feet) east of the 4713-B building.

Waste Type: Stormwater Runoff

Waste Description: The current "Inventory of Miscellaneous Streams", Revision 3 states that the site collects stormwater and discharges it to the 400 Area stormwater collection system. The current flow rate is less than 1.9 liters per minute (0.50 gallons per minute). Earlier documents, Low Volume Effluent Streams report (Milikan 1988) and the Inventory of Miscellaneous Streams Report (WHC 1993 and DOE/RL-95-82), have stated it receives cooling water from welding equipment or sink water. This earlier data may actually refer to WIDS Site 4713-B FD.

Code: 4721 FD

Classification: Accepted

Names: 4721 FD; 4721 French Drain; Miscellaneous Stream #28; 400 Area French Drain Discharge from 4721 Building

Reclassification: Rejected (12/3/1998)

Type: French Drain

Start Date: 1/1/1979

Status: Active

End Date:

Description: The unit is a 1.2 meter (4 foot) diameter, 1.5 meter (5 foot) long concrete or vitrified clay pipe filled with gravel. The unit is below grade and cannot be identified visually at the location identified in the "Inventory of Miscellaneous Streams".

Location: The site is located west of the 4721 building in a gravel covered area.

Related Sites/ Structures: The french drain is connected to the 4721 Building. This facility is also called the FFTF Emergency Generator Facility or Gas Turbine Building.

Waste Type: Water

Waste Description: The unit may have received janitorial solutions of water and detergents. The "Inventory of

Miscellaneous Streams", Revision 3, states that the site routes stormwater from floor drains to an injection well on the west side of the building. The flow rate is less than 0.038 liters per minute (0.01 gallons per minute).

Waste Type: Oil
Waste Description: If a spill occurred during generator operations, the unit might have received diesel oil. Because oil had to be pumped up to the generator from the underground storage tank, spills should not have occurred when the system was not operating. There are no known spills.

Code: 4722 PSHWSA **Classification:** Accepted
Names: 4722 PSHWSA; 4722-C Hazardous Waste Storage Area; 4722 Paint Shop Hazardous Waste Storage Area; 4722 Paint Shop HWSA **Reclassification:** Rejected (1/27/1999)
Type: Storage Pad (<90 day) **Start Date:** 1/1/1980
Status: Active **End Date:**
Description: The Hazardous Waste Storage Area is three metal cabinets that are located on a curbed, concrete pad outside the 4722-C Building.
Location: The site is located on the north side of the 4722-C building, adjacent to the northeast corner.
Waste Type: Chemicals
Waste Description: The site is a staging area primarily for paint solvents. Signs indicate that solvent rags, antifreeze, and absorbent materials (for spill cleanup) may also be present.

Code: 4722-B FD **Classification:** Accepted
Names: 4722-B FD; 4722-B French Drain **Reclassification:** Rejected (1/27/1999)
Type: French Drain **Start Date:** 1/1/1979
Status: Inactive **End Date:**
Description: The unit is described in the Hanford Site Waste Management Units Report as 1.22 meter (4 foot) diameter pipe that is 1.52 meters (5 foot) long. It is made of concrete or vitrified clay and filled with gravel. There are no visible surface features.
Location: Coordinates place the drain approximately 9.7 meters (32 feet) north of 4722-B, under the roadway.
Related Sites/ Structures: The site is related to the 4722-B Building.
Waste Type: Sanitary Sewage
Waste Description: In 1987, the drain was described to have received 3,785 liters (1,000 gallons) per year of wastewater from lunchroom sinks in the 4722-B building. More current documents of miscellaneous stream discharges do not include this french drain. 4722-B employees believe the lunch room sink is connected to the sanitary sewer.

Code: 4722-C FD **Classification:** Accepted
Names: 4722-C FD; 4722-C French Drain; French Drain South of 4722-C; Miscellaneous Stream #29 **Reclassification:** Rejected (1/27/1999)
Type: French Drain **Start Date:** 1/1/1979
Status: Inactive **End Date:** 1/1/1985
Description: The Hanford Site Waste Management Units Report (1987) lists the site as a french drain that is

Description: 1.22 meter (4 foot) in diameter, concrete or vitrified clay, gravel-filled buried pipe that extends 1.5 meters (5 feet) below grade. Surface features include a 5 centimeter (2 inch) diameter pipe protruding from the south side of the 4722-C Building. The pipe emerges from the wall approximately 0.6 meters (2 feet) above the building foundation and travels west approximately 0.9 meters (3 feet). The pipe turns 90-degrees downward and then turns 90-degrees to the south. The visible piping terminates in the gravel beside the building. No drain structure is visible. Per Curt Clement, Dyncorp, the pipe is connected to a sink. The drainage will be eliminated.

Location: The drain is located approximately 1.2 meters (4 feet) from the south wall of the 4722-C building.

Process Description: The site receives waste water from a sink inside the 4722-C Facility. A statement provided by Dyncorp on January 21, 1999 says that it is noteworthy that currently there are two sinks in this facility. The sink, located within the area where the painting is done, is connected to the sewer not the drywell.

Related Sites/ Structures: The site is associated with the 4722-C Paint Shop (managed by Fluor Daniel Northwest).

Waste Type: Steam Condensate

Waste Description: The source of the discharge to the french drain was eliminated by close of business on 1/28/99. The water was disconnected.

The information provided in the following paragraph has been provided for historical purposes. The Hanford Site Waste Management Units Report (1987) states the drain received water 7570 liters (2,000 gallons per year) from a sink used to wash latex paint from hands, brushes and rollers. It also states a sample was taken from the unit and found no hazardous constituents. A 1988 report (DOE/RL-88-11, Revision 0) states that the hazardous chemical inventory for this site includes 1,000 kilograms (2,200 pounds) of sodium dichromate (Reference 1). This data is unsubstantiated. In 1995, the Inventory of Miscellaneous Streams Report DOE/RL-95-82, Rev 0, Table 3-1, changed the process description to indicate the waste is condensate that originates from a water heater on the west side of 4722-C. The flow rate is listed as 0.038 liters (0.01 gallons) per minute.

A statement provided by Dyncorp on January 21, 1999 says that it is noteworthy that currently there are two sinks in this facility. The sink, located within the area where the painting is done, is connected to the sewer not the drywell.

Dyncorp has not been able to find anyone with any knowledge of what went into the drain. The 'Registration of Hanford Site Class V Underground Injection Wells', DOE/RL-88-11 contains no references that could be used to verify the statement related to the amount of sodium dichromate. It is possible this statement is in error. There is at least one other error, as the formula for sodium dichromate (Na₂Cr₂O₇) is not NaCr₂.

Code: 4831 LHWSA	Classification: Accepted
Names: 4831 LHWSA; 4831 Flammable Storage Facility; 4831 Laydown Hazardous Waste Storage Area; 4831 Laydown HWSA	Reclassification: Closed Out (12/3/1998)
Type: Storage Pad (<90 day)	Start Date: 1/1/1984
Status: Inactive	End Date: 1/1/1993
Description: Currently the site is an empty concrete pad with a metal berm around its edges. The metal berm measures 5 centimeters (2 inches) tall and 5 centimeters (2 inches) wide. It runs around the pad	

approximately 7.6 centimeters (3 inches) inward from the edges and is bolted down. Cylindrical concrete anchors are attached to 1.2 meter (4 feet) high metal posts that have been placed around the edges of the pad. Most of the posts remain upright and are connected with a metal chain, although many have fallen down. A small, tan metal shed at the east end of the pad provided supply storage and a sheltered workspace when the storage area was operating. The shed is 4.9 meters (16 feet) long and 3 meters (10 feet) wide and has double sliding doors on its south side.

Location: The site is located at the east end of Texas Street, north of the 427 Building. The concrete pad is approximately 10 meters (30 feet) north of the 4831 Flammable Storage Facility.

Waste Type: Chemicals

Waste Description: The site was used as a staging area for oils and hazardous wastes produced and collected in the 400 Area. Wastes staged at this site in 1977 were primarily oils, solvents, ethylene glycol, and empty drums for cooling water treatment chemicals such as Endcor 4690, which is acutely hazardous. These wastes were stored in containers on the pad.

Code: 4843

Classification: Accepted

Names: 4843; 4843 Alkali Metal Storage Facility; 4843 AMSF; 4843 Building; 4843 FFTF Sodium Storage; 4843 Laydown Area Warehouse

Reclassification: Closed Out (4/14/1997)

Type: Storage

Start Date: 1/1/1986

Status: Inactive

End Date: 1/1/1997

Description: The 4843 Alkali Metal Storage Facility was built to store dangerous and mixed alkali metal waste. The structure is a fully-insulated, bolted steel building on a concrete slab. Heat was provided by ceiling-suspended heaters. Two 3.7 meter (12 foot) roll-up doors are located on the structure's east and west sides and were used for moving materials into and out of the building. A large fenced laydown area adjacent to the building could be accessed through the west door. The facility also has several other doors and windows. A 2.4 meter (8 foot) wide and 3.0 meter (10 foot) tall portion of the south wall has corroded and appears rust-colored. The bottom edges of the facility's outside walls have also corroded. Inside the building, a rope barrier separated the dangerous alkali metal waste storage area from the mixed alkali metal storage area. Concrete blocks were used to provide shielding from the radioactive alkali metal waste.

Location: The 4843 Building is located in the northwest corner of the 400 Area. A large laydown area is located adjacent to and west of the structure.

Related Sites/ Structures: After the site was closed out, a new WIDS code was created (400-36) at the request of EPA for its new use as a waste transfer station.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: The unit was a storage area for dangerous and mixed alkali metal wastes generated by FFTF and various other operations at the Hanford site. Dangerous and mixed alkali metal wastes that have been stored at the facility include mixed sodium waste; materials used to clean up radioactive sodium; non-radioactive sodium waste; waste radioactive sodium metal; and non-waste, non-radioactive sodium metal. Waste containers used at this facility may have included steel 19 liter (5 gallon), 114 liter (30 gallon), and 208 liter (55 gallon) drums or sealed piping and components that have been welded closed.

Code: 600 BPHWSA

Classification: Accepted

Names: 600 BPHWSA; Hazardous Waste Storage Area (607 Batch Plant); 600 Area Batch Plant HWSA

Reclassification: Rejected (9/6/2000)

Status: Inactive **End Date:** 1/1/1988

Description: This was the site of the Exploratory Shaft Facility septic tank. This area has been reclaimed due to project cancellation. No visual evidence of a septic tank remains.

Location: This site is at the Exploratory Shaft Facility, west of 200 West Area and southeast of the Yakima Barricade, near Army Loop Road.

Process Description: This site provided sanitary wastewater disposal for the Exploratory Shaft Facility.

Related Sites/ Structures: This site has an associated drainfield and distribution box.

Waste Type: Sanitary Sewage

Waste Description: The unit received sanitary wastewater.

Closure Info: The site has been abandoned per WAC code. Decommissioning and reclamation work was completed at the Exploratory Shaft Facility on March 23, 1988. The septic tank was pumped out, the access manhole covers were removed, and it was backfilled with clean sand. The sanitary concrete distribution box was removed and voids were filled. The steel posts and barrier rope around the drainfield were removed, and the drainfield pit was backfilled.

Code: 600 NSTFST **Classification:** Accepted

Names: 600 NSTFST; Near Surface Test Facility; Septic Tank; 600 Area Near Surface Test Facility Septic Tank **Reclassification:** Closed Out (5/31/2001)

Type: Septic Tank **Start Date:** 1/1/1981

Status: Inactive **End Date:** 1/1/1988

Description: This site is a septic tank and associated tile field. The septic tank serviced the Trailer Village that was located at the base of Gable Mountain. The septic tank was pumped out and backfilled.

Location: This site is located at the west end of Gable Mountain, at the base of the north side.

Process Description: This unit provided sanitary disposal for the Near Surface Test Facility Trailer Village.

Related Sites/ Structures: The tank was associated with the Near Surface Test Facility Trailer Village.

Waste Type: Sanitary Sewage

Waste Description: The unit received sanitary wastewater.

Code: 600 NSTFUT **Classification:** Accepted

Names: 600 NSTFUT; Near Surface Test Facility; Underground Tank; 600 Area Near Surface Test Facility Underground Tank **Reclassification:** Closed Out (5/31/2001)

Type: Storage Tank **Start Date:** 1/1/1981

Status: Inactive **End Date:** 1/1/1988

Description: This site consists of two sanitary waste holding tanks. The tanks supported the mobile office trailers that were located on the tunnel bench for the Near Surface Test Facility. The tanks each

had a 3,785-liter (1,000-gallon) capacity and were emptied every other week. This facility has been decommissioned and reclaimed.

Location: The tanks were located on the tunnel bench for the Near Surface Test Facility, on the north side of Gable Mountain.

Process Description: The tanks received sanitary waste from mobile office trailers.

Waste Type: Sanitary Sewage

Waste Description: The tanks received sanitary wastewater.

Closure Info: The holding tanks were removed from the site.

Code: 600-1

Classification: Accepted

Names: 600-1; Westinghouse Debris Pit

Reclassification: Rejected (4/6/1999)

Type: Dumping Area

Start Date: 1/1/1976

Status: Inactive

End Date:

Description: The site is a large depression with sandy soil and sagebrush. Part of the depressions has been backfilled with soil from adjacent areas. Metal and wood scrap can be seen on the surface. Soil subsidences (sink holes) are evident. One faded yellow sign that states "Positively No Dumping" is located on the south side of the site, adjacent to the gravel road. The sign is located in between the 600-1 trench (located on the east side of the depression) and the JA Jones Pit 1 (located on the west side of the depression). Bulldozer scars are evident on the surface.

Location: This site is located on the east side of a large depression that is located north of the 300 Area, east of the point where the railroad tracks cross Route 4 South.

Process Description: Interviews with two employees indicate that two trenches were co-located in this depression. One trench was dug from east to west. It was located on the west side of the depression and was used by the J.A. Jones Company to dispose of inert waste, paint products and debris (see WIDS Site JA Jones #1). The other trench was dug from north to south, located adjacent to the J.A. Jones pit. It was used by the 300 Area Westinghouse facilities as a disposal site for tumbleweeds that collected on the 300 Area fences. The site may have received miscellaneous wood, pallets and debris from the 300 Area Westinghouse facilities during the late 1970's and early 1980's. A 1994 site visit observed evidence that tumbleweeds had recently been dumped along the southeast edge of the site, indicating the area was still being used for this purpose.

Related Sites/ Structures: The trench is adjacent to and east of the J. A. Jones 1 Dumping Pit.

Waste Type: Misc. Trash and Debris

Waste Description: Roofing remnants, plastic bucket with dried paint, rebar, aluminum, bits of concrete, asphalt, wood, and plastic are visible at the site.

Waste Type: Chemicals

Waste Description: October 1994 interviews with Will Kirk and Tony Day, retired Hanford employees, disclosed that aluminum silicon alloy, may have been disposed of at 600-1. Interviewees were unable to positively confirm dumping at this site, but felt a reasonable certainty. Aluminum silicon alloy was used in its molten state as a reactor fuel cladding process dip in the 313 Building and waste aluminum silicon alloy usually had low levels of uranium contamination.

boxes, a 18.9 liter (5 gallon) drum with holes in the bottom was found. The drum was partially buried and appeared to be some type of french drain or sanitary sewage facility (latrine).

Code: 600-6 **Classification:** Accepted

Names: 600-6; Battery B Nike Missile Launch Site; MIL - H-12-L **Reclassification:** Rejected (1/30/2003)

Type: Military Compound **Start Date:** 1/1/1953

Status: Inactive **End Date:** 1/1/1960

Description: The unit is an abandoned military installation that once included two sheds (paint and acid storage), a generator building, an oil tank, an 11,356 liter (3,000 gallon) UST, a 200 meter (650 feet) deep well, and a septic system. In 1990 the site consisted of concrete foundation pads, a backfilled underground storage area, a 3-4 ft deep excavation, and a large soil depression at the northwest corner of the unit. The large soil depression in the northwest corner of the site was suspected to be a disposal area, based on a general disturbance pattern within the nearby soil (Roos 1990). All above-ground structures were sold to Washington State University prior to 1974 and have been removed.

Location: The Unit location is northeast of 100-F Area on the opposite side of the Columbia River (SW 1/4 of NW 1/4 Section 23 T 14N R 27E). The Unit is approximately 1/2 mile east of the intersection to White Bluffs landing.

Related Sites/ Structures: Storage bunker, electrical access port and acid pit, 600-10 Control Area, and 600-17 Antiaircraft gun site

Waste Type: Demolition and Inert Waste

Waste Description: Only concrete building foundations and a soil depression remain. An Acid pit was sampled but no hazards were identified.

Code: 600-7 **Classification:** Accepted

Names: 600-7; Concrete/Asbestos Pipe Site; Nike Asbestos Pipe Site **Reclassification:** Rejected (1/30/2003)

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The unit is a depression containing miscellaneous construction debris and exposed pieces of concrete/asbestos pipe. Demolition activities at waste site 600-6 are believed to be the reason for debris found on this waste site.

Location: The site is located northeast of 100-F Area on the opposite side of the Columbia River (SW 1/4 of NW 1/4 Section 23 T 14N R 27E). It is adjacent to the H-12-L Nike Launch site.

Related Sites/ Structures: The site is associated with demolition at the Nike Missile Launch Site, H-12-L.

Waste Type: Demolition and Inert Waste

Waste Description: This unit contains concrete/asbestos pipe, concrete, and miscellaneous construction debris.

Code: 600-10 **Classification:** Accepted

Names: 600-10; Battery B Nike Missile Control Center; MIL - H-12C **Reclassification:** Rejected (1/30/2003)

Description: automatic weapons, and several tires.

Code: 600-13

Classification: Accepted

Names: 600-13; Battery "C" Launch Site; MIL - H-83L; PSN 80

Reclassification: Rejected (1/30/2003)

Type: Military Compound

Start Date: 1/1/1955

Status: Inactive

End Date: 1/1/1974

Description: This unit is an abandoned military installation. Buildings and other above ground structures have been removed. Underground structures have been filled. The Air Defenses of Hanford: Camp Hanford The Forward Positions 1950-1964 descriptive summary (Anonymous 1993) states there were 15 aboveground structures (including barracks, paint, oil, and acid storage), a septic system, and assorted "miscellaneous tanks." The barracks were located about 0.4 kilometers (0.25 miles) away from the launch site. The summary also reported that the site is "destroyed;" the AEC cleanup was from May to July 1974. The ammunition magazines were detonated in June 1974. The adjacent PSN 80 was merged with this site after 1956 (Anonymous 1993).

Location: The site is located northwest of 100-B/C Area on the opposite side of the Columbia River (SW 1/4 Section 16, R 14N R 25E) It is at the end of a paved access road.

Related Sites/ Structures: 600-11, 600-12, 600-75, 600-18 and 600-96

Waste Type: Demolition and Inert Waste

Waste Description: Wastes identified at the unit are miscellaneous disposal area debris, material from 1960's practice maneuvers, and miscellaneous trash scattered over a 50 acre area.

Code: 600-14

Classification: Accepted

Names: 600-14; MIL - PSN 01

Reclassification: Rejected (1/30/2003)

Type: Military Compound

Start Date:

Status: Inactive

End Date: 1/1/1960

Description: The unit is an abandoned military tent camp and anti-aircraft battery site. During the April 1999 visit, no foundations were observed but several regular shaped disturbed areas and chunks of concrete were visible. What appeared to be an abandoned well was found under a removable metal cover. There is an area of erosion or subsidence with exposed concrete along the edges. Circular areas with little or no vegetation were also seen around the site. Mature trees, grasses and 0.6 to 1.2 meter (2 to 4 foot) tall sagebrush cover the site. An underground septic tank and drain field may still exist as there is no record of them being removed. The well that serviced the position was 892 feet deep, and drilled in 1953.

Location: The site is located north of the Columbia River, north of Highway 24, in the Wahluke Slope State Wildlife Recreation Area. It can be accessed via Gate 136. The site is approximately 1 mile north of marker 56 on Highway 24.

Process Description: Original structures at the site included a 20-foot by 34-foot aluminum pre-fab pumphouse with a concrete floor and foundation, a 550-gallon underground storage tank, and septic system. The site also had a direct communications cable connection with Headquarters site H-03-H, which was in the central region of Hanford, south of the 100-N Area. The use permit was terminated by the Atomic Energy Commission on December 21, 1960. After the site ceased to function as an AAA site, a repeater remained operational.

food cans, condiment containers and beer bottles), washing machine parts, a water tank, a water heater, 1-gallon solvent cans, and artillery shell packing boxes marked 120 M.

Code: 600-18 **Classification:** Accepted

Names: 600-18; H-82; MIL - PSN 72/82; PSN 72; Tent **Reclassification:** Rejected (1/30/2003)
Camp 515

Type: Military Compound **Start Date:** 1/1/1951

Status: Inactive **End Date:** 1/1/1961

Description: The site is an abandoned military tent camp site and anti-aircraft battery. The unit consisted of a few small disposal pits and piles located west of the road and a small firing range located at the northeast corner of the unit. The site also contained a pumphouse and a 500 gallon underground tank. A disposal area was identified with a considerable amount of surface debris; all debris has been removed.

Location: The site is located northwest of 100 B/C on the opposite side of the Columbia River (SW 1/4 Section 31, T 14N R 25E) Parts of it are on both sides of a small highway heading north from Vernita Bridge, around a group of trees at the top of the hill.

Process Description: The gun emplacements and all the facilities except for the septic system and roads were removed during the 1974 cleanup.

Waste Type: Demolition and Inert Waste

Waste Description: The unit contained wood debris, empty 5-gallon and 1-quart oil cans, an empty 5 gallon can of lubricant, artillery packing materials, two partially buried plywood boxes, ash, communications wire, cable, lead and brass. The unit also contained a septic tank.

Code: 600-19 **Classification:** Accepted

Names: 600-19; Base Camp 410; H-90; MIL - PSN 90 **Reclassification:** Rejected (1/30/2003)

Type: Military Compound **Start Date:**

Status: Inactive **End Date:**

Description: This is an abandoned anti-aircraft military installation. Before final cleanup in 1994, structures included a concrete foundation pad, an abandoned well, cinderblock well pumphouse with a 550 gallon underground tank, a usable well, abandoned well, and a recently used old oil rack and grease pit, wash platform, generator shed, septic system, and support facilities. Other unit features include an old dumping ground (located south of Highway 24), several trash pits, and a 10 feet by 15 feet by 4 feet deep trench. During the April 1999 visit, several concrete foundations and walkways were observed, as well as a stone wall, earthen mounds and a small cinderblock structure. Mature trees are growing around the abandoned installation.

Location: The site is located north of the Columbia River in the Saddle Mountain National Wildlife Refuge. Most of the site is located north of Highway 24; however, an old dumping ground is described as being located south of the highway.

Related Sites/ Structures: Military motor pool

Waste Type: Demolition and Inert Waste

Waste Description: Unit waste consists of small amounts of refuse including tent parts electrical parts, automobile parts, and sand bag material. In addition, a small area of the ground was oil stained near the oil rack.

Code: 600-20 **Classification:** Accepted

Names: 600-20; 615 Hot Mix Plant for Road Materials; Tank Cleaning Site **Reclassification:** Rejected (10/1/1997)

Type: Depression/Pit (nonspecific) **Start Date:**

Status: Inactive **End Date:**

Description: The site was originally described as two abandoned asphalt tanks, each with a volume capacity of 45,420 to 52,990 liters (12,000 to 14,000 gallons [based on the exterior measurements provided in WHC-MR-0425]). A 1999 waste site walkdown identified several valve pits, and a depression which contains discarded asphalt material, several pails and drums. Waste asphalt, dumped in solid and liquid form, is prevalent at the site, as is other construction and equipment debris. In warm weather, the discarded asphalt liquefies and resembles puddles. The asphalt puddle in the depression (trench) south of the tank area was approximately 0.3 meters (1 foot) deep in May and June 1999.

Location: The site is located on the west side of the Hanford Townsite, south of the railroad tracks. The two remaining tanks are 600 meters (1968.6 feet) west of Route 2 North.

Process Description: The Hot Mix Plant for the preparation of bituminous road surfacing materials was originally erected for temporary and permanent road construction. This Plant was a "TC" (temporary field construction) plant that continued to operate after the construction phase. It was located along the south side of a railroad spur and just east of the former Hanford Aggregate Pit. The Plant was rated at 3/4 to 1-1/4 cubic yards per minute and consisted mainly of eight horizontal oil storage tanks; a Barber-Greene, Model #843, Central Mixer for single aggregate, and a Model #833 Single Drum Dryer; and Steam Facilities. At the close of construction, the above facilities were transferred to the Operating Department and assigned permanent building number 615. The horizontal oil storage tanks were arranged in a single row at the foot of the railroad fill to provide a gravity flow for unloading operations. Six of the tanks, measuring 1.5 meters (5 feet) in diameter and 7.3 meters (24 feet) in length, were supported by reinforced concrete cradles. Two of the tanks, measuring 3.0 meters (10 feet) in diameter by 7.3 meters (24 feet) in length, rested on the ground surrounded by an earthen dike. All tanks were provided with wooden frame access platforms and stairways.

Waste Type: Oil

Waste Description: The remaining waste is located in the pit. The floor of the pit is coated with asphalt.

Code: 600-24 **Classification:** Accepted

Names: 600-24; H-21 Anti-Aircraft Artillery Compound and Dump Site; West P-11 **Reclassification:** Rejected (10/1/1997)

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site shows evidence of several former building foundations and walkways located along both sides of the roadway. A 20 foot wide by 36 foot wide concrete pad exists with concrete cradles for a large (approximately 30 x 8 foot radius) water tank. A well # 64-27, A-5295 BNW, is located in the concrete pad. Metal water pipes are visible at most building sites. Multiple small dumping sites are evident northwest and northeast of the compound, but none could be located that exhibit more than a small scattering of debris. Lesser amounts of debris are located at a site 100 meters southeast of the end of the paved road. An ammunition case is also located here. A coal pile site exists on the east shoulder of the railroad tracks northwest of the compound, and a large pile of military barbed wire fence posts (screw type) is located west

of the tracks. The remains of building debris may be found throughout the area, especially in northeast portion of the site.

Location: This unit is northwest of P-11 Unit and at the end of the paved road. Access road intersects Route 2N 0.6 miles north of mile marker 3.

Process Description: The site is typical of other Hanford military facilities of the early 1950's.

Related Sites/ Structures: Associated with this unit was a possible containment basin.

Waste Type: Misc. Trash and Debris

Waste Description: The waste at this unit includes: foundations, pipes (above and below grade), paint cans, a pile of army fence posts, antifreeze cans and miscellaneous debris.

Code: 600-25

Classification: Accepted

Names: 600-25; Susie Junction

Reclassification: Consolidated (4/12/2004)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site consists of a gravel pit, disposal pit, ash pile and several waste piles at "Susie Junction," where two railroad tracks intersect.

Location: This unit is located north of 200 West Area near Gable Butte. R.R. junction south of Gable Butte.

Waste Type: Misc. Trash and Debris

Waste Description: Wastes identified at the unit include 4-5 drums (one which has leaked oil and one which is labeled "KEROSENE"), rubber boots, canvas gloves, a canvas bag containing laundry, brooms, brushes, chisels mounted on poles hoses, nails, cans, miscellaneous debris and a fluffy white fibrous material.

The Site Was Consolidated With:

Code: 600-38

Names: 600-38; Railroad Siding Susie; Susie Junction; 600-25

Code: 600-26

Classification: Accepted

Names: 600-26; Hanford Townsite Burn Pile

Reclassification: Rejected (10/1/1997)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The Technical Baseline Report states the site consists of a 2.4 meter (8 foot) excavation containing a construction refuse burn pile. However, it also states that the author was unable to locate the site in the field. This site was originally identified as a "mystery site" by Richard Roos. In his field notes, Roos describes the site as "old burn pile, apparently a construction disposal location. Site is graded off, perhaps 8' below original grade." He then goes on to describe various features north of the site, such as 600-20 (The Tank Cleaning Site) and several gravel pits. Under "Unusual or Identifying Features," Roos lists "very large spikes (10" x 1/2"), molten glass and metal, wood ashes. A dump site for concrete building foundation is located behind the soil mound..." The site is described as being east of this soil mound. This soil mound with the concrete chunks on its west side is easy to find and can be seen from Highway 2 North. The mound is found in a large excavated area. The excavation was made into the side

of a slope and is not a typical borrow or gravel pit. It increases in depth from east to west. The area east of the soil mound and within the excavated area appears to coincide with Roos' description. However, there appear to have been several areas of burning, not just a single burn pile. The spikes, molten glass and wood ashes described by Roos were found in this area during the June 1999 visit.

Location: The site is located west of Route 2 North and south of an access road leading to 600-20, the "Tank Cleaning Site." The site is between wells 699-54-18E and 699-54-19 and east of a large soil mound.

Waste Type: Misc. Trash and Debris

Waste Description: Unit wastes include construction debris and possible asbestos and barrels.

Code: 600-27

Classification: Accepted

Names: 600-27; 6-54-18A; 6-54-18B; 6-54-18C; 6-54-18D; A58858; A8855; A8856; A8857; Foundations and Dumping Area; Water Supply Valve Pits; Well 699-50-18C; Well DC-6

Reclassification: Rejected (10/6/1997)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site contains wells, valve pits, foundations, and a dumping area. The site has four monitoring wells identified as follows: 6-54-18A, A8855; 6-54-18B, A8856; 6-54-18C, A8857; 6-54-18D, A58858. Note that 6-54-18C is an alias for 699-54-18C. The second identifier beginning with an alpha character is a barcode value located on all wells that are presently used by the samplers during the collection of samples and groundwater elevations. The well named 699-50-18C, DC-6 does not exist either in the Hanford Environmental Information System (HEIS) database or in historical well documents. Two ex-Basalt Waste Isolation Project (BWIP) personnel were also consulted about this well. Both persons stated that the well does not exist and that the picture shown in the Technical Baseline Report is not an old BWIP well. The two other sites that were previously identified as "wells" (see photograph in the Technical Baseline Report) are likely to be valve pits for water utilities and are marked with four steel posts surrounding the pits. The easternmost pit has been filled in with soil and a concrete structure can be seen just under the soil. The other pit has a wooden cover and had two water pipes protruding through the cover. One water pipe was approximately 7.6 centimeters (3 inches) in diameter and was open ended. The other pipe was approximately 2.54 centimeters (1 inch) in diameter and had a faucet (garden hose type) attached to the end. In addition, two valve handles also protruded from the wooden cover. Two power poles were observed between the wells and Route 2 North. The power poles appeared to be active and the breaker switches were not locked out. Evidence of former buildings shows up between the well house and Route 2 North. Building debris includes concrete footings, concrete pads, transite, sewer pipe, electrical wiring and a large diameter clay pipe approximately 0.77 meters (30 inches) in diameter buried vertically from the surface to approximately 2 meters (6.5 feet) below grade. The clay pipe has no incoming/outgoing pipes. The area surrounding the wells show evidence of former roads and walkways that have been overgrown with weeds.

Location: The site is located approximately 0.5 miles west of the old Hanford School, 45.7 meters (150 feet) east of Route 2 North, and on the south side of a dirt road formerly known as Roosevelt Avenue.

Waste Type: Misc. Trash and Debris

Waste Description: The original waste site package identified that chemical analysis of the monitoring well shows volatile organics. No evidence has been found to support this claim. In order to substantiate this information, the HEIS database was searched for groundwater monitoring wells near the

area. The following wells were searched for volatile organics: 699-54-18E, 600-54-19, 699-52-18A, 699-52-18B, 699-52-18C, 699-52-19, 699-52-17, 699-54-18A, 699-54-18B, 699-54-18C, 699-54-18D, 699-54-15A. The results are as follows: Well Number 699-54-18D, Sample Number B07Q48, Date 11/24/92, Constituent 67-64-1, Acetone, 190 micrograms per liter; Well Number 699-54-18D, Sample Number B075S7, Date 11/17/92, Constituent 108-88-3, Toluene, 6.1 micrograms per liter; Well Number 699-54-18D, Sample Number B07Q48, Date 11/24/92, Constituent 108-88-3, Toluene, 5.69 micrograms per liter; Well Number 699-54-18D, Sample Number B01NN6, Date 11/24/92, Constituent 108-88-3, Toluene, 5.2 micrograms per liter. HEIS for Well 699-48-18 was searched for volatile organics. The results are for Sample Number H000DQT1, Date 8/25/87, Constituent 75-09-02 methylenechloride, analytical method id = 16, 80 micrograms per liter. A later sample for the same well showed Sample Number B08185, Date 1/28/93, Constituent 75-09-02 methylenechloride, analytical method id = 83, 5 micrograms per liter (below minimum detectable concentration). Other wells had no volatile organics or the results were below minimum detectable concentration. Some asbestos transite is visible in the area.

Code: 600-31 **Classification:** Accepted

Names: 600-31; 100-F Area Bottle Disposal Site **Reclassification:** Rejected (7/29/1997)

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site is a sandy area with rabbitbrush growing throughout. It exhibits physical evidence that the dumping of laboratory materials took place. The area also appears to have been disturbed by a blade or bulldozer. During the April 1999 visit, scattered debris was visible, composed primarily of glass with some metal and wood debris. The glass is found in a swath on the west side of a sandy rise. There is a moderate vegetation cover of rabbitbrush and grasses on the sandy rise with less cover on the disturbed ground.

Location: The site is located approximately 91 meters (300 feet) north of the southeast corner of the perimeter road and approximately 9.1 meters (30 feet) east of the perimeter road.

Waste Type: Misc. Trash and Debris

Waste Description: Wastes identified are laboratory-type bottles and bottle caps with the following markings on some of the caps: 1) Sulfuric 2) Mallinckrodt, 3) Bakers, 4) B & A, 5) Fisher. The markings and colors on the bottles and caps indicate they most likely contained laboratory chemicals (e.g. nitric acid, sulfuric acid, hydrochloric acid, etc).

Code: 600-32 **Classification:** Accepted

Names: 600-32; N Area Landfill **Reclassification:** Rejected (6/30/2004)

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: A field walkdown done in August 2000 compared the site to the area mapped in Arcview and found it to be a duplicate of 100-N-39 and 100-N-19 (it is contained within the much larger 100-N-19). The site is a large area covering approximately 13 hectares (32 acres), consisting of an abandoned gravel pit and several other depressions which were used as dumping areas for 100-N Reactor and the Hanford Generating Plant (HGP). The main gravel pit depression is approximately 6 meters (20 feet) deep and is located southwest of the HGP facility fence. A steel casing, described as a well head, is located near the northern edge of the unit. Large concrete blocks, a burning area, broken glass, a sandblast material pile, and other debris is scattered across the bottom of the site.

Location: The unit is about 300 meters (1000 feet) south of the 100-N Hanford Generating Plant (HGP)

and Bonneville Power Administration (BPA) Hanford Substation facility fence.

Process Description: The site was used as a dumping area for 100-N Area and the Hanford Generating Plant.

Related Sites/Structures: This site is associated with 100-N-19 (it is contained within the larger site 100-N-19), 100-N-39 (it is a duplicate of 100-N-39), and 100-N-18 (a smaller burning/dumping area about 270 meters (900 feet) north, just south of the HGP fenceline.)

Waste Type: Misc. Trash and Debris

Waste Description: Unit waste includes 19-liter (5-gallon) paint cans (one labeled SCC Portland 26 5 65, one labeled USS 5-28/26-65, one labeled ICC=37-76-80 NRC, others are crushed), sheet aluminum, steel pipes, rebar, transite, cans wood, two 208-liter (55-gallon) drums (one labeled Delvac 1330 SAE-30 motor oil), concrete, wire, cable and spools, bottles (soda pop and amber 3.8-liter [1-gallon] jugs), broken fluorescent and incandescent light blubs, tires, grass clippings and miscellaneous construction debris.

The Following Sites Were Consolidated With This Site:

Code: 100-N-39

Names: 100-N-39; Hanford Substation Construction Dump Area; SWMU #11

Code: 600-33

Classification: Accepted

Names: 600-33; 105-C Reactor Test Loop Burial Site

Reclassification: Rejected (12/9/2004)

Type: Burial Ground

Start Date: 1/1/1963

Status: Inactive

End Date: 1/1/1963

Description: The waste site was a temporary burial site for the 105-C Reactor Test Loop.

Location: Five locations were identified as possible locations for the site, including the one listed as 90 to 120 meters (300 to 400 feet) south of the 105-C Reactor Fan Room (E 565368.938, W 143846.781). Trenches, aka potholes, were dug at (1) E 565369, N 143847, (2) E 565369, N 143916, (3) E 565372, N 143916, (4) E 565371, N 143940, (5) E 565855, N 143769.

Process Description: The selected design for the test loop was a tube within a tube (annular design). The outer tube was a 3.8-centimeter (1.5-inch) inside diameter Schedule 160 stainless steel tubing. The inner tube was 2.5-centimeter (1-inch) inside diameter with 0.17-centimeter (0.065-inch) wall thickness within a 12-meter (40-foot) carbon steel shield tube. The test loop was inserted into the south side of the C Reactor core (one of the channels) and was used to test the effects of ionization on various chemicals being considered for reactor process tube scaling and cleaning.

Waste Type: Equipment

Waste Description: The waste consists of a radioactive double-tube test loop, contaminated carbon-steel shielding pipe, and about 305 meters (1,000 feet) of cable used to remove the test loop from the 105-C Reactor. The test loop is approximately 5.5 to 6.1 meters (18 to 20 feet) long and consists of various sizes of stainless steel tubing. The test loop may have dose rates in excess of 100 rads/hour. Potential contaminants include: Co-60, Ni-63

Code: 600-34

Classification: Accepted

Names: 600-34; 100-B Baled Tumbleweed Disposal Site

Reclassification: Rejected (9/9/1997)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site is a dumping area used for disposal of miscellaneous waste. The dumping area is

within a borrow or gravel pit which is 3.0 to 4.6 meters (10 to 15 feet) deep.

Location: The unit is west of the 181-B intake structure, north of the 90 degree corner where Route 6 changes from north/south to an east/west direction, and east of Pit #24.

Waste Type: Misc. Trash and Debris

Waste Description: The main concentration of waste is located in the eastern section of the pit. However, there is minor surface rubble spread over the pit floor. Visible wastes include wood (timbers and ties), piles of a silt-like material, sheet metal, cardboard, roofing material, concrete, electrical insulators, and a 10 liter (5 gallon) plastic bucket (090-NRC Paragon Molding Co. Melrose Park, Ill.). Pre-Hanford waste is also evident including barbed wire, what appears to be old farm equipment, and remnants of wire wrapped wooden irrigation pipe. Bales of tumbleweeds were located at the site in 1992, but have since been removed.

Code: 600-39 **Classification:** Not Accepted

Names: 600-39; H-50 Gun Site Building Foundations and Ammunition Storage; Military Camp South of 200W **Reclassification:** None

Type: Foundation

Start Date:

Status: Inactive

End Date: 1/1/1958

Description: The site has concrete building foundations, walkways and footings. The foundations are: #1. Vehicle maintenance with a mechanic's pit: 30 meters by 14 meters (97 feet by 47 feet). While the pit is filled in with tumbleweeds making observation of the floor impossible, it is likely concrete. It is unlikely that oil would have been allowed to drain freely in the pit, since mechanics would have had to work in the oil while servicing the vehicles. #2. Kitchen/mess: 12 meters by 10 meters (40 feet by 32 feet) #3. Toilet/showers: has five visible toilet drains and two floor drains visible, along with a metal box inset in the foundation, presumably with a water valve inside. The foundation is partially covered with sand. #4. Concrete pad: 9 meters by 6 meters (30 feet by 21 feet) #5. Concrete pad: 15 meters by 6 meters (50 feet by 20 feet). Seven circular ammunition storage berms constructed of wood, sandbags, rock and soil measuring approximately 18 meters (60 feet) in diameter are also present. The July 2000 fire did not affect these bunkers. Very little debris is present, just a couple of empty 5-gallon oil cans (no leaks onto soil are evident), and fencing material in two piles (site 600-223).

Location: The unit is located at the southwest quarter of Section 19, Township 12 North, Range 26 East, 3.2 kilometers (2 miles) south of the 200 West Area and 0.4 miles east of the Rattlesnake Barricade on SR 240.

Process Description: This was the site of a U. S. Army anti-aircraft gun installation. Typically, Camp Hanford's anti-aircraft artillery sites were each roughly 20 acres in size and contained any number of buildings (typically around 20), various utility distribution systems, roads, and sidewalks. Each site consisted of emplacements protected by revetments made of sandbags and wood planking, wooden structures, prefabricated metal buildings, and, later, permanent, concrete block structures. The prefabricated buildings had aluminum walls and roofs with wooden or concrete floors set on concrete pier blocks and were the most commonly constructed. The permanent structures included barracks, latrines, mess halls, craft shops, pump houses, motor pools, and radar facilities. Each site typically had a small arms range, water storage cistern, sanitary, and sewage disposal facilities. Pathways, sidewalks, roadways, and parking lots connected the structures.

Related Sites/Structures: The septic system associated with this site is 600-224. Site 600-223 is the associated pits containing fencing material.

Waste Type: Demolition and Inert Waste

Waste Description: The waste includes concrete walkways, concrete foundations, and ammunition storage berms constructed of wood, sandbags, rock and soil.

Code: 600-41 **Classification:** Accepted
Names: 600-41; H 70 Anti-Aircraft Artillery (AAA) Site **Reclassification:** Rejected (4/11/2002)
Type: Military Compound **Start Date:** 1/1/1951
Status: Inactive **End Date:** 1/1/1963

Description: The unit is an abandoned Military Installation (H-70) consisting of a few covered foundations and cleared areas. Some man-made mounds were present. There is a paved road and a few trees at the site. During the April 16 and April 19, 1999, visits, two earthen mounds were observed as well as the remains of several foundations. The site is overgrown with approximately 0.9 meter (3 foot) tall sagebrush, making it difficult to discern either features or the edges of the site. There are several opens areas covered with cheatgrass. Scattered pieces of metal, concrete, glass and transite were observed. A burn pit/dump had traces of burned wood, glass and transite. A burrow going into the center of the dump also shows buried glass.

Location: The unit is located approximately 4.2 kilometers southwest of the Vernita Bridge rest area. The site is on the west side of Highway 24, behind Gate 122.

Process Description: This camp is the site of an anti-aircraft battery. Structures reported to have been at the site include administration, classroom, supply and day rooms, barracks, and latrine facilities. The electrical power was provided by overhead wires; water supplied by the "McGee Well;" and the camp was serviced by a septic tank and drain field.

Code: 600-42 **Classification:** Accepted
Names: 600-42; H 71 Anti-Aircraft Artillery (AAA) Site **Reclassification:** Rejected (4/11/2002)
Type: Military Compound **Start Date:** 1/1/1951
Status: Inactive **End Date:** 1/1/1963

Description: The site is an abandoned military installation. The structures have been removed. The site is accessed by a northeast trending primitive road that runs through it. Berms run along the south side of this road and the remains of barbed wire fences can be found on either side. Well 699-68-105 is found near the northern edge of the site. The marker for this well is a good landmark. Most of the evidence of the site is found on the north side of the road. During the April 16, 1999, visit, evidence of a small tile field was found. It appeared as though the septic tank associated with the tile field has been removed or has collapsed. A pit that could have housed a second septic tank was found on the south side of the road that runs through the site. No evidence of a second tile field was found. A concrete walkway and a rock walkway were found. Wood debris, glass and concrete chunks were found, as well as a metal lid stamped "120 MM GUN" and "CONT M79A." An approximately 1.2 meter (4 foot) by 2.4 meter (8 foot) underground bunker was discovered. Its wooden roof is collapsing and presents a physical hazard. The depth of the bunker could not be estimated. Numerous areas with little or no vegetation were also observed around the site. Evidence of an old orchard can be found north of the site. The orchard can be seen in photo # 02646. Within the old orchard is an earthen mound with vegetation growing on its sides but not on its crown.

Location: The site is located approximately 1.6 kilometers southwest of the Vernita Bridge rest area on Highway 24.

Code: 600-43 **Classification:** Accepted

However, the man made mounds were created when the surface was bulldozed in preparation for the coal pile. No waste materials are in evidence.

Location: The site is located approximately 200 meters (656 feet) north-northeast of the old Hanford High School and northwest of the pump house. It is on the east side of Avenue A.

Waste Type: Misc. Trash and Debris

Waste Description: The waste is coal dust remaining from the coal that was stored at the site.

Code: 600-53

Classification: Not Accepted

Names: 600-53; H-51 Anti-Aircraft Artillery Site
Building Foundations

Reclassification: None

Type: Foundation

Start Date:

Status: Inactive

End Date: 1/1/1958

Description: Six building foundations and concrete pads were observed at this site and are described as follows: #1. 12.5 meters by 10 meters (41 feet by 33 feet), concrete foundation with 4 floor drains #2. 15.6 meters by 6.1 meters (51 feet by 20 feet), concrete pad with 8 toilet drains and 11 sink/floor drains #3. 6.1 meters by 15.3 meters (20 feet by 50 feet), concrete foundation #4. 6.7 meters by 15.3 meters (22 feet by 50 feet), concrete foundation #5. 5.5 meters by 3.3 meters (18 feet by 11 feet), Concrete pad #6. 7.3 meters by 5.8 meters (24 feet by 19 feet), Concrete pad.

Location: The H-51 Gun Site is on Army Loop Road, southwest of 200 West Area. This site is located in the southeast quarter of Section 15, Township 12 North, Range 25 East.

Process Description: This is the location of a former U. S. Army anti-aircraft gun site. Typically, Camp Hanford's anti-aircraft artillery sites were each roughly 20 acres in size and contained any number of buildings (typically around 20), various utility distribution systems, roads, and sidewalks. Each site consisted of emplacements protected by revetments made of sandbags and wood planking, wooden structures, prefabricated metal buildings, and, later, permanent, concrete block structures. The prefabricated buildings had aluminum walls and roofs with wooden or concrete floors set on concrete pier blocks and were the most commonly constructed. The permanent structures included barracks, latrines, mess halls, craft shops, pump houses, motor pools, and radar facilities. Each site typically had a small arms range, water storage cistern, sanitary, and sewage disposal facilities. Pathways, sidewalks, roadways, and parking lots connected the structures.

Related Sites/ Structures: The site's dumping areas are 600-220; 6607-3 is the site septic system.

Waste Type: Demolition and Inert Waste

Waste Description: Concrete building foundations and concrete pads

Code: 600-55

Classification: Accepted

Names: 600-55; Paved Area and Collapsed Structure

Reclassification: Rejected (10/1/1997)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site is a dumping area that consists of an asphalt paved area which may have been a parking

lot, miscellaneous farm debris and a collapsed wooden building. The pre-Hanford farm debris is scattered approximately 135 meters (443 feet) to the east of the paved area. There is also a cellar and an old stove near the collapsed wooden structure.

Location: The asphalt paved area is located to the west of the 100K Area, southeast of the Allard Pumping Station and to the southwest of the 128-K-2 Burn Pit.

Waste Type: Misc. Trash and Debris

Waste Description: The miscellaneous debris at the site consists of asphalt paving, empty paint and paint solvent containers, an empty antifreeze container, a fan belt, wood, and metal.

Code: 600-56

Classification: Accepted

Names: 600-56; Pre-Hanford Farm Site; Undocumented Solid Waste Site

Reclassification: Rejected (9/9/1997)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site is the abandoned waste from what appears to be a pre-MED (Manhattan Engineering District) farm. The site is identifiable by scattered debris, piles of rocks, and an excavated pit.

Location: The site is located southwest of the 128-B-2 Burn Pit and south of well 699-71-77.

Waste Type: Misc. Trash and Debris

Waste Description: Miscellaneous waste at the site included wood, metal buckets, cans, and wire fencing.

Waste Type: Batteries

Waste Description: Several aging dry cell batteries were found at the site. In September 1997, a field visit was performed by B. D. Schilperoort. He examined the batteries and noted that they appeared to have been in a fire. Some material was removed from the inside of a battery surrounding a carbon electrode. A 50/50 test for corrosivity found neutral pH. A lead test swab found no evidence of lead. The conclusion based on the field investigation was that no hazardous constituents remained in the batteries.

Code: 600-61

Classification: Discovery

Names: 600-61; White Bluffs Substation

Reclassification: None

Type: Electrical Substation

Start Date: 1/1/1976

Status: Active

End Date:

Description: The waste site consisted of potential contamination of the soil from the electrical equipment at the substation.

Location: The substation is located northwest of the Hammer Training Facility off of Horn Rapids Road. The site name has nothing to do with the location.

Process Description: The electrical equipment at the substation included transformers, couplings, capacitors, circuit breakers, reclosers, voltage regulators, switches, and cable. Release occurred from storage tank No. 2.

Waste Type: Oil

Waste Description: The White Bluffs Substation used petroleum oil, primarily mineral oil, as insulation in electrical equipment. Insulating oil was a highly refined, 10-weight petroleum oil with approximately 0.1 percent 2,6-di-terbutyl-paracresol (an antioxidant known as BHT that was also used as a food

additive) and varying amounts of polychlorinated biphenyls (PCBs) to increase dielectric strength. The aboveground tanks contained mineral oil which was used as make-up oil for equipment maintenance or cleaning.

Code:	600-62	Classification:	Accepted
Names:	600-62; Benton Switch Substation Releases	Reclassification:	None
Type:	Unplanned Release	Start Date:	1/1/1948
Status:	Active	End Date:	
Description:	The substation is currently active and is enclosed in a locked, chain link fenced area. It began operations on November 11, 1948. The site contains various electrical equipment, circuit breakers, transformers, tanks, and support facilities. The primary environmental concern stems from leaking insulating oil from transformers and circuit breakers. A site visit on November 20, 1998, observed several areas of discolored gravel and stained concrete beneath vessel valves.		
Location:	The substation is located northwest of the northernmost tip of Wooded Island, near the river, at the north end of a gravel utility access road. It is east of the Energy Northwest (Washington Public Power Supply System) property.		
Release Description:	A number of releases have been associated with the facility. (See releases section). The switchyard has had past mineral oil spills and detections of polychlorinated biphenyls (PCBs) in the the soil.		
Process Description:	This substation is part of the Bonneville Power Administration main transmission grid, that conducts electrical power from the Columbia and Snake Rivers dams to five states (Washington, Oregon, Idaho, western Montana, and northern California). The BPA transmission grid is divided into four subareas. The substations on the Hanford Site are within the Snake River subarea. The substations use petroleum oil, primarily mineral oil, as insulation in electrical equipment. This includes transformers, coupling and potential devices, capacitors, circuit breakers, reclosers, voltage regulators, switches, and cable. Insulating oil is a highly refined, 10-weight petroleum oil with approximately 0.1 percent 2,6-di-tertbutyl-paracresol (an antioxidant known as BHT that is also used as a food additive) and varying amounts of polychlorinated biphenyls (PCBs) to increase dielectric strength. All of the substations have above ground tanks of mineral oil, that is used as make-up oil for equipment maintenance of electrical equipment. Solvents are used for cleaning and degreasing operations. Once maintenance is completed, rags soaked in solvent and all personal protective clothing are to be placed in drums for transport to the generator storage area at the H. J. Ashe Substation. All equipment filled with mineral oil is regularly analyzed for PCB concentration. All untested and unmarked equipment is assumed to be PCB contaminated. Electrical equipment fluid is assumed to be PCB, if the manufacturer's manuals or nameplates do not identify the type of dielectric fluid in the equipment, or if the equipment is known to be PCB according to available information.		
Waste Type:	Oil		
Waste Description:	The waste is soil potentially contaminated with polychlorinated biphenyls (PCBs) (Arochlors 1254 and 1260), insulating oil (10-weight petroleum oil with 0.1% 2,6-di-tertbutyl-paracresol). Mineral oil containing PCBs and solvents are the hazardous constituents used at the site.		

Code:	600-64	Classification:	Not Accepted
Names:	600-64; Sanitary Waste Tie-Line from the 400 Area to WPPSS; Underground Sanitary Sewer Line from 400 Area to WPPSS	Reclassification:	None

Type:	Sanitary Sewer	Start Date:	1/1/1997
Status:	Active	End Date:	
Description:	This underground, gravity flow line begins at the inlet to the 4607 Sanitary Sewer septic tanks and connects the 400 Area sanitary sewer main (also known as the 4903 Sanitary Sewer Main) with the Washington Public Power Supply System sewage treatment facility. The sewer line route appears as a disturbed area covered with sand and little vegetation. Washington Public Power Supply System signs posted along the route mark the existence of an underground sewer line.		
Location:	The new sewer line extends eastward from the existing 400 Area Septic Tanks (WIDS Site 400-7) to the existing Washington Public Power Supply System sewer line. The line crosses under the Route 4 South highway. The tie-in is located approximately 4.8 kilometers (3 miles) northeast of the 400 Area.		
Related Sites/ Structures:	The site is associated with the 4607 Sanitary Sewer, 4607 Sanitary Tile Field, 4607 Sanitary Sewer Lagoon, and the 4903 Sanitary Sewer Main.		
Waste Type:	Sanitary Sewage		
Waste Description:	Site personnel report that a small amount of sanitary wastes was unintentionally discharged into the tie-line (and, thus, the WPPSS sewage treatment facility), prior to reaching agreement with WPPSS in late 1992. The sanitary wastes remained with the underground tie-line and the treatment facility. No wastes were released to the environment. Radiation detection systems in the treatment facility indicated the presence of radioactive cobalt, cesium, and tritium beyond set limits. However, only tritium was confirmed to have been present in the sanitary wastes from the 400 Area. Water from 400 Area wells contains elevated levels of tritium, which may explain the presence of tritium in sanitary wastes.		

Code:	600-67	Classification:	Accepted
Names:	600-67; Bruggemann's Fruit Storage Warehouse	Reclassification:	Rejected (2/6/2001)
Type:	Storage	Start Date:	1/1/1922
Status:	Inactive	End Date:	1/1/1943
Description:	The Bruggemann's Warehouse site is the remaining single story warehouse, associated foundations, piping, and debris surrounding the site. During 1998 and 2000 field visits, an abandoned fuel tank was identified adjacent to the warehouse. The tank has a 0.6 meter (2 foot) filler pipe showing above ground. All other pipes seen in the area could be attributed to the facility water system. The building is considered culturally significant because of its good condition and use of native materials for construction. It is in the process (as of January 2001) for listing on the National Register of Historic Places. The main warehouse construction consists of local cobblestones in a concrete matrix. An extension of similar construction is present on the south end; it is unknown if this is original to the building or a later addition. The long axis of the warehouse runs north-south. The horizontal wood sheathing of the gable roof is still present on the rafters. On the southeast corner, however, the roof has caved in. Small nails in the roof sheathing indicate that shingles were probably present at one time. The roof overhangs the east and west walls. A cobblestone chimney emerges from the crest of the gable near the south end of the roof. On the west elevation, there is a distinct straight line of cobbles running along the length of the wall about 3 feet (0.9 meters) above grade. A wooden door with a wood frame is in the center of the elevation. On the south edge of the doorway is a wooden plank off its hinges that looks like a garage door. The doors are orange with dark brown decorative trim and each bears two wood frame windows. The north half of this wall has a distinctly straight line of cobbles about 2 feet (0.6 meters) above grade, similar to the west and north walls. On the south wall of the warehouse, there is a wood frame doorway just east of center. The cobblestone extension at the south end of the warehouse is missing its roof. Above		

most of the structure's doors and windows, the cobblestones are arranged to form decorative arches. The east wall appears to be the main entrance. On all four corners of the building and in the center of the east wall, decorative columns taper diagonally from the ground to the top of the wall. There is a wood frame doorway near the south end. A tall wood frame window south of the door, and two similar windows are north of the door. On the west wall is a single window. The north wall of the extension faces the warehouse, and there is approximately 1 meter (3 feet) between the two walls. In the center of the wall is a doorway with a small square window east of it. A large pile of cobbles lies outside the chain link fence south of the extension. Foundations to the east of the warehouse show other facilities related to fruit packing. A possible fruit washing facility shows evidence of two parallel tables with troughs underneath for draining. Also east of the warehouse is a round concrete foundation with heavy steel eyebolts, presumably to support a tank for pressurized water.

Location: The site is located approximately 1.1 kilometers (0.7 miles) east of the Vernita Bridge and State Highway 240. On the Hanford Site, the site may be accessed via Route 6 between miles 6 and 7.

Process Description: The following comments on life at the site (1937 - 1943) are from a telephone interview with Mary Bruggemann (she was married to Paul Bruggemann). She is now living in Yakima. They grew peaches, cherries, a new orchard of prunes, and a few wine grapes. The site had a river pumphouse for acquiring water for the orchards. Native Americans were hired during harvest time to pick fruit. Fruit was transported by truck and utilized the Hanford Engineering Works (HEW) train when it first came through. They also had a lot of sheep and a few cattle. The Bruggemann's had two employees.

Related Sites/ Structures: Remnants of previous structures at the site include a concrete pad located approximately north of the warehouse, and a concrete walkway that runs from the east side of the warehouse to a rectangular concrete foundation approximately 12 meters (40 feet) by 24 meters (80 feet). East of the foundation is the circular concrete foundation for the water tank, approximately 6 meters (20 feet) in diameter. West of the warehouse is the remnant of a house foundation. The area surrounding the warehouse consists of agricultural debris including vitrified clay piping for irrigation, dead fruit trees, and fencing material.

Waste Type: Storage Tank

Waste Description: The underground storage tank was used for storing fuel. Approximately 5 centimeters (1.97 inches) of water and fuel residue remained in the bottom of the tank in February 1998 and September 2000.

Waste Type: Misc. Trash and Debris

Waste Description: Farm debris was observed around the site including fence posts, pipe, food tins, buckets, farm machinery parts, barbed wire, and wire.

Code: 600-69

Classification: Not Accepted

Names: 600-69; Red Stained Soil (Rust)

Reclassification: None

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The site is an area of reddish soil that was discovered while a road grader was scraping an area for installation of a pipeline. As of July 14, 1997, the stain was disappearing. Some pinkish soil is visible on the surface. The area is covered with vegetation, including cheat grass, tumbleweeds, and rabbitbrush.

Location: The site is located west of 200 East. It is 600 meters (1969 feet) west of the 200 East perimeter fence, west of Route 4 South, and northwest of 2704HV.

Code: 600-72	Classification: Accepted
Names: 600-72; H-12R; Wahluke Slope H-12-R Debris Site	Reclassification: Rejected (1/30/2003)
Type: Dumping Area	Start Date:
Status: Inactive	End Date:
Description: The site is an abandoned military radar and dump site that runs east-west approximately 5 acres in size. A gravel road forms the perimeter of the site. AEC (1993) lists only that it is associated with the H-14 and H-12 sites, and possibly built after 1956.	
Location: The site is northeast of 100-F Area on the opposite side of the Columbia River (Section 23, T 14N, R 27E). The site southeast of H-12L.	
Related Sites/ Structures: PSN-12/14, H-12L	
Waste Type: Construction Debris	
Waste Description: The primary hazard at this site is construction debris including domestic garbage, wood, oil cans, and 55 gallon drum. Visible debris has been removed.	

Code: 600-73	Classification: Accepted
Names: 600-73; Wahluke Slope Igloo Sites	Reclassification: Rejected (1/30/2003)
Type: Military Compound	Start Date:
Status: Inactive	End Date:
Description: This is the site of two ammunition storage "igloos." The buildings have been removed and the area has been cleaned up.	
Location: On Wahluke Slope, north of the 100 D Area at the upper east and west ends of a "T-shaped" gravel road.	
Waste Type: Misc. Trash and Debris	
Waste Description: The debris at this site included a stock watering drum, glass bottles, tin cans, barbed wire, and other garbage. The debris has been removed.	

Code: 600-74	Classification: Accepted
Names: 600-74; Motor Pool Dump; Wahluke Slope PSN 12/14 Military Construction Dump	Reclassification: Rejected (1/30/2003)
Type: Military Compound	Start Date: 1/1/1950
Status: Inactive	End Date: 1/1/1960
Description: This military construction and motor pool dump site is located approximately 2/3 miles north and east of the PSN 12/14 camp location. It is an area of building remains, trash and debris extending in an east-west direction near the border of sections 13 and 24 in Section T14N R27E. Lubricant cans and automobile parts suggested some of the trash may be from a military motor pool. Construction debris (boards with nails) is all that remained in 2001.	
Location: The site is located 1 kilometer (2/3 mile) north and east of waste site PSN 12/14 (600-17). The site extends from east to west near the borders of sections 13 and 24 in Section T14N R27E.	
Related Sites/ Structures: This site is associated with the MIL-PSN 12/14 (600-17) and the MIL-H-12C, Battery B Nike Missile Control Center (600-10) sites. It is suspected that this dump area was used as part of the	

600-10 and 600-17 site demolitions.

Waste Type: Construction Debris
Waste Description: Miscellaneous debris and trash from demolished wooden buildings, automobile parts and 1 gallon and 5 gallon oil cans. The automobile parts and cans suggest the trash may have come from a motor pool.

Code: 600-75 **Classification:** Accepted
Names: 600-75; Wahluke Slope PSN 80 Debris Site **Reclassification:** Rejected (1/30/2003)
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site is no longer visible. The debris was removed. According to Roos (1990), the site is similar to the H-12R site (600-72) and the "Radar" sites (600-76). It is roughly oval and surrounded by a gravel road. Roos found two locations with four small concrete pads with imbedded bolts, but thought that there should be three sets of pads. He found only one concrete building foundation, and no obvious disposal pits.
Location: The site is located northwest of 100 B Area, on the opposite side of the Columbia River (14N, 26E, section 16)
Related Sites/Structures: The site contained a 160-meter (522-foot) well and pumphouse, metal pre-fab buildings, and septic system, with no fuel tanks listed (Anonymous 1993). After 1956 the identity of the site was merged with Nike site H-83L (WIDS site 600-13), the use permit terminated in 1960, and the site later destroyed (Anonymous 1993).
Waste Type: Misc. Trash and Debris
Waste Description: The debris at this site included building materials, insulators, glass bottles, tin cans, cable, and other garbage. Two septic tanks openings were discovered at this site. These tanks were filled with 12.2 cubic meters (16 cubic yards) of concrete. The debris was picked up. An area of petroleum-contaminated soil around a concrete well structure was excavated and five 208 liter (55-gallon) drums of contaminated soil were removed.

Code: 600-76 **Classification:** Accepted
Names: 600-76; Underground Rooms; Wahluke Slope Radar Site **Reclassification:** Rejected (1/30/2003)
Type: Military Compound **Start Date:**
Status: Inactive **End Date:**
Description: The site is roughly oval, approximately 400 meters (1/4 mile) by 370 meters (400 yards), and surrounded by a gravel
Location: The site is a radar site with underground rooms on Wahluke Slope, north of the 100H area and just north of Highway 24. It is southeast of PSN 04 (600-15).

Code: 600-77 **Classification:** Accepted
Names: 600-77; Antiaircraft Gun Shrapnel Sites 1, 2, and 3; Wahluke Slope Shrapnel Sites **Reclassification:** Rejected (1/30/2003)
Type: Military Compound **Start Date:**
Status: Inactive **End Date:**
Description: The shrapnel sites are three nearby but separate areas containing shrapnel from antiaircraft gun

firing on the North Slope.

Location: There are three shrapnel sites located on the North Slope. Site 1 is east of 100H area and north of the electrical transmission lines, 1/2 mile north of the White Bluffs boat landing, west of the old highway (Section 22, T 14N, R 27E). Site 2 is located northeast of 100F area, north of the railroad track, south of Highway 24, and northeast of PSN 12/14 (Section 8, T 14N, R 28E), Site 3 is located north of 100-D Area and south of the Igloo Site in the Saddle Mountain National Wildlife Refuge (Section 2, T 14N, R 26E).

Waste Type: Ordnance

Waste Description: Two pieces of aluminum or magnesium shrapnel have been found at Shrapnel Site 2. Two pieces of iron or steel shrapnel have been found at Shrapnel Site 3. At the major shrapnel area, Shrapnel Site 1, it is reported that over 100 lbs (45 kg) of shrapnel has been found. Shrapnel consists of iron fragments and aluminum or magnesium fuze ring pieces.

Code: 600-78

Classification: Accepted

Names: 600-78; Power Pole 12-3 Cistern; 12-3 Cistern

Reclassification: Rejected (1/30/2003)

Type: Catch Tank

Start Date:

Status: Inactive

End Date:

Description: The cistern is approximately 1.5 meters (5 feet) in diameter by 2.4 meters (8 feet) deep. Debris was removed and it was filled with gravel.

Location: The site is located east-southeast of the 100F Area, on the opposite side of the Columbia River. It is near power pole 12-3, and close to the point where the electrical transmission lines change direction from northeast to north. (SW 1/4 of NW 1/4 Section 8, T 13N, R 28E)

Waste Type: Demolition and Inert Waste

Waste Description: The homestead cisterns were relatively free of debris, except for wood. The cistern was filled with approximately 10 yards³ (7.7 m³) of pit-run gravel. Nearby debris has been removed.

Code: 600-79

Classification: Accepted

Names: 600-79; Wahluke Slope Clay Pit Cistern

Reclassification: Rejected (1/30/2003)

Type: Catch Tank

Start Date:

Status: Inactive

End Date:

Description: The clay pit cistern is a circular, concrete-lined pit approximately 1.7 meters (5 feet 6 inches) deep and 1.5 meters (5 feet) wide that has been backfilled with gravel. It is located near a pit that was used to obtain clay for lining irrigation canals. No obvious disposal pits remain from the homestead.

Location: Northeast of 100H area, on the opposite side of the Columbia River. It is north of Highway 24, south of the Wahluke Branch Canal, and east of the White Bluffs Wasteway. (SE 1/4 of NE 1/4 Sectio 27, T 15, R 27E)

Waste Type: Demolition and Inert Waste

Waste Description: The debris at this site included glass bottles, tin cans, asbestos pipe, and other garbage.

Code: 600-80

Classification: Accepted

Names: 600-80; Wahluke Slope Cow Camp Cistern

Reclassification: Rejected (1/30/2003)

Type: Catch Tank

Start Date:

Status: Inactive **End Date:**

Description: The cistern is approximately 1.4 meters (4 feet 9 inches) in diameter and backfilled with gravel. A depth value was not estimated during original site investigation because the cistern was filled with debris. Later documents do not mention a measured depth.

Location: Located northeast of the 100H Area, south of the Wahluke Branch Canal and north of Highway 24. (SE 1/4 of NE 1/4 of Section 26, T 15, R 27E)

Waste Type: Demolition and Inert Waste

Waste Description: The debris at this site included glass bottles, tin cans, and other garbage. Several of the empty bottles were from livestock antibiotic and pesticide for delousing cattle.

Code: 600-81 **Classification:** Accepted

Names: 600-81; Wahluke Slope Homestead Cistern **Reclassification:** Rejected (1/30/2003)

Type: Settling Tank **Start Date:**

Status: Inactive **End Date:**

Description: The site is a pre-Hanford cistern measuring approximately 1.52 to 1.83 meters (5 to 6 feet) in diameter and backfilled with gravel.

Location: East-northeast of the 100F area, southeast of the area where the north-south electrical transmission line crosses the east-west electrical transmission line.

Waste Type: Misc. Trash and Debris

Waste Description: The debris at the bottom of the cistern appeared to be homestead-associated food containers.

Code: 600-82 **Classification:** Accepted

Names: 600-82; Wahluke Slope Overlook Cistern **Reclassification:** Rejected (1/30/2003)

Type: Catch Tank **Start Date:**

Status: Inactive **End Date:**

Description: Roos (1990) reported two unfenced cisterns at this homestead location; one cistern measures 2.5 meters (8 feet) in diameter and 4.3 meters (14 feet) deep, and the other is 1 meter (3.5 feet) across by 1.2 meter (4 feet) deep.

Location: This site is on Wahluke Slope northeast of the Hanford townsite, southeast of 100F area, and near the bluffs overlooking the Columbia River.

Waste Type: Demolition and Inert Waste

Waste Description:

Code: 600-83 **Classification:** Accepted

Names: 600-83; Wahluke Slope Stock Tank Cistern **Reclassification:** Rejected (1/30/2003)

Type: Catch Tank **Start Date:**

Status: Inactive **End Date:**

Description: The stock tank cistern is approximately 3.7 meters (12 feet) by 3.7 meters (12 feet) by 1.2 meters (4 feet) deep with the top of the tank about 0.6 meters (2 feet) above the ground surface (Roos 1994). There were many metal cans in the area, as well as lumber used for fencing and corrals.

No homestead structure was found. A well with an approximate 20 centimeters (8 inches) diameter casing is north of the tank cistern.

Location: The site is located on the opposite side of the Columbia River, east-northeast of 100-F Area, near the electrical transmission lines. It is on a power line road that ends at the Wahluke Branch Wasteway. A large sand dune is at the east end of the road. The cistern is at the southwest end of the sand dune. (NW 1/4 of SW 1/4 Section 29, T 14N, R 28E)

Waste Type: Demolition and Inert Waste

Waste

Description:

Code: 600-84

Classification: Accepted

Names: 600-84; Wahluke Slope Wagon Road Cistern

Reclassification: Rejected (1/30/2003)

Type: Catch Tank

Start Date:

Status: Inactive

End Date:

Description: The cistern is approximately 2.4 meters (8 feet) in diameter by 2.4 meters (8 feet) deep.

Location: The cistern is located on Wahluke Slope, east of the 100F Area and north-northwest of the Hanford townsite on the opposite side of the Columbia River. (NW 1/4 of NE 1/4 Section 6, T 13N, R 28E)

Waste Type: Demolition and Inert Waste

Waste Debris at this site included glass bottles, tin cans, and other garbage.

Description:

Code: 600-85

Classification: Accepted

Names: 600-85; Wahluke Slope Stove Cistern

Reclassification: Rejected (1/30/2003)

Type: Catch Tank

Start Date:

Status: Inactive

End Date:

Description: This cistern is located on Wahluke Slope, east of 100-F Area, east-southeast of 100-H Area.

Waste Type: Demolition and Inert Waste

Waste

Description:

Code: 600-86

Classification: Accepted

Names: 600-86; Wahluke Slope Wasteway Cistern

Reclassification: Rejected (1/30/2003)

Type: Catch Tank

Start Date:

Status: Inactive

End Date:

Description: The cistern is approximately 2.4 meters (8 feet) in diameter by 0.9 meters (3 feet) deep. The walls are partially collapsed. The cistern has been filled with gravel. Roos (1990) reported that the cistern was mostly destroyed and filled in.

Location: The cistern is located on Wahluke Slope, northeast of 100H Area, near the Wahluke Branch Canal and the White Bluffs Wasteway. (SE 1/4 Section 22, T 15N, R 27E)

Waste Type: Demolition and Inert Waste

Waste Debris at this site included glass bottles, tin cans, cable, concrete, and other garbage.

Description:

Code: 600-87 **Classification:** Accepted
Names: 600-87; Wahluke Slope Dune Homestead **Reclassification:** Rejected (1/30/2003)
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**

Description: The homestead site contained buildings and a domestic trash disposal area.

Location: It is located on Wahluke Slope, east of 100F Area and northeast of the Hanford Townsite on the opposite side of the Columbia River. The homestead is near a series of sand dunes. (SW 1/3 of NE 1/4 Section 32, Y 14N, R 28E)

Waste Type: Misc. Trash and Debris

Waste Description: Debris consisted of domestic trash, parts of a barn or shed, parts of a flour mill, carriage pieces and a harness.

Code: 600-88 **Classification:** Accepted
Names: 600-88; Wahluke Slope Lonetree Homestead **Reclassification:** Rejected (1/30/2003)
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**

Description: The site contains a single live cherry tree, several dead trees and some small disposal areas. No above ground structures remain.

Location: The site is located on Wahluke Slope, east-northeast of the Hanford Townsite and southeast of the 100F Area, on the opposite side of the Columbia River. (SE 1/4 of NW 1/4 Section 20, T 13N, R 28E)

Waste Type: Misc. Trash and Debris

Waste Description: Debris consisted of metal cans and broken glass.

Code: 600-89 **Classification:** Accepted
Names: 600-89; Wahluke Slope Asphalt Batch Plant **Reclassification:** Rejected (1/30/2003)
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**

Description: The site is a graveled area about 0.8 hectares (2 acres) in size located on the Wahluke Slope. The site is north-northeast of the 100-D Area and south of Highway 24. It was apparently used as a temporary batch plant for mixing asphalt for paving operations. Two adjacent pits on site were empty. Another 4.6- by 4.6-meters (15- by 15-feet) area was used for disposal of concrete. The original users of the area are unknown.

Location: The site is located on Wahluke Slope, north-northeast of the 100-D Area and south of Highway 24 (NE 1/4 Section 4, T 14N, R 26E)

Waste Type: Demolition and Inert Waste

Waste Description: Debris from this site included asphalt, concrete, sheet metal, and other debris.

Code: 600-90 **Classification:** Accepted
Names: 600-90; Wahluke Slope Coyote Bait Can/Bait Station **Reclassification:** Rejected (1/30/2003)
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**

Description: This unit is composed of two separate sites, both on Wahluke Slope. The Coyote Bait Can is located southeast of 100F area and northeast of the Hanford Townsite. A large military ammunition box was partially buried at this site. The lid of the box was marked "BAIT CAN." Evidence in the area suggest that it was once used to store bait for coyote trapping. The Coyote Bait Station is east of the bait can, near the eastern edge of the wildlife area. At this location, over 50 coyote skulls were counted. Large animal bones in the area indicated that a poisoned carcass was most often used for bait. Historical records report that trappers would poison horse carcasses to attract and kill the coyotes for their pelts. Bones at this location were old and may predate government control of the land (Roos 1990).

Location: The sites are located southeast of 100-F Area on the opposite side of the Columbia River on Wahluke Slope (SW 1/4 Section 18, T 13N, R 28E and NE 1/4 Section 17, T 13N, R 28E)

Code: 600-91 **Classification:** Accepted
Names: 600-91; Pit 47; Wahluke Slope Gravel Pit #47 **Reclassification:** Rejected (1/30/2003)
Type: Depression/Pit (nonspecific) **Start Date:**
Status: Inactive **End Date:**

Description: The site is made up of two apparently active gravel pits. The smaller pit had been used as a disposal area.

Location: The site is located on Wahluke Slope, northeast of 100B Area, 1/4 mile south of Highway 24 at mile marker 47.

Waste Type: Misc. Trash and Debris
Waste Description: The debris at this site included building materials, glass bottles, tin cans, paint cans, cable, concrete, oil cans, and other garbage in the far pit. There was a significant amount of oil contaminated soil.

Code: 600-92 **Classification:** Accepted
Names: 600-92; Borrow Pit #56; Pit 56; Wahluke Slope Gravel Pit #56 **Reclassification:** Rejected (1/30/2003)
Type: Depression/Pit (nonspecific) **Start Date:**
Status: Inactive **End Date:**

Description: The site consists of several borrow pits.

Location: The site is located on Wahluke Slope, north-northwest of 100D Area and north of Highway 24.

Waste Type: Demolition and Inert Waste
Waste Description: Debris included communications wire, timbers, bottles, cans, barbed wire fencing, and fence posts. Potentially hazardous items identified included one 19 liter (5-gallon) can full of dead beetles (possible herbicide/insecticide) and two 19 liter (5-gallon) oil cans with liquid.

Code: 600-93 **Classification:** Accepted

Description: The site is sandy and mostly unvegetated. The site has been scraped for material to cover the adjacent burial ground. No waste was observed in the area in 1995, except for a large pile of tumbleweeds that were removed from the fence surrounding the 618-10 Burial Ground.

Location: The site is located west of Route 4 South between milepost 17 and 18. It is adjacent to the southwest corner of the 618-10 Burial Ground.

Related Sites/ Structures: The 618-10 Burial Ground is associated with the unit.

Waste Type: Vegetation

Waste Description: A large pile of tumbleweeds was observed.

Code: 600-97 **Classification:** Not Accepted

Names: 600-97; 618-11 Borrow Pit **Reclassification:** None

Type: Depression/Pit (nonspecific) **Start Date:**

Status: Inactive **End Date:**

Description: The site is located in a slight depression where 0.3 to 0.6 meters (1 to 2 feet) of soil has been removed to cover the 618-11 Burial Ground.

Location: The site is located approximately 1,500 meters (4,920 feet) west, northwest of Washington Public Power Supply System Plant Number 2 and just north of the 618-11 Burial Ground.

Code: 600-118 **Classification:** Accepted

Names: 600-118; Contaminated Soil Northwest of Gable Mountain Pond; Hot Spot Northwest of Gable Mountain Pond **Reclassification:** Consolidated (4/26/2000)

Type: Ditch **Start Date:**

Status: Inactive **End Date:**

Description: This overflow site has been consolidated with its source, the 216-A-25 Gable Mountain Pond. The stabilized site begins northwest of 216-A-25 Pond, and was formerly an overflow trench from 216-A-25 (Gable Mountain Pond) that ran north-south, approximately 0.9 meters (6 feet) deep. The site extends north, under the power lines where the site widens. The trench deepened again north of the power lines, so the site is narrower there, and fades out in a wider, but shallower area at the north end. The area outside the stabilized area is vegetated with sagebrush and cheatgrass. The stabilized area is sparsely vegetated with cheatgrass, crested wheatgrass, and Sandberg's bluegrass. The area is posted as an "Underground Radioactive Material" area.

Location: The site is located adjacent to (north side) the 216-A-25 (Gable Mountain Pond) stabilized overflow area.

Related Sites/ Structures: This site is an overflow area from 216-A-25 (Gable Mountain Pond), as evidenced by aerial radiation surveys and topographic relief maps showing a naturally downward flow direction toward this overflow area for water in Gable Mountain Pond.

Waste Type: Soil

Waste Description: The waste site was identified in the 1996 Flyover Survey and reported on April 11, 1996.

Description:

The Site Was Consolidated With:

Code: 216-A-25
Names: 216-A-25; 216-A-25 Swamp; Gable Mountain Pond; Gable Mountain Swamp; Gable Pond

Code: 600-121 **Classification:** Accepted
Names: 600-121; Coal Ash Piles; White Bluffs Coal Ash Piles **Reclassification:** Rejected (10/6/1997)
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site is several small coal ash piles located just east of the Pickling Acid Cribs.
Location: The site is located south of Federal Avenue and west of Route 2 North. The site is just east of the White Bluffs Pickling Acid Cribs (600-106).
Waste Type: Ash
Waste Description: The waste is coal ash that has been placed in piles (discernible units).

Code: 600-122 **Classification:** Not Accepted
Names: 600-122; White Bluffs Large Fenced Depression **Reclassification:** None
Type: Depression/Pit (nonspecific) **Start Date:**
Status: Inactive **End Date:**
Description: The eastern boundary of the site once was a power distribution line and powerline road. Power poles were removed by cutting them off just above the ground surface. Glass insulator material litters the area. Just west of this powerline is the fencing that surrounds the site. The fence is wood post and wire enclosure that appears to have been installed to keep deer out of the area. The fence is in very poor condition.
Location: The site is located west of Route 2 North and south of Federal Avenue, adjacent to a powerline road. It is southwest of the White Bluffs Pickling Acid Cribs (600-106).

Code: 600-123 **Classification:** Not Accepted
Names: 600-123; Farm Site; White Bluffs Farm Site **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site was a farm site. One source indicates that it may have been occupied by the army for a period of time indicates the site is littered with waste debris, including battery cores, broken glass, concrete, cans, bottles, wire, machinery parts, and other domestic wastes (Carpenter, 1994). A site visit done on August 16, 1996 did not find any battery cores or evidence of military debris. Two of the building foundations are deep and open to the surface. One of these is filled with concrete rubble, piping and debris. There is one concrete slab that could be a building foundation and one small concrete structure that is approximately 1.2 meters (4 feet) by 0.9 meters (3 feet) and is approximately 0.9 meters (3 feet deep).
Location: The site is located west of Route 2 North and south/southeast of Federal Avenue. It is southwest of the White Bluffs Large Fenced Depression (600-122) and approximately 1700 meters (1.1 miles) southwest of the intersection of Route 2 North and Federal Avenue.
Waste Type: Misc. Trash and Debris
Waste Description: The waste is farm debris, including sheep fencing, irrigation and other farming equipment,

Description: scattered household debris, and foundations for buildings. No evidence of army occupation remains. There is no evidence of any hazardous materials, and is a residential, not industrial site.

Code: 600-126 **Classification:** Not Accepted

Names: 600-126; Small Subsidence; White Bluffs Small Subsidence **Reclassification:** None

Type: Depression/Pit (nonspecific) **Start Date:**

Status: Inactive **End Date:**

Description: The site is a subsurface concrete structure that appears to be about 1.2 meters (4 feet) across. Soil around the structure has subsided into its underground void space. A few feet behind is a vertical pipe that opens into the void beneath the structure.

Location: The site is on a low rise located west of Route 2 North and north of Federal Avenue. It is 650 meters (2133 feet) southwest of the intersection of Federal Avenue and Route 2 North.

Related Sites/ Structures: 600-126, 600-166, 600-165 and 600-170 all appear to be part of a related underground piping system.

Waste Type: Construction Debris

Waste Concrete

Description:

Code: 600-130 **Classification:** Not Accepted

Names: 600-130; American Pipe Company Facilities; Stephensen's Cement Pipe Factory **Reclassification:** None

Type: Fabrication Shop **Start Date:**

Status: Inactive **End Date:**

Description: The site consists of remnants of the following facilities: valve box and 2 inch water line, concrete foundation, warehouse foundation, concrete sump attached to warehouse foundation, debris pile, foundation, potential smokestack base, and small subsidences that appear to be rotted wooden poles. The area is littered with wood, metal parts, glass, burned building materials, and debris.

Location: The site is located northeast of Route 2 North, northwest of Federal Avenue, and northwest of the White Bluffs townsite. It is approximately 700 meters (2297 feet) north/northwest of the intersection of Route 2 North and Federal Avenue.

Waste Type: Misc. Trash and Debris

Waste The waste is miscellaneous trash and debris consisting of wood, metal parts, glass, burned

Description: building materials, and debris.

Code: 600-135 **Classification:** Accepted

Names: 600-135; Horseshoe Pit; Spare Parts Machine Shop Landfill; White Bluffs Spare Parts Machine Shop Landfill and Pit **Reclassification:** Rejected (1/26/1998)

Type: Burial Ground **Start Date:**

Status: Inactive **End Date:**

Description: This unit includes two potential waste sites. One site is called the Spare Parts Machine Shop

Landfill, also known as the horseshoe pit. It was once a borrow pit that was later used as a waste disposal site. The borrow pit was dug in a semicircle to the northeast of nearby warehouses (hence the name horseshoe pit). The site appears to have been backfilled over about one-half to two-thirds of its area. The second site is a pit oriented in the east-west direction located directly west of Spare Parts Machine Shop Landfill. This pit measures about 90 meters (300 feet) long by 40 meters (130 feet) wide. No documentation could be found to indicate the purpose of the pit.

Location: The site is located northeast of Route 2 North, northwest of Federal Avenue and southwest of the export water line road. The site is approximately 700 meters (2297 feet) northeast of the intersection of Route 2 North and Federal Avenue and almost due west of the intersection of Federal Avenue and the export water line road.

Related Sites/ Structures: A DuPont drawing indicates that the southwest corner of the site was the location of the MS-9 Warehouses. The same drawing indicates a well in the vicinity of the warehouses.

Waste Type: Asbestos (non-friable)

Waste Description: The entire area was covered with scattered transite siding.

Waste Type: Equipment

Waste Description: Equipment parts and pieces are scattered about the area.

Code: 600-136

Classification: Not Accepted

Names: 600-136; Insulation Warehouses; White Bluffs Insulation Warehouses

Reclassification: None

Type: Storage

Start Date:

Status: Inactive

End Date:

Description: The site is a warehouse area within the White Bluffs townsite. It is covered with cheatgrass with some rabbitbrush and tumbleweed growth. There is very little evidence of the former warehouse buildings except for a few pieces of wood. Pavement from the former Lincoln St. shown in the referenced documents is still visible south of the site and aided identifying the precise location in the field. There was no evidence of asbestos at the site.

Location: The site is located within the old townsite of White Bluffs, north of Federal Avenue and west of Route 2 North. It is approximately 160 meters (525 feet) northwest of the intersection of Route 2 North and Federal Avenue. Source documents show it's location on the north corner of the former Lincoln Street and Railroad Avenue, which remain visible.

Process Description: This warehouse was used for insulation materials.

Code: 600-138

Classification: Not Accepted

Names: 600-138; Fumigation Chamber Building; White Bluffs Fumigation Building

Reclassification: None

Type: Maintenance Shop

Start Date:

Status: Inactive

End Date:

Description: The site is the remains of a fumigation building. A field investigation was performed by T. F. Johnson on October 15, 1996. The terrain was flat with gravel surface soil and had cheatgrass and rabbitbrush vegetation. Very little evidence of the fumigation building remained at the

site. A few pieces of wood and concrete were observed in the area. A standing wooden post remained near the site which may have been part of the fence surrounding the building.

Location: The site is located approximately 220 meters (722) west of the intersection of Route 2 North and Federal Avenue and approximately 150 meters (492 feet) northwest of the corner of Commercial Avenue and Federal Avenue. The building was located about 37 meters (120 feet) northeast of Commercial Avenue.

Process Description: The building was used primarily to fumigate bedding materials.

Code: 600-140 **Classification:** Not Accepted

Names: 600-140; Gunny Sacks South of H-70 Antiaircraft Site **Reclassification:** None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site is partially buried empty gunny sacks that appear to have been abandoned. The site was found on 01/11/95 during the Riverland field investigation.

Location: The site is located in the northwest portion of the Hanford Site, north of highway SR24, west of highway SR240 and approximately 1.9 kilometers (1.2 miles) west of gate 122 from highway SR240 and approximately 550 feet (170 meters) south southwest of the former antiaircraft site H-70 (Site Code 600-41).

Waste Type: Misc. Trash and Debris

Waste Description: The sacks were constructed of natural fibers.

Code: 600-141 **Classification:** Not Accepted

Names: 600-141; Barrels South of H-70 Antiaircraft Site **Reclassification:** None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site is two empty containers. One container is an empty 113 liter (30 gallon) drum painted army green and yellow. The other appears to be an empty garbage can. Both containers are partially buried. No labels or markings were visible on the containers that would identify what they were used for.

Location: The site is located in the northwest portion of the Hanford Site, north of highway SR24, west of highway SR240 and approximately 1.9 kilometers (1.2 miles) west of gate 122 from highway SR240 and approximately 240 meters (800 feet) south of the former antiaircraft site H-70 (Site Code 600-41).

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: An empty steel drum and a garbage can were found at the site.

Code: 600-142 **Classification:** Accepted

Names: 600-142; Car Body at McGee Ranch Fish Farm **Reclassification:** Rejected (2/9/1998)

Type: Dumping Area **Start Date:**

Status: Inactive

End Date:

Description: The site is an abandoned automobile. The car is resting upside down on its roof and has been partially crushed. The engine, transmission, differential, and radiator remain in the car. No battery was found, the radiator appeared empty and no visible leaks of automotive fluids were observed.

Location: The site is located in the northwest portion of the Hanford Site, north of highway SR24, west of highway SR240 and approximately 1.1 kilometers (0.7 miles) west driving from gate 121 on highway SR240. The car is located at the McGee Ranch Fish Farm site, approximately 140 meters (450 feet) north of the McGee Well.

Waste Type: Equipment

Waste Description: The auto body is constructed of sheet metal and a steel frame.

Waste Type: Oil

Waste Description: The engine, transmission, and differential may contain oil or oil residue.

Description:

Code: 600-143

Classification: Not Accepted

Names: 600-143; Car Body at Ford Well

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site is a car body only. The engine, transmission, radiator, and battery have been removed. Several bullet holes were observed in the car body.

Location: The site is located in the northwest portion of the Hanford Site, north of highway SR24 and west of highway SR240. From gate 121 on SR 240 just north of the Yakima Barricade, drive west 0.8 kilometers (0.5 miles) to the T. Turn left and follow the main road south and then west for 3.2 kilometers (2.0 miles) to well site 699-49-111. Turn right, and drive north 1.1 kilometers (0.7 miles) to the site, just past the Ford Well site. The car body located approximately 180 feet (55 meters) north of the Ford Artesian Well.

Waste Type: Equipment

Waste Description: The car body is constructed of sheet metal and a steel frame.

Description:

Code: 600-144

Classification: Not Accepted

Names: 600-144; Car Body Near Top of Umptanum Ridge

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site is a car body only. The engine, transmission, radiator and battery have been removed. Several bullet holes were observed in the car.

Location: The site is located in the northwest portion of the Hanford Site, north of highway SR24 and west of highway SR240 and approximately 2.9 kilometers (1.8 miles) west northwest of gate 122 from highway SR 240 and approximately 0.2 kilometers (1/8 mile) south of the crest of Umptanum Ridge, on the east flank, just west of the road than leads to the ridge crest.

Waste Type: Equipment

Waste Description: The car body is constructed of sheet metal and a steel frame.

Description:

DESCRIPTION.

Code: 600-147 **Classification:** Not Accepted
Names: 600-147; Wood Shack (Northwest of Gable Mountain) **Reclassification:** None
Type: Office **Start Date:**
Status: Inactive **End Date:**

Description: The site is an old, very weathered, one-room wooden shack with a gable roof, one door, one window per side, and central heater, mounted on two wooden skids. It has at least 12 wells within 50 meters (160 feet), and is probably a well driller's shed, used to shelter the crews and hold equipment when the nearby wells were installed.

Location: The site is located on the north side of Gable Mountain and just north of the dirt road that runs east west along the north side of Gable Mountain. However, the shed is not visible from the road, because of a small rise between the road and shed. The site is best accessed by turning east just north of milepost 2 on Route 4 North. Continue east on the paved road until the road begins to turn up the mountain. At this point, continue straight ahead on the dirt road which continues east along the mountain. The site is located approximately 2.1 miles east from Route 4 North and east of the high voltage power lines that cross the dirt road. Follow a rough road leading north from the east-west road.

Waste Type: Equipment
Waste Description: The site is a small weathered, wooden building.

Code: 600-148 **Classification:** Accepted
Names: 600-148; Environmental Restoration Disposal Facility; ERDF **Reclassification:** None
Type: Landfill (Lined) **Start Date:** 7/1/1996
Status: Active **End Date:**

Description: Designed to be expanded as needed, ERDF comprises a series of cells or disposal areas. Each pair of cells is 70 feet deep, and 500 feet by 1,000 feet at the base, large enough to hold about 2.8 million tons of material. The fourth and largest expansion of ERDF was completed in January 2011. Two "super cells," each the equivalent of a pair of existing cells, were constructed using Recovery Act funds. Additional upgrades included new maintenance facilities, additional dump ramps and additional transfer areas for waste containers, all of which will enhance the safety of increased, daily operations.

With the addition of super cells 9 and 10, ERDF capacity is 16.4 million tons. At the 70-foot-base, ERDF covers the same areas as 52 football fields. To date (2011), nearly 11 million tons of contaminated material has been disposed in the facility. One of the key components of ERDF is the liner that is built into each cell. The liner consists of multiple layers of plastic and other impermeable materials and a system to collect and removed liquids as they drain through the waste materials. ERDF does not accept liquid waste for disposal, but water enters the facility when it rains and snows, and water also is used for dust control during routine operations. The collected water, or leachate, is collected and routed to an onsite treatment facility. After treatment, the liquid is clean enough to be returned to the ground with no harm to the environment.

Location: The Environmental Restoration Disposal Facility (ERDF) is located southeast of the 200 West Area and southwest of the 200 East Area.

Process Description: generated during the cleanup activities at the Site. It does not accept any non-Hanford waste. After each load is placed into ERDF, it is compacted. Earth movers equipped with high-tech ground monitoring equipment drive over the waste to eliminate any air pockets or gaps in the landfill. Hollow tubes or pipes are either filled with a cement material or are cut into pieces. This ensures there are no void spaces in the facility, which could result in the landfill sagging or settling, which could cause damage to the permanent cap that ultimately will cover the entire facility when it is no longer needed. In the meantime, a temporary cap is placed over cells as they are filled.

Related Sites/Structures: Leachate collected at the landfill will be managed at the 200 Area Effluent Treatment Facility, located in the 200 East Area, or other approved facility.

Waste Type: Equipment
Waste Description: The total volume of waste is expected to be less than 2.14E+07 cubic meters (2.8E+07 cubic yards) is expected to consist of approximately 10% to 15% wastewater pipelines, ancillary equipment, and associated soil contamination.

Waste Type: Soil
Waste Description: The total volume of waste is expected to be less than 2.14E+07 cubic meters (2.8E+07 cubic yards) and is expected to consist of approximately 65% to 75% contaminated soil and demolition debris.

Waste Type: Misc. Trash and Debris
Waste Description: The total volume of waste is expected to be less than 2.14E+07 cubic meters (2.8E+07 cubic yards) and is expected to consist of approximately 15% to 20% burial ground waste.

Code: 600-153 **Classification:** Not Accepted
Names: 600-153; Dumping Area Between River Mile Markers 29 and 30 **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site is pre-Hanford debris, such as a metal strong box, car springs, broken dishes, barbed wire, and wood.
Location: The site is located between mile markers 29 and 30 approximately 50 meters (50 yards) from the water or 0.4 kilometers (1/4 mile) south of river mile marker 29 on the west bank of the Columbia River.
Waste Type: Misc. Trash and Debris
Waste Description: Observed debris includes a metal strong box, car springs, culvert, piping, wire, barbed wire, old piping, glass, broken dishes, metal culvert and wood.

Code: 600-154 **Classification:** Not Accepted
Names: 600-154; RCRA General Inspection HIRIV-FY96 Item #6; Remains of Windmill **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site is the remaining parts from an old windmill. The windmill was constructed of sheet metal and steel. An abandoned well was observed approximately 90 meters (295 feet) southwest of the windmill.

Location: left bank (facing downstream) of the Columbia River. On the USGS Map Coyote Rapids Quadrangle 7.5 minute series, the site is located about 200 meters (656 feet) east of the intersection labeled "Wahluke". If driving to the site, take the only paved road from highway SR24 to the river.

Waste Type: Equipment

Waste Description: The waste is parts from an old windmill which was constructed of sheet metal and steel.

Code: 600-155

Classification: Not Accepted

Names: 600-155; Dumping Area Upstream of River Mile Marker 35 Identified During RCRA General Inspection #HIRIV-FY96 Item #7

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site consists of an old rusty machine part with approximate dimensions of 1.8 meters by 1.2 meters by 0.6 meters (6 feet x 4 feet x 2 feet). The part is marked with a small metal tag "USA-HEW 355464/ Property of US Government." The surrounding soil is silty sand and cobbles, with moderate cheatgrass and bunchgrass vegetation. Nearby flood debris consists of tree branches and small logs. There are no other large pieces of metal or construction type material. The surface of the access road is sand and gravel. During visits to the site on February 1, 1999, and February 3, 1999, other debris was observed. This debris included: a chunk of concrete, an old muffler, a piece of metal that looked as though it could have come from the piece of machinery, other metal debris, a tire and wood debris (not flood debris). This miscellaneous debris is primarily south of the piece of machinery and most is within 100 meters (328.1 feet). A field visit on July 19, 1999, verified that the large piece of equipment had been removed. A small piece of metal (approximately 0.46 meters (18 inches) in length) remained half buried in the soil.

Location: The site is approximately 250 meters (810 feet) upstream from mile marker 35 and approximately 80 meters (260 feet) from the river shoreline. The site is visible from the road.

Process Description: The purpose of this piece of equipment is unknown.

Related Sites/ Structures: The origin of this piece of equipment is unknown.

Waste Type: Equipment

Waste Description: The waste is steel scrap. The metal tag contains "USA-HEW-355464". "HEW" stands for Hanford Engineering Works which was the name used during the era of reactor construction. Therefore, the material is not pre-Hanford historic waste.

Code: 600-156

Classification: Accepted

Names: 600-156; Construction Debris Dump Site

Reclassification: Rejected (12/7/2005)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: Scattered fragments of plastic are the only remaining debris at this site, which was formerly used as a construction dump.

Location: This site is on the east side of 200 East Area, east of the southeast corner of the Grout Treatment Facility Landfill (currently the Waste Treatment Plant construction area).

Waste Type: Construction Debris
Waste Description: In 1996, the waste was construction debris consisting of wood, broken concrete and galvanized metal pipe. In April 2002, only scattered fragments of plastic remained.

Code: 600-157 **Classification:** Not Accepted
Names: 600-157; White Bluffs Concrete Foundation Pads **Reclassification:** None
Type: Foundation **Start Date:**
Status: Inactive **End Date:**

Description: The site is described as several concrete foundation pads. Some of these pads have tie-down straps. Apparently these pads were used to support wooden warehouse buildings. The buildings were probably intentionally destroyed by fire, as the ground surface is littered with charred wood, burned electrical equipment (lights, switches, conduit, etc.), and nails.

Location: The site is located north of Federal Avenue and west of Route 2 North. It is approximately 500 meters (1640 feet) west of the intersection of Route 2 North and Federal Ave.

Waste Type: Misc. Trash and Debris
Waste Description: The waste is concrete pads and miscellaneous burned debris (electrical equipment, e.g., lights, switches, conduit, etc. and nails).

Code: 600-158 **Classification:** Not Accepted
Names: 600-158; White Bluffs Ground Storage Tank and Booster Pump Station **Reclassification:** None
Type: Storage Tank **Start Date:**
Status: Inactive **End Date:**

Description: There is an area of reduced vegetation that is a vague circular shape that could where a storage tank once sat. No evidence of a pumping station was found.

Location: The site was located within the White Bluffs Townsite city limits. The ground storage tank and booster pump station were located north of the intersection of Fifth Avenue and Federal Avenue, 475 meters (1558 feet) northeast of the current intersection of Route 2 North and Federal Avenue.

Process Description: The ground storage tank (100,000 gallons) was located adjacent to the booster pump station (16 feet x 20 feet x 10 feet). These facilities were used to handle potable water.

Code: 600-159 **Classification:** Not Accepted
Names: 600-159; White Bluffs Bank Well **Reclassification:** None
Type: Pump Station **Start Date:**
Status: Inactive **End Date:**

Description: The well had been a concrete structure covered with a steel plate and was surrounded by a light-duty steel post and orange barricade material. The well has been backfilled with grout and marked with a metal disk that reads "Well No. A8991, 699-80-39B, Abandoned 9-26-95."

Location: The site is located southeast of the White Bluffs Bank building and east of Route 2 North. It is south of a dirt road that provides access to 100F.

Code: 600-160 **Classification:** Not Accepted
Names: 600-160; White Bluffs Irrigation Debris **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site is an area containing concrete irrigation pipe sections. The piping sections are large in diameter and not very long. The site consists of a pipe standing within a large-diameter pipe. Other debris is scattered across the nearby area.
Location: The site is located west of Route 2 North, south of Federal Avenue, on the west side of a powerline road. It is approximately 975 meters (3199 feet) south of the intersection of Route 2 North and Federal Avenue, west of 600-188, White Bluffs Waste Disposal Trench 2.
Waste Type: Misc. Trash and Debris
Waste Description: The waste is concrete irrigation piping.

Code: 600-161 **Classification:** Not Accepted
Names: 600-161; White Bluffs Plumbing Debris **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site consists of two piles of plumbing debris. One pile contains ceramic plumbing fixtures and the other pile contains cast iron plumbing fixtures.
Location: The site is located west of Route 2 North and south of Federal Avenue. It is south of the intersection of Route 2 North and Federal Avenue and east of the White Bluffs Large Fenced Depression (600-122).
Waste Type: Misc. Trash and Debris
Waste Description: The waste is ceramic urinals, sinks, plumbing fixtures and cast iron piping fixtures.

Code: 600-162 **Classification:** Not Accepted
Names: 600-162; White Bluffs Pipe Debris and Bucket of Lead **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: There had been two debris remnants, one consisting of two 8 inch steel pipe sections embedded in concrete and the second is a bucket of what appeared to be lead. The bucket of lead was removed in 1995.
Location: The site is located west of Route 2 North and south of Federal Avenue. It is 900 meters (2953 feet) south of the intersection of Route 2 North and Federal Avenue on the west side of a powerline road.
Waste Type: Misc. Trash and Debris
Waste Description: The remaining waste is two 8 inch sections of pipe encased in concrete.

Code: 600-163 **Classification:** Not Accepted
Names: 600-163; White Bluffs Pipe Testing Shop **Reclassification:** None
Type: Laboratory **Start Date:**
Status: Inactive **End Date:**
Description: The vague outline of a building footprint was identified at this location.
Location: The White Bluffs Pipe Testing Shop was located southwest of the intersection of Federal Avenue and Commercial Avenue. It was west of the White Bluffs Main Pipe Fabrication Shop (600-194).
Process Description: The facility was reportedly used as the quality control test and training facility for welders who worked in the White Bluffs Main Pipe Fabrication Shop.

Code: 600-164 **Classification:** Not Accepted
Names: 600-164; White Bluffs Earth Berm and Trench **Reclassification:** None
Type: Trench **Start Date:**
Status: Inactive **End Date:**
Description: The earth berm appeared to have been some of the material removed from the trench excavation.
Location: The site is located east of Route 2 North and north of Federal Avenue. It is approximately 1000 meters (3,281 feet) north/northwest of the intersection of Route 2 North and Federal Avenue and just east of 600-132, White Bluffs Construction Contractor Shop Landfill..

Code: 600-165 **Classification:** Not Accepted
Names: 600-165; White Bluffs Valve Box **Reclassification:** None
Type: Valve Pit **Start Date:**
Status: Inactive **End Date:**
Description: The site is a subsidence of about one square meter and is lined with concrete, suggesting a valve box or drain system. The subsidence indicates a subsurface structure with a void space that allows overburden to subside into it because of storm runoff. There is a section of power pole laying across the top of the structure.
Location: The site is located west of Commercial Avenue and northwest of the intersection of Commercial Avenue and Federal Avenue.
Related Sites/Structures: 600-126, 600-166, 600-165 and 600-170 all appear to be part of a related underground piping system.

Code: 600-166 **Classification:** Not Accepted
Names: 600-166; White Bluffs Subsidences **Reclassification:** None
Type: Depression/Pit (nonspecific) **Start Date:**
Status: Inactive **End Date:**
Description: The site is a series of subsidences. A single subsidence measuring approximately four meters (13 feet) in size was originally identified in the White Bluffs Technical Baseline Report. The author of the report suggested that the site may be a subsurface structure with a void space that allowed overburden materials to be washed into it by rain runoff. A RARA Walkdown visit in

May 1999 identified three additional, similar subsidences, two of which are in line with the original one. The subsidences found in 1999 measured approximately 1.83 meters (6 feet) across and 0.9 meters (3 feet) deep.

Location: The site is located west of Commercial Avenue and north of Federal Avenue.

Related Sites/Structures: 600-126, 600-166, 600-165 and 600-170 all appear to be part of a related underground piping system, such as a sewer system, stormwater collection system or an irrigation system.

Code: 600-167

Classification: Not Accepted

Names: 600-167; White Bluffs Cistern

Reclassification: None

Type: Catch Tank

Start Date:

Status: Inactive

End Date:

Description: The site is a large Pre-Manhattan Engineering District concrete cistern. The top of the concrete cistern structure is located slightly below grade level. The hole is almost filled with windblown tumbleweeds. A small portion of the concrete structure was visible on a 1999 site visit.

Location: The site is located west of Route 2 North and south of Federal Avenue. It is northeast of the White Bluffs Loading Docks and Fuel Storage Area (600-127).

Process Description: The cistern was used to store water (not waste water).

Code: 600-168

Classification: Not Accepted

Names: 600-168; Buckholdt Ranch Toilet Pits; Herriford Ranch Toilet Pits

Reclassification: None

Type: Depression/Pit (nonspecific)

Start Date:

Status: Inactive

End Date: 1/1/1943

Description: The general area of the ranch is marked by several acres of orchard tree stumps visible from the highway (Route 2 North). The site contains a number of toilet pits (outhouse pits) that remain open. The toilet pits were described as being located between the house foundation and the road to the south. The ground in this area is very uneven and has a rolling surface. During the June 1999 visit, it was observed that much of the southern end of the orchard east of the house foundation has the same undulating ground surface. Several hazards are found near this site, including the house foundation, a wood-lined pit on the north side of the foundation, and the former well or pump house near the south side of the site.

Location: The site is located north of the Hanford townsite and west of Route 2 North. The site is accessed by a dirt road that exits Route 2 North approximately 4.7 kilometers (2.9 miles) north of the intersection of Route 2 and Route 11. It is located north of an east-west dirt road; the travel distance from Route 2 North is approximately 1100 meters (3609 feet, 0.68 miles).

Code: 600-169

Classification: Not Accepted

Names: 600-169; Hanford Construction Camp Trenches

Reclassification: None

Type: Trench

Start Date:

Status: Inactive

End Date:

Description: The site is three trenches located south of the Hanford Construction Camp, along the gravel road that is an extension of Avenue A. Each trench runs northwest to southeast and parallels the road. Spoil piles are pushed to the west side of the trenches. Their purpose is unclear. A

1997 site visit observed a pile of broken concrete between the southern most trench and the adjacent trench

Location: The site is located southeast of the Hanford Construction Camp. The northernmost trench is 1.5 kilometers (0.9 miles) southeast of the intersection of Avenue A and 9th Street. The trenches range from 77 to 93 meters (253 to 305 feet) southwest of Avenue A.

Code: 600-170 **Classification:** Not Accepted

Names: 600-170; White Bluffs Subsurface Concrete Structure **Reclassification:** None

Type: Sump **Start Date:**

Status: Inactive **End Date:**

Description: The site is a series of subsurface concrete structures. The White Bluffs Technical Baseline Report originally described a single subsurface concrete structure, possibly a sump. A RARA Walkdown visit in May 1999 found four additional similar concrete structures/subsidence surrounding an old building foot print.

Location: The site is located in the old warehouse area north of Federal Avenue and west of the intersection of Commercial Avenue and Federal Avenue.

Related Sites/ Structures: 600-126, 600-166, 600-165 and 600-170 all appear to be part of a related underground piping system.

Code: 600-171 **Classification:** Not Accepted

Names: 600-171; White Bluffs Townsite **Reclassification:** None

Type: Foundation **Start Date:**

Status: Inactive **End Date:**

Description: The site is the White Bluffs Townsite located in the proximity of the intersection of Route 2 North and Federal Avenue. Most of the buildings have been demolished except for the White Bluffs Bank.

Location: The site is located west of 100F and south of 100H, around the intersection of Route 2 North and Federal Avenue. The site is predominantly east of Route 2 North.

Related Sites/ Structures: See subsite for individual facility descriptions within the Townsite. Three sites, the booster pump station and the ground storage tank (located next to each other at the northeast corner of Fifth Avenue and Federal Avenue), and the sewer junction box (located about 70 meters due north of the Route 2 North and Federal Avenue intersection), are addressed separately (See Sitecode 600-158 and 600-184).

This Site has the Following SubSites:

Code: 600-171:1

Code: 600-172 **Classification:** Accepted
Names: 600-172; White Bluffs French Drain or Dry Well **Reclassification:** Rejected (10/6/1997)

Type: French Drain **Start Date:**
Status: Inactive **End Date:**

Description: The site is either a french drain or dry well that is a 61 centimeter concrete pipe, that has a steel lid, and appears to be about 1 meter deep. The sides are perforated, indicating that its purpose may have been for storm runoff or steam condensate. There does not appear to be an inlet pipe inside the structure.

Location: The site is on the north side of Federal Avenue and west of Commercial Avenue. It is approximately 470 meters (1542 feet) southwest of the intersection of Commercial and Federal and approximately 650 meters (2133 feet) southwest of the intersection of Federal and Route 2 North.

Waste Type: Steam Condensate
Waste Possibly, the waste was steam condensate.

Description:

Code: 600-173 **Classification:** Accepted
Names: 600-173; White Bluffs Domestic Debris Dump
and Building Foundations **Reclassification:** Rejected (10/6/1997)

Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**

Description: The site is a domestic type waste dump and pre-Manhattan Engineering District building foundations. The waste dump consists of miscellaneous debris and the building foundations

appear to be pre-Manhattan Engineering District. One building appears to have been a garage or farm shop because of the way that the concrete was formed.

Location: The site is located southwest of the intersection of Route 2 North and Federal Avenue. The site is east of the White Bluffs Large Fenced Depression.

Waste Type: Misc. Trash and Debris

Waste Description: The waste consists of miscellaneous debris including domestic bottles, glassware, paint cans, cans, containers of heavy industrial nuts and bolts (greater than 2.5 cm in diameter). Two building foundations are also included as a part of the site.

Code: 600-174

Classification: Accepted

Names: 600-174; White Bluffs French Drain

Reclassification: Rejected (10/6/1997)

Type: French Drain

Start Date:

Status: Inactive

End Date:

Description: The site is a 61 centimeter vitrified clay pipe french drain. The top is flush with the surface and it is filled with rocks.

Location: The site is located approximately 530 meters (1739 feet) northwest of the intersection of Route 2 North and Federal Avenue.

Waste Type: Steam Condensate

Waste Description: The french drain may have been used to dispose of steam condensate.

Code: 600-175

Classification: Accepted

Names: 600-175; Original Priest Rapids Ice House Drain Field

Reclassification: Rejected (10/6/1997)

Type: Drain/Tile Field

Start Date:

Status: Inactive

End Date:

Description: The site is three large depressions thought to be the original drain field for waste water generated at the ice house. The site was originally marked by a steel post and wooden rail fence that can still be found around much of the site.

Location: The site is located in the White Bluffs Area, south of the intersection of Route 2 North and Federal Avenue and northeast of the White Bluffs Pickling Acid Crib (600-106).

Waste Type: Water

Waste Description: The waste was waste water. It is unknown if other wastes were disposed of at the site or if the site was used for other purposes.

Code: 600-177

Classification: Accepted

Names: 600-177; White Bluffs Pipe Bender and Equipment Dumping Area

Reclassification: Rejected (10/6/1997)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site consists of two areas that are within close proximity. The pipe bender is a large heavy-walled pipe, placed vertically in the ground with approximately 1.2 meters (4 feet) of the pipe extending above grade. Several holes of varied sizes have been drilled into the vertical pipe.

The holes are the approximate size of varied small diameter pipes. The structure is assumed to have been used to do rough bending of pipe. Adjacent to the pipe bender is a large area of debris that appears to have been a miscellaneous equipment dumping/storage area. Random dumping of small quantities of oils also occurred in the area.

Location: The site is located west of Route 2 North and south of Federal Avenue. It is approximately 810 meters southeast of the intersection of Route 2 North and Federal Avenue and just west of a powerline road.

Waste Type: Oil

Waste Description: The site shows evidence of random oil dumping.

Code: 600-179

Classification: Accepted

Names: 600-179; Priest Rapids Ice House

Reclassification: Rejected (10/6/1997)

Type: Burial Ground

Start Date: 1/1/1943

Status: Inactive

End Date:

Description: The site is the remains of the Priest Rapids Ice House that was demolished in situ in 1975.

Location: The site is located west of Route 2 North, south of Federal Avenue, between Commercial Avenue and the railroad. It is approximately 260 meters (853 feet) south/southeast of the intersection of Route 2 North and Federal Avenue

Waste Type: Demolition and Inert Waste

Waste Description: The waste consists of the demolished facility buried in place in 1975. Occasionally small pieces of wood and clay can be observed on the surface

Code: 600-180

Classification: Accepted

Names: 600-180; White Bluffs Suspect Automotive Repair Shop

Reclassification: Rejected (10/6/1997)

Type: Maintenance Shop

Start Date:

Status: Inactive

End Date:

Description: The site is described as the remains of what appears to have been an automotive repair shop.

Location: The site is located west of Route 2 North and south of Federal Avenue. It is northeast of the White Bluffs Pickling Acid Cribs (600-106).

Waste Type: Chemicals

Waste Description: The waste may have been solvents, grease, antifreeze, oils, gasoline. Concern was expressed by the Environmental Protection Agency (EPA) because of the types of materials usually found at an automotive repair shop. However, there is no evidence of this type of disposal. (Per Discovery Site Evaluation Checklist completed by Steve Weiss 8/6/96). Remaining surface material consists of jack stands, car parts, wooden debris, and other metallic debris.

During the May 1999 visit, the following were observed: light fixtures, paint cans, a muffler, lumber, sections of what appears to be stove pipe, a 55 gallon drum marked "Property of Shell Oil," and buckets containing what appeared to be tar. The site's remains didn't suggest an automotive repair shop as much as a supply hut.

Code: 600-183

Classification: Accepted

Names: 600-183; White Bluffs Burn Pile and Debris **Reclassification:** Rejected (10/6/1997)
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site is a burn pile and debris dumping area. Within the site is one area consisting of a burn pile of domestic type debris. The other area consists of 5 gallon military type drums.
Location: The site is located west of Route 2 North and south of Federal Avenue. It is approximately 680 meters (2231 feet) south of the intersection of Route 2 North and Federal Avenue.
Waste Type: Misc. Trash and Debris
Waste Description: The waste consists of miscellaneous debris, including domestic type debris and military drums. It is unknown if any hazardous materials remain.

Code: 600-184 **Classification:** Accepted
Names: 600-184; White Bluffs Townsite Septic System **Reclassification:** Rejected (10/6/1997)
Type: Septic Tank **Start Date:**
Status: Inactive **End Date:**
Description: The site is a concrete box with a metal lid. It is about 0.61 meters deep (2 feet) and is dry inside.
Location: The sewer junction box is located about 30 meters due north of the intersection of Route 2 North and Federal Avenue. The site is about 50 meters east of Route 2 North and 50 meters north of Federal Avenue.
Process Description: The site is the various components of a septic system serving the central area of the White Bluffs Townsite. In the rehabilitation of existing buildings containing inside toilets and plumbing facilities, whenever possible, connections were made to permanent systems (DuPont, 1945). The White Bluffs Townsite had one septic tank and 300 feet of sewer line. During field surveillance activities, a sewer junction box consisting of a shallow concrete box with a heavy steel cover was located within the confines of the city.
Waste Type: Sanitary Sewage
Waste Description: The waste is sanitary sewage (if the septic tank and/or drainfield could be located).

Code: 600-185 **Classification:** Accepted
Names: 600-185; Hanford Construction Camp Honey Dump Site **Reclassification:** Rejected (10/1/1997)
Type: Trench **Start Date:** 1/1/1943
Status: Inactive **End Date:** 1/1/1945
Description: The site is described as a dumping and cleaning station for the portable toilets used at the various Hanford construction sites.
Location: The site is located southeast of the Hanford Construction Camp, 280 meters (919 feet) east/southeast of the intersection of Avenue A and 9th Street. It is south of the southernmost sewage treatment plant (600-186).
Waste Type: Sanitary Sewage
Waste Description: The unit received portable toilet cleaning chemicals and human waste.

Code: 600-189 **Classification:** Accepted
Names: 600-189; White Bluffs Warehouse Facility **Reclassification:** Rejected (1/26/1998)
French Drains; 100-H-23
Type: French Drain **Start Date:**
Status: Inactive **End Date:**

Description: The site is three french drains associated with a large warehouse and temporary construction facility. The area near the french drains is littered with debris and patches of gravel. There is no oil-stained soil or other indication of hazardous waste disposal at or near the french drains.

Location: The site is located approximately 1100 meters (3609 feet) northwest of the intersection of Route 2 North and Federal Avenue in a large warehouse-temporary construction facility area.

Release Description: The use of the drains was not reported. Drains were constructed for disposal of liquid wastes and may have been used for wastewater and/or stormwater.

Process Description: No documentation has been found describing the purpose of the drains. French drains were used for disposal of liquid wastes and these may have been used for wastewater and/or stormwater.

Waste Type: Water
Waste Description: The waste may have been wastewater/stormwater.

Waste Type: Asbestos (non-friable)
Waste Description: Transit siding was scattered throughout the area.

Code: 600-192 **Classification:** Not Accepted
Names: 600-192; Hanford Construction Camp **Reclassification:** None
Fumigation Chamber
Type: Maintenance Shop **Start Date:**
Status: Inactive **End Date:**

Description: The site is the remains of a fumigation building. During a field investigation by T. F. Johnson on October 24, 1996, there was no evidence of the fumigation chamber at the site except for a few small pieces of concrete. The area was covered with cheatgrass, rabbitbrush, and tumbleweeds. The fumigation chamber (disinfestation building) was a small wooden frame building. It was posted with "Poison Gas, Keep Out" signs and protected by an 2.4 meter (8 foot) barbed-wire security fence.

Location: The site is located between Avenue A and the Columbia River, between the two northernmost sewage treatment plants (600-186). The site may be approached from the north by taking a road southeast from Route 2 North between mileposts 1 and 2. Continue southeast on this road, which parallels the river, for 3.5 kilometers (2.2 miles). A group of trees is located just above the riverbank and north of the site. The site is located approximately 140 meters (459 feet) northeast of the intersection formerly known as Avenue A and 5th Street.

Process Description: A small building adjacent to the fumigation chamber is referred to as the "bedding storage" building, suggesting that the fumigation chamber was used to fumigate bedding.

Code: 600-193 **Classification:** Accepted
Names: 600-193; White Bluffs Gas Station **Reclassification:** Rejected (10/6/1997)
Type: Storage Tank **Start Date:** 1/1/1942
Status: Inactive **End Date:** 1/1/1975

Description: The site is located in a shallow depression with heavy tumbleweed and cheatgrass growth. Prior to November 1997, the depression had been marked with a steel post and chain barrier and posted with two "DANGER KEEP AWAY" signs. The posts and chains were removed on November 19, 1997.

Location: The site is located east of Federal Avenue, south and west of Route 2 North, between the railroad tracks and the old road which was "Railroad Avenue."

Process Description: The site is the location of the White Bluffs Gas Station, that was demolished in 1975 as part of a sitewide clean up project. No documentation can be found to determine if any underground storage tanks were removed. A depressed area, that measured 4.88 X 7.62 meters (16 X 25 feet), was identified in 1989 and surrounded with steel posts and chain. Federal Avenue is located just north of the site of the depression. The west side of the site is bounded by railroad tracks and the east side is bounded by an old road believed to be "Railroad Avenue." The soil in the area is soft and sandy. The existence of the underground storage tanks could not be determined from the initial (1996) field investigation. In addition, it is possible that the tanks, if present, may have been located north of Federal Avenue and east of Railroad Avenue.

Code: 600-194 **Classification:** Accepted
Names: 600-194; Main Pipe Fabrication and Blacksmith Shop; White Bluffs Main Pipe Fabrication Shop **Reclassification:** Rejected (10/6/1997)
Type: Fabrication Shop **Start Date:**
Status: Inactive **End Date:**

Description: The site is the remnants of pipe fabrication shop. The building footprint can be discerned by observing the disturbed ground surface and the lack of rabbitbrush as compared to the surrounding terrain. In some areas near the western portion of the site, the concrete floor is visible. The floor appears to be intact, but much of it is covered by soil. Waste materials observed at the site include wood, coal, metal, metal lathe turnings, pipe, nails, brick, and concrete.

Location: The site is located approximately 60 meters (197 feet) southeast of Federal Avenue and about 230 meters (755 feet) southwest of Route 2 North. The site is just west of the old road once known as "Commercial Avenue" and between Federal Avenue and the BPA Powerlines.

Process Description: The Main Pipe Fabrication Shop was used to prepare piping systems for the reactor areas. The pipe was prepared for welding by grinding, etching with acid (pickling), and then cleaning with solvent materials. This shop was the source of waste discharged to the White Bluffs Pickling Acid Cribs (600-106).

Related Sites/ Structures: Liquid wastes from the Main Pipe Fabrication Shop were disposed to the Pickling Acid Cribs.

Waste Type: Misc. Trash and Debris

Waste Description: The site contains concrete, brick, wood, coal, metal, and small amounts of glass. The Main Pipe Fabrication And Blacksmith Shop used acids and solvents in the pipe fabrication process which may have contaminated the waste materials and soil remaining at the site. Carbon

tetrachloride was a common degreasing agent at the time and may be present in the debris.

Code: 600-195 **Classification:** Not Accepted
Names: 600-195; White Bluffs Townsite Electrical Substation **Reclassification:** None
Type: Electrical Substation **Start Date:**
Status: Inactive **End Date:**
Description: The site is the location of a demolished substation that serviced the White Bluffs Townsite. The site had two footprints measuring 4.3 meters by 3.8 meters and 1.8 meters by 5.5 meters (14 feet by 11 feet and 6 feet by 18 feet). The footprints of the former substation site are still visible. The soil at the site is sandy. Cheatgrass vegetation growth within the site appears stunted and indicates the size and location of the former site. There is no evidence of oil spills or stains in the soil at this site or the ground surrounding the site.
Location: The site is located on the south corner of the intersection of Federal Avenue and Commercial Avenue. It is approximately 200 meters (656 feet) southwest of the intersection of Route 2 North and Federal Avenue.
Waste Type: Soil
Waste: No waste was observed at the site.
Description:

Code: 600-196 **Classification:** Not Accepted
Names: 600-196; White Bluffs Farm Dump Site and Partially Backfilled Pit **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site is areas of random scattered debris and a pit. The debris includes cans, bottles, barbed wire and car parts scattered along the west side of a dirt road. The pit is a fairly large excavation on the east side of the road and shows no evidence of being used as a waste site.
Location: The site is located approximately 1 kilometer (0.62 miles) northeast of the intersection of Route 2 North and Federal Avenue. The site may be approached from a dirt road heading due north from Federal Avenue about 644 meters (2112 feet) northeast from the intersection of Route 2 North and Federal Avenue.
Waste Type: Misc. Trash and Debris
Waste: Cans, glass, barbed wire, and auto parts
Description:

Code: 600-198 **Classification:** Not Accepted
Names: 600-198; RCRA General Inspection LORIVFY96 Item #2; White Bluffs River Bank Concrete Structure **Reclassification:** None
Type: Foundation **Start Date:**
Status: Inactive **End Date:**
Description: The site is a box shaped concrete structure partially buried in the river bank. The site appears to have slid partially down the bank. The structure is filled with dirt and debris. There is a large

quantity of 0.635 centimeter (0.25 inch) nylon tubing hanging around and in the structure. Four steel pipes extend from each corner of the box. An electrical conduit also extends from the box. A square notch was observed on a top corner of the box.

Location: The site is located 500 meters (1641 feet) upstream from the White Bluff's Landing. It is on the east side of the dirt road leading north from the boat landing and is perched on the riverbank above the water.

Waste Type: Construction Debris
Waste Description: Concrete, steel pipe, and nylon tubing.

Code: 600-199 **Classification:** Accepted
Names: 600-199; White Bluffs Ash Covered Concrete Pad **Reclassification:** Rejected (3/11/1998)
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**

Description: The site is a concrete foundation pad that is completely covered with coal ash. The original purpose of the pad is unknown.

Location: The site is located west of Route 2 North and north of Federal Avenue. It is approximately 675 meters (2215 feet) southwest of the intersection of Route 2 North and Federal Avenue.

Waste Type: Ash
Waste Description: The waste is coal ash which is a state regulated solid waste. The waste has been placed in a waste pile (discernible unit).

Waste Type: Asbestos (non-friable)
Waste Description: Transite siding was scattered throughout the area.

Code: 600-200 **Classification:** Accepted
Names: 600-200; Priest Rapids Ice House Septic Tank **Reclassification:** Rejected (10/6/1997)
Type: Septic Tank **Start Date:**
Status: Inactive **End Date:**

Description: The site is a large septic tank thought to have been associated with the Priest Rapids Ice House.

Location: The site is located south of Federal Avenue and west of Commercial Avenue. It is approximately 315 meters (1034 feet) south of the intersection of Route 2 North and Federal Avenue. The site is southwest of the Priest Rapids Ice House (600-179).

Waste Type: Sanitary Sewage
Waste Description: The waste is a septic tank, possibly containing human septage. Septage is a state regulated solid waste.

Code: 600-203 **Classification:** Accepted
Names: 600-203; White Bluffs French Drains **Reclassification:** Rejected (10/6/1997)
Type: French Drain **Start Date:**
Status: Inactive **End Date:**

Description: The White Bluffs Technical Baseline Report states the site is two french drains and what

appears to be a valve box. No additional information is known. A RARA Walkdown visit done in May 1999 found a round clay french drain filled with rock and an additional small subsidence near the valve box and noticed a long narrow area of disturbed vegetation that may indicate these structures were part of an old irrigation system. A third item was observed, photographed and mapped as a new component of this site. It was a concrete, square hole that measured approximately 8 by 8 inches.

Location: The site is located north of Federal Avenue and west of Commercial Avenue. It is approximately 360 meters (1181 feet) northwest of the intersection of Commercial and Federal Avenue.

Waste Type: Steam Condensate

Waste Description: The waste may have been steam condensate.

Code: 600-206

Classification: Accepted

Names: 600-206; 101 Building Graphite Dump Site

Reclassification: Rejected (10/1/1997)

Type: Burial Ground

Start Date: 1/1/1943

Status: Inactive

End Date: 1/1/1945

Description: The site is a burial ground used for the disposal of scrap graphite and building rubble. The building was plowed into the ground when it was demolished. Remnants of the site remain on the surface. The 101 Building was used during the 1943-1944 construction program for machining graphite for the 100 Areas. It was then declared surplus and partially dismantled. It was reconstructed for machining graphite in 1948.

Location: The dump site appears to be along the southern edge of the 101 Building site, probably along the railroad right-of-way that serviced the building.

Related Sites/Structures: The 101 Building site was located at the Hanford Construction Camp, north of Roosevelt Avenue and North of the Hanford High School, west of Avenue A, in the "V" formed by Avenue A and the powerlines.

Waste Type: Demolition and Inert Waste

Waste Description: The records appear to indicate that the site received debris from the demolished building. It is unlikely to contain hazardous or radioactive materials. A records review and site inspection reveal no evidence of radioactive or toxic dumping.

Code: 600-207

Classification: Accepted

Names: 600-207; Hanford Construction Camp
Powerhouse Ash Pile

Reclassification: Rejected (10/6/1997)

Type: Dumping Area

Start Date: 1/1/1943

Status: Inactive

End Date: 1/1/1945

Description: The site is a large coal ash pile. The pile is pear-shaped and oriented north to south with the wider portion to the south. It is covered with cheatgrass and tumbleweeds. A second smaller ash pile exists to the northwest.

Location: The site is located southeast of the Hanford Construction Camp, approximately 1000 meters (3281 feet) inland from the Columbia River. The site is approximately 780 meters (2559 feet) southeast of 10th Street and 740 meters (2428 feet) southwest of Avenue A.. The ash pile is located adjacent to the bluff that overlooks the Hanford Construction Camp from the south. The site is accessible from the north by an overgrown gravel road.

Waste Type: Ash

Waste Type: Ash
Waste Description: The waste is ash that appears characteristic of powerhouse ash and probably came from coal fired power houses used at the Hanford Construction Camp. The dirt road leading to the main site has been overlaid with ash. The waste has been placed in a discernible unit (pile).

Code: 600-209 **Classification:** Accepted
Names: 600-209; White Bluffs Excess Railroad Tie Materials **Reclassification:** Rejected (10/6/1997)
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**

Description: The site is several stacks of excess railroad ties. The ground surface at the site appears to have been graveled, suggesting that the entire area was a warehouse area for industrial type materials. During the May 1999 visit, it was observed that scattered stacks and piles of railroad ties were found in a large undefined area on both sides of a powerline road. Ties were found to the west and south of 600-188.

Location: The single point that is mapped for this site is located west of Route 2 North, south of Federal Avenue, on the west side of a powerline road. It is 1050 meters (3445 feet) south of the intersection of Route 2 North and Federal Avenue.

Waste Type: Oil

Waste Description: The waste is creosote soaked railroad ties and possibly creosote in the soil underneath the railroad ties. The Regulators were concerned about this site for the reasons stated above.

Code: 600-210 **Classification:** Not Accepted
Names: 600-210; 300 Area TEDF Outfall **Reclassification:** None
Type: Outfall **Start Date:** 1/1/1994
Status: Inactive **End Date:**

Description: The outfall line was a 25-centimeter (10-inch) polyvinyl chloride (PVC) pipeline that is routed to the shore of the Columbia River [approximately 600 meters (2000 feet)] from the TEDF. To protect an archaeological site near the river, the pipeline is routed aboveground until it is close to the shoreline. At this point, the pipe was routed below grade into a gravel-filled, rock-armored trench. At the shoreline the PVC pipe was transitioned to an 20 centimeter (8-inch) ductile iron pipe that transfers the effluents to the mid-channel single-point diffuser. The diffuser lies on the bottom of the channel, and consisted of an iron pipe routed through a large, rectangular concrete casing. An angled discharge-pipe bolted directly to the concrete block.

Location: The outfall is located directly east of the 300 Area TEDF. The outfall runs from the TEDF to the middle of the near channel of the Columbia River.

Process Description: The outfall discharged treated effluent released from the 300 TEDF. The influent to the 300 TEDF was generated by facilities discharging to the 300 Area process sewer. On September 2, 2009, the discharge from the outfall to the Columbia River was permanently terminated.

Related Sites/Structures: This structure is associated with the 310 Facility aka the 300 Area Treated Effluent Disposal Facility (TEDF) - See WIDS sitecode 600-117.

Waste Type: Process Effluent

Waste Description: The outfall discharges effluent from the 300 Area TEDF to the Columbia River.

Code: 600-211 **Classification:** Accepted

Names: 600-211; 616A; 616-A; SALDS; State Approved Land Disposal Site **Reclassification:** None

Type: Drain/Tile Field **Start Date:** 1/1/1995

Status: Active **End Date:**

Description: The site is surrounded by steel posts/chain and posted as "SALDS Building 616A Disposal Field". The cobble terrain is flat with primarily cheatgrass cover. There are seven 5 inch plastic pipes (monitoring ports) that extend two to three feet above grade and one 30 inch sampling access manhole that extends one foot above grade. Two feet below grade in the gravel disposal bed are sixty-six perforated 4 inch diameter distribution laterals branching 90 degrees from an 8 inch diameter feed header. A geotextile and PVC membrane cover the disposal field and are one foot below grade.

Location: About 1200 feet north of the 200 West Area exclusion fence, 1700 feet south of Route 11A, 1100 feet east of the 200 West entrance road to gate 609, and 6500 feet west of Route 3.

Process Description: The site receives liquid waste that has been treated and verified at the 200 Area Effluent Treatment Facility in 200 East Area. The waste is distributed (below grade) to a gravel bed via perforated pipe. The liquid waste meets delisting requirements of the 216 permit #ST 4500 and is discharged as nondangerous waste; however it may contain tritium.

Related Sites/ Structures: SALDS Disposal Pipeline (600-292-PL), 200 Area Effluent Treatment Facility (2025E), Liquid Effluent Treatment Facility (LERF), 242-A Evaporator, PUREX.

Waste Type: Process Effluent

Waste Description: Treated and verified liquid waste received from the 200 Area Effluent Treatment Facility (ETF). The waste meets the delisting requirements of the 216 permit ST 4500 and is considered nondangerous; however it may contain tritium.

Code: 600-212 **Classification:** Accepted

Names: 600-212; Relocatable Latrine Facility Holding Tank System **Reclassification:** None

Type: Septic Tank **Start Date:** 1/1/1993

Status: Active **End Date:**

Description: The site is surrounded with fourteen steel posts painted yellow. The top of the tank is visible at grade level and measures 9 feet by 15 feet. Two concrete covers are located on top of the tank, one has a steel access port for pumping. The electrical conduit for transmitting to the alarm system is visible on top of the tank.

Location: The site is located just west of the 200E area, between Route 4 North and the 200E Perimeter Fence. The site is within the trailer village established for the HWVP Project approximately 8 meters west of MO-730.

Process Description: The HWVP Relocatable Latrine Facility (RLF) Holding Tank System consists of a trailer (MO-730) divided into men's and women's restrooms. Fixtures which drain into the holding tank system include ten toilets, three urinals, six sinks and four self-contained sinks. The latrine trailer is connected to a holding tank via a 4" diameter drain line. The holding tank is a recast concrete vault providing a nominal volume of 5,440 gallons and working volume of 4,500 gallons.

Related Sites/ Structures: The tank receives waste from MO-730.

Structures:**Waste Type:** Sanitary Sewage**Waste****Description:**

Code: 600-213**Classification:** Accepted**Names:** 600-213; Hanford Airport Underground Fuel Storage Tanks**Reclassification:** Rejected (1/31/2010)**Type:** Storage Tank**Start Date:****Status:** Inactive**End Date:**

Description: The site consisted of underground fuel storage tanks that were associated with the Hanford Airport. The airstrip runways are still visible. A windsock pole is visible just off the southeast corner of the airstrip intersection. Two field walkdowns in 2007 were performed, no visual evidence of building locations or fuel storage tanks were observed. A United States Geological Survey (USGS) June 1, 1948 aerial photograph of the area shows a connecting taxi-way between the south end of the north-south runway and the east end of the east-west runway. The photo shows buildings on the southeast side of the taxi-way. The taxi-way has a large north arrow painted on it that is about 61 meters (200 feet) long.

Location: The site is located approximately 2 kilometers (1.2 miles) east of the southeast end of Gable Mountain. The site is best approached from Route 2 North on a dirt road which heads west 0.32 kilometers (0.2 miles) north of milepost 1 on Route 2 North. The site is north of the dirt road and approximately 0.8 kilometers (0.5 miles) west of Route 2 North. A metal pipe sticking out of the ground may mark the site.

Process Description: The airport consisted of two landing strips, one running almost north and south, and the other east and west. Both strips were 61 meters (200 feet) wide with the north-south strip approximately 1,220 meters (4,000 feet) long and the east-west strip approximately 732 meters (2,400 feet) long. The landing strips were of bituminous stabilized construction, i.e., mixing the surface sand and gravel in place with road oil and rolling to a 15 to 20-centimeter (6 to 8-inch) thick packed surface. Two wood-frame open-type shed hangars and a 5.6 by 12.2-meter (16 by 40-foot) Pacific Hutment were erected east of the air strip intersections. Electrically-driven gasoline pumps, with underground storage tanks, were provided for refueling of Army planes. The airport was totally enclosed by a Type #2, three-strand barbed wire fence. All construction work was performed by Project forces.

Code: 600-214**Classification:** Accepted**Names:** 600-214; 600-PSTF; MODU-Tanks; 600 Area Purgewater Storage and Treatment Facility**Reclassification:** None**Type:** Retention Basin**Start Date:** 1/1/1990**Status:** Active**End Date:**

Description: The waste site is the Purgewater Storage and Treatment Facility. It is enclosed within a fenced area that measures 210 by 150 meters (680 by 480 feet). The two original storage tanks (Units #1 and #2) were located in the southeast portion of the fenced area. East of the tanks is the truck unloading area and west of the tanks are two leak detection risers. Unit #1 was demolished in May 2011. Modular Storage Tank #2 was relined and is in-use. Modular Storage Tank #3 was constructed and is in-use.

Location: The waste site is located outside the 200 East Area security fence and near the northeast corner

of 200 East Area. It is about 400 meters (1,300 feet) north of B-Pond, 750 meters (2,460 feet) east of Canton Avenue, and 300 meters (980 feet) west of the 216-E-28 Contingency Ponds. Tank Unit #1 was south of Unit #2.

Process Description: The original Unit 1 tank provided greater than 90-day storage and treatment of purgewater generated from Hanford Site groundwater monitoring wells under RCRA. Subsequent modular storage tanks also held purgewater generated from Hanford Site groundwater monitoring wells, but under CERCLA authority. The Treatment is by solar evaporation.

Related Sites/ Structures: Purgewater from Hanford Site wells is transported to the site by tanker truck and unloaded.

Waste Type: Water

Waste Description: Wastes include: purgewater from Hanford Facility groundwater monitoring wells. Liquid resulting from well sampling, well development, and aquifer testing. Waste may also include nonregulated purgewater from wells. By permit, purgewater may contain radioactive material, carbon tetrachloride, and other non-specific solvents (F001, F002, F003).

Code: 600-215

Classification: Accepted

Names: 600-215; 6265A 90-Day Waste Accumulation Area

Reclassification: Rejected (9/14/2000)

Type: Storage Pad (<90 day)

Start Date:

Status: Active

End Date:

Description: The storage pad is a fenced-in concrete pad covered with an open shed divided into three sections. The fence is on the east and west sides, and connects to the cinder block walls on the north and south sides, which holds up the roof. The fence has six gates, two into each section of the pad. The two northernmost sections of the pad are chained off inside the fence and marked as "Radioactive Materials Area." The floor of the pad is a metal grate that opens to a concrete basin underneath. This basin is about 20 centimeters (8 inches) deep, and is designed to catch any leaks. It does not have any other drain, but appears to be large enough to hold the entire contents of several drums, if they should leak. In April 2000, no water (that may have come from natural spring precipitation) was evident in the basin, but a small amount of vegetation debris had collected in a few spots.

Location: The site is located east of the 200 West Area. It is approximately 100 meters (300 feet) west of the Waste Sampling and Characterization Facility laboratory building.

Process Description: This site is used to temporarily store analytical laboratory waste generated at the Waste Sampling and Characterization Facility (WSCF).

Related Sites/ Structures: This storage pad is related to the WSCF.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: Analytical laboratory waste is stored at this site.

Code: 600-216

Classification: Not Accepted

Names: 600-216; 600-48; H-61-H Anti-Aircraft Artillery Site Building Foundations

Reclassification: None

Type: Foundation

Start Date:

Status: Inactive**End Date:** 1/1/1958

Description: Seven concrete foundations and pads are at this site: #1. A vehicle maintenance shop with a mechanic's trench in the foundation floor and drive-through ability on each end. The dimensions are 34 meters by 14 meters (111 feet by 45 feet). The mechanic's trench is filled with tumbleweeds, but as a place to work it would also have a concrete floor and not be used to drain oil to the ground. #2. Concrete pad, 9 meters by 9 meters (29 feet by 29 feet). #3. Concrete Pad, 6.4 meters by 12.5 meters (21 feet by 41 feet). #4. Concrete kitchen foundation with floor drains and a grease trap. The dimensions are 10 meters by 12.5 meters (33 feet by 41 feet). #5. Concrete pad, 14.6 meters by 5.5 meters (48 feet by 18 feet). #6. Concrete foundation that appears to have been a toilet and shower facility. The dimensions are 14.6 meters by 6 meters (48 feet by 20 feet). #7 Concrete pad, 4 meters by 2.4 meters (13 feet by 8 feet). A large, approximately 12 by 12 meters (40 by 40 feet) open pit is at the site and fenced; the purpose and age of the pit are unknown. There is no evidence of trash in the bottom. Two old building heaters also remain at the site.

Location: This site is located just southwest of the intersection of Route 11 and Route 6. It is 640 meters (0.4 mile) south of Route 11 and just west of Army Loop Road. The site is in the east half of the northeast quarter of Section 34, Township 13 north, Range 25 east.

Process Description: Typically, Camp Hanford's anti-aircraft artillery sites were each roughly 20 acres in size and contained any number of buildings (typically around 20), various utility distribution systems, roads, and sidewalks. Each site consisted of emplacements protected by revetments made of sandbags and wood planking, wooden structures, prefabricated metal buildings, and, later, permanent, concrete block structures. The prefabricated buildings had aluminum walls and roofs with wooden or concrete floors set on concrete pier blocks and were the most commonly constructed. The permanent structures included barracks, latrines, mess halls, craft shops, pump houses, motor pools, and radar facilities. Each site typically had a small arms range, water storage cistern, sanitary, and sewage disposal facilities. Pathways, sidewalks, roadways, and parking lots connected the structures.

Related Sites/ Structures: Septic system 600-217 serviced this site, and dumping area 600-218 received associated trash.

Waste Type: Demolition and Inert Waste

Waste Description: Concrete foundations and pads from former buildings and structures, some containing floor drains and steel anchors.

Code: 600-217**Classification:** Accepted**Names:** 600-217; H-61-H Anti-Aircraft Artillery Site Sewer System**Reclassification:** Rejected (5/18/2011)**Type:** Sanitary Sewer**Start Date:****Status:** Inactive**End Date:**

Description: The sewer system extended from the kitchen, toilet and shower building and ran into a septic tank on the eastern side of the site. The manholes and septic tank have been filled in with clean sand (September 2001). Twelve toilet drains and five floor drains were observed on the toilet and shower building foundation floor. A sewer manhole is located just NE of the toilet/shower building. The kitchen foundation has four floor drains and a grease trap. A sewer manhole is located NW of the kitchen.

Location: This site is located just southwest of the intersection of Route 11 and Route 6. It is 0.4 miles south of Route 11 and just west of Army Loop Road. The site is in the east half of the northeast quarter of Section 34, Township 13 north, Range 25 east.

Code: 600-223

Classification: Accepted

Names: 600-223; H-50 Gun Site Pit; Military Camp South of 200W

Reclassification: Rejected (5/31/2001)

Type: Depression/Pit (nonspecific)

Start Date:

Status: Inactive

End Date: 1/1/1958

Description: The site was described in 1987 as a pit that is filled with blown in tumbleweeds. Fence posts and barbed wire are visible on the northwest corner of the pit. A sanitary sewer manhole is located just south of the pit. While the presence of the tumbleweeds made determining if other debris was present impossible when the site was discovered, the July 2000 fire showed that the pit is empty. A plastic orange fence surrounds the pit to warn of falling danger.

Location: The unit is located south of the 200 West Area, 0.6 kilometers (0.4 miles) east of the Rattlesnake Gate and south of Army Loop Road. The pit is located in the southern portion of the H-50 Gun Site just north of the septic tank.

**Process
Description:** The reason for the pit is unknown, and not evident from the surrounding area. There is no evidence of spills or other hazardous material in the pit. The fencing debris at the top end may have been used to mark the site during military operations, but was left when the anti-aircraft site was decommissioned.

**Related Sites/
Structures:** This pit is associated with site 600-39, the building foundations, and 600-224, the site septic system.

Waste Type: Equipment

Waste Steel fence posts and barbed wire.

Description:**Waste Type:** Vegetation**Waste** The pit is filled with blown in tumbleweeds.**Description:****Code:** 600-224**Classification:** Accepted**Names:** 600-224; H-50 Gun Site Septic System; Military Camp South of 200W**Reclassification:** Closed Out (2/23/2001)**Type:** Septic Tank**Start Date:****Status:** Inactive**End Date:**

Description: The site is a septic system located in the south portion of the H-50 Gun Site. The tanks have been filled with sand and abandoned in place. Signs reading "Abandoned Septic Tank" are posted. The system included a manhole, two concrete tanks and concrete block house between the tanks. The first tank is below grade, has three manholes, and measures approximately 3.7 meters by 0.8 meters by 1.5 meters (12 feet by 2.6 feet by 5 feet). The second tank is visible above grade, has two manholes, and measures 1.8 meters by 3.3 meters by 2.7 meters (5.8 feet by 10.7 feet by 9 feet). A concrete block house was located between the two tanks. The structure was demolished and the rubble removed.

Location: The unit is located at the southwest quarter of Section 19, Township 12 North, Range 26 East, 2 miles (3.2 kilometers) south of the 200 West Area and 0.4 miles east of the Guard House on SR 240. The septic system is located in the southern portion of the H-50 Gun Site.

Waste Type: Demolition and Inert Waste**Waste** Debris from a demolished block house was located between the two septic tanks.**Description:****Waste Type:** Sanitary Sewage**Waste****Description:**

Closure Info: The septage was removed from both tanks sometime in the past. In July, 2000 the lids were removed from both tanks and the void space in both tanks was filled with a sand slurry. The inert rubble from the block house, which had been left from past demolition activities, was discarded in a landfill.

Code: 600-229**Classification:** Not Accepted**Names:** 600-229; Dumping Area Near White Bluffs Ferry Landing (East Side); RCRA General Inspection 200WFY97 Item #21 Historic Disposal Site**Reclassification:** None**Type:** Dumping Area**Start Date:****Status:** Inactive**End Date:**

Description: The site contains several empty rusty 19 liter (5 gallon) steel containers that are partially buried or filled with soil. The site also contains wire, wire rope, and small amounts of sheet metal.

Location: The site is located approximately 250 meters (820 feet) downstream from the old White Bluffs Ferry Landing on the east side of the Columbia River and just above the high water mark. The Bonneville Power Administration cross the river approximately 25 meters (82 feet) south of the site.

Waste Type: Barrels/Drums/Buckets/Cans

Status: Inactive **End Date:** 1/1/1995

Description: The site was a treatment facility for petroleum-contaminated soil. The site is now a closed

Description: with earth berms on all sides. The site is lined with black plastic, soil is spread evenly on top of the black plastic throughout the interior of the site. The site is posted on all sides with signs stating: "WIDS Site 600-236".

Location: The site is located between the 200 East and 200 West areas and is located approximately 300 meters (1000 feet) east-northeast of the 200 Area Fire Station.

Waste Type: Soil
Waste Description: Petroleum contaminated soil.

Code: 600-237 **Classification:** Not Accepted

Names: 600-237; Gable Pond (216-A-25) North and South Borrow Pits **Reclassification:** None

Type: Depression/Pit (nonspecific) **Start Date:** 1/1/1984

Status: Inactive **End Date:** 1/1/1988

Description: The borrow pits are large, shallow scraped areas along the north and south sides of the stabilized Gable Pond. The stabilized pond surface was vegetated with wheat grass, but the borrow pits are bare.

Location: The sites are located north of 200 East Area, and north of Route 11A, adjacent to the backfilled Gable Pond.

Process Description: Gable Mountain Pond was backfilled and stabilized in a phased approach, over a four year time span ranging from 1984 to 1988. Clean backfill material was taken from areas adjacent to the north and south sides of the pond. No waste has been put into the borrow areas. Only clean backfill material was removed.

Related Sites/ Structures: This borrow pit provided fill for the stabilization of site 216-A-25, Gable Pond.

Code: 600-240 **Classification:** Accepted

Names: 600-240; 615 Hot Mix Plant Debris; Debris in Pit 17; Hanford Aggregate Pit Debris **Reclassification:** Rejected (5/31/2001)

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site is metal and wooden debris scattered within Gravel Pit #17. The debris originated from the 615 Hot Mix Plant and operation of the gravel pit (Hanford Aggregate Pit). Some of the pipes and wood are partially buried in scattered locations. The pile is naturally revegetating to grasses and rabbitbrush. To the east of the pit is an irregularly shaped pile of a mix of asphalt pieces, soil, gravel, and cobble, about 12 meters by 3.5 meters by 1 meter high (40 feet by 12 feet by 3 feet high). Rabbitbrush plants have started to colonize the pile.

Location: This site is west of Route 2 North, on the north side of the Hot Mix Plant location.

Release Description: There is no evidence of hazardous or dangerous wastes at the site.

Related Sites/ Structures: This pit is related to the adjacent Hot Mix Plant (600-20, reclassified as Rejected), and adjacent to Pit #16, site 600-239.

Waste Type: Misc. Trash and Debris
Waste Description: The waste is metal pipe, coarse mesh screens, wood, sheetmetal, concrete, a rubber tire, and a

waste**Description:** pile of asphalt pieces mixed with soil, gravel, and cobble.

Code: 600-244 **Classification:** Not Accepted
Names: 600-244; Gravel Pit #6; Gravel Pit 6; Pit 6 **Reclassification:** None
Type: Depression/Pit (nonspecific) **Start Date:**
Status: Active **End Date:****Description:** The pit is a source for gravel used for bedding and backfill material. A gravel road leads into a large irregular shaped pit area. The physical boundaries of the site are larger than the area where gravel is currently being excavated. The four corners of the pit's largest extents are marked with posts (railroad ties installed vertically). Stock piles of gravel and excavation equipment are present, indicating active gravel pit operations. A chain link fenced equipment storage area is located in the northwest corner of the Pit #6 property.**Location:** Gravel Pit #6 is located west of 300 Area, on the west side of Highway Route 4S. It is south of the 618-7 burial ground.**Related Sites/ Structures:** The Bioremediation Area (WIDS Site 600-243) is located within the boundaries of the Gravel Pit #6 area, and northeast of the current excavation area. A large spoil pile of dirt, rock, and debris is located in the northwest quadrant of the site (WIDS Sites 600-249). For a short time in 1987, water treatment filter backwash solutions were trucked to this area for disposal (WIDS Site 300 IFBD).

Code: 600-245 **Classification:** Not Accepted
Names: 600-245; Gravel Pit #8; Pit 8 **Reclassification:** None
Type: Depression/Pit (nonspecific) **Start Date:**
Status: Active **End Date:****Description:** The gravel pit is an irregular shaped depression. No waste of any kind was found in the pit.**Location:** Gravel Pit #8 is located approximately 3.2 kilometers (2 miles) north of the 300 Area. It is north of where the railroad tracks cross Route 4S and east of Gravel Pit #9.

Code: 600-246 **Classification:** Accepted
Names: 600-246; Gravel Pit #9; Inert/Demolition Waste Landfill; Pit 9 **Reclassification:** Rejected (1/27/1999)
Type: Burial Ground **Start Date:**
Status: Active **End Date:****Description:** Gravel Pit #9 is a large depression where gravel is extracted. The gravel pit is also used as an inert landfill for nondangerous/nonradioactive wastes.**Location:** Pit #9 is located approximately 1.2 kilometers (2 miles) north of 300 Area, east of Route 4S.**Related Sites/ Structures:** WIDS site 600-278, a Bio Remediation pad, was located within the gravel pit.**Waste Type:** Demolition and Inert Waste**Waste Description:** The waste includes concrete, wood and asphalt. Soil was removed from around the 384 fuel oil day tanks and placed in Pit 9 in 1999. Soil sample results showed a plutonium spike, so the bio-remediation pad was posted as a Soil Contamination Area.

Code: 600-247 **Classification:** Accepted
Names: 600-247; Gravel Pit #10; Inert Landfill; Pit 10 **Reclassification:** Rejected (1/27/1999)
Type: Burial Ground **Start Date:**
Status: Inactive **End Date:**
Description: The site is an old gravel pit. Once extraction operations were completed, the site was then used as a solid waste landfill for inert and demolition waste. Gravel Pit #10 has been closed and backfilled to grade. The site perimeter is marked with posts and chain.
Location: Gravel Pit #10 is approximately 1.2 kilometers (2 miles) north of 300 Area on the west side of Route 4S.
Waste Type: Demolition and Inert Waste
Waste Description: The gravel pit is an approved inert landfill. Waste includes wood, concrete and asphalt.

Code: 600-248 **Classification:** Not Accepted
Names: 600-248; Gravel Pit #11; Pit 11 **Reclassification:** None
Type: Depression/Pit (nonspecific) **Start Date:**
Status: Active **End Date:**
Description: Gravel Pit #11 is a large, rocky excavated area north of the WYE Barricade. It is actively being used as a source of gravel for backfill.
Location: The site is located north of the WYE Barricade, on Route 2S, near mile marker 6, on the east side of the road.
Related Sites/ Structures: The site is associated with WIDS Site 600-23, Dumping Area Within Gravel Pit #11.

Code: 600-249 **Classification:** Accepted
Names: 600-249; Debris Within Gravel Pit 6 **Reclassification:** Rejected (4/6/1999)
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site is areas of dumped material located within Gravel Pit #6. There are spoil piles of material excavated during the construction of the Environmental Molecular Sciences Laboratory (EMSL) facility that are located in the northwest section of the Gravel Pit #6 property boundaries. Miscellaneous debris can be seen in scattered piles and protruding from the soil.
Location: The debris is located in the northwest quadrant of Gravel Pit #6.
Related Sites/ Structures: The site is associated with Gravel Pit #6 (WIDS Site 600-244), and WIDS Site 300 ASH PITS.
Waste Type: Misc. Trash and Debris
Waste Description: The site contains miscellaneous debris and ash pit sludge. Visible debris includes metal pipes, PVC pipes, concrete and tires. (The tires and some other debris were removed in 1999 for proper disposal) Periodically, damp ash was trucked from the 300 Area Ash Pits (WIDS Site 300 ASH PITS) and placed in Pit #6. Eventually, the area reserved for the ash became filled. The area was covered with dirt. This is the same area where a bioremediation pad was located (WIDS Site 600-243).

Code: 600-250 **Classification:** Not Accepted
Names: 600-250; Metal Debris from RCRA General Inspection #LORIVFY97 Item #4 **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site is a recorded cultural resources site, a historic homestead where rusty sheet metal vent ducting and other miscellaneous debris have been abandoned, including: broken bricks and concrete, old lumber, metal cables and wiring. Some of the debris extends on to the top of the bank, including some half-buried, rusty cans.
Location: The site is located approximately 68.8 meters (225 feet) upstream from Columbia River mile marker #26 (Hanford mile marker) and USGS river mile 362. The site is also approximately 36.6 meters (120 feet) from the water's edge (on the date of inspection).
Waste Type: Misc. Trash and Debris
Waste Description: The waste is sheet metal and other debris.

Code: 600-251 **Classification:** Not Accepted
Names: 600-251; Steel Pipe from RCRA General Inspection #LORIVFY97 Item #6 **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site is a near-vertical (tilted at about 20 degrees) steel pipe with the above ground portion of the pipe approximately 1.2 meters (4 feet) in length. The reason the pipe is tilted is not known. The pipe appears to be buried in the ground about 20 feet (6 meters) (John Auten, personal communication, December 19, 2001). The pipe is approximately 0.46 meters (1.5 feet) in diameter and has a 1.3 centimeters (0.5 inches) thick wall. The pipe is rusted and is filled with earth inside the pipe up to the level where it enters the ground. A well identification label is attached to its side (B8542). The pipe is covered with a flat metal lid.
Location: The site is located between Hanford mile markers 26 and 27 (USGS river miles 362 and 361). The site is on the south bank of the Columbia River, approximately 45.7 meters (150 feet) from the water edge (at the time of the inspection).
Waste Type: Misc. Trash and Debris
Waste Description: The waste is a 40 centimeter (16 inch) diameter steel pipe extending from the ground approximately 1.5 meters (5 feet).

Code: 600-252 **Classification:** Not Accepted
Names: 600-252; Old Tank from RCRA General Inspection #LORIVFY97 Item #8 **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site is an old, rusty, corrugated steel tank laying on its side. The tank is approximately 2.74 meters (9 feet) long, 0.91 meters (3 feet) in diameter, and has a 25.4 centimeter (10 inch) hole cut in its side near the bottom, and two short schedule 40 pipes on the side at either end (one pipe at each end). This item meets the specific reporting criteria of the inspection as a solid

waste disposal site not previously identified for remedial action. During a site inspection on October 8, 1997 the tank was measured to be (8 feet) 2.44 meters long and (3.5 feet) 1.07 meters in diameter with a tape measure.

Location: The site is located on the south bank of the Columbia River at Hanford mile marker 2 (USGS river mile marker 386) and approximately 228.6 meters (750 feet) from the water edge (at the time of the inspection). The site is also located approximately 1.5 kilometers (0.9 miles) west, northwest of 100 B/C Area just north of Route 6. A site warning siren located just north of Route 6 aids in approaching the site. The site is located between the siren and the Columbia River.

Process Description: The site was visited on September 26, 2000, with a cultural resource specialist familiar with the history of the farms in this area. The tank was identified as a water tank because of the lack of any oil staining inside of or below the tank, and the cuts for the pipes fit irrigation piping but not typical oil heating or storage systems.

Related Sites/ Structures: This tank is part of the old homestead found in the same area.

Waste Type: Misc. Trash and Debris
Waste Description:

Code: 600-253	Classification: Not Accepted
Names: 600-253; Gravel Pit #24; Pit 24	Reclassification: None
Type: Depression/Pit (nonspecific)	Start Date:
Status: Active	End Date:

Description: Gravel Pit #24 is a large excavated area that is actively used as a source of gravel and sand material. Because the bottom of the pit reached groundwater, a wetland was deliberately created in 1999 by excavating a little deeper and contouring the bottom to form islands and different depths of water. The pit was expanded to the west in 2000 as a source of additional backfill for remedial actions in the 100 B Area.

Location: The pit is located northwest of 100-B/C Area on the north side of Route 6, near the Columbia River

Related Sites/ Structures: This gravel pit is being used (from 1998 until end of remediation) for backfill at 100 B/C sites remediated as part of site cleanup. A rejected waste site, 600-34, is east of the gravel pit, just off the northwest corner of the 100 B/C Area. It is the site where baled tumbleweeds were dumped. The tumbleweed bales have been removed.

Code: 600-254	Classification: Not Accepted
Names: 600-254; Abandoned 251-W Substation Mineral Oil Underground Pipelines	Reclassification: None
Type: Product Piping	Start Date: 1/1/1946
Status: Inactive	End Date:

Description: The Electrical Distribution equipment yard is surrounded by a locked, chain link fence and posted with "Danger" signs. The ground surface is covered with gravel. Part of the pipeline is visible at the surface, and has been painted red.

Location: The 251-W Electrical Substation is located north of Route 11A, and southwest of the 200 North

Area 212-P building.

Process Description: Oil Filled Circuit Breakers (OCB's) are used in high voltage areas to extinguish any sparks caused by the triggering of any circuit breaker actions before the sparks can cause damage. The oil in the circuit breakers is usually plain mineral oil. 251-W was built in the 1940's with an underground oil pipeline to fill the circuit breakers. This process ended in the 1960's, and thus the underground oil pipeline system at 251-W has not been used since then. Because PCBs in electrical equipment has been a concern, the potential for these pipelines to be contaminated was evaluated. In the 1970's, manufacturers of new equipment began to use oil that contained polychlorinated biphenyls (PCB's), such as a brand name oil called Askeral. During pumping activities of oil from one circuit breaker to another across the Hanford Site, the equipment became cross contaminated with PCB's. But, because the underground pipelines at 251-W were abandoned in the 1960s, they were not used to carry PCB-containing mineral oil. PCB's became regulated as a hazardous material in 1976. By 1980, the Hanford Electrical Utilities had separate equipment for PCB equipment and non-PCB equipment to stop further cross contamination of equipment and material.

Waste Type: Equipment
Waste Description: In 1996, a section of pipe was removed from the 251-W yard, taken to 212-P, cut up and placed in a barrel. Wipe samples were collected from the outside and inside of the pipe and analyzed at WSCF. All three samples contained less than 1 ppm of PCB and the pipe is considered to be non-PCB material. Since the oil pipeline had been abandoned several years prior to the to the introduction of PCB oil to the Hanford Site, no PCB contaminated oil would have passed through the pipeline.

Code: 600-255 **Classification:** Not Accepted
Names: 600-255; 300 Area Stormwater Percolation Pond **Reclassification:** None
Type: Pond **Start Date:** 1/1/1980
Status: Active **End Date:**

Description: The site is a very large, unlined basin. It has a gravel bottom and coble covered sloped sides. There are two effluent pipes protruding from the east wall of the basin. Using the contour patterns on Arcview, it was determined the site is approximately 90 meters (295 feet) long and 30 meters (98 feet) wide.

Location: The basin is located west of 300 Area, on the west side of Highway 4S.

Process Description: The stormwater is directed to two collection points inside the 300 Area, located adjacent to the west 300 Area perimeter fence, behind the 3745-B building that has a packed gravel surface. The perimeter fence of the 300 Area is posted with "Underground Radioactive Material" signs. There is no documentation to confirm that contamination exists beneath the gravel surface behind the 3754 Building, but the possibility exists anywhere inside the 300 Area fence. Since no weeds are growing in the gravel, it is possible the gravel is sprayed with herbicide. The water flows through piping, under the highway, to the basin.

Waste Type: Stormwater Runoff
Waste Description: The site receives stormwater runoff from the northwest section of the 300 Area.

Code: 600-256 **Classification:** Accepted
Names: 600-256; Atmospheric Dispersion Modeling Towers; Ethylene Glycol Release **Reclassification:** Rejected (7/28/2008)

Description: food cans, a small concrete box (filled in with soil), and a little broken glass.

Code: 600-260

Classification: Accepted

Names: 600-260; Roped Off Area Near Meteorological Tower

Reclassification: Rejected (7/28/2008)

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The site's vegetation cover is composed of mature sagebrush and grasses and is fairly complete. T-posts laying on the ground are all that remain of the site originally found in 1999. An attached photograph shows the condition of the site as it looked in 2003.

Location: The site is located in the area between 200 East and 200 West, north of Route 3. It is approximately 415 meters (1362 feet) southeast of the Meteorology Tower and just east of the arc road labeled U4.

Waste Type: Misc. Trash and Debris

Waste Description: After discovering the roped area in 1999, the site was investigated and a radiation survey was done. No radioactive contamination was found. No soil discoloration or items were found to indicate any other waste in the area.

Code: 600-263

Classification: Accepted

Names: 600-263; Pile of Cans and White Powder

Reclassification: Rejected (5/31/2001)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: There are seven cans scattered within a distance of 2 meters (6.6 feet) of each other. The cans are rusty and approximately 20 centimeters (8 inches) long. Most of the cans are broken open, revealing their current contents of calcium carbonate. No vegetation stress was noticed. A few of the cans were intact, but appeared to be empty. Some lettering could be seen on the cans. Some of the cans were marked "RL - HAR, 300 Order, -----MMABLE, Sealed For Use" One intact canister is located approximately 6 meters (20 feet) from the group of ruptured cans. It has lettering that reads "-----RAY, ___HARGE, Y-45-SE-6".

Location: The cans are located in the White Bluffs area. They are northeast of the intersection of Route 2 and Federal Avenue, and northeast of the old White Bluffs Bank building.

Process Description: Conversations between the Hanford Fire Department and the U.S. Army Corp of Engineers determined the cans originally held calcium hydride, which was used to produce hydrogen for weather balloons. In the presence of water calcium hydroxide produced hydrogen and calcium hydroxide; calcium hydroxide exposed to the environment becomes calcium carbonate.

Waste Type: Abandoned Chemicals

Waste Description: The chemical originally in the cans was calcium hydride, with a chemical formula of CaH₂.

Description: Hydrogen and calcium hydroxide are produced when calcium hydride is mixed with water. Calcium hydroxide rapidly decomposes to calcium carbonate in the environment.

Code: 600-264

Classification: Accepted

Names: 600-264; Abandoned Oil Drum

Reclassification: Rejected (6/28/2001)

Type: Dumping Area

Start Date:

Status: Inactive**End Date:** 1/1/1943

Description: When discovered, the 55 gallon drum was laying on its side, surrounded by orchard smudge pots. The drum was inside a recently erected "Caution" tape barrier. No soil discoloration was noted in March 2000, but according to Ron Del Mar, who made the report when the drum was removed (April 18, 2000), there had been past spills to the ground from the drum. A field visit in September 2000 showed a small area of old, hardened oil-soaked ground. This oiled area was removed in June 2001. Two other drums were nearby, one to the south and one to the north. Both of these drums were empty and neither showed discolored soil underneath.

Location: The site is located 1333 meters (0.83 miles) northwest of Gravel Pit 24, west of 100-B Area.

Waste Type: Oil

Waste Description: The oil remaining has hardened on the ground surface.

Code: 600-265**Classification:** Not Accepted

Names: 600-265; Unidentified Pipes Near the 618-10 Burial Ground

Reclassification: None

Type: Depression/Pit (nonspecific)

Start Date:**Status:** Inactive**End Date:**

Description: The site consists of two, 5 centimeter (2 inch) diameter, stainless steel pipes protruding approximately 10 centimeters (4 inches) above ground. The pipes are approximately 1.5 meters (5 feet) apart. Each stainless steel pipe has a rusted pipe inserted in the center that extends approximately 0.6 meters (2 feet) above ground.

Location: The site is located approximately 15.25 meters (50 feet) west of the 618-10 Burial Ground.

The Site Was Consolidated With:

Code: 618-10

Names: 618-10; 300 North Solid Waste Burial Ground; 318-10

Code: 600-266**Classification:** Accepted

Names: 600-266; Trash Dump West of Gate 117A

Reclassification: Rejected (5/31/2001)

Type: Dumping Area

Start Date:**Status:** Inactive**End Date:**

Description: This site was discovered after the June 2000 fire. Large sagebrush had been concealing the debris. After the fire destroyed the sagebrush, an area of about 20 by 20 meters (65 by 65 feet) containing most of the trash was noted. Other material trailed off to the north. The debris (except for the cable) was removed within a month after the fire exposed it.

Location: The site is about 50 meters (150 feet) northwest of Highway 240, about 300 meters (1,000 feet) west of Gate 117A.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: Metal, glass, cinder blocks, and transite debris had been disposed here, but are now removed.

Description:**Code:** 600-267**Classification:** Not Accepted

Names: 600-267; Weather Station 90 Day Storage Pad

Reclassification: None

Status: Active **End Date:**

Description: The site is an underground pipeline. It is marked on the surface with Underground Radioactive Material - Pipeline signs. It passes through Diversion Box 6241-A, located east of Beloit Ave. in 200 West Area. The line continues to the Vent Station 6241-V, located between 200 East and West areas, and runs northwest of the 241-EW-151 Vent Station. A short portion of the pipeline ties into the former termination point at the 244-A Lift Station. A segment of pipeline was extended to 241-AN Tank Farm.

Location: The pipeline extends from 241-SY Tank Farm inside 200 West Area to the 244-A Lift Station in 200 East Area. A large portion of the line is located between the 200 West and 200 East areas, south of Route 3. A segment of pipeline was extended to 241-AN Tank Farm.

Process Description: The pipeline was constructed in 1995 to convey tank waste to 200 East Area and will support the tank waste Vitrification project. It includes lines SNL-3150 and 3160.

Related Sites/Structures: The pipeline is associated with the 244-A lift station, Diversion Box 6241-A and Vent Station 6241-V.

Waste Type: Process Effluent

Waste Description: The underground encased line transfers tank farm liquid waste between 200 West Area and 200 East Area.

Code: 600-276 **Classification:** Not Accepted

Names: 600-276; Cold Test Facility; GEDF; Hanford Geotechnical Engineering and Development Facility; Little Egypt **Reclassification:** None

Type: Laboratory **Start Date:** 1/1/1982

Status: Inactive **End Date:**

Description: The site is surrounded with light posts and chain. A vehicle gate is posted "Authorized Personnel Only". The site is a large open field with a high mound of soil in the center. Several pipes extend vertically through the surface of the soil in some areas. A small pallet containing damaged bags of bentonite is located in the southeast corner of the area adjacent to some vertical pipes. Two steel hinged plates cover access holes to underground culverts used as monitoring stations for buried waste tests.

Location: The site is located approximately 4 miles northwest of 300 Area, west of Route 4 South.

Process Description: The Hanford Geotechnical Engineering and Development Facility became operational in 1982 to test burial ground subsidence control alternatives. The original site consisted of three test areas. Each test area was a cluster of buried simulated waste with a center monitoring caisson. The monitoring caissons were underground rooms constructed of a circular corrugated metal, measuring 3 meters (10 feet) in diameter and 2.5 meters (8.5 feet) deep. The monitoring caissons had a metal roof and a personnel access hatch. Each caisson contained an array of monitoring equipment. Each cluster contained three areas of buried simulated waste. The simulated waste consisted of boxes containing styrofoam and wood chips and stacks of buried 208 liter (55 gallon) drums. Later, the site was used to perform "cold test" demonstrations of geotechnical engineering prototype systems for in situ isolation and stabilization of waste disposal structures. Mock up burial trenches, caissons, vertical pipe units, drain fields, waste transfer lines and cribs were installed in the area for grout treatment and equipment testing purposes. The site contains nine areas containing simulated buried waste. The 1994 Technical Task Plan Proposal states the site also includes four tile fields and two underground storage tanks. However, Steve Phillips stated that no storage tanks or tile fields were ever placed at this site. In 1986, an area containing caissons, designed to represent the types of caissons used for

Hanford waste, was installed.

Waste Type: Equipment
Waste Description: Only simulated buried waste was placed into this test site.

Code: 600-283 **Classification:** Not Accepted
Names: 600-283; Suspect Buried Equipment in Gravel Pit 11 **Reclassification:** None
Type: Dumping Area **Start Date:** 1/1/1983
Status: Inactive **End Date:**
Description: The site is currently an area of recently excavated gravel material. It is not marked or posted. There is no visual evidence of buried material.
Location: The equipment was placed in the southeast portion of Gravel Pit 11.
Process Description: Gravel Pit 11 is an active gravel pit. Material is removed from this pit periodically. Nothing unusual has been reported during excavation of material in the southeast portion of Gravel Pit 11.

Related Sites/ Structures: The suspect equipment is associated with Gravel Pit 11 (sitecode 600-248).

Code: 600-291-PL **Classification:** Accepted
Names: 600-291-PL; TEDF Line; 200 Area Treated Effluent Disposal Facility Pipeline **Reclassification:** None
Type: Process Sewer **Start Date:**
Status: Active **End Date:**
Description: The TEDF system includes approximately 11 miles of pipeline, three pumping stations, one sample station and two five acre disposal ponds.
Location: The TEDF basis are fed by a series of pipelines that extend from T-Plant, the Plutonium Finishing Plant, 222-S and the 283-W Water Treatment facility in 200 West area and 225-B, 283-E, 241-AZ Tank Farm and the 242-A Evaporator in 200 East Area.
Process Description: The TEDF pipe collection system does not have any treatment or retention capacity. It conveys treated effluent to the disposal basins, located east of 200 East Area.

Related Sites/ Structures: The piping is associated with T-Plant, the Plutonium Finishing Plant, 222-S and the 283-W Water Treatment facility in 200 West area and 225-B, 283-E, 241-AZ Tank Farm and the 242-A Evaporator in 200 East Area, the 200 East Powerhouse Ditch and pipeline (200-E-237-PL) and the 200 TEDF disposal basins.

Code: 600-292-PL **Classification:** Accepted
Names: 600-292-PL; SALDS Pipeline; State Approved Land Disposal Site Pipeline **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:** 1/1/1995

Status: Active **End Date:**

Description: The site is an underground, 20 centimeter (8 inch) diameter PVC pipeline that feeds the State Approved Land Disposal Site. The pipeline is approximately 6 miles long.

Location: The pipeline is located north of 200 East Area and 200 West Area. The pipeline originates at the Effluent Treatment Facility, near the northeast corner of 200 East Area. It extends westward to the State Approved Land Disposal site, north of 200 West Area.

Process Description: The SALDS receives liquid waste that has been treated and verified at the 200 Area Effluent Treatment Facility via the 8 inch diameter plastic pipeline. The liquid waste meets delisting requirements of the 216 permit #ST 4500 and is discharged as nondangerous waste; however it may contain tritium.

Related Sites/ Structures: The pipeline is associated with the Effluent Treatment Facility and the State Approved Land Disposal Site (sitecode 600-211).

Waste Type: Process Effluent

Waste Description: Treated and verified liquid waste received from the 200 Area Effluent Treatment Facility (ETF). The waste meets the delisting requirements of the 216 permit ST 4500 and is considered nondangerous; however it may contain tritium.

Code: 600-304 **Classification:** Not Accepted

Names: 600-304; White Bluffs Sanitary Water **Reclassification:** None

Type: Product Piping **Start Date:**

Status: Inactive **End Date:**

Description: This site consists of the White Bluffs sanitary water service piping as shown on construction drawing H-11-3709 and three associated features discovered during the Orphan Site Evaluation (OSE) process.

Location: A network of clean water service pipelines connect facilities as shown in White Bluffs drawing plot plan H-11-3709 and C-3316. A total of 13,870 meters (45,507 feet) of pipeline were plotted with 125 segments represented by 168 vertices locations with attached coordinates.

Process Description: Little is known about the pipeline sizes, depth or construction material.

Code: 600-330 **Classification:** Accepted

Names: 600-330; Division Street Service Station **Reclassification:** Rejected (6/10/2010)

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: During the 2010 geophysical investigation it was noted that the site was flat terrain with grasses and occasional rabbit brush. Originally the site was thought to consist of potential underground components of a service station, including storage tanks, associated piping, and contaminated soils.

Location: The site's historical location is on the east side of Division Street, south of Avenue A and west of the administration building (IN-323). Further historical research indicated that the service station maybe located on the east side of Division Street, south of Avenue A and east of the theater building (IN-163 and IN-321). The coordinates for the site are E585804.0, N139435.0.

Process Description: This site was used for the dispensing of petroleum products for automotive use. The specific

Description: location of underground storage tanks and associated piping for this site are unknown.

Waste Type: Oil

Waste Description: The waste consists of underground storage tanks, associated piping and underlying soil.

Code: 600-335

Classification: Accepted

Names: 600-335; Service Station and UST

Reclassification: Rejected (6/10/2010)

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: During the 2010 geophysical investigation it was noted that the site was flat terrain with grasses and occasional rabbit brush. Originally, the site was thought to consist of potential underground components of a service station, including storage tanks, associated piping, and contaminated soils, that were identified in historical photo # P-8244. The photo also appears to show two gasoline pumps.

Location: The coordinates for the site are E585924.0, N139746. The site is located approx. 54 meters (177 feet) to the SW of the former 145 Building.

Code: 600-336

Classification: Accepted

Names: 600-336; 609-G Septic Tank and Tile Field; 6607-03; 6607-3

Reclassification: Closed Out (11/4/2009)

Type: Septic Tank

Start Date: 1/1/1989

Status: Inactive

End Date: 1/1/1998

Description: The waste site is an underground septic tank and tile field.

Location: The septic tank and tile field are located south of Route 3, southwest of the 200 Area Fire Station.

Related Sites/ Structures: The septic system was associated with the 609-G office facility.

Closure Info: The septic tank and tile field were abandoned per WAC codes.

Code: 600-337

Classification: Accepted

Names: 600-337; 6290 Building Drain Field; 6607-01; 6607-1; Rigging Services Facility Septic

Reclassification: None

Type: Septic Tank

Start Date: 1/1/2003

Status: Active

End Date:

Location: This septic system is located outside the west perimeter fence of 200 East Area. It is northeast of the 6290 Rigging Facility.

Process Description: A new tank was installed to meet facility expansion requirements.

Code: 616

Classification: Accepted

Names: 616; 616 Building Non-Radioactive Dangerous

Reclassification: Closed Out (10/24/2001)

closure standards for all constituents.

Code: 618-6 **Classification:** Accepted
Names: 618-6; Solid Waste Burial Ground #6 **Reclassification:** Rejected (10/7/1998)
Type: Burial Ground **Start Date:** 1/1/1943
Status: Inactive **End Date:** 1/1/1944

Description: The 618-6 Burial Ground was originally located in the southeast corner of 300 Area near where the 325 Building is currently located. The waste was exhumed and relocated twice to allow for 300 Area construction expansions. In 1962, the contents were permanently moved to the 618-10 Burial Ground.

Location: This burial ground has been moved twice. The site was first located in the southeast corner of the 300 Area. Then the contents of the site were moved to just south of the 316-1 Process Pond. Finally, the contents were exhumed again and moved to the 618-10 Burial Ground.

Waste Type: Equipment
Waste Description: The unit contained solid uranium waste.

Code: 622-1 **Classification:** Accepted
Names: 622-1; Construction and Demolition Debris **Reclassification:** Rejected (5/31/2001)
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**

Description: All material has been removed and the site sampled for radioactivity, asbestos, and organics. The site is no longer marked or posted.

Location: This site is located south of the intersection of Sixteenth Street and Albany Avenue outside the perimeter fence of the 200 West Area.

Waste Type: Asbestos (non-friable)
Waste Description: The site contained transite siding.

Waste Type: Asbestos (friable)
Waste Description: The site contained friable asbestos.

Waste Type: Misc. Trash and Debris
Waste Description: The site contained miscellaneous trash.

Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: Some 208-liter (55-gallon), 19-liter (5-gallon), and 4-liter (1-gallon) containers were present at the site.

Code: 622-R ST **Classification:** Accepted
Names: 622-R ST; 6607-02; 6607-2; 622-R Atmospheric Physics Laboratory Septic Tank; 622-R Septic Tank **Reclassification:** None

the 200 Area Fire Station.

Process Description: The vent station is located at the hydraulic high point of the RCSTS, and the pipeline slopes down continuously from this point to the two ends. The main structure (room 105) is an underground building with the lower half of the building below finish grade. It houses the transfer piping and other items that support operation of the RCSTS and is designed for maintenance access on an infrequent basis. The main structure is cast-in-place concrete equipped with a stainless steel floor liner and a carbon steel shielding floor located above the transfer piping.

Related Sites/ Structures: The vent station is associated with the Replacement Cross Site Transfer Line (WIDS sitecode 600-269)

Waste Type: Process Effluent

Waste Description: Some residual waste will be found in the dead legs of the piping systems.

Code: 6607-1

Classification: Accepted

Names: 6607-1; H-40 Gun Site Septic Tank

Reclassification: Rejected (9/10/2010)

Type: Septic Tank

Start Date: 1/1/1945

Status: Inactive

End Date: 1/1/1958

Description: This site includes a manhole located near the kitchen/mess hall and toilet/shower foundations and a below ground concrete septic tank with three manholes. The manholes and the septic tank have been backfilled with clean pit run material and are no longer visible, and the ground over the tank is gravel as of June 2001.

Location: This site is located 1.1 kilometers (0.7 miles) southeast of the southeast corner of 200 East Area, on the south side of Route 4 South. Trees viewed from Route 4 South aid in locating the site. The septic tank is located in the eastern portion of the H-40 Gun Site.

Process Description: This site provided sanitary sewage disposal for a former U. S. Army facility. Typically, Camp Hanford's anti-aircraft artillery sites were each roughly 20 acres in size and contained any number of buildings (typically around 20), various utility distribution systems, roads, and sidewalks. Each site consisted of emplacements protected by revetments made of sandbags and wood planking, wooden structures, prefabricated metal buildings, and, later, permanent, concrete block structures. The prefabricated buildings had aluminum walls and roofs with wooden or concrete floors set on concrete pier blocks and were the most commonly constructed. The permanent structures included barracks, latrines, mess halls, craft shops, pump houses, motor pools, and radar facilities. Each site typically had a small arms range, water storage cistern, sanitary, and sewage disposal facilities. Pathways, sidewalks, roadways, and parking lots connected the structures.

Related Sites/ Structures: The site is associated with 600-227 (the H-40 Gun Site Building Foundations kitchen and toilet/shower buildings).

Waste Type: Water

Waste Description: The tank contains water to a depth of 0.9 meters (3 feet).

Waste Type: Sanitary Sewage

Waste Description: The unit received unknown amounts of sanitary sewage.

Code: 6607-2	Classification: Accepted
Names: 6607-2; Gun Site H-42 Septic Tank	Reclassification: Rejected (9/10/2010)
Type: Septic Tank	Start Date: 1/1/1945
Status: Inactive	End Date: 1/1/1955
Description: This site includes a manhole, two septic tanks and connecting tile field. In May 2001, the open holes associated with the septic system were backfilled. The original manhole measured 71 centimeters (28 inches) diameter by 86 centimeters (34 inches) deep, with two inlet pipes, one outlet pipe and is constructed of cement bricks and mortar. The large septic tank is below grade and had three manholes and a concrete box structure visible above grade. The manholes were covered with concrete covers. The center manhole was broken providing visual access to the interior of the tank, prior to being backfilled. In 1997, the tank contained water. An above ground structure, located at the west end of the tank, appears to have been used as a pumping station to pump liquid to the smaller tank located to the west. The overall site dimensions of the large tank are 21 by 9 meters (70 by 30 feet). The small tank to the west measures 2.2 by 1.7 meters (7.3 by 5.8 feet) and has one covered manhole. The structures had been surrounded by orange plastic fencing, but the fencing was destroyed in the 2000 grass fire. The open features were backfilled in 2001.	
Location:	The site is located 6.4 kilometers (4 miles) south of 200 East Area, on the south side of Army Loop Road and east of the powerline road to Rattlesnake Mountain.
Process Description:	This site provided sanitary sewage disposal for a U.S. Army Facility.
Related Sites/ Structures:	The site received sanitary sewage from the 600-49, H-42 Gun Site Building toilet/shower building and the kitchen/mess hall building.
Waste Type:	Water
Waste Description:	The septic tank contained water at the time of the inspection.
Waste Type:	Sanitary Sewage
Waste Description:	The unit received unknown amounts of sanitary sewage.

Code: 6607-3	Classification: Accepted
Names: 6607-3; Anti-Aircraft Artillery Site H-51 Septic Tank	Reclassification: Rejected (9/10/2010)
Type: Septic Tank	Start Date: 1/1/1945
Status: Inactive	End Date: 1/1/1955
Description: The septic tank is constructed of concrete, has three open manholes and an above ground square concrete box-like structure located on the east end. This box-like structure may have been used to support a pump for pumping liquid to the drain field. The tank is below grade. The roped off section measures 17 by 4.6 meters (55 by 15 feet) and the tank interior is 3.4 meters (11 feet) deep. The drain field is located east of the septic tank. The septic tank and four manholes are delineated by orange plastic fencing.	
Location:	This site is located approximately 2.4 kilometers (1.5 miles) southwest of 200 West Area just west of Army Loop Road between Highway 240 and Army Loop Road.
Process Description:	This site provided sanitary sewage disposal for a U.S. Army Facility.

Related Sites/ Structures: The site is associated with the former U.S. Army Anti-Aircraft Gun Site H-51, which is sites 600-53 (the building foundations) and 600-220 (the dumping areas).

Waste Type: Sanitary Sewage

Waste Description: The unit received unknown amounts of sanitary sewage.

Code: 6607-4 **Classification:** Accepted

Names: 6607-4; 6607-4 Septic System; Replacement for 2607-FSN; 609A Building Septic Tank; 6607-04 **Reclassification:** None

Type: Septic Tank **Start Date:** 1/1/1989

Status: Active **End Date:**

Description: The septic tanks consist of two concrete tanks placed in series. The design capacity of the tanks was 1800 gallons (6813 liters) with the first tank being 1200 gallons (4542 liters) (minimum) and the second being between 600 and 1000 gallons (2271 liters and 3785 liters).

Location: The septic system is located east of the 609-A Building (200 Area Central Fire Station) and south of Route 3. The septic tanks are approximately 100 feet east of the northeast corner of the 609-A building. The drainfield is located just east of the tanks.

Related Sites/ Structures: The 6607-4 septic system is associated with the 609-A building and the 2607-EP septic system.

Waste Type: Sanitary Sewage

Waste Description: The system receives sanitary sewage from the 609-A building.

Code: 6607-5 **Classification:** Accepted

Names: 6607-5; 616 Building Septic System; 6607-05 **Reclassification:** None

Type: Septic Tank **Start Date:** 1/1/1986

Status: Active **End Date:**

Description: The unit consists of a septic tank and a drain field. The septic tank is surrounded by four yellow posts and is covered by gravel. The drain field is surrounded by metal posts and chain. The drain field is not marked by a sign.

Location: The tank is located on the south side of the 616 Building. The drain field extends southwest of the tank.

Process Description: The unit provides sanitary sewage disposal for the 616 Building.

Related Sites/ Structures: The site is associated with the 616 Nonradioactive Hazardous Waste Storage Facility.

Waste Type: Sanitary Sewage

Waste Description: The unit receives sanitary wastes from the 616 Building.

Code: 6607-6 **Classification:** Accepted

Names: 6607-6; 6701 Building Septic Tank and Tile **Reclassification:** None

Field; Wye Barricade Septic; 6607-06 Septic System

Type: Septic Tank **Start Date:** 1/1/1991

Status: Active **End Date:**

Description: The waste site is an underground septic tank and tile field.

Location: The septic tank is located at the Hanford Wye Barricade. It is located east of the guard shack building.

Code: 6607-7 **Classification:** Accepted

Names: 6607-7; Yakima Barricade Septic System and Permitted Holding Tank; 6607-07 **Reclassification:** None

Type: Septic Tank **Start Date:**

Status: Active **End Date:**

Description: The waste site is an underground septic holding tank.

Location: The holding tank is located north of the Yakima Barricade guard house.

Code: 6607-8 **Classification:** Accepted

Names: 6607-8; 251-W Electrical Substation Septic System; 6607-08 **Reclassification:** None

Type: Septic Tank **Start Date:** 1/1/1946

Status: Active **End Date:**

Description: The waste site is an underground septic tank and tile field.

Location: The 251-W Electrical Substation is located north of Rt 11A, south of 200 North Area. The septic system is south of the 251-W building.

Code: 6607-9 **Classification:** Accepted

Names: 6607-9; Project W-011H; Septic Tank 6607-9 Large On-Site Sewage System; 6607-09 Septic System **Reclassification:** None

Type: Septic Tank **Start Date:**

Status: Active **End Date:**

Description: The site is a septic system and disposal field. The site is bordered with a steel post and chain barricade with signs posted "SEPTIC TANK AND DISPOSAL FIELD." There are five manholes and two concrete boxes with metal hatch covers visible at grade level at the site. There is also an electrical panel with a red warning light on top and a bell on the side.

Location: The site is located east of 200 West Area and immediately west of the perimeter fence that surrounds the Waste Sampling and Characterization Facility.

Related Sites/ Structures: Waste Sampling and Characterization Facility.

Waste Type: Sanitary Sewage

Waste Description: The site receives sanitary sewage from the Waste Sampling and Characterization Facility.

Code: 6607-10 **Classification:** Accepted
Names: 6607-10; Hanford Patrol Training Academy Septic System **Reclassification:** None
Type: Septic Tank **Start Date:**
Status: Inactive **End Date:**
Location: The septic tank and tile field are located west of 300 Area, north of Horn Rapids Rd.
Related Sites/ Structures: The septic system is associated with the Patrol Training building (662).

Code: 6607-13 **Classification:** Accepted
Names: 6607-13; Core Area Septic; Project FP-0003 Septic **Reclassification:** None
Type: Septic Tank **Start Date:** 1/1/1993
Status: Active **End Date:**
Description: The waste site is an underground septic tank and drain field.
Location: The septic and drain field are located in a fenced area attached to the southwestern boundary of 200 East Area. It is southwest of the 2750E building. 6607-13 is north of 1st Street.

Code: 6607-16 **Classification:** Accepted
Names: 6607-16; ECN-C018H-040; Project C-018H; 6107-16 Septic System **Reclassification:** None
Type: Septic Tank **Start Date:** 1/1/1994
Status: Active **End Date:**
Description: The site is visible in three separate locations. Two locations for the tanks and one for the sanitary tile field. All locations are surrounded with steel fence posts and chain. The sanitary tile field is posted with a sign "Sanitary Tile Field." The tanks are not posted as septic tanks however, all access covers are posted as confined spaces. The septic tank south of the 2025E building has two concrete boxes with metal hatch covers, four vertical culverts, and an electrical panel. The tank south of the 2025EA building has five vertical culverts. The sanitary tile field has several iron rods painted yellow with square orange tops and capped PVC pipes protruding vertically from the tile field.

Location: The site is located just northeast of the 200-E area within the Effluent Treatment Facility (ETF). The two septic tanks are located on the south side of the 2025E and 2025EA buildings. The sanitary tile field is located just north of the entrance road to the ETF.

Related Sites/ Structures: 2025E building and 2025EA building.

Waste Type: Sanitary Sewage
Waste Description: The septic system receives sanitary sewage from the 2025E and 2025EA buildings and is designed to receive 5000 gallons per day. The current daily flow is 2725 gallons per day.

Code: 6607-17 **Classification:** Accepted
Names: 6607-17; Conoco Service Station Septic System; **Reclassification:** None

6291 Service Station Building Septic System

Type: Septic Tank **Start Date:** 1/1/1995
Status: Active **End Date:**
Description: The waste site is an underground septic tank and drain field.
Location: The 6291 Service Station Building is located west of 200 East Area, near the intersection of Rt 4S and 4th Street. The septic system is located east of the 6291 building.
Process Description: The drain field has a 1365 liter (360 gallon) per day capacity.

Code: 6607-18 **Classification:** Accepted
Names: 6607-18; 609-G and MO292 Septic System **Reclassification:** None
Type: Septic Tank **Start Date:** 1/1/1997
Status: Active **End Date:**
Description: The waste site is an underground septic tank.
Location: The septic tank is located south of Route 3, near the 200 Area Fire Station complex. It is located north of the 609-G building.
Process Description: The new 5678 liter (1500 gallon) tank is tied to the 2607-EP septic system, located inside 200 East Area.

Related Sites/ Structures: The tank is associated with the 2607-EP septic system.

Code: 6607-19 **Classification:** Accepted
Names: 6607-19; Emergency Vehicle Operations Facility Mobile Office Septic **Reclassification:** None
Type: Septic Tank **Start Date:**
Status: Active **End Date:**
Description: The waste site is an underground septic system that services two mobile office units near the Emergency Vehicle Operations area.
Location: The septic system is located north of Horn Rapids Rd and west of Ila Lane. It is west of the Hazardous Material and Emergency Response (HAMMER) facility.

Code: 700-1 **Classification:** Accepted
Names: 700-1; 747 Building 90-Day Waste Accumulation Area **Reclassification:** Rejected (9/14/2000)
Type: Storage Pad (<90 day) **Start Date:**
Status: Inactive **End Date:** 1/1/1995
Description: There is no longer a 90 Day Storage Area at the 747 Building; the part of the 747 Building that held the 90 Day pad is no longer in use.
Location: The 747 Building is on the corner of Knight Street and Goethals Drive in Richland, west of the Federal Building. The pad was in the now-abandoned (unused) part of the building that is east

of the whole body count facility. However, the specific location of the 90 Day Storage Pad within the building is not known.

Process Description: This pad supported the HEHF Industrial Hygiene Laboratory in the 747 Building.

Related Sites/ Structures: The 747 Building is the whole body count facility operated by PNNL.

Code: 1100 HPADS	Classification: Accepted
Names: 1100 HPADS; 1100 Area Hanford Patrol Academy Demolition Site	Reclassification: Closed Out (9/6/1995)
Type: Depression/Pit (nonspecific)	Start Date: 1/1/1984
Status: Inactive	End Date: 1/1/1995

Description: The site consisted of two demolition areas that were used by the Hanford Patrol to detonate discarded explosive chemical products generated on the Hanford Site. These products were either excess material or beyond their designated shelf life. The site was a treatment unit for nonradioactive explosive, ignitable, shock-sensitive, and/or reactive discarded chemical products. The discarded chemical products treated at the site all exhibited the dangerous waste characteristics of ignitability and reactivity. Some of the discarded chemical products also exhibited the dangerous waste characteristic of corrosivity and may have had the state-only designations for toxic extremely hazardous waste, toxic dangerous waste, persistent halogenated hydrocarbons, extremely hazardous waste, persistent polycyclic aromatic hydrocarbons, extremely hazardous waste, and/or carcinogenic dangerous waste. The treatment design capacity of the site was 568 liters (150 gallons) of discarded explosive chemical products per day. The last detonation event at the site took place on October 27, 1991.

Location: The site is located northwest of 1100 Area and west of 300 Area.

Waste Type: Chemicals

Waste Description: The unit was used for the treatment of shock-sensitive or potentially explosive chemical wastes. The following detonations took place: 1984: Ethyl Ether 169 g (0.37 lb), Perchloric Acid 44.3 kg (97.7 lb), Nitric Acid 1.42 kg (3.13 lb); 1985: 2,4,6-Trinitroresorcinol 25 g (0.06 lb), 2,4-Dinitroresorcinol 70 g (0.15 lb), 2,4-Dinitrophenol 500 g (1.10 lb), Alpha-Nitrosomethylisobutylketone 174 g (0.38 lb), Trinitrotoluene 100 g (0.22 lb), Tetrahydrofuran 36 kg (79.4 lb), Picryl Chloride 300 g (0.66 lb), Picric Acid 100 g (0.22 g), Perchloric Acid 4.4 kg (9.7 lb), Ethyl Ether 4.7 kg (10.4 lb), Hexadinitrophenylamine 70 g (0.15 lb), Glycol Dimethyl Ether 500 g (1.1 lb), Carbon Trichloride 600 g (1.3 lb), Carbon Disulfide 1,100 g (2.4 lb), Butyl Ethanol 9.5 kg (20.9 lb), Butyl Cellosolve 100 g (0.22 lb), Benzene with N-Butyl Lithium 100 g (0.22 lb); 1986: None; 1987: Ethyl Ether 20 kg (44.1 lb), Picric Acid 200 g (0.44 lb).

Code: 1100-9	Classification: Accepted
Names: 1100-9; 1164 Building 90-Day Waste Accumulation Area	Reclassification: Rejected (9/14/2000)
Type: Storage Pad (<90 day)	Start Date:
Status: Inactive	End Date: 1/1/1998

Description: The 90 Day Storage Area was inside the 1164 Building, a small (15 by 11 meters [48 by 36 feet]) steel structure surrounded by gravel and pavement. The Building is closed, and has transferred to the Port of Benton. However, the Port has not started to use it yet.

Location: The 1164 Building is northeast of the 1167A Excess Salvage Office Building. The 1164

Building is also marked as the 2453 Building. The exact location of the pad within the building is not known.

Process Description: The 90 Day Storage Area was used by the Investment Recovery group to process aerosol cans, which were used to identify sensitive equipment for central stores and investment recovery, along with rags, brushes, and other miscellaneous wastes.

Related Sites/ Structures: The pad held waste paint aerosol cans and associated equipment waste used at the Excess Salvage Yard.

Waste Type: Chemicals

Waste Description: The wastes stored here were materials (for example, rags and brushes) and paints left over from marking sensitive equipment.

Code: 1100-12

Classification: Accepted

Names: 1100-12; 1100-12 Dumping Areas

Reclassification: Rejected (5/9/2000)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site is miscellaneous pre-Hanford debris consisting of old concrete, glass, and metal (e.g., camp stove, food cans, buckets, and wire). The decayed batteries previously reported were not seen on May 4, 2000. Two separate areas of debris were reported in 1996 and 1998, but only one is evident in 2000.

Location: The debris fields are located in the northern portion of the 1100 area and just south of the powerline road that runs east - west. They are east the of ATG facility and 500 meters west of Stevens Drive.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: Buckets and cans were observed at the site.

Waste Type: Batteries

Waste Description: Dry cell batteries were observed at the site in 1996. Vegetation surrounding the batteries was reported to be stressed in 1996, but no sign of the batteries was found in 2000.

Code: 1100-13

Classification: Not Accepted

Names: 1100-13; Gravel Pit #1; Pit 1

Reclassification: None

Type: Depression/Pit (nonspecific)

Start Date:

Status: Active

End Date:

Description: The site is a pit where sand was excavated to be used for bedding and backfill material. The northern perimeter is marked with post and chain.

Location: Pit #1 is located north of the 1100 Area, north of the 1171 Laydown Yard.

Related Sites/ Structures: UPR-1100-6 is located adjacent to Pit 1.

Code: 1100-14

Classification: Not Accepted

Names: 1100-14; Gravel Pit #2; Pit 2

Reclassification: None

Type: Depression/Pit (nonspecific) **Start Date:** 1/1/1954
Status: Inactive **End Date:** 1/1/1985
Description: The pit was a source of gravel for backfill material. It also was used as a dumping site for miscellaneous debris, paint and solvents.
Location: The pit is located north of 1100 Area and north of the 1171 Laydown yard
Related Sites/ Structures: 1100-2 Paint/Solvent dump

Code: 1100-15 **Classification:** Not Accepted
Names: 1100-15; Gravel Pit #3; Pit 3 **Reclassification:** None
Type: Depression/Pit (nonspecific) **Start Date:** 1/1/1979
Status: Inactive **End Date:** 1/1/1985
Description: The site was used as a source of gravel for backfill material. It was also used as a disposal site for construction material (concrete rubble and roofing material. Occasionally antifreeze and degreaser solutions from the 1171 building were disposed into the pit
Location: The pit is located north of 1100 Area, north of the 1171 Laydown Yard, on the west side of the railroad tracks.
Related Sites/ Structures: The site was associated with 1100-3 Antifreeze, Degreaser Pit.

Code: 1100-18 **Classification:** Not Accepted
Names: 1100-18; Cistern and Possible Historic Disposal Site Identified During RCRA General Inspection 1100FY98 Item #3 **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site appears to be a cistern. In the general area of the cistern is a homestead dump site. There appears to have been a well casing inside of the cistern. The casing is plugged approximately 1.5 meters (5 feet) below the ground surface. The cistern is in the middle of an old concrete pad and is lined with concrete (at least as much as is visible). The area between the sides of the cistern and the metal well casing is filled with large rocks and cobbles. Connected to this concrete pad, there appears to be another concrete-lined, rock-filled hole. The second hole is now very overgrown and is filled with large rocks and cobbles. It appears to have been rectangular and may have had a wooden cover. A snake was living under the remains of this wooden cover. North of the cistern are the remains of a wire mesh fence and an old household dump (cans primarily, some glass and ceramics). Further north, there is a smaller concrete structure. It is square and is now filled with dirt and vegetation. Overall, the site is mostly grass-covered, with some mature sagebrush and tumbleweeds. Debris is concentrated in the household dump, but there is some scattered debris across the site, including the metal frame of a coil mattress. The features mentioned thus far (with the exception of the small concrete structure) are south of an extensive ditch (irrigation?). Northeast of the cistern and north of the ditch, a cement pipe was found extending into the ditch. Just north of this feature, some of the cement pipe is exposed. This could be considered a physical hazard. Southeast of the cistern are the remains of an old foundation. The cellar presents a physical hazard. Adjacent to the foundation is a small, thin area of coal, level with the ground surface.
Location: The site is located approximately 274 meters (900 feet) west of Stevens Drive and 91 meters

Status: Inactive **End Date:** 1/1/1996

Description: The unit consisted of various laboratories in the 324, 325, and 331 Buildings. The processing equipment covered under this unit included lab, bench, pilot, and full-scale treatment equipment.

Location: The unit was located in various laboratories throughout the 324, 325 and 331 Buildings.

Process Description: Various technologies were used to treat radioactive mixed waste and hazardous waste via biological treatment research and development processes. These technologies treated radioactive mixed waste and hazardous waste constituents in soil, effluents, and groundwater through the use of microorganisms (naturally present or organisms that were environmentally enhanced) to treat various chemical constituents, such as organics, nitrates, chromium, and cyanide. Biological treatment processes were capable of treating up to a maximum of 151, 400 liters (40,000 gallons).

Related Sites/ Structures: Structures related to these treatment facilities included the 300 Area Process Sewer, similar laboratories in the other buildings, and the remaining laboratories in each building.

Waste Type: Chemicals

Waste Description: Wastes treated by the unit included listed waste, waste from non-specific sources, characteristic wastes, and state-only wastes.

Code: GTF **Classification:** Accepted

Names: GTF; Grout Treatment Facility **Reclassification:** None

Type: Process Unit/Plant **Start Date:** 1/1/1986

Status: Inactive **End Date:** 1/1/1991

Description: The facility included the Transportable Grout Equipment and an underground feed pipeline from the 241-AP-102 tank. The fenced area previously known as the Grout Treatment Facility has been transitioned to the construction contractor that will build the new Waste Treatment Facility (vitrification plant). The head end of the 216-A-29 ditch was located within this fenced area. The ditch has been backfilled and stabilized.

Location: The Grout Treatment Facility was located east of the 241-AP Tank Farm, east of the 200 East Area. It is west of the Grout Treatment Facility Landfill area.

Process Description: The Grout Treatment Facility was put on long term standby and the project was later cancelled. The feed transfer system was disconnected from the 241-AP-102 Tank. The High Efficiency Particulate Air filters were removed from the Liquid Collection Tank/Mixer Module (Transportable Grout Equipment) ventilation system. This reduced the level of contamination in the facility. A failed mixer pump in Tank 241-AP-102 was removed in 1995. The Grout Treatment Facility was to be used as an emergency option in the event that tank space is not available to resolve tank safety issues. During operations, the waste was stored in Tank 241-AP-104 and pumped to the Grout Feed Tank 241-AP-102. The dry materials (from the Dry Materials Receiving and Handling Facility) were trucked to the Transportable Grout Equipment. The Transportable Grout Equipment mixed the dry blend with liquid additives and aqueous waste to form a cementitious slurry. The slurry was pumped to a below grade vault located in the Grout Treatment Facility Landfill, where it hardened. Excess water from the vaults and flush solutions from the Transportable Grout Equipment were pumped to feed Tank 241-AP-102 or other tanks in the tank farms.

Related Sites/ Structures: The Grout Treatment Facility was associated with the Dry Materials Receiving and Handling Facility, the AP-Tank Farm and the Grout Treatment Facility Landfill (Near Surface Disposal Facility).

Waste Type: Process Effluent
Waste Description: The liquid waste at this facility had low concentrations of radioactive and other hazardous materials. The facility had the capacity to treat 101,000 gallons (382,285 liters) per day.

Code: GTFL **Classification:** Accepted

Names: GTFL; PSW Vault; 218-E-16; Grout Treatment Facility Landfill; GTF Vaults **Reclassification:** None

Type: Burial Ground **Start Date:** 1/1/1986

Status: Inactive **End Date:** 1/1/1991

Description: The Grout Treatment Facility Landfill had been located within a fenced area, now designated for construction of the Waste Treatment Plant (vitrification plant). Access is currently controlled by the construction contractor. Five underground vaults were constructed of reinforced concrete with cover blocks to support the Grout Treatment facility. The vault floors are sloped toward a leachate collection trench. The site consists of five rectangular vaults known as 101, 102, 103, 104, and 105.

Location: The Grout Treatment Facility Landfill is located east of the 200 East Area fence. It was located inside the fence that currently surrounds the Waste Treatment Facility construction site. The landfill is east of the area formerly known as the Grout Treatment Facility. The vaults are located in the western portion of the Grout Treatment Facility Landfill.

Process Description: The vaults at the Grout Treatment Facility Landfill received liquid grout slurry from the Transportable Grout Equipment. The liquid feed contained low activity (8.4E-5 curies per liter) phosphate-sulfate waste. The grout slurry hardened in the vaults; at which time, the excess liquid was pumped back to the feed tank (241-AP-102 or another tank at the tank farms). After the excess water was removed, the void space between the grout surface and vault roof was filled with nonradioactive grout.

Related Sites/ Structures: The vaults are associated with the Grout Treatment Facility.

Waste Type: Process Effluent

Waste Description: As of 1992, the Grout Treatment Facility Landfill Vaults had a total capacity of approximately 185 acre feet (228,200 cubic meters). The waste feed had low concentrations of radionuclides and hazardous materials.

Code: HWVP **Classification:** Accepted

Names: HWVP; Hanford Waste Vitrification Plant (Original Proposed Site) **Reclassification:** Closed Out (11/3/1999)

Type: Process Unit/Plant **Start Date:**

Status: Inactive **End Date:**

Description: This WIDS site is the original facility designed to be a test treatment/support facility. The proposed Vitrification facility was never built. The 2704 HV office building, 2101 HV and the Canister Storage building were constructed. They have supported different projects.

Location: The proposed Vitrification facility was to be located west of the 200 East Area perimeter fence, between Route 4 North and Akron Ave. This facility was never constructed.

Process Description: The Canister Storage building was built to support HWVP but never used for that purpose. It has been used to store material from the 100-K Basins project.

Waste Type: Chemicals
Waste Description: The site was designed to treat 8,000 gallons (30,000 liters) per day of waste, producing 220 pounds (100 kilograms) of glass per hour.

Code: PCTTF **Classification:** Accepted
Names: PCTTF; Physical and Chemical Treatment Test Facilities **Reclassification:** Closed Out (5/13/1996)
Type: Laboratory **Start Date:** 1/1/1979
Status: Inactive **End Date:** 1/1/1995

Description: The unit consisted of the use of the 324 Building Biological Treatment Test Facilities, the 324 Building Radiochemical Hot-Cell Complex, and the 325 Building Shielded Analytical Laboratory to test treatment technologies for radioactive mixed waste and hazardous waste. The processing equipment covered under this unit included lab and bench-scale treatment equipment.

Location: The unit was located in various laboratories in the 324 and 325 Buildings.

Process Description: Treatment processes are usually small, bench-scale operations. The processes included pH adjustment, ion exchange for selective removal of contaminants from waste solution, waste concentration by evaporation, waste dissolution such as waste retrieval from storage tanks by pH adjustment or fusion, precipitation/filtration and solvent extraction from solutions, slurries, and sludges, solids washing for separation of contaminants from sludges, catalytic destruction methods, e.g., electrolytic generation of oxidants such as silver, cerium, and other electrochemically enhanced processes for decontaminating metals and oxidizing non-metals, and grouting. Most treatment processes were small, bench-scale operations.

Related Sites/Structures: Structures related to these treatment facilities included the 300 Area Process Sewer, and laboratories in the 324 and 325 Buildings.

Waste Type: Chemicals
Waste Description: Waste treated by various processes included listed wastes, wastes from non-specific sources, characteristic wastes, and state-only wastes. Petroleum refining wastes were also included. The processes used in this unit included pH adjustment, ion exchange processes, waste concentration, precipitation/filtering, solids washing, catalytic destruction, and grouting.

Code: RMWSF **Classification:** Accepted
Names: RMWSF; 2401W, 2402W, 2402WB, 2402WC, 2402WD, 2402WE, 2402WF, 2402WG, 2402WH, 2402WI, 2402WJ, 2402WK, 2402WL, 2403WA, 2403WB, 2403WC, 2403WD, 2404WA, 2404WB, 2404WC; Hanford Central Waste Complex; Radioactive Mixed Waste Storage Facility **Reclassification:** None
Type: Storage **Start Date:** 1/1/1988
Status: Active **End Date:**

Description: The Radioactive Mixed Waste Storage Facility consists of the 2401-W Storage Building, 23 low-flash-point mixed waste storage modules, the twelve 2402-W series storage buildings, a mixed waste storage pad, the 2403-W mixed waste storage buildings, and the waste receiving and staging area. The 2401-W, 2402-W, and 2403-W Storage Buildings are preengineered steel structures.

Location: The unit is located west of Dayton Avenue, north of Nineteenth Street and south of the proposed Twenty Second Street.

Process Description: The unit provides safe storage for mixed waste until burial in disposal units at the Hanford Site, or shipment to a Transuranic Waste Disposal Site.

Related Sites/ Structures: Structures associated with the buildings in the Radioactive Mixed Waste Storage Facility include the Waste Receiving and Packaging Facility, and the other facilities that make up the Central Waste Complex.

Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: The unit receives and stores designated mixed waste.

Code: SHLWSTS **Classification:** Accepted

Names: SHLWSTS; Simulated High-Level Waste Slurry Treatment/Storage **Reclassification:** Closed Out (9/6/1995)

Type: Process Unit/Plant **Start Date:** 1/1/1987

Status: Inactive **End Date:** 1/1/1995

Description: The site has been cleaned and turned over to the Port of Benton. This site was three roped off areas within the fenced-in 1234 Storage Yard. The site consisted of a treatment area, a storage area, and a less than 90 day accumulation area.

Location: This site is located within the 1234 Storage Yard which is southwest of the intersection of Stone Street and "W" Avenue.

Process Description: This site was used to store containerized simulated high-level waste slurry. The slurry was treated at this site in a grout/stabilization process. The slurry treatment program was initiated on September 13, 1988 and ended on October 28, 1988. The treatment process consisted of neutralization and mixing with grout within lined 55-gallon containers. The treatment eliminated the characteristics of ignitability, corrosivity and EP Toxicity. The grouted slurry was stored in drums at the site of treatment until tests (EP Toxicity, Acute Fish and Rat Toxicity) were completed. These tests verified that the treated waste exhibited no dangerous waste characteristics.

Related Sites/ Structures: The associated structure is the 1234 Storage Yard.

Waste Type: Chemicals
Waste Description: The slurry was dangerous waste containing toxic constituents and dissolved metals. The treated slurry was managed as non-radioactive solid waste.

Waste Type: Chemicals
Waste Description: The 90-day pad stored waste from various Battelle research activities including the slurry treatment wastes.

Code: TFS OF 218-E-4 **Classification:** Accepted

Names: TFS OF 218-E-4; Tile Field South of 218-E-4; 2607-E3 Tile Field **Reclassification:** Consolidated (4/12/2004)

Type: Drain/Tile Field **Start Date:** 1/1/1944

Status: Inactive **End Date:** 1/1/1997

Description: The tile field south of 218-E Burial Ground is comprised of vitrified clay pipe and drain tile. The laterals of the tile field are open jointed and are spaced 7.9 feet (2.4 meters) apart.

Location: This tile field is located southwest of the 218-E-4 Burial Ground and north of the 2607-E3 Septic Tank.

Process Description: The tile field was designed to percolate wastewater into the ground without exposing it to the open air. The 2607-E3 Septic Tank was abandoned in place in 1997.

Related Sites/ Structures: This tile field is associated with the 2607-E3 Septic Tank and received sanitary wastewater and sewage from B-Plant Facilities.

Waste Type: Sanitary Sewage

Waste Description: The 2607-E3 Septic Tank has received approximately 5.45 cubic meters (3,800 gallons) of sanitary wastewater and sewage per day from the B Plant Aggregate Area Facilities. The waste is discharged to the tile field located north of the 2706-E3 and South of the 218-E-4 Burial Ground.

The Site Was Consolidated With:

Code: 2607-E3
Names: 2607-E3; 2607-E3 Septic System; 2607-E3 Septic Tank and Drainfield; TFS of 218-E-4; Tile Field South of 218-E-4

Code: TRUSAF **Classification:** Accepted

Names: TRUSAF; 224-T TRUSAF; Transuranic Assay Facility **Reclassification:** None

Type: Storage **Start Date:** 1/1/1985

Status: Inactive **End Date:** 1/1/1997

Description: The building is a RCRA compliant storage unit occupying 2/3 of the 224-T building and adjacent outdoor areas. One third of the building (224-T Canyon) was sealed off in 1975. The storage capacity is 2,000 (55-gallon) drums (110,000 gallons). Access to the building is restricted with a locked, chain link fence.

Location: This is a three story concrete building located southeast of 221-T and south of 222-T.

Process Description: The building was originally constructed in 1943 as part of the T Plant bismuth-phosphate fuel processing complex. From 1944 to 1956 it functioned as the Plutonium Concentration Facility. Six radiologically contaminated process cells are located in the eastern 1/3 of the building. The cells were sealed off from the rest of the building in 1975. The amount of radiological or regulated material remaining within the process cells is unknown. This section of the building is documented in WIDS Sitecode 224-T. The TRUSAF process included the exterior inspection of waste drums, neutron assay of waste containers to determine the isotope content and an X-ray examination of the waste containers to confirm the absence of prohibited contents (e.g. free liquids). After examination the containers were stored on the second and third floors, in rows (following a pattern marked on the floor) or in storage modules. All TRUSAF waste was removed from the 224-T building in August 1997. The building is on standby. No operations are currently taking place in 224-T except for routine building surveillance.

Related Sites/ Structures: The TRUSAF activities are associated with waste management operations.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: hazardous waste that may be allowed into this facility could be any of the listed or characteristic wastes as defined by RCRA and Washington Administrative Code 173-303. The waste was generated by DOE processing facilities and will eventually be shipped to the WIPP in New Mexico for disposal. Prior to placing the building on standby, all of the waste was removed from 224-T.

Code: TTF
Classification: Accepted
Names: TTF; Thermal Treatment Test Facilities
Reclassification: Closed Out (5/13/1996)
Type: Laboratory
Start Date: 1/1/1978
Status: Inactive
End Date: 1/1/1996

Description: The unit consists of various laboratories in the 324 and 325 Buildings and the in-situ vitrification (ISV) unit which is a transportable treatment unit. The processing equipment covered under this unit included bench, engineering, pilot, and full-scale treatment equipment.

Location: The unit was located in various labs throughout the 324 and 325 Buildings. The in-situ unit is transportable across the Hanford Site.

Process Description: These units treated mixed and hazardous waste with in-situ vitrification or waste vitrification treatment processes. Equipment and processes used to treat the waste included bench, pilot, engineering, and full-scale treatment equipment. ISV was a thermal treatment process that converted contaminated soils and sludges into a glass and crystalline product. An electrical current was passed among an array of four electrodes imbedded in the contaminated soil or sludge, melting and glassifying it. The process continued outward and downward until the appropriate vitrification depth was obtained. Radioactive mixed waste and dangerous waste constituents were stabilized in the glass and crystalline product. Organic contaminants were destroyed by pyrolysis, and the pyrolysis products oxidized as they migrated to the surface. PNL operated four treatability testing units (bench, engineering, pilot, and large-scale). The engineering and bench-scale units were located in the 324 Building in the 300 Area. The pilot and large-scale units were transportable within the Hanford Site. The pilot and large-scale units were transportable within the Hanford Site. The design capacity of the units varied from 18.9 liters (5 gallons) per day (bench-scale) to 64345 liters (17,000 gallons) per day (large-scale). Waste vitrification prototype equipment was located in the 324 Building. Treatability studies were performed using simulated and actual radioactive mixed waste samples. Radioactive mixed waste was mixed with glass-forming materials and vitrified into a highly durable glass for disposal. The design capacity ranged from 5.7 liters (1.5 gallons) per day (bench-scale) to 113.6 liters (30 gallons) per day (pilot-scale). In some treatability studies with ISV, vitrified soil was left in place for additional study before either being removed or designated as nonhazardous. Other thermal treatment processes covered by this permit included plasma arc pyrolysis, in situ heating of soils and sludges for removal of organics, metal melting for volume reduction and immobilization of contaminated metals, gamma induced oxidation of organic chemicals, thermal treatment for the drying and decomposition of liquid slurries, in can melting of soil wastes and liquid slurries, and microwave heating to dry and immobilize liquid and solid wastes.

Related Sites/Structures: Structures related to these treatment facilities included the 300 Area Process Sewer, engineering development laboratory (EDL), EDL high bay and hot cell complex of the 324 Building. Additionally, the in-situ treatment unit had ancillary structures providing power, filtration and control. The 116-B-6A Crib was used for testing as were other laboratories located in the 324, 325 and 331 Buildings.

Waste Type: Chemicals
Waste Description: Wastes treated by these processes included listed wastes, wastes from non-specific sources, characteristic wastes, and state-only wastes. In-situ vitrification is a thermal process that

converts contaminated soil and sludges into a glass and crystalline product. Non-volatilized contaminants are immobilized in the glass and crystalline product. Volatilized contaminants are recovered in a filtration system. Other vitrification processes explored in these units included plasma arc pyrolysis, melters, and gamma-induced oxidation.

Code:	UPR-100-N-15	Classification:	Accepted
Names:	UPR-100-N-15; 108-N Neutralization Sump Spill; Acid Spill at 108-N; UN-100-N-15; UN-116-N-15	Reclassification:	Rejected (9/11/2000)
Type:	Unplanned Release	Start Date:	1/1/1981
Status:	Inactive	End Date:	1/1/1981
Description:	The release site is concrete structures and a graveled field. There is no evidence of the spill at the site.		
Location:	The release occurred at the 108-N Sump. The volume of contaminated soil was less than 1.4 cubic meters (50 cubic feet).		
Release Description:	<p>On March 20, 1981, during the 8-4 shift, while sulfuric acid was being transferred from the 108-N storage tanks to the 163-N day tanks, a leak developed in a connection in the discharge line from the acid transfer pumps. The operator noticed the leak spraying across the interior of the 108-N building, but knowing the piping of the 108-N building to be prone to leaks over the past several years, he continued to fill the 163-N day tanks (10-15 minutes) until the desired level was reached in accordance with procedure. After the tanks were filled, the operator shut the system down and notified his supervisor of the problems. The pressure in the leaking line during the transfer operation resulted in spraying a large portion of the interior of the 108-N building with highly corrosive sulfuric acid. The operator wore adequate protective clothing and received no injuries. The building interior sustained considerable acid damage. After supervision was notified, cleanup of the 108-N building began. The interior of the building was hosed down with water and drained to the 108-N neutralizing sump. When this sump became filled to capacity, it became necessary to transfer the neutralized mixture to another neutralizing pit. During this transfer a "water leak" was observed coming from the ground outside of the 108-N building. Following pH tests, the leak was traced to the discharge line from the 108-N neutralizing sump. During the transfer of the liquid, the outside of the 108-N building became flooded and was roped off. The Environmental Control Subsection was notified of the spill; and upon their recommendation, the surface leakage was neutralized with soda ash. No further actions were deemed necessary at that time. On March 23, 1981, during the 8-4 shift, Rockwell cement finishers reported to an N Plant Maintenance Analyst requesting permission to enter the 108-N building to clean the area around the base of the two acid transfer pumps to prepare the base for a new surfacing. Since no "hands on maintenance of any equipment" was required, the N Plant Maintenance Analyst saw no need for the preparation of a formal work authorization form. The Maintenance Analyst left the cement finishers at the job site and returned to his office. The cement finishers dressed in protective clothing and went about their assigned task. While scraping the surface of loose debris, the Rockwell cement finishers struck and broke off a small drain pipe coming off the suction header of the acid transfer pumps. Residual acid from the previously isolated line sprayed out on the interior of the 108-N building. Both cement finishers, dressed in appropriate protective clothing, were uninjured. Subsequent cleanup operations similar to those performed on 3/20/1981, again forced the usage of the transfer line from the 108-N neutralizing sump. The Environmental Control Subsection was notified prior to the transfer. They advised similar precautions be taken as those on 3/20/1981. Residual liquid on the ground outside of the 108-N was neutralized with soda ash.</p>		
Related Sites/ Structures:	This release is associated with the 108-N Chemical Unloading Facility.		

Waste Type: Chemicals
Waste The release consisted of sulfuric acid.
Description:

Code: UPR-100-N-33 **Classification:** Accepted
Names: UPR-100-N-33; 108-N Acid Transfer Spill; UN-100-N-33; UN-116-N-33 **Reclassification:** Rejected (9/11/2000)
Type: Unplanned Release **Start Date:** 1/1/1981
Status: Inactive **End Date:** 1/1/1981

Description: The location of this release is a graveled lot at the 108-N Chemical Unloading Facility (CUF). There is no evidence of the spill at the site.

Location: The release occurred near the sodium hydroxide storage tank at the 108-N Facility.

Release Description: Approximately 3,800 liters (1,000 gallons) of 97% sulfuric acid was spilled during an acid transfer from a rail car to the sulfuric acid storage tank at 108-N. The release occurred on November 9, 1981.

Related Sites/ Structures: This release is related to the 108-N CUF.

Waste Type: Chemicals
Waste The spill consisted of a solution containing 97% sulfuric acid.
Description:

Code: UPR-100-N-34 **Classification:** Accepted
Names: UPR-100-N-34; 108-N Tank Transfer; Sulfuric Acid Line Break; UN-100-N-34 **Reclassification:** Rejected (9/11/2000)
Type: Unplanned Release **Start Date:** 1/1/1980
Status: Inactive **End Date:** 1/1/1980

Description: The release occurred in a concrete trench in a graveled lot. There is no evidence of the spill at the site.

Location: The release occurred at the southwest corner of the 120-N-5, 108-N/163-N Transfer Line And Neutralization Pit.

Release Description: Washington Public Power Supply System (WPPSS) supervision called the 105-N Control Room and reported a large cloud of steam in the vicinity of the WPPSS trestle. An investigation revealed liquid spurting several feet into the air from a sulfuric acid and sodium hydroxide line encasement at the encasement sump. The weekly sulfuric acid transfer from 108-N to 163-N was in process. It was subsequently determined that the sulfuric acid had been transferred from the storage tank at 108-N, and none had been received at the 163-N Storage Tank. Approximately 12,870 liters (3,400 gallons) of 94% sulfuric acid was released to the ground. Contamination was limited to the region near the sulfuric acid transfer line in the vicinity of the sump. The release occurred on May 12, 1980. (While the CMS reports a spill of 3,800 liters (1,000 gallons), historical records [e.g., Stenner et al. 1988] lists a release of 12,870 liters (3,400 gallons).

Waste Type: Chemicals
Waste The release was a solution containing 94% sulfuric acid.
Description:

Code:	UPR-100-N-38	Classification:	Accepted
Names:	UPR-100-N-38; 100-N Spring 1983 Caustic; 116-N-2 Facility Liquid Unplanned Release; Truck Spill 116-N-2	Reclassification:	Rejected (9/11/2000)
Type:	Unplanned Release	Start Date:	1/1/1983
Status:	Inactive	End Date:	1/1/1983
Description:	The site is level and graveled. A pipe is present that carried sodium hydroxide from the tankers to the 1310-N Facility (116-N-2). The site is located in a radiation zone, but the sodium hydroxide should not have been radioactively contaminated. The 116-N-2 Facility complex consists of piping, pumps, a transfer tank (commonly referred to as the silo) and a large, spherical storage tank (commonly referred to as the golf ball). The site was used as a collection tank for N Reactor primary piping decontamination wastes. The 3.4E+06-liter (9.0E+05-gallon) spherical tank is partially buried in the ground. A compacted soil radiation barrier, 7.6 meters (25 feet) high, borders the tank on three sides.		
Location:	The spill occurred in the 100-N Area, west northwest of 1310-N.		
Release Description:	In Spring 1983, a tanker truck was offloading caustic sodium hydroxide to the silo (transfer tank) at 1310-N when a fitting came loose, spilling 380 liters (100 gallons) of sodium hydroxide to the soil.		
Process Description:	The sodium hydroxide was used to neutralize the radioactively contaminated and hazardous decontamination solution pumped from the N Reactor to the 116-N-2 (1310-N Facility).		
Related Sites/Structures:	The 116-N-2 (1310-N Chemical Waste Treatment and Storage Facility) is associated with the site.		
Waste Type:	Chemicals		
Waste Description:	Three hundred eighty liters, (100 gallons) of sodium hydroxide was spilled to the ground during offloading operations in a radiation zone.		

Code:	UPR-100-N-40	Classification:	Not Accepted
Names:	UPR-100-N-40; 6/14/86 163-N Cation/Anion Regeneration Waste Spill; Regeneration Waste Transport System Liquid UPR 1 (06/14/86 Cleaned Up); UN-116-N-27	Reclassification:	None
Type:	Unplanned Release	Start Date:	1/1/1986
Status:	Inactive	End Date:	
Description:	The surface of the area is graveled.		
Location:	The exact location of the leak is unknown, however, it occurred in the section of line that goes southeast from the southeast corner of 183-N.		
Release Description:	On June 14, 1986, a leak was detected in the waste transport pipe while wastes from the anion and cation regeneration process were being routed to 120-N-2 Surface Impoundment. Once the leak was discovered, regeneration processes were shut down. A sample was collected at the point of leak and found to have a pH of 1.4. It was estimated that 25,000 liters (6,500 gallons) of acidic regeneration waste had leaked to the ground and formed a pond in an area south and east of the 163-N/183-N Buildings. Caustic regeneration waste was pumped through the line		

and allowed to leak into the acidic pond to neutralize the spilled material. Several hours elapsed until the pH of the spilled material reached 6.9.

Waste Type: Process Effluent

Waste Description: The 120-N-1 and 120-N-2 disposal sites received waste from the 163N Plant, the same waste that was involved in these unplanned releases. The liquid released was regeneration waste from ion exchange columns in the 163-N Facility, consisting of sulfuric acid and sodium hydroxide.

Code: UPR-100-N-41

Classification: Not Accepted

Names: UPR-100-N-41; Waste Spill; 163-N
Regeneration; Regeneration Waste Transport
System Liquid UPR 2

Reclassification: None

Type: Unplanned Release

Start Date: 1/1/1986

Status: Inactive

End Date:

Description: The spill occurred at the 163-N Regeneration Waste Sump near the northwest corner of the 163-N Building and formed a small pond in this area.

Location: The site is a graveled area northeast of the 163-N Building.

Release Description: A spill of acidic wastewater (pH 1.1) from the 163-N Demineralized Water Treatment Plant occurred on June 30, 1986. The spill happened when a temporary 15-centimeter (6-inch) hose became dislodged for approximately 4 minutes during a discharge cycle, spilling approximately 3,800 liters (1000 gallons) of the liquid. The corrective action was to add 82 kilograms (180 pounds) of soda ash to the spill to neutralize the acid. Subsequent pH of the spill was 10.1 standard units. No cleanup action is mentioned in the occurrence report.

Waste Type: Water

Waste Description: The liquid released was regeneration waste consisting of sulfuric acid from ion exchange columns in the 163-H Facility. Soda ash was added to the spill to help neutralize the liquid.

Code: UPR-200-E-4

Classification: Accepted

Names: UPR-200-E-4; 241-B-151 Diversion Box
Contamination Spread; UN-200-E-4

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1951

Status: Inactive

End Date: 1/1/1952

Description: The site is not separately marked or posted.

Location: The release occurred in an area surrounding the 241-B-151 Diversion Box, inside the 241-B Tank Farm fence.

Release Description: The area around the 241-B-151 Diversion Box was contaminated as a result of work activities in the diversion box in the fall of 1951 and again in the summer of 1952.

Related Sites/ Structures: The release is associated with the 241-B-151 Diversion Box.

Waste Type: Process Effluent

Waste Description: The release involved approximately 10 curies of fission products from the 241-B-151 Diversion Box.

The Site Was Consolidated With:

Code: 200-E-120
Names: 200-E-120; Contaminated Soil at 241-B Tank Farm; Contamination Migration Beyond the 241-B fence

Code: UPR-200-E-5 **Classification:** Accepted
Names: UPR-200-E-5; 241-BX-102 Tank Overflow; UN-200-E-5 **Reclassification:** Consolidated (6/13/2002)
Type: Unplanned Release **Start Date:** 1/1/1951
Status: Inactive **End Date:**

Description: The fence of the 241-BX Tank Farm is marked with appropriate radiological warning signs. The release site is not separately marked or posted.

Location: The release occurred inside the 241-BX Tank Farm, around the 241-BX-102 Tank.

Release Description: On March 20, 1951, a cascade outlet became plugged, contaminating the soil near the 241-BX-102 Tank. Approximately 348,000 liters (91,600 gallons) of metal waste was released.

Process Description: In 1951, this tank was receiving the "metal waste" stream from the Bismuth Phosphate plutonium separation process at B Plant. The metal waste stream was the first waste stream discharged after the fuel rod dissolution. It was a large volume waste stream that contained high concentrations of uranium and 90 percent of the radionuclides originally present in the irradiated fuel rods.

Waste Type: Process Effluent
Waste Description: The waste stream involved with this release was the Bismuth Phosphate process metal waste stream. It typically contained approximately 0.5 pound of uranium per gallon of liquid waste. The waste released contained approximately 20.4 metric tons (22.5 tons) of depleted uranium.

The Site Was Consolidated With:

Code: 200-E-132
Names: 200-E-132; 241-BX/BY Tank Farm Contaminated Soil; Contamination Migration Beyond the 241-BX/BY fence

Code: UPR-200-E-6 **Classification:** Accepted
Names: UPR-200-E-6; Contamination Around the 241-B-153 Diversion Box; UN-200-E-6 **Reclassification:** Consolidated (6/13/2002)
Type: Unplanned Release **Start Date:** 1/1/1954
Status: Inactive **End Date:** 1/1/1954

Description: The site is not separately marked or posted.

Location: The release occurred in the area around the 241-B-153 Diversion Box, inside the 241-B Tank Farm fence. The diversion box is in the southwest corner of the 241-B Tank Farm.

Release Description: The contamination spread was the result of work being done in the 241-B-153 Diversion Box during 1954 and 1955. In 1954, an area measuring approximately 30.5 meters by 15.25 meters (100 by 50 feet) surrounding the diversion box was marked as a radiation zone.

Waste Type: Process Effluent
Waste Description: Contamination spread from the 241-B-154 Diversion Box. Contaminated specks surrounded the work area. The release contained approximately 1 curie of fission products.

Reclassification: Consolidated (1/25/2000)

Type: Unplanned Release

Start Date: 1/1/1958

Status: Inactive

End Date:

Description: WIDS site UPR-200-E-13 has been reclassified based on documentation that verified it was a DUPLICATE of UPR-200-E-15. Future updates and closeout information will only be added to UPR-200-E-15. This site will no longer be updated. The unplanned release contaminated both the soil and blacktop areas between the 291-A Turbine House and the 216-A-4 Crib. The release site was not separately marked or posted.

Location: The release occurred south of PUREX, between the 216-A-4 Crib and the 291-A Turbine House.

Release Description: In December 1958, the 216-A-4 Crib became plugged during the jetting of the 216-A-2 Catch Tank which resulted in contaminated material backing into the 291-A Turbine House through the floor drains. The floor was contaminated to 20 rads/hour at 25.4 centimeters (10 inches). In addition, an area of ground and blacktop outside the turbine house was contaminated up to 8 rads/hour.

Related Sites/ Structures: The release was associated with 200-E-102, 200-E-103, 216-A-4, 216-A-2 and the 291-A Turbine House.

Waste Type: Process Effluent

Waste Description: The 216-A-4 crib plugged during the jetting of the 216-A-2 catch tank. Contaminated liquid backed up into the 291-A Turbine House floor drains. The floor of the Turbine House was contaminated to 20 rads/hour at 25.4 centimeters (10 inches). The liquid effected an area of ground and blacktop outside the turbine house that was contaminated with beta/gamma levels up to 8 rads/hour.

The Site Was Consolidated With:

Code: 200-E-103

Names: 200-E-103; PUREX Stabilized Area; Radiologically Controlled Area - South Side of PUREX

Code: UPR-200-E-14

Classification: Accepted (Proposed)

Names: UPR-200-E-14; 216-B-3 Pond Dike Break; UN-200-E-14

Reclassification: Consolidated (1/19/2000)

Type: Unplanned Release

Start Date: 1/1/1958

Status: Inactive

End Date: 1/1/1958

Description: The site is an unplanned release that occurred as a result of a dike break in 216-B-3 Pond. In 1983, the 216-B-3A Pond lobe was built over the top of this release site. There is no visible evidence of this release. It is not physically marked or posted. There is a large percolation trench in the center of the 216-B-3A pond that is posted as a Soil Contamination Area. However, the percolation trench was dug in 1984 and this Unplanned Release occurred in 1958. This site has been consolidated with 216-B-3B RAD

Location: The release site was located east of the 200 East Area perimeter fence. The release occurred on the east side of the 216-B-3 Main Pond.

Release Description: A break in the dike at 216-B-3 Pond in 1958 caused ground contamination in a ravine east of the pond. The "A" lobe of 216-B-3 Pond was built in 1983, over the top of the area where this release occurred. The release site was probably removed when the pond lobe was dug out.

Related Sites/ Structures: The release is associated with 216-B-3 Pond and 216-B-3A lobe.

Waste Type: Water

Waste Description: A dike break had the potential to carry material from any of the sources listed here. Waste streams flowed from the 216-A-29 and 216-B-3-3 Ditches into the 216-B-3 Pond. Discharges to 216-B-3 via 216-B-3-3 included: 221-B Building steam condensate and process cooling water; 284-E Powerhouse water; 244-CR Vault cooling water; 244-AR Vault and 242-A Evaporator cooling water; 202-A process cooling water, condenser cooling water, and air sampler vacuum pumps seal cooling water; 241-BY Tank Farm condenser cooling water; and Waste Encapsulation Storage Facility cooling water. Discharges to 216-B-3 via 216-A-29 included 202-A chemical sewer and acid fractionator condensate. The main pond received corrosive and toxic dangerous waste from two primary sources: the regeneration of the Plutonium Uranium Extraction (PUREX) plant demineralizer columns and from spills of dangerous or mixed waste from PUREX. The spills included hydrazine, cadmium nitrate, and ammonium fluoride/ ammonium nitrate. The backwash from the regeneration of the demineralizer columns included nitric acid, sulphuric acid, sodium hydroxide, and potassium hydroxide.

The Site Was Consolidated With:

Code: 216-B-3A RAD

Names: 216-B-3A RAD; West Expansion Lobe; 216-B-3 1st Overflow Pond; 216-B-3A Expansion Lobe Residual Radioactive Waste

Code: UPR-200-E-15

Classification: Accepted

Names: UPR-200-E-15; Overflow at 216-A-4; UN-200-E-15; UPR-200-E-13

Reclassification: Consolidated (1/25/2000)

Type: Unplanned Release

Start Date: 1/1/1958

Status: Inactive

End Date:

Description: WIDS site UPR-200-E-15 has been consolidated into site 200-E-103, because it was located within this larger "Underground Radioactive Material" area. Future updates and closeout information will only be added to 200-E-103. This site will no longer be updated. The release was a liquid unplanned release that contaminated the soil and blacktop areas between the 291-A Turbine House and the 216-A-4 Crib. Documentation states that the contaminated soil was removed and taken to a trench (WIDS Site 200-E-102) located south of 216-A-4 crib. Contamination could have remained on the blacktop area. This unplanned release is not separately marked or posted.

Location: The release site is located within the PUREX exclusion area, south of the 202-A Building between 291-A Turbine House and 216-A-4. The exact location of the contaminated blacktop is unknown.

Release Description: The monthly report (HW-58711) for December 1958 states the 216-A-4 Crib became plugged during the jetting of the 216-A-2 Catch Tank, causing a backflow of contaminated liquid into the 291-A Turbine House floor drains. The floor of 291-A was contaminated to 20 rad/hour at 25 centimeters (10 inches). The blacktop outside the building was contaminated to 8 rad/hour.

HW-60807 states that the soil was contaminated at surface and that the soil was removed to a trench along the south boundary of 216-A-4.

Related Sites/ Structures: The site is associated with 200-E-102, 200-E-103, the 216-A-4 crib and the 291-A Turbine House.

Waste Type: Process Effluent

Waste Description: The 216-A-4 crib plugged during the jetting of contaminated liquid from the 216-A-2 Catch Tank. When the 216-A-4 crib plugged, the floor drains in the 291-A Turbine House backed up, contaminating the floor with dose rates up to 20 rads/hour at 25.4 centimeters (10 inches). The liquid then flowed out of the turbine house and contaminated surrounding blacktop and soil. Beta/gamma readings on the blacktop and soil read up to 8 rad/hour were measured immediately following the incident.

The Site Was Consolidated With:

Code: 200-E-103

Names: 200-E-103; PUREX Stabilized Area; Radiologically Controlled Area - South Side of PUREX

Code: UPR-200-E-16

Classification: Accepted

Names: UPR-200-E-16; 241-C Overground Transfer Line Leak; UN-200-E-16

Reclassification: Consolidated (6/13/2002)

Start Date: 1/1/1959

Status: Inactive

End Date:

Description: Neither the spill or the associated pipe, buried at the conclusion of the transfer, are marked or posted within the Tank Farm.

Location: The release occurred northeast of the 105-C Tank Pit, inside the 241-C Tank Farm.

Release Description: A leak in the overground coating waste transfer line at 241-C tank farm resulted in contamination of the ground to 1.5 rad per hour at a distance of 4.5 meters (15 feet). The line was replaced with a maximum exposure of 4 rad per hour. The release consisted about 50 gallons. It occurred during the transfer of PUREX coating removal waste from tank 241-C-105 to tank 241-C-108. The leak occurred in the vicinity of the pump pit which is located on the north side (12 o'clock position) of the tank.

Process Description: The 241-C-105 to 241-C-108 overground transfer line broke and contaminated the soil northeast of the 241-C-105 tank pit.

Waste Type: Process Effluent

Waste Description: The waste was PUREX coating waste that was released to the ground from a line break in the 241-C-105 to 241-C-108 overground transfer line.

The Site Was Consolidated With:

Code: 200-E-133

Names: 200-E-133; Contaminated Soil at 241-C Tank Farm; Contamination Migration Beyond the fence at C Farm

Code: UPR-200-E-22

Classification: Accepted

Reclassification: Consolidated (7/19/2004)

Structures: also associated with UPR-200-E-24.

Waste Type: Soil

Waste The contamination originated from PUREX process tube bundles (from F-11 and H-4).

Description: Radiological readings ranged from a maximum of 60 millirad/hour beta/gamma at the burial ground to approximately 1,000 counts/minute outside the 200 East Area fence.

The Site Was Consolidated With:

Code: 218-E-10

Names: 218-E-10; Equipment Burial Ground #10; 200 East Industrial Waste No. 10

Code: UPR-200-E-24

Classification: Accepted

Names: UPR-200-E-24; Contamination Plume from the 218-E-10 Burial Ground; UN-200-E-24

Reclassification: Consolidated (5/6/2004)

Type: Unplanned Release

Start Date: 1/1/1960

Status: Inactive

End Date:

Description: The contaminated area is not currently marked or posted.

Location: Contamination spread from the 200 East Burial Ground (218-E-10) to as far as 3 miles (4.83 kilometers) beyond the 200 East Area perimeter fence.

Release Description: On Friday, June 10, 1960, a burial box containing two PUREX process steam tube bundles was placed in the 218-E-10 Burial Ground. It was covered with dirt, but not completely backfilled. Over the weekend, the box collapsed, causing a contamination spread. On Monday, June 13th, the burial ground was found to be contaminated with radiological levels ranging from 10 to 60 millirads/hour. It was also determined that wind had carried the contamination southeast across the 200 East Area to mile post 7 on Highway 4-S. Contamination levels beyond the 200 East area fence were approximately 1000 counts per minute. Two private vehicles were decontaminated that had been located in the PUREX parking lot. The incident was investigated and reported as Radiation Exposure Occurrence Type C, CPD 60-1. The date of the incident is probably June 10, 1960 instead of the June 17, 1960 as reported in PNL-6456. However, it is likely that the distant contamination (identified at mile marker 7 southeast of 200 East Area) was not documented until June 17th.

Process Description: Large boxes of contaminated equipment were routinely transported to solid waste burial grounds on railroad flat cars.

Related Sites/ Structures: This site is associated with UPR-200-E-23.

Waste Type: Soil

Waste Description: The release was caused from a burial box containing PUREX tube bundles. The average radiation level on the soil surfaces inside the burial ground fence was 30 millirads/hour at 10.16 centimeters (4 inches). The contamination diminished as it traveled from the burial site. Less than one particle of contamination per 9 square meters (100 square feet) was found outside the 200 East Area perimeter fence.

The Site Was Consolidated With:

Code: 218-E-10

Names: 218-E-10; Equipment Burial Ground #10; 200 East Industrial Waste No. 10

Code: UPR-200-E-25

Classification: Accepted

Names: UPR-200-E-25; Contamination Spread from the 241-A-151 Diversion Box; UN-200-E-25 **Reclassification:** Consolidated (12/7/2004)

Type: Unplanned Release **Start Date:** 1/1/1960

Status: Inactive **End Date:**

Description: The area south of PUREX, inside the facility fence had been posted as a Contamination Area. In 1999, the large posted Contamination Area was covered with clean backfill and changed to an Underground Radioactive Material Area (200-E-103). It is possible this release contributed to the contamination in the area. The release is not separately marked or posted, but is documented on a sign hung on the PUREX south perimeter fence.

Location: The area of contamination extended southwest of PUREX, as far as 61 meters (200 feet) beyond the 200 East Area fence.

Release Description: On September 5, 1960, steam released from the 241-A-151 Diversion Box during jumper testing contaminated an area southwest of PUREX. A plume of contaminated particles extended 200 feet (61 meters) beyond the 200 East Area fence. The average ground deposition was approximately five particles per 9.3 square meters (100 square feet). The maximum contamination level per particle was 100,000 counts per minute. Seven of ten Hanford Site buses, parked at the 200 East Area Badge House, were contaminated on the outside. No private vehicles were involved.

Related Sites/ Structures: The site is associated with 241-A-151 and 200-E-103.

Waste Type: Steam Condensate

Waste Description: Steam rising from the diversion box caused a spread of beta/gamma (specks) with readings up to 100,000 counts per minute per particle. The average ground deposition (specks) was approximately five particles per 9.3 square meters (100 square feet).

The Site Was Consolidated With:

Code: 200-E-103
Names: 200-E-103; PUREX Stabilized Area; Radiologically Controlled Area - South Side of PUREX

Code: UPR-200-E-26 **Classification:** Accepted

Names: UPR-200-E-26; 241-A-151 Release; UN-200-E-26 **Reclassification:** Consolidated (12/7/2004)

Type: Unplanned Release **Start Date:** 1/1/1960

Status: Inactive **End Date:**

Description: The area south of PUREX, inside the facility fence had been posted as a Contamination Area. In 1999, the large posted Contamination Area on the south side of PUREX was covered with clean backfill and changed to an Underground Radioactive Material Area (200-E-103). The release is not separately marked or posted, but is documented on a sign hung on the PUREX south perimeter fence. It is possible this release contributed to the contamination in the area.

Location: Contamination from this release spread southwest of the 241-A-151 Diversion Box, outside of the 200 East Area perimeter fence and across Route 4S.

Release Description: On September 30, 1960, a recently installed jumper was being tested. A gross leak was observed in the 241-A-151 Diversion Box causing an operator to stop test. However, the E-1 process tank emptied causing a cloud of steam to blow out of the faulty jumper connection, contaminating the area around the diversion box and beyond the PUREX fence. Beta/gamma readings ranged from 1 to 3 rad per hour near the diversion box. Just outside the PUREX

exclusion fence, the general contamination decreased to 3,000 counts per minute. Contamination concentrations of approximately 5 particles per 9.3 square meters (100 square feet) were found as far away as the BC Crib Area. Several employees and government vehicles at the job site were contaminated.

Related Sites/ Structures: The release is associated with the 241-A-151 Diversion Box and 200-E-103.

Waste Type: Steam Condensate

Waste Description: A cloud of contaminated steam escaped from a faulty connection inside the diversion box.

Beta/gamma contamination (specks) with readings ranging from 1 to 3 millirads per hour were found near the diversion box. The general contamination levels on surfaces further away averaged 3,000 counts per minute. The waste line being tested was used for routing PUREX strontium interim storage to 244-CR vault.

The Site Was Consolidated With:

Code: 200-E-103

Names: 200-E-103; PUREX Stabilized Area; Radiologically Controlled Area - South Side of PUREX

Code: UPR-200-E-27

Classification: Accepted

Names: UPR-200-E-27; 244-CR Contamination Spread; UN-200-E-27

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1960

Status: Inactive

End Date: 1/1/1960

Description: The release site, within the Tank Farm fenceline, is not specifically marked or posted.

Location: The release originated from the 244-CR Vault and spread eastward, contaminating the inside of the tank farm and also several hundred feet beyond the tank farm perimeter fence.

Release Description: On November 1, 1960, during work in the 244-CR Vault, winds spread contaminated particles eastward. Contamination levels around the vault, inside the fence, ranged between 50 and 100 millirads/hour. Particles reading as high as 40,000 counts per minute were found outside the fence. The original incident report says work was being done in a diversion box when the release occurred. The 241-CR-151 Diversion Box is adjacent to the 244-CR Vault.

Waste Type: Process Effluent

Waste Description: Beta/gamma contamination (specks) with readings of 50 to 100 millirads/hour was found near the vault. Readings of particles on surfaces outside the tank farm fence area were up to 40,000 counts/minute.

The Site Was Consolidated With:

Code: 200-E-133

Names: 200-E-133; Contaminated Soil at 241-C Tank Farm; Contamination Migration Beyond the fence at C Farm

Code: UPR-200-E-30

Classification: Accepted

Names: UPR-200-E-30; Contamination Within 218-E-10; UN-200-E-30

Reclassification: Consolidated (6/28/2007)

Type: Unplanned Release

Start Date: 1/1/1961

Status: Inactive

End Date: 1/1/1961

Description: The burial ground has been surface stabilized. The burial ground is posted as Underground.

Related Sites/ Structures: The release is associated with the 241-A-151 Diversion Box and 200-E-103.

Waste Type: Steam Condensate

Waste Description: Steam rising from the 241-A-151 Diversion Box resulted in a spread of beta/gamma contamination (specks) with readings ranging from 40,000 to 100,000 counts per minute in the vicinity of PUREX. Readings on surfaces outside of the limited area fence decreased to 1,000 counts per minute. The diversion box provided routing for high level waste from the PUREX F and G cells to the tank farms.

The Site Was Consolidated With:

Code: 200-E-103

Names: 200-E-103; PUREX Stabilized Area; Radiologically Controlled Area - South Side of PUREX

Code: UPR-200-E-32

Classification: Accepted

Names: UPR-200-E-32; Coil Leak from 221-B; UN-200-E-32

Reclassification: Consolidated (1/19/2000)

Type: Unplanned Release

Start Date: 1/1/1963

Status: Inactive

End Date: 1/1/1963

Description: The site is an unplanned release that affected the 207-B Basin and the 216-B-2-1 Ditch. The unplanned release is not visually marked or posted. The 207-B Basin is labeled and posted as a Contamination Area. The 216-B-2-1 ditch is marked with AC-540 markers and is included within a larger Underground Radioactive Material area. This site has been consolidated with the 207-B Retention Basin.

Location: The release occurred at B-Plant and affected the 207-B Retention Basin and the 216-B-2-1 Ditch. The basin and the ditch are located inside the 200 East Area, east of Baltimore Ave. and south of 241-B Tank Farm.

Release Description: On November 7, 1963, a coil failed in the 221-B Building (6-1 Rare Earth Storage Tank) and caused a liquid release, contaminating the 207-B Retention Basin and the head end of the 216-B-2-1 Ditch. Document HW-79768 states the general dose rates ranged from 500 millirem per hour to 2 Rad per hour. Tumbleweeds driven into the contaminated ditch by high winds were found to be reading 50 rads per hour. The tumbleweeds were removed and transported to the burial grounds.

Related Sites/ Structures: The release was related to B-Plant (221-B) 6-1 Tank inside 221-B. The pipeline from B Plant to the 207-B Basin is sitecode 200-E-112-PL.

Waste Type: Process Effluent

Waste Description: The B Plant 6-1 Rare Earth Storage Tank coil failed and cause a release to the retention basin and 216-B-1 ditch. A sample of the effluent released to the 207-B Retention Basin was analyzed in 1963. It was primarily Cerium-144 (30 curies) and .05 curies of strontium-90.

Description: Dose rates up to 500 millirad per hour were documented. Tumbleweeds that had blown into the ditch read up to 50 rad/hr.

The Site Was Consolidated With:

Code: 207-B

Names: 207-B; 207-B Retention Basin; B Plant Retention Basin

Code: UPR-200-E-34

Classification: Accepted

Names: UPR-200-E-34; Liquid Release to B-Pond and Gable Pond; UN-200-E-34 **Reclassification:** Consolidated (1/19/2000)

Type: Unplanned Release **Start Date:** 1/1/1964

Status: Inactive **End Date:** 1/1/1964

Description: This was a liquid unplanned release to a pond. There is no visual evidence of this release. The release effected the 216-B-3 Pond, 216-A-25 Pond and 216-A-29 Ditch. The 216-B-3 Pond, 216-A-25 Pond, and 216-A-29 Ditch have all been surface stabilized and are posted as Underground Radioactive Material Areas. This site has been consolidated with the 216-B-3 Pond.

Location: The unplanned release was a liquid release from PUREX that terminated in 216-B-3 Pond located east of 200 East area, outside the east perimeter fence and to 216-A-25 (Gable) Pond, located north of 200 East Area via ditches and an underground pipeline.

Release Description: On June 12, 1964, a coil leak in the F-15 Plutonium Uranium Extraction (PUREX) Tank contaminated 216-B-3 (B Pond) and 216-A-25 (Gable Mountain Pond). Approximately one fourth of the release was discharged to 216-B-3 Pond and the remaining three fourths of the contamination was released to 216-A-25 (Gable) Pond.

Related Sites/ Structures: The release is associated with the PUREX facility, 216-A-25, 216-A-29 and 216-B-3.

Waste Type: Process Effluent

Waste Description: The ponds and ditch were contaminated with approximately 10,000 curies of mixed fission products from a coil leak in the PUREX F-15 tank. Water and biota samples found niobium-95, zirconium, yttrium, strontium-89, cerium-144, praseodymium-144, strontium-90 and cesium-137.

The Site Was Consolidated With:

Names: 216-B-3; 216-B-3 Main Pond; 216-B-3 Swamp; B Plant Swamp; B Pond; B Swamp; B-3 Pond; West Side Overflow Pond

Code: UPR-200-E-36 **Classification:** Accepted

Names: UPR-200-E-36; Contamination Spread North of Semi-Works; Road Contamination North of Semiworks; UN-200-E-36 **Reclassification:** Consolidated (11/22/2004)

Type: Unplanned Release **Start Date:** 1/1/1967

Status: Inactive **End Date:**

Description: The release site is no longer marked or posted. The release was described as contamination that spread in a fan-shaped measuring 150 yards (137 meters) wide and 300 yards (275 meters) long. The contamination effected the road and desert land north of the Strontium Semiworks.

Location: The release effected the road and land north of Strontium Semiworks. The road north of the Semiworks facility is 7th Street. The location description is vague.

Release Description: The release occurred on July 24, 1967 during removal of two pumps from A cell at the Strontium Semiworks facility. The contaminated area consisted of a fan-shaped area extending 150 yards (137 meters) wide and 300 yards (275 meters) long north of A cell at Semiworks (201-C). No conclusive cause of the spread is discussed.

Related Sites/ Structures: The stabilized Semiworks area is known as 200-E-41.

Waste Type: Process Effluent

Waste Description: The release contaminated the area with beta/gamma with readings of 30,000 to 80,000 counts per minute from two pumps removed from the Semiworks A cell.

The Site Was Consolidated With:

Code: 200-E-41

Names: 200-E-41; Stabilized Hot Semiworks Area; Strontium Semi-Works Stabilized Area; UN-216-E-38

Code: UPR-200-E-38

Classification: Accepted

Names: UPR-200-E-38; Release from 241-B-152; UN-200-E-38; UN-216-E-4

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1968

Status: Inactive

End Date: 1/1/1968

Description: 241-B Tank Farm is enclosed with a chain link fence. The release is not separately marked or posted.

Location: The release occurred in the southwest corner of 241-B Tank Farm, adjacent to the 241-B-152 Diversion Box.

Release Description: A line, carrying 221-B cell drain waste, leaked causing a subsidence at the southeast corner of the 241-B-152 Diversion Box. Liquid was observed in the hole. Dose rate levels included 5 rad per hour at a distance of 10 meters (30 feet) and 30 millirem per hour at a distance of 45 meters (150 feet). Contamination spread in a northeast direction from the diversion box. Ground contamination levels ranged from 2,000 to 6,000 counts per minute at a distance of 183 meters (600 feet). Contamination levels decreased to background levels before reaching the 200 East Area perimeter road and fence.

Related Sites/ Structures: The release is associated with the 241-B-152 Diversion Box.

Waste Type: Chemicals

Waste Description: Dose rates ranged from 5 rad per hour to 30 millirem per hour. Ground contamination readings ranged from 2,000 to 6,000 counts per minute. The waste came from the 221-B 9-2 tank and contained ruthenium and cerium.

The Site Was Consolidated With:

Code: 200-E-120

Names: 200-E-120; Contaminated Soil at 241-B Tank Farm; Contamination Migration Beyond the 241-B fence

Code: UPR-200-E-40

Classification: Accepted

Names: UPR-200-E-40; Release from the 216-A-36B Crib Sampler; UN-200-E-40

Reclassification: Consolidated (1/19/2000)

Type: Unplanned Release

Start Date: 1/1/1968

Status: Inactive

End Date:

Description: The site is an unplanned release. The site is not separately marked or posted. It has been consolidated with 200-E-103, because it is located within the boundaries of the larger site. 200-E-103 is a surface stabilized area that is posted Underground Radioactive Material.

Location: The release occurred on the ground and blacktop area outside the 216-A-36B Crib Sampler

Shack (#295-A). The sample shack is located inside the PUREX Exclusion fence, south of 202-A, adjacent to the west side of the PUREX Storage Tunnel.

Release Description: On August 5, 1968, the valve to the vent line at the 216-A-36B Crib Sampling Shack was inadvertently left open. Liquid was noted spewing from the vent on the 216-A-36B Crib Sample Shack (295-A). The release contaminated approximately 4.65 square meters (50 square feet) of the blacktop outside the shack. The maximum contamination was 150 millirad/hour.

Related Sites/Structures: The site is associated with the 216-A-36B Crib, the 295-A Sample Shack, UPR-200-E-39 and the surface stabilized area known as 200-E-103.

Waste Type: Process Effluent

Waste Description: The release consisted of contaminated liquid (ammonia scrubber) with maximum beta/gamma readings of 150 millirad/hour.

The Site Was Consolidated With:

Code: 200-E-103

Names: 200-E-103; PUREX Stabilized Area; Radiologically Controlled Area - South Side of PUREX

Code: UPR-200-E-41

Classification: Accepted

Names: UPR-200-E-41; UPR-200-E-85; UN-200-E-41
Soil Contamination in the Vicinity of R-13
Stairwell (221-B)

Reclassification: Consolidated (10/6/2005)

Type: Unplanned Release

Start Date: 1/1/1972

Status: Inactive

End Date:

Description: This is a DUPLICATE of UPR-200-E-85.

Location: The site is located in the vicinity of the R-13 stairwell on the south side of the 221-B Building.

Release Description: This site was originally reclassified as Rejected. The reclassification form states that the site was reclassified because it is a duplicate of another site. The reclassification occurred before a Consolidated reclassification status was available. The reclassification status was administratively changed to Consolidated. The reclassification date was not changed. Elevated dose rates were found inside a concrete electrical utility pit during a routine radiation monitoring survey on July 19, 1972. The maximum dose rate levels were up to 12.5 rad per hour, including 1.5 rad per hour of gamma. The release occurred in the ion exchange loading waste export line from tank 18-1 going to 241-BX Tank Farm via the 241-BX-154 diversion box. This waste line is located adjacent to the electrical utility pit. Contaminated waste seeped from the waste line and effected the electric utility pit.

Waste Type: Process Effluent

Waste Description: An estimated 30 curies of cesium-137 with readings of 12.5 rad per hour was released to the soil around the pipeline that carried tank 18-1 waste. Half of the cesium released was removed with the soil excavated to expose the line leak.

The Site Was Consolidated With:

Code: UPR-200-E-85

Names: UPR-200-E-85; Line Leak at 221-B Stairwell R-13; UN-200-E-41; UN-200-E-85; UN-216-E-13; UPR-200-E-41

Classification: Accepted

Names: UPR-200-E-47; Contamination Spread from 241-

Reclassification: Consolidated (6/13/2002)

The Site Was Consolidated With:**Code:** 200-E-131**Names:** 200-E-131; Contaminated Soil Associated with 241-A Tank Farm Complex

Code: UPR-200-E-49 **Classification:** Not Accepted**Names:** UPR-200-E-49; Roadway Contamination; UN-200-E-49 **Reclassification:** None**Type:** Unplanned Release **Start Date:** 1/1/1975**Status:** Inactive **End Date:** 1/1/1975**Description:** The sites of the release are not currently marked or posted.**Location:** The two contaminated areas were on the roadway between the 241-AY Tank Farm and 218-E-12B Burial Ground.**Release Description:** On February 7, 1975, a thermocouple well was removed from the 241-A-104 Storage Tank by pulling the well into a plastic tube as it was withdrawn from the tank. The contained well was placed on a flatbed truck for transportation to the burial ground. When leaving the Tank Farm gate, the plastic tube was ripped at the end closest to the front of the truck. At each of two downhill grades on the road, condensate in the plastic tube dripped out of the rip. Because the road was covered by 15 centimeters (6 inches) of snow, the driver thought the drips were probably melting snow. Upon arrival at the burial ground, the driver informed the foreman of the drips. A monitoring survey showed the release of contamination, which was limited to the snow cover and did not reach the roadway. The cleanup was begun that day and finished by noon on February 10, 1975.**Waste Type:** Process Effluent**Waste Description:** The road was contaminated with beta/gamma with readings of 100,000 counts/minute while transporting a themocouple from the 241-A-104 tank to the burial ground.

Code: UPR-200-E-51 **Classification:** Accepted**Names:** UPR-200-E-51; Liquid Release from Purex to B-Pond; UN-200-E-51 **Reclassification:** Consolidated (1/19/2000)**Type:** Unplanned Release **Start Date:** 1/1/1977**Status:** Inactive **End Date:****Description:** The site is an unplanned release that discharged to 216-A-29 Ditch, 216-B-3-3 Ditch, and 216-B-3 Pond. There is no visual evidence of this release. It is not separately marked or posted. The 216-B-3 Pond, 216-A-29 Ditch and the 216-B-3-3 Ditch have all been backfilled and surface stabilized. They are posted Underground Radioactive Material areas. This site has been consolidated with the 216-A-29 Ditch.**Location:** The incident involved a release to 216-B-3 Pond via the PUREX Building chemical sewer and the 216-B-3-3 Ditch. All of these waste units are located east of the 200 East Area perimeter fence.**Release Description:** On May 15, 1977, a maximum of 15 kilograms (33 pounds) of cadmium as a nitrate solution was released from the PUREX storage tank, TK-324, to the chemical sewer (216-A-29 Ditch), 216-B-3-3 Ditch, and eventually released into the 216-B-3 Pond (B Pond). The incident occurred during an attempted transfer in the PUREX Building from storage tank TK-324 to storage tank TK-F18. A total of 61 drums that had previously contained cadmium nitrate were rinsed out and the solution was put in storage tank TK-324. TK-324 was discharged to the chemical sewer (216-A-29 Ditch). The cadmium nitrate solution was supposed to be

transferred to TK-F18 for ultimate disposal to an underground storage tank, however, the Instrument Engineering Flow Diagram was not correct regarding the discharge routing from TK-324.

Related Sites/ Structures: The release is associated with the PUREX facility, 216-B-3, 216-B-3-3 and 216-A-29.

Waste Type: Chemicals

Waste Description: A cadmium nitrate solution containing 15 kilograms (33 pounds) of cadmium was released to the pond and ditch system. Water samples found levels of cadmium to be 5 times the drinking water standard.

The Site Was Consolidated With:

Start Date: 1/1/1978

Status: Inactive

End Date:

Description: The burial ground is surrounded with concrete markers and Underground Radioactive Material signs. The release site is not marked or posted.

Location: The release occurred at the south end the 218-E-1 Burial Ground .

Release Description: On October 17, 1978, a contamination spread occurred during backfilling operations when shallow buried contaminated waste in an adjacent trench was uncovered by a bulldozer blade. Numerous spots of radioactive contamination were detected throughout an area of approximately 15.3 meters (50 feet) by 45.8 meters (150 feet) at the south end of the dry waste trench. A spot of contamination measuring up to 150 millirads/hour was also detected on the bulldozer which had been used during backfilling operations at the trench on October 12, 1978.

Waste Type: Soil

Waste Description: Beta/gamma with readings to 150 millirads/hour were detected on the bulldozer blade after working in the 218-E-1 Burial Ground uncovered a portion of the buried waste. Contamination spots were detected in an area at the south end of the waste trench.

The Site Was Consolidated With:

Code: 218-E-1

Names: 218-E-1; 200 East Dry Waste No. 001

Code: UPR-200-E-58

Classification: Accepted

Status: Inactive	End Date:

Description: The release, inside the Tank Farm fenceline, is not marked or posted.**Location:** General contamination was identified from 244-AR Vault to 241-C Tank Farm. The source was determined to be the 241-C-151 Diversion Box, located inside the C Tank Farm fence.**Release Description:** On January 11, 1985, A Radiation Protection Technologist reported finding 2,000 counts per minute removable contamination in the vicinity of the 244-AR Vault. He asked for assistance to define the contamination boundaries. All available Radiation Protection personnel were directed to assist in characterizing the situation. PUREX, B-Plant and 241-A Tank Farm were determined not to be the source. The characterization efforts were complicated by the presence of low level contamination with a rapid decay that was determined to be radon from a prolonged weather inversion. The affected area was in the vicinity of the 241-C Tank Farm. Environmental samples and roadway and surface surveys indicated the 241-C-151 Diversion Box was the source of the contamination spread. Dose rates of 5 rad per hour were found on the cover blocks.**Waste Type:** Process Effluent**Waste Description:** The contamination consisted of beta/gamma particulates, with readings ranging from 2,000 counts per minute to 5 rad per hour on the diversion box cover blocks and other surfaces in 200 East Area.**The Site Was Consolidated With:****Code:** 200-E-133**Names:** 200-E-133; Contaminated Soil at 241-C Tank Farm; Contamination Migration Beyond the fence at C Farm

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1954

Status: Inactive

End Date: 1/1/1955

Description: The release site is not separately marked or posted.

Location: The site is an area around the 241-B-153 Diversion Box, located in the southwest corner of the 241-B Tank Farm.

Release Description: Work activities in the 241-B-153 Diversion Box during 1954 and 1955 caused a general buildup of contamination around the 241-B-153 Diversion Box.

Related Sites/ Structures: The release is associated with the 241-B-153 Diversion Box.

Waste Type: Process Effluent

Waste Description: Approximately 1 curie of fission products (particulate build up) was released from working in the 241-B-153 Diversion Box.

The Site Was Consolidated With:

Code: 200-E-120

Names: 200-E-120; Contaminated Soil at 241-B Tank Farm; Contamination Migration Beyond the 241-B fence

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1968

Status: Inactive

End Date: 1/1/1968

Description: The site, inside the 241-B Tank Farm, is not separately marked or posted. It is a duplicate of UPR-200-E-38.

Location: The release caused the ground to cave in near the southwest corner of the 241-B-152 Diversion Box, inside the 241-B Tank Farm.

Release Description: On January 4, 1968, a soil cave-in was noticed near the southwest corner of the 241-B-152 Diversion Box. High background readings indicated the pipeline that connected the 9-2 tank in the 221-B Plant to the 241-B-110 tank had ruptured.

Related Sites/ Structures: The release is associated with the 241-B-152 Diversion Box.

Waste Type: Process Effluent

Waste Description: The release consisted of solution from the 9-2 Tank in B Plant containing cerium-144 with

Description: 4,780 curies, ruthenium-106 with 340 curies, and zirconium-95/Nb with 850 curies. This is a fission product disposal site, high in salt and is neutral to basic pH waste.

The Site Was Consolidated With:

Code: 200-E-120

Names: 200-E-120; Contaminated Soil at 241-B Tank Farm; Contamination Migration Beyond the 241-B fence

Code: UPR-200-E-81

Classification: Accepted

Names: UPR-200-E-81; 241-CR-151 Line Break; UN-200-E-81; UN-216-E-9

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1969

Status: Inactive

End Date: 1/1/1969

Description: The release, inside the tank farm fenceline, is not separately marked or posted.

Location: UPR-200-E-81 occurred in the waste transfer line near the 241-CR-151 Diversion Box, inside the 241-C Tank Farm.

Release Description: On October 15, 1969, a puddle of contaminated liquid, measuring approximately 1.8 meters by 12.2 meters (6 feet by 40 feet), was discovered a few feet west of the 241-CR-151 Diversion Box. The source was determined to be a leak in an underground transfer line from the PUREX facility (F-18 cell drainage line) to the 241-C-102 Waste Storage Tank, via the 241-CR-151 Diversion Box. When the leak was stopped, most of the liquid seeped into the soil. The contaminated area was covered with about 0.5 meters (18 inches) of backfill and clean gravel. A maximum dose rate of 5 rad per hour at distance of 6.1 meters (20 feet) was recorded.

Process Description: The original transfer line had a carbon steel segment between the 241-CR-151 diversion box and 241-C-102. The leak occurred at the welded connection between the carbon steel portion of the line and the stainless steel portion of the pipeline. The transfer line is now all stainless steel.

Related Sites/Structures: UPR-200-E-81 is associated with the 241-CR-151 Diversion Box, the 241-C-102 Tank, and the PUREX 202-A Building.

Waste Type: Process Effluent

Waste Description: Approximately 136,800 liters (36,000 gallons) of PUREX coating waste was released to the soil. The release included strontium-90 (360 curies), cesium-137 (720 curies), cerium-144 (360 curies), zirconium-95/niobium (1,080 curies), and ruthenium-103 (1,080 curies) at the time of release.

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 12/19/1969

Status: Inactive **End Date:** 12/19/1969

Description: A large mound of shotcrete is currently on top of the area where the leak surfaced, inside the tank farm fence.

Location: UPR-200-E-82 occurred at the 241-C-152 Diversion Box (inside the tank farm) and flowed to the northeast, downgrade, until it pooled into an area outside the 241-C Tank Farm fence.

Release Description: On December 19, 1969, an underground waste line (V122) leak was discovered near the 241-C-152 Diversion Box. The source was determined to be the feed line (V122) that ran from 241-C-105 tank to the 221-B Building. Approximately 3800 liters (1000 gallons) of the total liquid released collected on the surface and was visually noticed by a Radiation Monitor. The liquid traveled downgrade, in a northeast direction, until it pooled into an area measuring approximately 0.46 square meter (5 square feet), outside the tank farm fence. The precise location of this area is not provided in the references.

Process Description: The feed for the B Plant cesium ion exchange process was pumped from the 241-C-105 (lag storage) tank through an underground pipeline and several diversion boxes, to the 221-B building.

Related Sites/Structures: UPR-200-E-82 was associated with the 241-C-152 Diversion Box, the 241-C-105 Tank, 200-E-116-PL and the 221-B Canyon Building.

Waste Type: Process Effluent

Waste Description: The waste line leak consisted of B Plant Ion Exchange waste containing cesium-134 (100 curies), cesium-137 (11,300 curies), cerium-144 (260 curies), ruthenium-106 (130 curies) and zirconium-95/niobium (260 curies) at the time of release.

The Site Was Consolidated With:

Code: 200-E-133

Names: 200-E-133; Contaminated Soil at 241-C Tank Farm; Contamination Migration Beyond the fence at C Farm

Code: UPR-200-E-86 **Classification:** Accepted

Names: UPR-200-E-86; 241-C Tank Farm Line (V812) Break Southwest Corner; UN-200-E-86; UN-216-E-14 **Reclassification:** Consolidated (7/13/2005)

Type: Unplanned Release **Start Date:** 1/1/1971

Status: Inactive **End Date:** 1/1/1971

Description: The site is an area covered with shotcrete, with concrete AC-540 marker posts at each corner. It is posted with Underground Radioactive Material signs.

Location: UPR-200-E-86 occurred near the southwest corner of the 241-C Tank Farm, outside the tank farm fence.

Release Description: On February 25, 1971, routine line (leak detection) monitoring equipment detected a leak in the vicinity of transfer line number 812. The line was being used to transfer process waste (containing approximately 25,000 curies of cesium-137) from the 244-AR Vault to 241-C-106 in 241-C Tank Farm. The leak occurred at the welded junction of a carbon steel segment and a stainless steel segment of the pipeline. The pipeline is identified as line V108/812.

Process Description: The 812 transfer line is a 5 centimeter (2 inch) diameter carbon steel line with stainless steel joints. It is buried 2.4 meters (8 feet) below ground.

Related Sites/ Structures: UPR-200-E-86 is associated with the process transfer line number 812 (Site Code 200-E-153 PL), the 244-AR Vault, and the 241-C Tank Farm.

Waste Type: Process Effluent

Waste Description: A leak of approximately 65802 liters (17,385 gallons) of process waste, containing 25,000

curies of cesium-137, caused approximately 36 cubic meters (1,300 cubic feet) of soil to be contaminated. The waste contained approximately 1.35 curies per gallon of cesium-137.

The Site Was Consolidated With:

Code: 200-E-153-PL

Names: UPR-200-E-90; Ground Contamination Around B Plant Sand Filter; Radioactive Spill Near 221-B Building; UN-200-E-90; UN-216-E-18; UN-216-E-90

Reclassification: Rejected (7/19/2004)

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: This release site is not separately marked or posted. A 1991 site visit found the area around the 291-B Sand Filter delimited by a light weight chain link fence and marked with surface contamination warning signs.

Location: The site location is described as being approximately 300 feet (92 meters) south of the 221-B Building and adjacent to the 291-B Stack Sand Filter.

Release Description: A correspondence from Harold Maxfield dated September 24, 1981 states UN-216-E-18 (aka UPR-200-E-90) is an operational dose rate zone, established because of high gamma dose rates emitting from the 291-B Stack Area. It was mistakenly designated as an Unplanned Release Site.

Related Sites/ Structures: UPR-200-E-90 is associated with the 291-B Stack Sand Filter.

Waste Type: Process Effluent

Waste Description: In September 1980 the area surrounding the 291-B Stack sand filter (inoperable) and filtration system was found to have high gamma dose rates. Millions of curies of radionuclides filtered through these systems and is the source of the radiation according to BHI-00179.

Code: UPR-200-E-92

Classification: Accepted

Reclassification: Consolidated (4/12/2004)

Type: Unplanned Release

Start Date: 1/1/1980

Status: Inactive

End Date: 1/1/1981

Description: This site was released from radiation zone status after the contaminated soil was removed in 1981. It is no longer marked or posted.

Location: UPR-200-E-92 had been located along the exterior of the eastern 200 East Area perimeter fence.

Release Description: UPR-200-E-92 was the result of contaminated Russian thistle being blown from some of the

Release Description: 200 East Area waste sites and lodging against the east perimeter fence. The thistles decomposed and released radioactive strontium and cesium into the blown sand along the bottom of the fence.

Related Sites/ Structures: The contaminated soil from UPR-200-E-92 was excavated and placed in UPR-200-E-56, which was the site of a leak from the 216-A-24 Retention Basin. WIDS site 200-E-109 addresses the reoccurring contamination of the 200 East Area perimeter fence due to contaminated tumbleweeds accumulating along the fence line.

Waste Type: Vegetation

Waste Description: Small amounts of strontium and cesium were deposited into the sand from contaminated

Russian thistle fragments.

The Site Was Consolidated With:

Code: 200-E-109

Names: 200-E-109; Contaminated Tumbleweed Accumulation; Contamination Spread in Northeast Corner of 200 East Area

Code: UPR-200-E-93

Classification: Accepted

Names: UPR-200-E-93; UN-216-E-21 Ground Contamination Along 200 East Area fence

Reclassification: Consolidated (4/12/2004)

Type: Unplanned Release

Start Date: 1/1/1980

Status: Inactive

End Date: 1/1/1981

Description: This unplanned release is no longer marked or posted.

Location: UPR-200-E-93 was located along the interior of the eastern 200 East Area perimeter fence, extending from the 207-A Retention Basin to the northeast corner of the 200 East Area.

Release Description: UPR-200-E-93 is the result of contaminated Russian thistle being blown from some of the 200 East Area waste sites and lodging against the east perimeter fence. Over a number of years, the thistles decomposed and formed a layer of radioactivity under the sand along the fence.

Process Description: Contamination areas are often identified that are attributed to the accumulation of blowing contaminated tumbleweeds and tumbleweed fragments.

Related Sites/ Structures: The contaminated soil from UPR-200-E-93 was excavated and placed in UPR-200-E-56, which was the site of a leak from the 216-A-24 Retention Basin. WIDS site 200-E-109 addresses the reoccurring contamination of the 200 East Area perimeter fence due to contaminated tumbleweeds accumulating along the fence line.

Waste Type: Vegetation

Waste Description: Small amounts of contamination were deposited into the sand from the contaminated Russian

thistle that collected and then decomposed along the fence line.

The Site Was Consolidated With:

Code: 200-E-109

Names: 200-E-109; Contaminated Tumbleweed Accumulation; Contamination Spread in Northeast Corner of 200 East Area

Code: UPR-200-E-94

Classification: Accepted

Names: UPR-200-E-94; Vehicle Decontamination Area;

Reclassification: Rejected (2/10/2000)

UN-200-E-94; UN-216-E-22

Type: Unplanned Release**Start Date:** 1/1/1979**Status:** Inactive**End Date:** 1/1/1979

Description: The site was a large gravel pit that was sometimes used to decontaminate equipment. The gravel pit had been posted with Surface Contamination Area (SCA) signs. The radiological posting was removed from the gravel pit in 1984. The gravel pit was obliterated by heavy construction equipment in the area during the stabilization of the 216-B-3-1 and 216-B-3-2 ditches. The gravel pit is no longer visible or marked.

Location: The site was located inside a gravel pit located north of the 216-B-3-1 Ditch. The 216-B-3-1 Ditch is located east of the 200 East Area perimeter fence.

Release Description: In June 1979, the Radiation Monitoring Department was informed that moisture was being encountered in the excavation east of the 200 East Area perimeter fence adjacent to the 216-A-24 Crib, where fill dirt was being obtained for the construction of the 241-AN Tank Farm (see Site Code UPR-200-E-56). Follow-up surveys revealed a maximum of 8,000 counts per minute beta/gamma contamination in the moisture, on the earth moving equipment and in the newly hauled-in soil around the new 241-AN Tank Farm. The contaminated equipment was taken to the large gravel pit north of the 216-B-3 Ditch Diverter Station, where it was decontaminated. The designation of the gravel pit as UPR-200-E-94 (alias UN-216-E-22) is the result of the contamination residue on the bottom of the gravel pit, with beta/gamma activity reading 300 counts per minute.

Process Description: In 1970, the gravel pit was posted as a Radiation Zone and used to park regulated (contaminated) equipment during the decontamination of the 216-B-3-2 Ditch. It was used again in 1979 to decontaminate earth moving equipment that became contaminated by digging too close to the 216-A-24 Crib (see UPR-200-E-56). The gravel pit remained posted as a radiological area until 1984.

Related Sites/ Structures: The site is associated with UPR-200-E-56, 216-B-3-1 and 216-B-3-2.

Waste Type: Soil

Waste Description: An earth moving vehicle was found to be contaminated with a maximum of 8000 counts per minute. Equipment decontamination efforts done in the gravel pit left a 300 counts per minute residue on the bottom of the pit. The waste was unknown beta and gamma contamination.

Code: UPR-200-E-97**Classification:** Accepted**Names:** UPR-200-E-97; Contamination Near PUREX Railroad Tunnel; Ground Contamination Around Cribs South of PUREX; UN-200-E-97; UN-216-E-25**Reclassification:** Consolidated (7/19/2004)**Type:** Unplanned Release**Start Date:** 1/1/1980**Status:** Inactive**End Date:**

Description: The site is not separately marked or posted. It had been located near the 216-A-21 crib, inside the stabilized area now known as 200-E-103. The area was surface stabilized in 1999.

Location: The site is located south of the 202-A Building near the railroad tunnel. A map attachment to RHO-CD-1048 indicates it was adjacent to the west side of tunnel 218-E-14.

Release Description: Ground contamination from an unknown source was detected around the cribs south of PUREX, west of the railroad tunnel (218-E-14).

Related Sites/ The release site is associated with the 200-E-103 stabilized area.

Structures:

Waste Type: Soil

Waste Surface soil contamination was identified from an unknown source.

Description:

Code: 200-E-103

Names: 200-E-103; PUREX Stabilized Area; Radiologically Controlled Area - South Side of PUREX

Code: UPR-200-E-105

Classification: Accepted

Names: UPR-200-E-105; Liquid Release in the 241-BY Tank Farm; UN-200-E-105

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1952

Status: Inactive

End Date:

Description: The release site is not separately marked or posted.

Location: The contaminated liquid discharge occurred at the manifold header at the 241-BY-107 Tank, inside the 241-BY Tank Farm.

Release Description: On December 16 and 17, 1952, first cycle waste leaked from the manifold header at the 241-BY-107 Tank in the 241-BY Tank Farm onto the ground surface. A mechanic forgot to replace and tighten the bolts on the manifold header after breaking one of the bolts at the flange connection to the manifold header while removing a waste pump. On December 16, 1952, at 2:55 PM liquid waste started being pumped from the 241-BX-107 Tank to the 241-BY-107 Tank. A pool of contaminated liquid next to 241-BY-107 was discovered by a chemical trainee on December 17, 1952, just after midnight, when he went to the wrong tank by mistake. He took a dose reading, which was well up on the third scale of the CP meter, and immediately left the area. The pumping at the 241-BX-107 Tank was stopped when they realized where the liquid was coming from. About 87,055 liters (23,000 gallons) of first cycle waste was discharged onto the ground surface in a low, well confined area, measuring about 27.9 square meters (300 square feet).

Waste Type: Process Effluent

Waste Description: The release consisted of first-cycle waste. The exposure rate to the chemical operator trainee was 7.5 rad per hour about 0.91 meters (3 feet) from the liquid. Estimated dose to the individual was 60 millirems. Radiation surveys revealed a maximum dose rate of 150 rad per hour at 5.08 centimeters (2 inches) from the surface of the release.

The Site Was Consolidated With:

Code: UPR-200-E-106

Classification: Accepted

Names: UPR-200-E-106; Contamination at a Burning Ground; UN-200-E-106

Reclassification: Consolidated (5/6/2004)

Type: Unplanned Release

Start Date: 1/1/1946

Status: Inactive

End Date: 1/1/1946

Description: UPR-200-E-106 is an unplanned release that occurred in a burning ground in the 200 East Area. There is no visual evidence of contaminated material remaining in the 200-E Burn Pit. This Unplanned Release is not marked or posted.

Location: The location information contained in the 1946 Occurrence Report is vague. The authors of the PUREX Plant Aggregate Area Management Study Technical Baseline Report (BHI-00178) have assumed that this incident occurred within the 200-E Burning Pit.

Release Description: On September 5, 1946 contaminated towels showing radiation levels as high as 2.4 rads/hour (originally measured as 2.5 reps/hour) were found in one of the "burning grounds". The towels were traceable to the Control Laboratory since they were contained with waste from that location. The acronym rep stands for Roentgen Equivalent Physical with one rep equaling 95 ergs/gram (0.0095 joules/kilogram). One rep is roughly equivalent to 1 rad.

Waste Type: Chemicals

Waste Description: The waste consisted of radiologically contaminated towels.

The Site Was Consolidated With:

Code: 200-E BP

Names: 200-E BP; 200-E Burning Pit; 200 East Burn Pit

Code: UPR-200-E-107

Classification: Accepted

Names: UPR-200-E-107; Contamination Spread in 241-C Tank Farm; UN-200-E-107

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1952

Status: Inactive

End Date: 1/1/1952

Description: The site is not separately marked or posted from the rest of the tank farm postings.

Location: UPR-200-E-107 occurred within the 241-C Tank Farm.

Release Description: On November 26, 1952, process waste was being directed to the first tank in a three tank cascade series. The waste failed to cascade to the second tank, indicating the overflow line was plugged. Since there was an urgent need to discharge the waste to these tanks, an overground transfer was attempted. The foreman wanted to check the pump operation. He believed the pump was not yet submerged into the waste and opened the air valve. Since the pump leg was already in the liquid, it discharged waste with sufficient force to be propelled 6 meters (20 feet) away. Approximately 19 liters (5 gallons) of waste was discharged to the ground with a dose rate of 4 rad per hour.

Related Sites/Structures: UPR-200-E-107 is associated with the 241-C-110 Tank in the 241-C Tank Farm.

Waste Type: Process Effluent

Waste Description: The waste was tributyl phosphate (TBP) from the 221-U uranium recovery process.

Description: Approximately 18.9 liters (5 gallons) of contaminated liquid was discharged to the ground before the pump could be shut off. The maximum dose rate was 4.2 rad per hour at the surface, including 200 millirem per hour at a distance of 2 inches.

The Site Was Consolidated With:

Code: 200-E-133

Names: 200-E-133; Contaminated Soil at 241-C Tank Farm; Contamination Migration Beyond the fence at C Farm

Code: UPR-200-E-108 **Classification:** Accepted

Names: UPR-200-E-108; 241-B-102 Tank Release; UN-200-E-108 **Reclassification:** Consolidated (6/13/2002)

Type: Unplanned Release **Start Date:** 1/1/1953

Status: Inactive **End Date:** 1/1/1953

Description: The release is not separately marked or posted from the rest of the tank farm.

Location: Contamination spread in and around the 241-B-102 heel jet pit inside the 241-B Tank Farm. The tank is located in the eastern portion of the 241- B Tank Farm.

Release Description: On April 14, 1953, a high level contamination spread was caused when supernatant pumped from 241-B-102 to 241-B-101 spilled to the ground inside the tank farm because a blank was not installed on the heel jet discharge line. The heel jet pit is located near the surface in the center of the tank. Personnel contamination of 4,000 counts per minute on a shoe led to the discovery of the incident. Ground contamination up to 10 rad per hour was identified 3.05 meters (10 feet) from the pit. No significant exposures were known to have occurred. The incident was investigated by the Manufacturing Department as Incident #64, and published as HW-27914. The same incident (same date, location, and circumstances) was later documented by the Radiological Sciences Department on November 5, 1953, as Incident #279 in HW-29957.

Waste Type: Process Effluent

Waste Description: Metal waste supernatant from 241-B-102 was released to the ground. Visible evidence of

ground contamination was noted with dose rates up to 10 rad per hour on the surface.

Status: Inactive **End Date:**

Description: The site is not separately marked or posted from the rest of the tank farm.

Location: The release occurred inside the 241-B Tank Farm near the north side of tank 241-B-104.

Release Description: On November 11, 1953, tributyl phosphate (TBP) waste liquid contaminated the ground around the 241-B-104 Tank due to a blocked riser. The incident was created by a pump float jammed in the riser. About noon on November 10, 1953, operations and maintenance personnel were attempting a routine placement of a portable pump within a 30.48 pump float became jammed about 3.35 meters (11 feet) below the flange and broke loose from the pump. Pending salvage of the float, the concrete riser plug was replaced. Shortly after this happened, a routine transfer of 15140 liters (4000 gallons) of TBP waste, followed by a 757 liter (200 gallon) hot water flush, was made into the 241-B-104 Tank without apparent incident. About 12 hours later another 15140 liter (4000 gallon) waste transfer was made, followed by a steam sparge for 10 to 20 minutes. After the steam sparge, a process operator entered the tank farm to determine if the transfer was complete. An area of approximately 27.9 square meters (300 square feet) surrounding the jammed riser was visibly discolored, with exposure rates of 18 rad per hour at a distance of 15.24 centimeters (6 inches) and 100 millirads per hour at a distance of 9.1 meters

(30 feet). Approximately 567.75 liters (150 gallons) of concentrated waste is estimated to have spread onto the ground. It is assumed that the float partially obstructed the waste flow. When steam pressure was applied, the waste was forced up the riser around the gasketed plug and onto the ground.

Waste Type: Process Effluent

Waste Description: 567.75 liters (150 gallons) of tributyl phosphate waste contaminated the ground at the 241-B-104 Tank. The exposure rate was 18 rad per hour at a distance of 15.24 centimeters (6 inches).

The Site Was Consolidated With:

Code: 200-E-120

Names: 200-E-120; Contaminated Soil at 241-B Tank Farm; Contamination Migration Beyond the 241-B fence

Code: UPR-200-E-110

Classification: Accepted

Names: UPR-200-E-110; 241-BY Valve Pit Release; UN-200-E-110

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1955

Status: Inactive

End Date: 1/1/1955

Description: The release occurred in the 241-BY Tank Farm. A crescent shaped area around a valve pit was contaminated. The area is not separately marked or posted.

Location: UPR-200-E-110 occurred around the 241-BY-112 Valve Pit, inside the 241-BY Tank Farm.

Release Description: UPR-200-E-110 occurred when liquid contaminant spread through the soil from the 112-BY Valve Pit. Several employees were potentially over-exposed as a result of the release at the 241-BY Tank Farm. A crescent shaped area around the 112-BY Pit was contaminated. A fire hose and two worker's gloves were also contaminated.

Related Sites/Structures: UPR-200-E-110 was associated with the 241-BY-112 Tank, the 241-BY-112 Valve Pit and the 241-BY Tank Farm.

Waste Type: Process Effluent

Waste Description: The release consisted of first cycle waste from the 241-BY-112 Tank. UPR-200-E-110 covered approximately 700 cubic meters (25,000 square feet) of ground around the 112-BY Valve Pit.

Contamination levels up to 22 rad per hour were recorded.

The Site Was Consolidated With:

Code: 200-E-132

Names: 200-E-132; 241-BX/BY Tank Farm Contaminated Soil; Contamination Migration Beyond the 241-BX/BY fence

Code: UPR-200-E-114

Classification: Accepted

Names: UPR-200-E-114; 202-A Valve Pit; UN-200-E-114

Reclassification: Rejected (4/20/2000)

Type: Unplanned Release

Start Date: 1/1/1974

Status: Inactive

End Date: 1/1/1974

Description: The documented release describes a personnel contamination. The location where the employee became contaminated was not identified beyond "a valve pit outside 202-A."

Location: The event occurred in an unidentified valve pit outside the 202-A Building.

inches. The area around the pit was covered with dirt.

Waste Type: Process Effluent

Waste Description: An unknown amount of caustic flush water containing cesium-137, yttrium-90, and strontium-89/90 was released with dose rates up to 3 rad per hour at 15 centimeters (6 inches).

The Site Was Consolidated With:

Code: 200-E-132

Names: 200-E-132; 241-BX/BY Tank Farm Contaminated Soil; Contamination Migration Beyond the 241-BX/BY fence

Code: UPR-200-E-117

Classification: Accepted

Names: UPR-200-E-117; Contaminated Liquid Spill; UN-200-E-117

Reclassification: Consolidated (11/22/2004)

Type: Unplanned Release

Start Date: 1/1/1972

Status: Inactive

End Date:

Description: The release was identified above an encased waste line on the south of PUREX and west of the railroad tunnel. The release site is no longer marked or posted. The release site is within a larger area that was surface stabilized in 1999, known as 200-E-103.

Location: The spill occurred on the south side of 202-A, west of the railroad tunnel.

Release Description: During the excavation of an encased waste line on April 20, 1972, employees encountered liquid spurting up out of ground in the hole they had dug. The excavation was within a few inches of the top of the encasement. Personnel were evacuated from the caisson in which they were working.

Process Description: Underground pipelines V021, V022 and V023 connect the 241-A-151 Diversion Box to the 241-AW Tank Farm.

Related Sites/ Structures: The site is associated with the 241-A-151 Diversion Box and 200-E-103.

Waste Type: Process Effluent

Waste Description: Dose rates following the release were 2 rad per hour including 500 millirad per hour at 0.3 meters (1 foot) from the liquid. Mud samples taken at the point where the leak occurred showed primarily cesium and strontium with little evidence of short-lived radionuclides.

The Site Was Consolidated With:

Code: 200-E-103

Names: 200-E-103; PUREX Stabilized Area; Radiologically Controlled Area - South Side of PUREX

Code: UPR-200-E-118

Classification: Accepted

Names: UPR-200-E-118; Airborne Release from 241-C-107; UN-200-E-118

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1957

Status: Inactive

End Date: 1/1/1957

Description: The release site is not separately marked or posted.

Location: The release occurred inside the 241-C Tank Farm, at the 241-C-107 Tank.

Release Description: On April 20, 1957, an airborne particle release caused contamination to spread inside the 241-C Tank Farm fence and extended 91 meters (300 feet) to the south of the badge house and an additional 270 meters (900 feet) to the north of the badge house. The contamination also spread outside of the fence, affecting the south bank of the parking lot. The highest dose rate at the surface was estimated at 50 millirad per hour, with one particle deposited per square foot.

Related Sites/ Structures: UPR-200-E-118 is associated with the 241-C-107 Tank and the 241-C Tank Farm.

Waste Type: Soil

Waste Description: The contaminated particles on the ground surface read up to 3,000 counts per minute.

The Site Was Consolidated With:

Code: 200-E-133

Names: 200-E-133; Contaminated Soil at 241-C Tank Farm; Contamination Migration Beyond the fence at C Farm

Code: UPR-200-E-119	Classification: Accepted
Names: UPR-200-E-119; Contamination Spread Inside 241-AX; UN-200-E-119	Reclassification: Consolidated (6/13/2002)
Type: Unplanned Release	Start Date: 1/1/1969
Status: Inactive	End Date: 1/1/1969

Description: The release occurred on the ground near the 241-AX-104 Tank. It is not separately marked or posted from the rest of the tank farm.

Location: UPR-200E-119 occurred adjacent to the 241-AX-104 Tank, inside the 241-AX Tank Farm fence.

Release Description: An employee mistakenly pulled a contaminated electrode cable out of Tank 241-AX-104 and set it on the ground. He then removed his contaminated gloves and set them on the ground. Contamination was limited to a small area near the 241-AX-104 Tank, the employee, and the change house. Due to the high dose rate on the electrode, the employee received a whole body and extremity dose.

Related Sites/ Structures: UPR-200-E-119 was associated with the 241-AX-104 Tank and Change House.

Waste Type: Process Effluent

Waste Description: The release consisted of high-level waste from Tank 241-AX-104 dripping onto the soil from a contaminated electrode cable that had been inside the 241-AX-104 tank.

The Site Was Consolidated With:

Code: 200-E-131

Names: 200-E-131; Contaminated Soil Associated with 241-A Tank Farm Complex

Code: UPR-200-E-125	Classification: Accepted
Names: UPR-200-E-125; 241-A-104 Release; UN-200-E-125	Reclassification: Consolidated (6/13/2002)
Type: Unplanned Release	Start Date: 1/1/1975

Status: Inactive **End Date:** 1/1/1975
Description: The release is within the 241-A Tank Farm fence. The site is not separately marked or posted.
Location: UPR-200-E-125 occurred in the soil underneath the 241-A-104 Tank, inside the 241-A Tank Farm.
Release Description: Single Shell Tank 241-A-104 was classified a "Confirmed Leaker" on April 8, 1975 due to radiation readings increasing at several locations beneath the tank. Occurrence Report 75-39 was issued to document the event.

Related Sites/ Structures: UPR-200-E-125 was associated with the 241-A-104 Tank and the 241-A Tank Farm.

Waste Type: Process Effluent
Waste Description: Approximately 9463 liter (2500 gallon), containing 18,000 curies of cesium-137 with levels reading to 6,450 counts per minute, was released from the 241-A-104 tank.

The Site Was Consolidated With:

Code: 200-E-131
Names: 200-E-131; Contaminated Soil Associated with 241-A Tank Farm Complex

Code: UPR-200-E-126 **Classification:** Accepted
Names: UPR-200-E-126; 241-A-105 Tank Leak; UN-200-E-126 **Reclassification:** Consolidated (6/13/2002)
Type: Unplanned Release **Start Date:** 1/1/1965
Status: Inactive **End Date:** 1/1/1965
Description: The unplanned release is not separately marked or posted.
Location: UPR-200-E-126 occurred in the soil beneath the 241-A-105 Tank, inside the 241-A Tank Farm.
Release Description: In January 1965, soon after Tank 241-A-105 was filled, a sudden steam release of severe intensity occurred. An investigation revealed that the bottom liner had bulged significantly, thus creating a void volume of 80,000 gallons (303,000 liters). Approximately 18,900 liters (5000 gallons) of waste leaked from the deformed tank.

Related Sites/ Structures: UPR-200-E-126 is associated with the 241-A-105 Tank and the soil beneath the tank.

Waste Type: Process Effluent
Waste Description: Approximately 18,900 liters (5000 gallons) of waste leaked from the tank that was deformed after a sudden, volatile release of steam.

The Site Was Consolidated With:

Code: 200-E-131
Names: 200-E-131; Contaminated Soil Associated with 241-A Tank Farm Complex

Description: This site is the soil surrounding and beneath the 241-B-201 Tank in the 241-B Tank Farm.

Location: The tank is located on the north side of the 241-B Tank Farm, inside the fence.

Release Description: In 1968, it was reported the tank had lost 4560 liters (1200 gallons) of waste containing 420 curies of cesium-137. Slowly decreasing liquid levels prompted the tank to be categorized as Questionable Integrity in 1971. In June of 1982, tank 241-B-201 was classified as a confirmed leaker. It was documented on Operating Limit Deviation Report 82-04.

Waste Type: Process Effluent

Waste Type: Process Effluent

Waste Description: Approximately 4,500 liters (1,200 gallons) of waste containing 420 curies of cesium-137 leaked from the 241-B-201 Tank.

The Site Was Consolidated With:

Code: 200-E-120

Names: 200-E-120; Contaminated Soil at 241-B Tank Farm; Contamination Migration Beyond the 241-B fence

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1955

Status: Inactive

End Date: 1/1/1977

Description: The release, under the 241-B-203 Tank, is not separately marked or posted.

Location: This release is the soil surrounding and underneath the 241-B-203 Tank, located inside the 241-B Tank Farm. The tank is in the northwest corner of the 241-B Tank Farm.

Release Description: Between 1951 and 1977, unplanned release (UPR) occurred when about 300 gallons (1,136 L) of lanthanum fluoride escaped from tank 241-B-203 and contaminated the soil surrounding and beneath the tank. The leak was determined by decreasing liquid level measurements.

Waste Type: Process Effluent

Waste Description: Approximately 1,135 liters (300 gallons) of waste containing lanthanum fluoride leaked from the 241-B-203 Tank.

The Site Was Consolidated With:

Code: 200-E-120

Names: 200-E-120; Contaminated Soil at 241-B Tank Farm; Contamination Migration Beyond the 241-B fence

Code: UPR-200-E-131

Classification: Accepted

Names: UPR-200-E-131; 241-BX-102 Release; UN-200-E-131

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1971

Status: Inactive

End Date:

Description: The release is not separately marked or posted.

Location: The release includes the soil around and underneath the 241-BX-102 tank, inside the 241-BX Tank Farm.

Release Description: The tank was determined to be leaking based on liquid level measurements and dry well radiation detection profiles. Over time, approximately 266,000 liters (70,000 gallons) of tank waste leaked into the soil. Nineteen new wells were added in 1970 to determine the extent of the plume. An estimated 930 cubic meters (31,000 cubic feet) of soil were affected by the leak. The plume extends eastward in a 1.8 meters (6 foot) band for approximately 30 meters (100 feet).

Waste Type: Process Effluent

Waste Description: Approximately 266,000 liters (70,000 gallons) of high-level, nonboiling liquid waste from the 241-BX-102 Tank was released. It contained 51,000 curies of cesium-137.

The Site Was Consolidated With:

Code: 200-E-132

Type: Unplanned Release **Start Date:** 1/1/1947

Status: Inactive **End Date:** 1/1/1977

Description: The release, at the 241-C-203 Single-Shell Tank, is not separately marked or posted.

Location: UPR-200-E-137 includes the soil around and underneath the 241-C-203 Single-Shell Tank, inside the 241-C Tank Farm.

Related Sites/ Structures: UPR-200-E-137 was associated with the 241-C-203 Tank and the 241-C Tank Farm.

Waste Type: Process Effluent

Waste Description: Approximately 1520 liters (400 gallons) of liquid, containing high level PUREX waste, has leaked from the 241-C-203 tank.

The Site Was Consolidated With:

Code: 200-E-133

Names: 200-E-133; Contaminated Soil at 241-C Tank Farm; Contamination Migration Beyond the fence at C Farm

Code: UPR-200-E-138 **Classification:** Accepted

Names: UPR-200-E-138; UPR-200-W-66; Liquid Release from B-Plant; UN-200-E-138 **Reclassification:** Consolidated (1/19/2000)

Type: Unplanned Release **Start Date:** 1/1/1970

Status: Inactive **End Date:** 1/1/1970

Description: This is a liquid Unplanned Release from 221-B to the 216-B-2-2 Ditch that terminated in the 216-B-3 Pond. The ditch is within a large, surface stabilized, Underground Radioactive

Material area that includes the 216-B-2-1, 216-B-2-2 and 216-B-2-3 Ditches. The Unplanned Release is not separately marked. This release has been consolidated with the 216-B-2-2 Ditch.

Location: The origin of the release occurred at the 8-1 Tank, inside the 221-B Building, in the 200 East Area. The release contaminated an area in the 216-B-2-2 Ditch and the 216-B-3 Pond.

Release Description: On March 22, 1970, a leaking manometer sensing line from the 8-1 Tank inside the 221-B Building was flushed down a floor drain connected to a chemical sewer that contaminated an area in the 216-B-2-2 Ditch and the 216-B-3 Pond. The 207-B Retention Basin was bypassed and was not contaminated as a result of this release. The dose rate on the manometer line in the B Plant pipe gallery was 500 R/hr at a distance of 4 inches. On March 23, 1970 at 6:00am, a dose rate of 5 R/hr was noted at check point one of the 216-B-2-2 Ditch. On March 24, 1970 at 6:00am, the dose rate at check point one of the 216-B-2-2 ditch was 2 R/hr. Check point two was 10 mr/hr, check point three was 5 mr/hr, check point four was 2R/hr and check point five was 1 R/hr.

Process Description: After UPR-200-E-138 occurred, the chemical sewer piping from the 221-B Building was flushed to the 216-B-2-2 Ditch (see 200-E-188-PL). Due to the contamination levels from the release, the ditch was then backfilled and a replacement ditch (216-B-2-3) was excavated parallel to and south of the entire length of the old ditch. B Plant effluent was then routed to the new ditch. This pipeline bypasses the 207-B Retention Basin.

Related Sites/Structures: UPR-200-E-138 was associated with a manometer sensing line from the 8-1 Tank (inside the 221-B Building), the 216-B-2-2 Ditch, the 216-B-2-3 Ditch and the 216-B-3 Pond. The pipeline associated with this release is sitecode 200-E-188-PL (line 2904-2).

Waste Type: Process Effluent

Waste Description: Radioactive liquid was released while attempting to measure the liquid level in the Storage Tank 8-1, located inside the 221-B Building. A breakdown of the radioactive material released indicates 1,495 curies (total beta) was discharged to the ditch including approximately 950 curies of strontium-90, 96 curies of cerium/promethium-144 and 1 curie of cesium-137.

The Site Was Consolidated With:

Code: 216-B-2-2

Names: 216-B-2-2; 216-B-2-2W; 216-B-1 Ditch

Code: UPR-200-E-140	Classification: Accepted
Names: UPR-200-E-140; PCB Oil Spill at 211-B Bulk Chemical Storage Area; UN-200-E-140	Reclassification: Rejected (7/28/2008)
Type: Unplanned Release	Start Date: 1/1/1986
Status: Inactive	End Date: 1/1/1986

Description: No warning signs or evidence of the unplanned release were observed during a 1991 site visit. Later, a single post was placed into the ground, with a WIDS Sitecode number sign, to mark the approximate location where the release occurred.

Location: The 211-B Bulk Storage area is located north of the 221-B building. The spill site is located at the southwest corner of the 211-B Bulk Chemical Storage Area in the 200 East Area.

Release Description: The Hanford Site Waste Management Units Report (1987) states that UPR-200-E-140 occurred on April 23, 1986. Less than 7.6 liters (2 gallons) of oil containing between 1 to 38 parts per million of polychlorinated biphenyl (PCB) was spilled to the ground at the southwest corner of the 211-B Bulk Storage Area.

Related Sites/ UPR-200-E-140 was associated with the 211-B Bulk Chemical Storage Area

200-W-7

Type: Unplanned Release**Start Date:** 1/1/1950**Status:** Inactive**End Date:**

Description: The release occurred inside the 241-T Tank Farm. The Tank Farm is surrounded with a chain link fence and posted with radiological warning signs. The diversion boxes have been covered with a protective foam layer. The unplanned release is not separately marked or posted.

Location: The 241-T-151 and 152 Diversion Boxes are located in the southeast corner of the 241-T Tank Farm - inside the tank farm fence.

Release Description: Work done in the spring of 1950 at the 241-T-151 and 241-T-152 diversion boxes resulted in contamination spread to the ground around both boxes.

Waste Type: Process Effluent**Waste Description:** Dried, loose specks spread from the diversion box and contaminated the surrounding area.**The Site Was Consolidated With:****Code:** 200-W-93**Names:** 200-W-93; Contaminated Soil at 241-T Tank Farm**Code:** UPR-200-W-10**Classification:** Accepted**Names:** UPR-200-W-10; Contamination Spread at 203-S UNH Tanks; UN-200-W-10**Reclassification:** Consolidated (7/19/2004)**Type:** Unplanned Release**Start Date:** 1/1/1952**Status:** Inactive**End Date:** 1/1/1952

Description: The site consisted of an area around the 203-S Uranium Nitrate Hexahydrate (UNH) tanks. The 203-S facility area has been decommissioned and surface stabilized (see 200-W-22). It is currently posted with Underground Radioactive Material signs. The release is not separately marked or posted.

Location: The 203-S Uranium Nitrate Hexahydrate (UNH) tanks were located northwest of the 202-S building.

Release Description: In the summer of 1952, the ground around the 203-S Uranium Nitrate Hexahydrate storage tanks were contaminated with uranium. A maximum of 10,000 counts per minute at 25 centimeters (1 inch) was found in this area. The contaminated area was covered with blacktop and surrounded with a wooden rail fence. The fence was posted with Radiation Zone signs in 1952.

Process Description: The 203-S, 204-S and 205-S Facilities were constructed in the early 1950's as a process unit for the decontamination of uranyl nitrate hexahydrate (UNH) produced by Reduction Oxidation (REDOX) operations. The primary process unit consisted of a column filled with silica gel that removed traces of fission products from the UNH. The silica gel column (SG-1) was located in the underground 205-S vault. The vault also contained a waste neutralization tank. Operations in the vault were accomplished remotely. The 205-S facility was a two story, aboveground, chemical make-up building. It contained two chemical make-up tanks, a UNH sample room and extensive piping connected to the REDOX facility and the underground vault. The 203-S facility was an aboveground UNH storage facility that consisted of two 19,000 liter (5,000 gallon) stainless steel tanks that were set in an open concrete basin. A UNH Unloading Facility was located at the adjacent railroad siding. An aboveground UNH pipeline connected the 203-S, 204-S, 205-S Area to the 224-U (UO₃ Plant). During the REDOX Plant operation, the

UNH solution was pumped from REDOX to the 205-S silica gel column for purification. The purified UNH was stored in the 203-S and 204-S tanks and then routed to 224-U for final processing via the above ground pipeline.

Related Sites/ Structures: The site is associated with the 203-S tanks and sitecode 200-W-22.

Waste Type: Soil

Waste Description: The release was described as uranium contamination of the soil with a maximum reading of 10,000 counts per minute at 25 centimeters (1 inch).

The Site Was Consolidated With:

Code: 200-W-22

Names: 200-W-22; 203-S/204-S/205-S Stabilized Area

Code: UPR-200-W-11

Classification: Accepted

Names: UPR-200-W-11; UPR-200-W-16; 218-W-1 Burial Ground Fire; UN-200-W-11

Reclassification: Consolidated (4/12/2004)

Type: Unplanned Release

Start Date: 1/1/1952

Status: Inactive

End Date: 1/1/1952

Description: This site was a result of a spontaneous fire in the 218-W-1 Burial Ground. It is also a duplicate of UPR-200-W-16, which was mapped correctly on the 218-W-1 Burial Ground.

Location: The unplanned release occurred in and surrounding one of the trenches located in the 218-W-1 Burial Ground. The trench where the fire occurred runs east and west and was roughly in the center of the burial ground. A fire in the dry waste, spread plutonium contamination to the north and south sides of the trench and outside the burial ground in the vicinity of 231-W (also known as 231-Z). The earliest document (HW-25227) described the release as "in the vicinity of the Z Facility" and also as "the area north of the Isolation Building" (231-W).

Release Description: A fire occurred on July 9, 1952 in the "200 West Burial Ground," causing a spread of plutonium contamination to the north of the Isolation Building. Spotty airborne plutonium contamination from this fire fell out of the smoke in the vicinity of the Z Facility. The fire was probably caused by spontaneous ignition of contaminated waste. A survey of the area found a maximum of 20,000 disintegrations inside the burial ground and 30,000 disintegrations outside the burial ground.

Related Sites/ Structures: This fire actually occurred at the 218-W-1 Burial Ground, and not immediately outside the PFP Building, as it was mis-mapped. The correct location (WIDS site UPR-200-W-16) was verified in Selby and Soldat (1958).

Waste Type: Chemicals

Waste Description: Eighteen air samples were collected near the 200 West Area Burial Ground during the fire of July 9. Only one of the samples showed detectable alpha activity, this being 2.6 by 2.6E+12 microcuries/cubic centimeter. A vegetation sample collected near the Meteorology Tower on the following day showed an activity density from alpha emitters of 1.5E+06 microcuries/gram. Resamples collected several days later did not confirm this result.

The Site Was Consolidated With:

Code: 218-W-1

Names: 218-W-1; Solid Waste Burial Ground #1; 200-W Area Dry Waste No. 001

Description: pond increased from 6 millireps/hour to 700 millireps/hour.

The acronym "rep" stands for Roentgen equivalent physical. One rep equals 95 ergs/gram (0.0095 joules/kilogram). One rep is roughly equivalent to 1 rad.

The Site Was Consolidated With:

Code: 207-S

Names: 207-S; 207-S Retention Basin; REDOX Retention Basin

Code: UPR-200-W-15

Classification: Accepted

Names: UPR-200-W-15; Liquid Release from REDOX to 207-S and 216-S-17 Pond; UN-200-W-15

Reclassification: Consolidated (1/25/2000)

Type: Unplanned Release

Start Date: 1/1/1952

Status: Inactive

End Date: 1/1/1952

Description: The unplanned release was a contaminated liquid release to the 207-S Retention Basin and the 216-S-17 Pond (REDOX Swamp). Both the pond and the basin are surface stabilized and posted as "Underground Radioactive Material". The release is not separately marked or posted.

Location: The 207-S Retention Basin is located inside the 200 West Area, southwest of 202-S. The 216-S-17 Pond is located southwest of 200 West Area, outside the perimeter fence.

Release Description: In October 1952, a steam coil failure in the REDOX "D-12" Waste Concentrator caused gross contamination of process cooling water, the 207-S Retention Basin, and the swamp area outside of the 200 West Area (216-S-17). Dose rates at the swamp up to 2 Rad per hour were recorded. A dike was constructed to maintain a constant water level.

Process Description: The 216-S-17 Pond was the only pond receiving REDOX process cooling water when the release occurred. The pond was used from 1951 to 1954 and was taken out of service because it exceeded contamination limits.

Related Sites/Structures: The release is associated with the REDOX facility (202-S), the 207-S Retention Basin, and the 216-S-17 Pond.

Waste Type: Steam Condensate

Waste Description: According to the October 1952 monthly report, fission product activity was detected in the 207-S Retention Basin and at the edge of the 216-S-17 Pond. Measurements taken of dry sand at the periphery of the pond were as high as 2200 millireps/hour (CP window open) and 80 millirads/hour (CP window closed).

The acronym "rep" stands for Roentgen equivalent physical. One rep equals 95 ergs/gram (0.0095 joules/kilogram). One rep is roughly equivalent to 1 rad.

The Site Was Consolidated With:

Code: UPR-200-W-16

Classification: Accepted

Names: UPR-200-W-16; Fire at 218-W-1 Burial Ground

Reclassification: Consolidated (5/6/2004)

Type: Unplanned Release

Start Date: 1/1/1952

Status: Inactive

End Date: 1/1/1952

Description:

Location: The unplanned release occurred in and surrounding one of the trenches located in the 218-W-1 Burial Ground. The trench where the fire occurred runs east and west and is roughly in the center of the burial ground. A fire in the dry waste spread plutonium contamination to the north and south sides of the trench and outside the burial ground in the vicinity of 231-W (also known as 231-Z).

Release Description: A fire in the Dry Waste Burial Ground occurred on July 9, 1952, spreading alpha contamination from waste boxes. A survey of the area found a maximum of 20,000 disintegrations inside the burial ground and 30,000 disintegrations outside the burial ground.

Related Sites/ Structures: This fire occurred in the 218-W-1 Burial Ground.

Waste Type: Ash

Waste Description: A fire occurred in the 200 West Area Dry Waste Burial Ground on July 9, 1952. Surveys after the fire did not reveal any contamination spread to personnel or equipment. However, appreciable alpha contamination was found on the ground. The maximum reading was 200,000 disintegrations per minute in the burial ground and 30,000 disintegrations outside the burial ground. The burial trench contained cardboard boxes used to dispose of dry waste such as rags, paper, gloves, etc. Procedures limit the amount of plutonium to 5 grams per box, although most boxes contained less than one gram of plutonium. It was estimated that less than 500 grams of plutonium would have been present in the burial trench at the time of the fire.

The Site Was Consolidated With:

Code: 218-W-1

Names: 218-W-1; Solid Waste Burial Ground #1; 200-W Area Dry Waste No. 001

Code: UPR-200-W-17	Classification: Accepted
Names: UPR-200-W-17; Contamination Spread form 241-TX-106 Pump Removal; UN-200-W-17	Reclassification: Consolidated (6/13/2002)
Type: Unplanned Release	Start Date: 1/1/1952
Status: Inactive	End Date: 1/1/1952

Description: The release occurred inside the tank farm fence. The tank farm is surrounded with a chain link fence and radiological warning signs. The release is not separately marked or posted.

Location: The release occurred inside the 241-TX Tank Farm fence, extending southward from the 241-T-106 Tank to the 244-TXR Vault area and northward from 241-TX-106 to the 241-TX-114 Tank.

Release Description: On September 12, 1952, contamination spread in the 241-TX Tank Farm during the removal of a temporary process waste pump from the 241-TX-106 Tank. Waste was being transferred from 241-TX-106 to 241-TX-114 Tank via an overground line. The contamination on a pump seal was not sufficiently removed or packaged prior to moving the assembly, affecting the ground, personnel, and vehicles at the job site. Adverse wind conditions developed before the contamination could be totally removed or fixed, which caused the contamination spread to enlarge.

Waste Type: Chemicals

Waste Description: Contamination consisted of cerium, cesium, nobelium, ruthenium, strontium, and zirconium. After the wind had subsided, the southern area of the 241-TX tank farm was found to be contaminated generally up to 6,000 c/m with isolated spots up to 50,000c/m. The "major construction zone" immediately south of the 241-TX area had lesser amounts of contamination up to 2000c/m with a maximum of 35,000 c/m detected. Less than 1 g of solvent was dispersed

by the wind.

Type: Unplanned Release

Start Date: 1/1/1953

Status: Inactive

End Date: 1/1/1953

Description: The release affected an area between 221-T and 222-T. This area is currently covered with shotcrete and posted with Underground Radioactive Material signs. A single post and sign marks the approximate location where the release occurred.

Location: The release occurred at the 241-TX-154 Diversion Box, located east of 221-T.

Release Description: A cave-in occurred above a process line near the 241-TX-154 Diversion Box causing an area of contamination on both sides of the diversion box, between 221-T and 222-T. The reported dose rate was 25 rad per hour at a distance of eight inches. More than one contamination release occurred at this site (UPR-200-W-38).

Related Sites/ Structures: The release is associated with the 241-TX-154 Diversion Box and UPR-200-W-38.

Waste Type: Process Effluent

Waste Description: The release consisted of T Plant process waste with a maximum dose rate of 25 rad per hour at a distance of 20 centimeters (8 inches).

The Site Was Consolidated With:

Code: UPR-200-W-38

Names: UPR-200-W-38; UPR-200-W-40; 216-T-30; Line Break at 241-TX-302C; UN-200-W-38; UPR-200-W-160

Code: UPR-200-W-24

Classification: Accepted

Names: UPR-200-W-24; Release from the 244-UR Vault; UN-200-W-24
Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1953

Status: Inactive

End Date: 1/1/1953

Description: The release was a fan shaped contamination spread from the 244-UR Vault extending southeast across Camden Avenue and 16th Street. The release occurred in 1953. No visual evidence or posting related specifically to this release currently exists.

Location: The release originated from the 244-UR vault located inside the 241-U Tank Farm fence and extended to the southeast, across Camden Avenue to the 207-U Retention Basin area.

Release Description: On April 30, 1953, a contamination spread was caused by a violent chemical reaction in the 002 Blending Tank of the 244-UR Vault. The incident occurred when metal waste supernate was being pumped from the 241-U-109 Tank into the 002-UR Blending Tank inside the 244-UR Vault. Pressure built up from the waste reacting with acid in the 002 tank and was suddenly relieved through a riser. A geyser of liquid was seen rising 9 meters (30 feet) above the vault cover blocks, persisting for approximately 30 seconds. Five people in the area were found to be contaminated with maximum contamination levels of 4,000 counts per minute. Wind (estimated at 20 miles per hour) blew the contamination in a southeast direction beyond the tank farm fence and across the road (Camden Avenue). Ground surface contamination varied from 35 rad per hour at the point of origin (on the 244-UR cover blocks) inside the tank farm, diminishing to 500 counts per minute 300 meters (1,000 feet) away, outside the tank farm.

Process Description: Uranium metal waste supernate was being pumped from the 109-U tank to the 002-UR blending tank prior to being fed into 221-U for continuation in the Tri butyl Phosphate separations process

Waste Type: Chemicals

Waste Description: Waste included metal waste supernate combined with nitric acid, with readings varying from 35 rad/hour at the source of the contamination to a few hundred counts per minute at a distance of 305 meters (1,000 feet) from the source.

The Site Was Consolidated With:

Code: 200-W-95

Names: 200-W-95; Contaminated Soil at 241-U Tank Farm; Contamination Migration Beyond the 241-U fence

Code: UPR-200-W-26

Classification: Accepted

Names: UPR-200-W-26; Contamination Spread During Burial Operation
Reclassification: Consolidated (5/6/2004)

Type: Unplanned Release

Start Date: 1/1/1953

Status: Inactive

End Date: 1/1/1953

Description: The release is not marked or posted. All the inactive 200 West Area burial grounds are marked and posted Underground Radioactive Material. Only portions of the railroad tracks are currently posted with radiological signs. No specific location or maps are included in the Radiation Incident Investigation Report to indicate where the contamination was found.

Location: Contamination was identified in the railroad burial ground and along the railroad tracks.

Release Description: On November 27, 1953, a box of used connectors was removed from 221-T and buried in the railroad burial garden. While unloading the box from the flatcar, the box lid was dislodged and contamination was spread to the flatcar and to the surrounding ground. Before the contamination had been removed, a sudden strong wind resulted in additional contamination spread. More contamination was discovered when a comprehensive traverse survey was made of the burial garden and adjacent areas, the T plant railroad spur, and (following discovery of previously unsuspected railroad contamination) the main railroad line between the burial garden and REDOX. The Radiation Incident Investigation report did not include any recommendations for reducing the contamination at the burial ground.

Related Sites/ Structures: This release is probably associated with the 218-W-1A Burial Ground, near T Plant.

Waste Type: Chemicals

Waste Description: A comprehensive traverse survey was made of the burial garden and adjacent areas, the T plant railroad spur, and (following discovery of previously unsuspected railroad contamination) the main railroad line between the burial garden and Reduction Oxidation (REDOX). Survey results were as follows: general particulate contamination in and near the burial garden with spots up to 600 mrep/hour (uncorrected for source size) at the surface; numerous spots along the T plant spur of similar levels, with one spot of 15 rep/hour at surface; general particulate contamination in large areas to the southeast and southwest of the burial garden; and numerous spots on both sides of the main railroad line to REDOX having dose rates up to 2 rep/hour (uncorrected for source size) at surface. Highest concentrations of particles (greater than one particle per square yard) were found along the main line west of U plant and west of the powerhouse, and in a large area southwest of the burial garden. Analysis of three spots of contamination, taken from (1) the area southwest of the burial garden, (2) from the T plant spur, and (3) the main line near U plant, revealed the activity to be greater than 95% ruthenium.

Description: WIDS site UPR-200-W-30, has been reclassified based on documentation that verified it was a DUPLICATE of 216-S-12. Future updates and closeout information will only be added to 216-S-12. This site will no longer be updated. The site was surrounded with a light chain and "Underground Radioactive Material" signs. A concrete marker post was labeled 216-S-12. The surface was sand and gravel with no vents or evidence of subsidence.

Location: The site was located northeast of the 202-S building, north of the 291-S stack.

Release Description: Early in July 1954, the REDOX stack was flushed and approximately 75,700 liters (20,000 gallons) of flush water was drained into a pit 6.1 meters (20 feet) wide, 27.4 meters (90 feet) long and 3 meters (10 feet) deep situated in the northeast corner of the REDOX exclusion area. An estimated five curies of beta particle emitters and two to three curies of gamma particle emitters, predominantly ruthenium and zirconium-niobium, were disposed of here and covered with several feet of clean soil. The approximate coordinates are: N-34965 and W-73384.

Process Description: The site was a single-use liquid waste disposal pit used for 291-S stack flush water.

Related Sites/Structures: The site was associated with the 291-S Stack and 216-S-12. The excavation was described as a 6.1 meters (20 feet) wide by 27.4 meters (90 feet) long by 3 meters (10 feet) deep pit near the northeast corner of the REDOX stack.

Waste Type: Water

Waste Description: The site received 68,100 liters (18,000 gallons) of flush water from the 291-S (REDOX) Stack. The water contained ammonium nitrate (600 kilograms). The material contained an estimated five curies of beta particle emitters and two to three curies of gamma particle emitters that were predominantly ruthenium and zirconium-niobium. Potential contaminants of concern include cobalt-60, cesium-137, strontium-90, plutonium-239/240, and uranium-238.

The Site Was Consolidated With:

Code: 216-S-12

Names: 216-S-12; 291-S Stack Wash Sump; REDOX Stack Flush Trench; UPR-200-W-30

Code: UPR-200-W-34 **Classification:** Accepted

Names: UPR-200-W-34; Overflow of the 216-S-10 Ditch; UN-200-W-34 **Reclassification:** Consolidated (1/19/2000)

Type: Unplanned Release **Start Date:** 1/1/1955

Status: Inactive **End Date:** 1/1/1955

Description: The site is an unplanned release resulting from an overflow of the 216-S-10 Ditch. The site is

Description: contaminated to a maximum of 100 millirad/hour. The site was cleaned by removing the cartons to the proper burial trench and decontaminating the pit

The Site Was Consolidated With:

Code: 218-W-4C

Names: 218-W-4C; Dry Waste No. 004C

Code: UPR-200-W-40

Classification: Not Accepted

Reclassification: None

Type: Unplanned Release

Start Date: 1/1/1955

Status: Inactive

End Date: 1/1/1955

Description: This site code is recommended for deletion because it is a duplicate of UPR-200-W-38 and UPR-200-W-160. UPR-200-W-38 has been selected to be the 'surviving' site code for this incident.

Location: The spill occurred in 200 West Area, southeast of the 221-T Building between the 241-TX-154 Diversion Box and the 241-TX-302C Catch Tank.

Release Description: On December 30, 1955, highly radioactive waste was spilled on the ground. The release consisted of highly radioactive liquid waste due to failure of an underground line during a waste transfer from the 241-TX-302C Catch Tank. A pool of liquid waste with a high dose rate was identified on the surface near the 241-TX-302 Catch Tank (December 30, 1955). It was estimated that several thousand gallons of "metal" waste and rain water had been released to the ground.

Waste Type: Process Effluent

Waste Description: Several thousand gallons of primarily metal waste and rainwater. RHO-CD-673 estimated 19,000 liters (5026 gallons). Other reference documents estimated 7520 liters (2000 gallons). The waste was high in salt and is neutral to basic. High beta/gamma levels were recorded, up to 100 rads/hour at 0.3 meters (1 foot) above the liquid.

Start Date: 1/1/1957

Status: Inactive

End Date:

Description: This site is located within the UPR-200-W-41 surface stabilized area. In 1996, the 2706-S shack was still standing, but the release site was not separately marked or posted. The railroad track adjacent to 202-S had been covered with clean dirt. The section of covered track from the fence to the first gravel road intersection is posted as an Underground Radioactive Material area.

Location: In 1957, contamination was found in and around the railroad shack (2706-S) near the REDOX facility.

Release On February 3, 1957, an unusually high radiation background was noticed by two operators on

Description: a routine supply check in the railroad shack (2706-S) north of REDOX. The shack was evacuated and radiation monitoring was immediately called. A follow up survey revealed contamination on the papered floor to 3,200 millirad/hour. Spotty contamination to 500 millirad/hour was found on the snow outside of the shack by the south exit, near the 202-S Canyon Building, and toward the telephone and railroad tracks. The cause of the contamination is unknown.

Related Sites/ Structures: The site is associated with the REDOX railroad cut and UPR-200-W-41.

Waste Type: Chemicals

Waste Description: The floor of the shack was contaminated with beta/gamma with readings to 500 millirads/hour on the snow outside of the shack and beta/gamma with readings to 3,200 millirads/hour on the papered floor inside the shack.

The Site Was Consolidated With:

Code: UPR-200-W-41

Names: UPR-200-W-41; Railroad Contamination; REDOX Railroad Cut Contamination; UN-200-W-41

Code: UPR-200-W-45

Classification: Accepted

Names: UPR-200-W-45; Burial Box Collapse

Reclassification: Rejected (6/18/2008)

Type: Unplanned Release

Start Date: 1/1/1957

Status: Inactive

End Date:

Description: This release is no longer able to be visually identified. The release is not marked or posted. Based on the date of the release and a sketch included in HW-54636, it is assumed to be associated with 218-W-2A Burial Ground.

Location: Airborne contamination was spread from a 200 West Burial Ground and covered an estimated 10 square kilometers (4 square miles) in and around the 200 West Area.

Release Description: On November 6, 1957, a burial box containing ruthenium contaminated process equipment from REDOX collapsed and released contamination throughout 200 West Area. The incident presumably occurred after the first bucket of dirt was dropped on the burial box lid in the burial ground at 0800 hours. A cloud of contamination was released and spread outside the burial ground. Skin and/or personal clothing contamination to twelve Chemical Processing Department employees occurred. Fifteen vehicles were also contaminated at the time of the incident, 5 of which were contaminated on the tires only. The cause of the contamination spread was believed to be thermal convection currents coming from around the contaminated equipment and becoming airborne. The heaviest contamination spread to the south and in subsequent days the contamination spread throughout the area by high winds. The half life of ruthenium-106 is 372.5 days.

Related Sites/ Structures: Based on the date of the release and a sketch included in HW-54636, it is assumed to be associated with 218-W-2A Burial Ground. 218-W-2A was active in 1957. The adjacent railroad track was used to transport large pieces of contaminated equipment.

Waste Type: Chemicals

Waste Description: Collapse of wooden burial box containing ruthenium contaminated process equipment from Reduction Oxidation (REDOX) during burial operations in a 200 West Area Burial Ground. Extensive surveys revealed ground contamination of 5 to 100 particles per 0.09 square meter (5 to 100 particles per square foot). A majority of the readings were from 10,000 to greater than 80,000 counts per minute, with a maximum of 1,100 millirads/hour.

Status: Inactive **End Date:** 1/1/1958

Description: The release site is not currently marked or posted. The area where this release had been located in 1958 was surface stabilized in 1992.

Location: A contamination spread caused an oval shaped area of ground that extended southward from the diversion box and included 10th Street and the south end of the 207-S Retention Basin.

Release Description: A contamination spread from the 241-S Diversion Box occurred on September 15, 1958. It contaminated the ground around the diversion box and an oval shaped area from the diversion box extending southward and includes the south end of the 207-S Retention Basin.

Waste Type: Process Effluent

Waste Description: Contaminated particulates from the diversion box contaminated a large area south of the tank farm.

The Site Was Consolidated With:

Code: UPR-200-W-51
Names: UPR-200-W-51; UPR-200-W-52; Release from 241-S Diversion Box; UN-200-W-51

Code: UPR-200-W-53 **Classification:** Accepted

Names: UPR-200-W-53; Burial Box Collapse **Reclassification:** Consolidated (5/6/2004)

Type: Unplanned Release **Start Date:** 1/1/1959

Status: Inactive **End Date:**

Description: The release site is not separately marked or posted.

Location: The major portion of the contamination was spread about 101 hectares (250 acres) extending in an easterly direction from the 218-W-2A Burial Ground to within 275 meters (300 yards) of the east perimeter fence of the 200 West Area. Spotty particulate contamination was also detected outside of the 200 West Area perimeter fence.

Release Description: On January 8, 1959, a burial box containing REDOX cell jumpers collapsed during backfilling operations at the burial grounds and spread fission product contamination generally eastward covering about 101 hectares (250 acres) in 200 West Area. Ten people received low-level skin and personal clothing contamination and thirteen government-owned vehicles and two railroad diesel engines were also contaminated. One private vehicle was contaminated. Contamination levels ranged from 50 millirads/hour at the burial site to 60,000 counts per minute at T-Plant. Readings up to 400 counts per minute were obtained east of the 200 West Area fence.

Waste Type: Equipment

Waste Description: The release contained fission product (ruthenium-106) with beta/gamma readings that ranged from 50 millirads/hour at the burial site to 60,000 counts/minute at T Plant and readings east of the 200 West Area fence at 400 counts/minute.

The Site Was Consolidated With:

Code: 218-W-2A
Names: 218-W-2A; Equipment Burial Ground #2; Industrial Waste No. 02A

Code: UPR-200-W-59 **Classification:** Accepted

Names: UPR-200-W-59; Contaminated Liquid Released to 216-S-16P **Reclassification:** Consolidated (1/25/2000)

Type: Unplanned Release **Start Date:** 1/1/1965

Status: Inactive **End Date:** 1/1/1965

Description: The site is a liquid unplanned release to the 216-S-16 Pond (WIDS site code 216-S-16P), and has been consolidated with that pond. The pond has been surface stabilized and posted as an "Underground Radioactive Material" area. The release is not separately marked or posted.

Location: The 216-S-16 Pond is located southwest of the 200 West area outside the perimeter fence.

Release Description: On September 26, 1965, a leak occurred in the 2D column feed tank (F-1) cooling coil. Process effluent entered the cooling water from the coil and was transported from REDOX to the 216-S-16 Pond. The maximum dose rate found at the water edge of the #1 pond lobe inlet was 190 millirads/hour. The release was promptly detected by a radiation monitor.

Process Description: Process cooling water and steam condensate was routinely discharged to the 216-S-16 pond from the REDOX facility.

Related Sites/ Structures: The release is associated with the REDOX facility (202-S) and the 216-S-16 Pond.

Waste Type: Process Effluent

Waste Description: Beta/gamma radiation with a maximum dose rate of 190 millirads/hour was measured at the 216-S16 Pond #1 Pond (lobe) inlet .

The Site Was Consolidated With:

Code: 216-S-16P
Names: 216-S-16P; REDOX Pond #2; 202-S Swamp #1; 202-S Swamp and Ditch

Code: UPR-200-W-62 **Classification:** Accepted

Names: UPR-200-W-62; Duplicate of UPR-200-W-97; Line Leak at 23rd and Camden; UN-200-W-62; UN-216-W-5 **Reclassification:** Consolidated (12/7/2004)

Type: Unplanned Release **Start Date:** 1/1/1966

Status: Inactive **End Date:**

Description: The area has been stabilized with gravel. It is surrounded with Underground Radioactive Material signs.

Location: The incident occurred at the corner of Camden Avenue and 23rd Street in 200 West Area.

Release Description: On May 4, 1966, contaminated liquid waste leaked from a ruptured transfer line and came to the ground surface during transfer of second-cycle waste (bismuth phosphate) from the 241-T-107 Tank to the 242-T evaporator feed tank. Liquid ran from the site of the leak and spread over an area about 2 yards (1.83 meters) wide and 40 yards (36.58 meters) long. Surface dose rates ranged from 20 to 5000 millirads/hour. The cause of the rupture is listed in the radiation occurrence report as faulty supervisor judgment. The same line that failed in 1954 was mistakenly tested in 1966, causing liquid waste to surface again.

Related Sites/ Structures: The site is a duplicate of UPR-200-W-97. The site is associated with UPR-200-W-29 because a repeat release from the same broken transfer line (documented in UPR-200-W-29 in 1954) occurred again in 1966.

Waste Type: Chemicals

Waste Description: Contaminated second-cycle waste consisting of bismuth phosphate, with readings from 20 to 5,000 millirads/hour.

The Site Was Consolidated With:

One Site was Consolidated with:**Code:** UPR-200-W-97**Names:** UPR-200-W-97; Transfer Line Leak; UN-200-W-97; UN-216-W-5

Code: UPR-200-W-68**Classification:** Accepted**Names:** UPR-200-W-68; Road Contamination; UN-200-W-68**Reclassification:** Rejected (7/28/2008)**Type:** Unplanned Release**Start Date:** 1/1/1972**Status:** Inactive**End Date:****Description:** The release is not physically marked or posted.**Location:** Contamination was found near the intersection of Dayton Avenue and 13th Street in 200 West Area.**Release Description:** On February 8, 1972, beta-gamma contamination was found on the blacktop at the intersection of Dayton Avenue and 13th Street during a routine survey of 200 West Area roadways. Initial surveys revealed two spots on the roadway to a maximum of 4.5 rads/hour at 5.1 centimeters (2 inches). Extensive surveys made on the following shift discovered a stretch of road of about 30.5 meters (100 feet) with spotty contamination of 5,000 to 80,000 counts per minute (exclusive of previously-mentioned spots) on 13th Street and several spots ranging from 5,000 to 20,000 counts per minute on Dayton Avenue. One Hanford Patrol vehicle (HO-1A 2564) had 10,000 counts per minute in the left rear fender well (which was promptly cleaned). The cause of the contamination was not conclusively determined. The most likely source of the contamination was dripping from an earlier transport of temperature probes from 241-SX Tank Farm to the burial ground.**Waste Type:** Chemicals**Waste Description:** Beta/gamma contamination with readings from 5,000 to 80,000 counts/minute was found.**Description:** Initial surveys revealed two spots to a maximum of 4.5 rads/hour at 5.1 centimeters (2 inches). Assumed to be from tank farm equipment being transported to burial ground.

Code: UPR-200-W-69**Classification:** Accepted**Names:** UPR-200-W-69; Railroad Contamination; UN-200-W-69**Reclassification:** Rejected (5/13/2008)**Type:** Unplanned Release**Start Date:** 1/1/1973**Status:** Inactive**End Date:****Description:** The contamination was identified in 1973. The area was bladed and released from Radiation Zone status in 1974. This Unplanned Release is no longer marked or posted.**Location:** Contamination was identified north and northeast from the 204-S Unloading Station and between the 204-S railroad spur and the REDOX railroad cut.**Release Description:** On March 2, 1973, a contamination status survey starting at the 204-S Unloading Station led to the discovery of a beta-gamma contamination spread north and northeast of the station. Numerous spots of ground contamination of 2,000 to 50,000 counts per minute were noted with infrequent spots of 20 to 100 millirads/hour. A spot measuring 5,000 millirads/hour was discovered near the railroad gate, outside the radiation zone. Inside the zone, the sump pit was found contaminated from 1,000 to 5,000 millirads/hour and the grating from the sump that was stacked nearby measured to 800 millirads/hour. The survey was extended outside the REDOX exclusion fence where several spots of 5,000 to 100,000 counts per minute (20 to 40 millirads/hour uncorrected) were detected between the 204-S railroad spur and the REDOX

Release Description: On April 4, 1978, contaminated coyote feces were found while soil samples were being collected for the Environmental Surveillance Program. Radioisotopic analyses were performed on samples of the feces. Apparently, the coyotes had eaten mice which had gained entry into medium or high level radioactive waste contamination systems. Many possible source areas exist in 200 West Area.

Waste Type: Animal Waste

Waste Description: The waste contained plutonium-239, americium-241, cerium-144, europium-155, and strontium-90 with beta/gamma readings to 40,000 counts/minute and alpha readings to 55,000 counts/minute.

Code: UPR-200-W-79	Classification: Accepted
Names: UPR-200-W-79; Contamination Spread at 241-Z; UN-200-W-79	Reclassification: Consolidated (5/14/2004)
Type: Unplanned Release	Start Date: 1/1/1978
Status: Inactive	End Date:

Description: Alpha contamination was spread inside and outside of the 241-Z Sump radiation zone fence. The area was decontaminated and is no longer marked or posted. It occurred in the graveled and concrete area around the 241-Z Building.

Location: The release occurred at the 241-Z area, south of the 234-5Z building, and inside the 234-5Z exclusion fence.

Release Description: On October 6, 1978, contamination was detected due to the failure of the pH line at the 241-Z Sump. During replacement of steam valves and lines at the 241-Z Sump D-7 and D-8 sample cabinets, Radiation Monitoring detected alpha contamination in excess of 40,000 disintegrations per minute on an out of service pH control line behind the D-8 sample cabinet. Other locations which were contaminated in excess of 40,000 disintegrations per minute included the concrete pad under the D-7 and D-8 sample cabinets, and the steam line to the sample cabinets. Ground contamination of a five-foot square dirt area under the pH meter lines and another five-foot square dirt area north of the D-7 and D-8 sample cabinets outside of the 241-Z Sump radiation zone fence was detected. Alpha contamination was detected up to 2,000 disintegrations per minute under the pH lines and up to 500 disintegrations per minute outside the fence area. The apparent cause of the contamination was the failure of the pH line due to normal deterioration. The line had not been used or worked on for many years.

Related Sites/ Structures: The area is associated with UPR-200-W-75.

Waste Type: Process Effluent

Waste Description: Alpha contamination with readings from 500 to 2,000 disintegrations per minute was detected behind the 241-Z "D-8" sample cabinet. Alpha contamination in excess of 40,000 disintegrations per minute was detected on the pH line, concrete pad, soil and steam line.

The Site Was Consolidated With:

Code: UPR-200-W-85**Classification:** Accepted**Names:** UPR-200-W-85; Radioactive Spill from Multipurpose Transfer Box; UN-200-W-85; UN-216-W-85**Reclassification:** Rejected (7/28/2008)**Type:** Unplanned Release**Start Date:** 1/1/1982**Status:** Inactive**End Date:** 1/1/1982**Description:** The site where UPR-200-W-85 occurred is a concrete pad west of the 2706-T building. A 1998 site visit found a new equipment decontamination and waste handling building (2706-TA) has been built on this concrete pad. The concrete pad was sealed with an epoxy coating. The building entry is posted as FCA-2706-002. The release site is not marked or posted.**Location:** UPR-200-W-85 occurred west of the 2706-T Building, which lies northwest of the 221-T Canyon Building in the 200 West Area.**Release Description:** In April 1982, a multi-purpose transfer box was moved from the 221-T railroad cut to the cement pad behind the 2706-T Building. While parked on the pad, liquid was observed dripping from the box. The apparent cause of the leak was a weld failure on the outside sheathing covering the concrete shell. Contamination levels up to 100,000 counts per minute were found on the ground. The contamination was cleaned up at the 2706-T pad area. The railroad track from the 2706-T Building to the 221-T railroad cut was surveyed and no contamination was detected.**Related Sites/ Structures:** UPR-200-W-85 was associated with a concrete pad behind the 2706-T Building, and the railroad tracks between the 2706-T Building and the 221-T railroad cut.**Waste Type:** Process Effluent**Waste Description:** The contents of the multi-purpose box is not known. The radiological reading on the spill was 100,000 counts per minute beta/gamma.

Code: UPR-200-W-86**Classification:** Accepted**Names:** UPR-200-W-86; Contaminated Pigeon Feces at 221-U and 204-S; UN-200-W-86; UN-216-W-86**Reclassification:** Rejected (1/3/2008)**Type:** Unplanned Release**Start Date:** 1/1/1981**Status:** Inactive**End Date:** 1/1/1981**Description:** No physical posting or markers currently identify this unplanned release.**Location:** Contamination was found around 221-U Building and the 204-S Waste Unloading Facility.**Release Description:** In 1981, contaminated pigeon feces were found at several facilities in 200 West Area. The largest amount of contaminated bird feces, as well as the highest levels of contamination, were found at 221-U and near 204-S. The source of the contamination was determined to be the contaminated water accumulating in the 204-S tank basin. The contamination that prompted this occurrence report (81-72) was found and reported on October 27, 1981.**Related Sites/ Structures:** The release is mainly associated with the 204-S facility and 221-U.

Process Description: Uranyl nitrate was routinely transported from PUREX in 200 East Area to 224-U in 200 West Area in tanker trucks.

Related Sites/Structures: UPR-200-W-88 was associated with a section of roadway inside the 200 West main gate, the intersection of Route 3 and Route 4N.

Waste Type: Chemicals
Waste Description: The waste had beta and gamma contamination with readings from 300 to 650 counts per minute.

Code: UPR-200-W-89 **Classification:** Not Accepted

Names: UPR-200-W-89; Radioactive Contamination Southwest of 236-Z Building; UN-200-W-89; UN-216-W-89 **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1985

Status: Inactive **End Date:** 1/1/1985

Description: The spill site was decontaminated and released by April 4, a few days after it occurred on March 29, 1985. The site was an area of asphalt outside the 236-Z Building. The release site is not marked or posted.

Location: The release site was a 3 foot (0.92 meter) area of asphalt at the southeast corner of the 236-Z Building inside the Z Plant fence.

Release Description: A fork-lift operator transported three recycled containers from Vault 236 to burial boxes located at the southeast corner of the 236-Z Building. While placing the fork-lift platform on the ground, a recycled container slid off and tipped over.

Related Sites/Structures: UPR-200-W-89 was associated with the 236-Z Building and Vault 236.

Waste Type: Chemicals
Waste Description: The waste contained alpha contamination with readings up to 50,000 disintegrations per minute.

Code: UPR-200-W-90 **Classification:** Accepted

Names: UPR-200-W-90; Radioactive Contamination South of 236-Z Building; UN-200-W-90; UN-216-N-90 **Reclassification:** Rejected (5/14/2004)

Type: Unplanned Release **Start Date:** 1/1/1985

Status: Inactive **End Date:** 1/1/1985

Description: Radioactive contamination was immediately removed to background levels. The release was to six personnel moving a box of contaminated pipes and affected an area of ground outside of the 236-Z Building. The area is not marked or posted.

Location: UPR-200-W-90 occurred in an area approximately 1,000 feet (300 meters) outside of the 234-5Z Building and south of the 236-Z Building in the 200 West Area.

Release Description: Six employees and an area of ground were contaminated during the transport and loading of pipe sections into a burial box. Apparently, while lifting the second load into the box, the plastic that covered the pipe was ruptured.

In September 1953, the dose rate in the basin rose to 2 rad per hour. In 1954, the contaminated concrete basin was filled with soil to prevent the contamination from spreading.

Process Description: Process cooling water and stem condensate was routinely discharged to the 207-S Retention Basin before being sent to other waste disposal sites.

Related Sites/ Structures: The site is associated with the 202-S facility and the 207-S Retention Basin.

Waste Type: Process Effluent

Waste Description: The basin has been contaminated with approximately 10 curies of fission products.

The Site Was Consolidated With:

Code: 207-S

Names: 207-S; 207-S Retention Basin; REDOX Retention Basin

Code: UPR-200-W-100

Classification: Accepted

Names: UPR-200-W-100; 105-TX to 118-TX Process Line Leak; UN-200-W-100; UN-216-W-8

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1954

Status: Inactive

End Date: 1/1/1954

Description: The release occurred inside the 241-TX Tank Farm. The tank farm is surrounded with a chain link fence and has been stabilized with gravel. The release is not separately marked or posted.

Location: The location of this Unplanned Release is difficult to define due to discrepancies in reference documentation. The most reliable reference, ARH-2757, places the release inside the 241-TX Tank Farm fence, east of the 241-TX-105 tank.

Release Description: First cycle waste was discovered leaking from a waste transfer line in November 1954. The maximum dose rate was 4.5 rad per hour at a distance of 1.2 meters (4 feet). The liquid release covered an area of approximately 30 by 38 meters (100 by 125 feet).

Related Sites/ Structures: UPR-200-W-100 is associated with the 241-TX-105 and 241-TX-108 tanks and the 241-TX Tank Farm.

Waste Type: Process Effluent

Waste Description: The release consisted of first-cycle, high-salt, neutral to basic waste containing fission products with a maximum dose rate of 4.5 rad per hour at a distance of 1.2 meters (4 feet). The waste contained approximately 10 curies of fission products.

The Site Was Consolidated With:

Code: 200-W-94

Names: 200-W-94; Contaminated Soil at 241-TX/TY Tank Farm

Code: UPR-200-W-104

Classification: Accepted

Names: UPR-200-W-104; 216-U-10 Pond Leach Trench; U Pond Fingers; UN-216-W-14

Reclassification: Consolidated (1/25/2000)

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: Radioactive Material" warning signs. The leach trenches were stabilized along with the 216-U-10 Pond. The AC-540 markers at the ends of the trenches are labeled 216-U-10 and URM. This site has been consolidated with the 216-U-10 Pond.

Location: The release site runs northwest from the northeast corner of the 216-U-10 Pond.

Process Description: The trench was dug to provide additional leaching area for 216-U-10 Pond overflow water.

Related Sites/ Structures: UPR-200-W-104 was associated with the 216-U-10 Pond.

Waste Type: Process Effluent

Waste Description: A trench was dug to give additional leaching surface for overflow water from the 216-U-10 Pond. There is low-level, beta/gamma and alpha activity in the bottom of the leach trench. Contaminants of concern include cesium-137, americium-241, cerium-144 and potassium-40.

The Site Was Consolidated With:

Code: 216-U-10

Names: 216-U-10; 216-U-10 Pond; 231 Swamp; U Swamp; 216-U-1

Names: UPR-200-W-126; Contamination Release Inside 241-TX Tank Farm	Reclassification: Consolidated (6/13/2002)
Type: Unplanned Release	Start Date: 1/1/1975
Status: Inactive	End Date: 1/1/1975

Description: The tank farm that is surrounded by a chain link fence and is posted with radiological warning signs, including Underground Radioactive Material, Radiation Area, Fixed Contamination Area, Radiological Buffer Area and Radioactive Material Area. The release site is not separately marked or posted.

Location: UPR-200-W-126 occurred at the 241-TX-153 Diversion Box, inside the 241-TX Tank Farm, southeast of the 241-TX-101 Tank.

Release Description: While removing old gaskets on an over-ground transfer line from the 241-TX-153 Diversion Box to the 241-TX-101 Tank, a pipe fitter and an operator became contaminated. As the gaskets were being placed into a plastic bag, spotty contamination became airborne. Both employees had approximately 2000 counts per minute on their faces.

Related Sites/Structures: UPR-200-W-126 is associated with the 241-TX-153 Diversion Box and the 241-TX-101 Tank.

Waste Type: Process Effluent

Waste Description: Spotty contamination became airborne. The employee received contamination levels reading up to 2,000 counts per minute.

The Site Was Consolidated With:

Code: 200-W-94

Names: 200-W-94; Contaminated Soil at 241-TX/TY Tank Farm

Code: UPR-200-W-127	Classification: Accepted
Names: UPR-200-W-127; Liquid Release from 242-S Evaporator to the Ground; UN-200-W-127	Reclassification: Consolidated (6/13/2002)
Type: Unplanned Release	Start Date: 1/1/1980
Status: Inactive	End Date: 1/1/1980

Description: The site was a pool of liquid that was covered with clean dirt located inside the tank farm fence, on the east side of the evaporator building. In June 2001, a gravel pile was noted near where the release occurred, but the area is not specifically marked or separately posted.

Location: UPR-200-W-127 occurred on the east side of the 242-S Evaporator Building, inside the 241-S Tank Farm fence.

Release Description: At approximately 5:30 on the morning of February 26, 1980, a radiation area detector (Area Radiation Monitor) sounded and notified the building operator of an elevated dose rate in the

241-S Tank Farm. The operator left the building to investigate and found a pool of liquid on the ground surface, on the east side of the 242-S Evaporator building. The operator immediately left the area. A Radiation Monitor arrived and determined that high radiation levels existed all around the building. Barricades were set up to restrict access to the area.

Related Sites/ UPR-200-W-127 is associated with the 241-S Tank Farm.

Structures:

Waste Type: Process Effluent

Waste The release was an unknown liquid associated with the 241-S Tank Farm.

Description:

The Site Was Consolidated With:

Names: 200-W-95; Contaminated Soil at 241-U Tank Farm; Contamination Migration Beyond the 241-U fence

Code: UPR-200-W-129	Classification: Accepted
Names: UPR-200-W-129; Contamination Release Inside 241-TX Tank Farm	Reclassification: Consolidated (6/13/2002)
Type: Unplanned Release	Start Date: 1/1/1971
Status: Inactive	End Date: 1/1/1971

Description: The personnel contamination incident release occurred inside the fenced 241-TX Tank Farm. The release site is not separately marked or posted.

Location: UPR-200-W-129 occurred at the 241-TX-113 Pump Pit, located inside the 241-TX Tank Farm.

Release Description: While leak testing a new jumper assembly, an employee closed a valve in a pump pit that caused a caustic solution to spray up through the pit cover. The employee's chin and left forearm were contaminated with radiation levels up to 30,000 counts per minute.

Related Sites/ Structures: UPR-200-W-129 is associated with the 241-TX Tank Farm and the 241-TX-113 Tank Pump Pit.

Waste Type: Process Effluent

Waste Description: The waste was a caustic radioactive solution. The contamination on the employee had readings up to 30,000 counts per minute.

The Site Was Consolidated With:

Code: 200-W-94

Names: 200-W-94; Contaminated Soil at 241-TX/TY Tank Farm

Code: UPR-200-W-132	Classification: Accepted
Names: UPR-200-W-132; 241-UR-151 Diversion Box Release; UN-200-W-132	Reclassification: Consolidated (6/3/2002)
Type: Unplanned Release	Start Date: 1/1/1956
Status: Inactive	End Date: 1/1/1956

Description: The release occurred inside the fenced 241-U Tank Farm. The area around the 241-UR-151 Diversion Box has been covered with shotcrete. The release is not separately marked or posted.

Location: UPR-200-W-132 occurred inside the 241-U Tank Farm, near the 241-UR-151 Diversion Box and the 254-UR Electrical Substation (adjacent to the 271-U Control Building).

Release Description: An operator working inside the 271-UR Control Building noticed an elevated background reading and an off scale reading on the panel board. He notified his supervisor, shut down operating equipment and evacuated the building. While leaving, he and a co-worker noticed a gurgling sound and observed two pools of liquid forming around the 241-UR-151 Diversion Box. One pool was approximately 1.8 meters by 6 meters (6 by 20 feet), the other was approximately 4.5 meters by 9 meters (15 by 30 feet). Dose rates taken from 3 meters (10 feet) away from the pools measured up to 10 rad per hour beta/gamma and 500 millirem per hour gamma.

Related Sites/ Structures: UPR-200-W-132 is associated with the 241-UR-151 Diversion Box, the 254-UR Electrical Substation, and the 241-U Tank Farm.

Waste Type: Process Effluent

Waste Description: The waste was feed solution for the tributyl phosphate uranium recovery process.

The Site Was Consolidated With:

Code: 200-W-95

Names: 200-W-95; Contaminated Soil at 241-U Tank Farm; Contamination Migration Beyond the 241-U fence

Code: UPR-200-W-134	Classification: Accepted
Names: UPR-200-W-134; Improper Drum Burial at 218-W-3A	Reclassification: Rejected (6/30/2004)
Type: Unplanned Release	Start Date: 1/1/1975

Status: Inactive **End Date:** 1/1/1975

Description: The improper burial of a drum containing transuranic material occurred was at the 218-W-3A Burial Ground. The burial trench has been covered with clean soil. This Unplanned Release site is not separately marked or posted.

Location: UPR-200-W-134 occurred at the 218-W-3A Burial Ground, in the 200 West Area.

Release Description: A waste drum from the 325 building, labeled TRANSURANIC, was improperly buried and documented on Occurrence Report 38-75. It contained 18.6 grams of plutonium, 2466 grams of uranium and a total of 53 grams of fissile material.. The handling and storage of this material did not meet applicable standards. The drum was dumped into the burial trench and covered with several other loads of radioactive waste and approximately 2.4 meters (8 feet) of dirt.

Related Sites/ Structures: UPR-200-W-134 was associated with the 218-W-3A Burial Ground.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: The transuranic waste in the drum contained 18.6 grams of plutonium, 2466 grams of uranium and a total of 53 grams (2 ounces) of fissile material.

The Site Was Consolidated With:

Code: 218-W-3A

Names: 218-W-3A; Dry Waste No. 003A

Code: UPR-200-W-137 **Classification:** Accepted

Names: UPR-200-W-137; 218-W-7; UN-200-W-137 **Reclassification:** Consolidated (4/12/2004)

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: A vent from the vault is visible above the ground surface; the rest of the site is graveled and surrounded by yellow metal poles and a chain to mark the radiation zone.

Location: The site is located in the 200 West Area. It is in a vault east of the 222-S Building.

Process Description: The site received dry, packaged laboratory and sampler wastes from the 222-S Building.

The Site Was Consolidated With:

Code: 218-W-7

Names: 218-W-7; 222-S Vault

Code: UPR-200-W-139 **Classification:** Accepted

Names: UPR-200-W-139; UPR-200-W-18; Liquid Release to the 216-U-9 Ditch; UN-200-W-139 **Reclassification:** Consolidated (1/25/2000)

Type: Unplanned Release **Start Date:** 1/1/1953

Status: Inactive **End Date:** 1/1/1954

Description: WIDS site UPR-200-W-139 was located within the boundary of the larger site of 216-U-9 Ditch and has been consolidated into that site. Future updates and closeout information will only be added to 216-U-9 Ditch. This site will no longer be updated. The site was an unplanned release into the eastern fork of the 216-U-9 Ditch. The eastern fork of the 216-U-9 Ditch was abandoned in 1954. Currently, the eastern fork of the ditch is not marked or posted. It has no chain barricades or radiation warning signs and is partially backfilled. There are no

posted.

Location: UPR-200-W-145 is located in the soil under and adjacent to the 241-SX-113 Tank, inside the 241-SX Tank Farm.

Release Description: The release occurred over time, as 56,800 liters (15,000 gallons) of REDOX high-level liquid process waste leaked from the 241-SX-113 Tank into the soil.

Related Sites/ Structures: UPR-200-W-145 is associated with the 241-SX-113 Tank.

Waste Type: Process Effluent

Waste Description: The waste consisted of REDOX high-level process waste, containing 8,000 curies of cesium-137.

The Site Was Consolidated With:

Code: 200-W-96

Names: 200-W-96; Contaminated Soil at 241-S/SX/SY Tank Farm

Code: UPR-200-W-146 **Classification:** Accepted

Names: UPR-200-W-146; 241-SX-115 Leak **Reclassification:** Consolidated (6/13/2002)

Type: Unplanned Release **Start Date:** 1/1/1958

Status: Inactive **End Date:** 1/1/1965

Description: The release is the soil under the 241-SX-115 Tank. The release is not separately marked or posted.

Location: UPR-200-W-146 occurred in the soil under and adjacent to the 241-SX-115 Tank, inside the 241-SX Tank Farm.

Release Description: UPR-200-W-146 occurred over time as 189,000 liters (50,000 gallons) of REDOX high-level liquid process waste leaked from the 241-SX-115 Tank into the surrounding soil.

Related Sites/ Structures: UPR-200-W-146 is associated with the 241-SX-115 Tank.

Waste Type: Process Effluent

Waste Description: The release consisted of high-level REDOX process waste, containing 40,000 curies (1.5E15) of cesium-137.

The Site Was Consolidated With:

Code: 200-W-96

Names: 200-W-96; Contaminated Soil at 241-S/SX/SY Tank Farm

Code: UPR-200-W-147 **Classification:** Accepted

Names: UPR-200-W-147; 241-T-103 Leak **Reclassification:** Consolidated (6/13/2002)

Type: Unplanned Release **Start Date:** 1/1/1973

Status: Inactive **End Date:**

Description: The release is the soil under the 241-T-103 Tank. It is not separately marked or posted.

Location: The release is located southeast of the 241-T-103 Tank, inside the 241-T Tank Farm.

Release In 1973, while monitoring wells were being drilled to assess the 241-T-106 tank leak,

Description: contamination was identified between monitoring wells 299-W10-116 and 299-W10-118. This contamination plume was determined to be from the 241-T-103 Tank. Subsequent investigations revealed that the leak resulted from a failed grout seal in a spare entry line to 214-T-103.

Related Sites/ Structures: UPR-200-W-147 is associated with the 241-T-103 Tank.

Waste Type: Process Effluent
Waste Description: In 1973, the release contained 1 microcurie/liter of ruthenium.

The Site Was Consolidated With:

Code: 200-W-93
Names: 200-W-93; Contaminated Soil at 241-T Tank Farm

Code: UPR-200-W-148	Classification: Accepted
Names: UPR-200-W-148; 241-T-106 Leak	Reclassification: Consolidated (6/13/2002)
Type: Unplanned Release	Start Date: 1/1/1973
Status: Inactive	End Date: 1/1/1973

Description: The release is the soil underneath and adjacent to the 241-T-106 Tank. The release is not separately marked or posted.

Location: The release is a contaminated soil plume located adjacent to the 241-T-106 tank, inside the 241-T Tank Farm.

Release Description: The release occurred during a routine tank filling operation. From January 1973 to April 4, 1973, the liquid level in 241-T-106 was stable at 61 centimeters (24 inches). On April 4, 1973, the contents of tank 241-T-107 began being transferred to 241-T-106. Liquid level readings were taken three times per shift during the transfer operations. When the pumping operation stopped on April 24, 1973, the liquid level reading was 445.5 centimeters (175.4 inches). Due to the tank cascading effect, the liquid level continued to rise after the pumping ended, with a maximum liquid level of 466.5 centimeters (183.7 inches) being recorded on April 25, 1973. The first routine, weekly liquid level measurement was taken on May 2, 1973 and recorded a level of 454.4 centimeters (178.9 inches). The liquid level was entered into the logbook. A week later, the routine measurement was recorded in the logbook at 442 centimeters (174 inches). On May 14, 1973 the weekly liquid level of 426.4 centimeters (167.9 inches) was recorded in the logbook. The shift supervisor did not review the logbook but did prepare a Tank Inventory Form and transmit it to the Process Control Group. Because Tank Inventory forms for the previous two weeks were missing, they could only compare the liquid level to the last form transmitted, which was for April 23, 1973 with a liquid level of 389.9 centimeters (153.5 inches), taken during the pumping operations. The missing data caused the diminishing tank levels to go unnoticed. By June 1, 1973, high readings were being identified in dry well 299-W10-51 and the routine weekly liquid level for June 4th was down to 378.9 centimeters (149.2 inches). On June 7, 1973 the tank data was reviewed and determined to be leaking. Emergency plans were made to pump the remaining liquid out of tank 241-T-106.

Process Description: This release occurred while waste was being transferred from the 241-T-107 tank to 241-T-106 tank (which is the last tank in the T-104, T-105, T-106 cascading tank series). Since 241-T-104 contained a large amount of solid salt cake, the waste was pumped from 241-T-107 to 241-T-105, which overflowed into 241-T-106.

U P R - 2 0 0 - W - 1 4 8 ; 2 4 1 - T - 1 0 6 T a n k ; 2 4 1 - T - 1 0 6 T a n k F a r m

**Related Sites/
Structures:**

Waste Type: Process Effluent

Waste Description: At the time the release occurred, the tank contained waste with approximately 40,000 curies of cesium-137, 14,000 curies of strontium-90, 4 curies of plutonium, and various fission products.

The Site Was Consolidated With:

Code: 200-W-93

Names: 200-W-93; Contaminated Soil at 241-T Tank Farm

Code: UPR-200-W-149

Classification: Accepted

Names: UPR-200-W-149; 241-TX-107 Leak

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1977

Status: Inactive

End Date: 1/1/1977

Description: The release is the soil adjacent to the 241-TX-107 Tank. The release is not separately marked or posted.

Location: The release is located in the soil south of the 241-TX-107 Tank, inside the 241-TX-Tank Farm.

Release Description: Elevated radiation readings were recorded in dry wells 51-07-01, 51-03-12, 51-03-11, 51-07-18 and 51-03-01 during 1977 resulting in several Occurrence Reports to be issued. After extensive studies it was concluded that the source of the high-level activity detected in dry well 51-07-18 may have been liquid from the 241-TX-107 Tank.

**Related Sites/
Structures:** UPR-200-W-149 is associated with the 241-TX-107 Tank and Dry Well 51-07-18.

Waste Type: Process Effluent

Waste Description: Assuming the waste came from 241-TX-107, the release would contain bismuth phosphate metal waste, REDOX high-level waste, and evaporator bottoms from the 242-T Evaporator.

The Site Was Consolidated With:

Code: 200-W-94

Names: 200-W-94; Contaminated Soil at 241-TX/TY Tank Farm

Code: UPR-200-W-150

Classification: Accepted

Names: UPR-200-W-150; 241-TY-103 Leak

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1953

Status: Inactive

End Date: 1/1/1973

Description: The release is the soil adjacent to the 241-TY-103 Tank. The release is not separately marked or posted.

Location: The release is located in the soil under and adjacent to the 241-TY-103 Tank, inside the 241-TY Tank Farm.

Release Description: In 1973, dry wells 52-03-06 and 52-03-03 recorded increases in radiation levels, indicating leakage from the 241-TY-103 Tank or the 241-TY-105 Tank. The exact date the leak began is difficult to determine.

**Related Sites/
Structures:** UPR-200-W-150 is associated with the 241-TY-103 Tank and the 52-03-06 and 52-03-03 Dry

Wells .

Waste Type: Process Effluent

Waste The waste contained in tanks 241-TY-103 and 241-TY-105 included 700 curies of cesium-137

Description: from bismuth phosphate process waste, PUREX organic wash waste, REDOX ion exchange waste, coating waste and evaporator bottoms.

The Site Was Consolidated With:

Code: 200-W-94

Names: 200-W-94; Contaminated Soil at 241-TX/TY Tank Farm

Code: UPR-200-W-151

Classification: Accepted

Names: UPR-200-W-151; 241-TY-104 Leak

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1953

Status: Inactive

End Date: 1/1/1974

Description: The release site is the soil adjacent to the 241-TY-104 Tank. The release is not separately marked or posted.

Location: UPR-200-W-151 occurred in the soil under the 241-TY-104 Tank, inside the 241-TY Tank Farm.

Release Description: In 1974, the liquid level of the tank decreased more than 0.3 inch (0.77 centimeter), causing the integrity of the 241-TY-104 Tank to be questioned and the tank to become inactive. The leak has occurred over time with routine tank use.

Related Sites/ Structures: UPR-200-W-151 is associated with the 241-TY-104 Tank.

Waste Type: Process Effluent

Waste The tank contained REDOX ion exchange waste, PUREX organic wash waste, bismuth

Description: phosphate first-cycle waste, tributyl phosphate waste, and decontamination waste from the 241-TX and the 241-TY Tank Farms.

The Site Was Consolidated With:

Code: 200-W-94

Names: 200-W-94; Contaminated Soil at 241-TX/TY Tank Farm

Code: UPR-200-W-152

Classification: Accepted

Names: UPR-200-W-152; 241-TY-105 Leak

Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release

Start Date: 1/1/1960

Status: Inactive

End Date: 1/1/1960

Description: The release is the soil adjacent to the 241-TY-105 Tank. The release is not separately marked or posted.

Location: UPR-200-W-152 occurred in the soil under the 241-TY-105 Tank, inside the 241-TY Tank Farm.

Release Description: Two dry wells, 52-03-05 and 52-03-06 showed slowing increasing radiological readings in 1974. The activity in these dry wells may be an indication of interstitial liquid seepage from the 241-TY-105 Tank. Occurrence Reports 74-101 and 74-102 were issued in June 1974 to document the findings.

Waste Type: Chemicals
Waste Description: The release consisted of bismuth phosphate metal waste and high-level supernatant waste, containing 20,000 curies of cesium-137.

The Site Was Consolidated With:

Code: 200-W-95
Names: 200-W-95; Contaminated Soil at 241-U Tank Farm; Contamination Migration Beyond the 241-U fence

Code: UPR-200-W-155	Classification: Accepted
Names: UPR-200-W-155; 241-U-104 Leak	Reclassification: Consolidated (6/13/2002)
Type: Unplanned Release	Start Date: 1/1/1947
Status: Inactive	End Date: 1/1/1951

Description: The site is the soil under the 241-U-104 Tank. It is not separately marked or posted.
Location: The release site is soil under the 241-U-104 Tank, inside the 241-U Tank Farm.
Release Description: A rupture in the bottom of the tank was first detected in 1956, while attempting to install a heel jet pump. The installation could not be accomplished.

Related Sites/ Structures: UPR-200-W-155 is associated with the 241-U-104 Tank.

Waste Type: Chemicals
Waste Description: From 1947 to 1956, the tank held bismuth phosphate metal waste.

The Site Was Consolidated With:

Code: 200-W-95
Names: 200-W-95; Contaminated Soil at 241-U Tank Farm; Contamination Migration Beyond the 241-U fence

Code: UPR-200-W-156	Classification: Accepted
Names: UPR-200-W-156; 241-U-110 Leak	Reclassification: Consolidated (6/13/2002)
Type: Unplanned Release	Start Date: 1/1/1946
Status: Inactive	End Date: 1/1/1975

Description: The tank farm is surrounded with a chain line fence and posted with radiological warning signs. The release is not separately marked or posted.
Location: The release is the soil adjacent to and underneath the 241-U-110 Tank, inside the 241-U Tank Farm.
Release Description: The tank release occurred over time. In 1975, surveillance of the 241-U-110 Tank indicated a slow drop in the liquid level. Over one month, the liquid level had dropped 0.5 inches (1.3 centimeters).

Related Sites/ Structures: UPR-200-W-156 is associated with Dry Well 60-10-07 and the 241-U-110 Tank.

Waste Type: Process Effluent
Waste Description: The release consisted of bismuth phosphate first-cycle waste and REDOX coating.

Classification: Accepted

Names: UPR-200-W-159; Caustic Spill at Plutonium Finishing Plant; UN-200-W-159

Reclassification: Rejected (7/28/2008)

Type: Unplanned Release

Start Date: 1/1/1985

Status: Inactive

End Date: 1/1/1985

Description: The release site was the soil adjacent to the Plutonium Finishing Plant. The soil that was contaminated with sodium hydroxide was disposed of as hazardous waste. The site is not marked or posted.

Location: UPR-200-W-159 occurred in the soil adjacent to the Plutonium Finishing Plant, inside the facility security fence.

Release Description: UPR-200-W-159 occurred when an unknown amount of 50% aqueous sodium hydroxide, a corrosive liquid, was spilled to ground near the Plutonium Finishing Plant.

Related Sites/ Structures: UPR-200-W-159 was associated with the Plutonium Finishing Plant.

Waste Type: Chemicals

Waste Description: The release consisted of an unknown amount of 50% aqueous sodium hydroxide.

Code: UPR-200-W-160 **Classification:** Not Accepted

Names: UPR-200-W-160; UPR-200-W-38; UPR-200-W-40; 216-T-30; Line Break at 241-TX-302C **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1955

Status: Inactive **End Date:** 1/1/1955

Description: The area around the 241-TX-154 Diversion Box has been stabilized with shotcrete. This UPR is a duplicate of UPR-200-W-40 and UPR-200-W-38. UPR-200-W-38 is the site that will remain.

Location: The release location is the area around the 241-TX-154 Diversion Box and the 241-TX-302 Catch Tank, and between the 221-T Building and the 222-T Building, near section R-11 of 221-T.

Release Description: The release consisted of highly radioactive liquid waste due to failure of an underground line during a waste transfer from the 241-TX-302C Catch Tank. A pool of liquid waste with a high dose rate was identified on the surface near the 241-TX-302 Catch Tank (December 30, 1955). It was estimated that several thousand gallons of "metal" waste and rain water had been released to the ground. The area was backfilled, sprayed with tar, and posted as a radiation zone in 1956. During April and May 1968, the east side of the radiation zone was cut back a distance of 10 ft (3.0 m). Thin concrete cell cover blocks were leaned at a 60-degree angle against the side of the cut to shield the dose rates to acceptable levels.

Waste Type: Process Effluent

Waste Description: Several thousand gallons of primarily metal waste and rainwater. RHO-CD-673 estimated 19,000 liters (5026 gallons). Other reference documents estimated 7520 liters (2000 gallons). The waste was high in salt and is neutral to basic. Dose rates up to 100 rad per hour were recorded at a distance of 0.3 meters (1 foot) from the release pool.

The Site Was Consolidated With:

Code: UPR-200-W-38

Names: UPR-200-W-38; UPR-200-W-40; 216-T-30; Line Break at 241-TX-302C; UN-200-W-38; UPR-200-W-160

Code: UPR-200-W-163 **Classification:** Accepted

Names: UPR-200-W-163; Contaminated Vegetation at the 216-U-8 Pipeline (200-W-42-PL); UN-216-W-33 **Reclassification:** Consolidated (5/14/2004)

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: The release consisted of radiologically contaminated vegetation growing above the underground pipeline to the 216-U-8 crib (the pipeline is known as 200-W-42). The area is currently posted with Underground Radioactive Material signs.

Because the pipeline that is the source of this release is a separate WIDS site (200-W-42), and the remediation of the pipeline will include the soil above it, this UPR was consolidated into 200-W-42. A large portion of the pipeline was removed in 2006.

Location: The release site is located in the soil above the pipeline from the 224-U building to the 216-U-8 Crib. Posted Underground Radioactive Material areas are located on the north and south sides of 16th Street. The pipeline is west of Beloit Ave.

Release UPR-200-W-163 occurred over time, as leaking waste from the underground pipeline

Description: contaminated the soil. Growing vegetation absorbed some of the radioactive contaminants. Broken pieces of contaminated vegetation scattered in the wind and caused the size of the surface posted contamination area to be increased.

Process Description: The vitrified clay underground pipeline transferred U Plant waste to the 216-U-8 crib.

Related Sites/ Structures: UPR-200-W-163 is associated with the vitrified clay pipeline (200-W-42-PL) connecting the 216-U-8 Crib to the 224-U Building. The posted area over the pipeline on the north side of 16th Street was stabilized in October 2001.

Waste Type: Process Effluent

Waste Description: The waste in the pipeline consisted of process condensate from the 224-U Building. The waste was acidic.

The Site Was Consolidated With:

Code: 200-W-42

Names: 200-W-42; 200-W-42-PL; U Plant Radioactive Process Sewer from 221-U to 216-U-8 & 216-U-12 Crib

Code: UPR-300-7

Classification: Accepted

Names: UPR-300-7; Oil Spill at 384 Building; UN-300-7

Reclassification: Closed Out (8/24/1999)

Type: Unplanned Release

Start Date: 1/1/1972

Status: Inactive

End Date: 1/1/1972

Description: The release site was to the ground and concrete valve pits around the underground day tanks located behind the 384 Building (300 Area Powerhouse). The area is paved with asphalt. There is no visual evidence of a spill. Most of the spilled oil was contained in the underground, concrete pits that surround the day tanks. This site was closed out in conjunction with the North Process Pond.

Location: The release occurred on the north side of the 384 Powerhouse, adjacent to the day tanks, but a portion of the spill was sent to the North Process Pond. The day tanks and adjacent oil-contaminated soil have been removed.

Release Description: According to the incident report, the release was discovered at 6:45 am on August 7, 1972. There are two 60,560 liter (16,000 gallon), underground day tanks on the north side of the 384 Powerhouse. At the time of the release, one day tank was full and one day tank was empty. The operator was instructed to fill the empty tank, but failed to close the valve on the full tank and open the valve to the empty tank. Approximately 3,220 liters (850 gallons) of #6 fuel oil overflowed from the full day tank when the oil was transferred from the storage bunker. The spilled oil was retained in the concrete valve pits around the day tanks and in the soil between and around these two adjacent tanks. However, approximately 114 liters (30 gallons) of the total oil spilled flowed into the 384 Building drain trench through conduits constructed to carry oil pipes through the building foundation to the trench. This oil mixed with waste water and emptied into a sewer system that terminates in a sump located in the southeast corner of the basement of the 384 Building. A heavy scum of oil was observed on the surface of the sump. A sump pump normally lifted the water from the basement to the process sewer which flows to the north process pond (WIDS Site 316-2). Since the pump suction was at the bottom of the sump, an immediate check was made of the process pond. A significant scum of oil was visible in the fore bay of the first holding section of the pond. An estimated 38 liters (10 gallons) of oil was observed floating on the process pond.

Related Sites/ Structures: UPR-300-7 was associated with the day tanks (WIDS Site 300-223) behind the 384 Building,

Structures: the North Process Pond (WIDS Site 316-2) and WIDS Site 300 ASH PITS.

Waste Type: Oil

Waste Description: The release consisted of approximately 3,220 liters (850 gallons) of #6 fuel oil. An estimated 3,028 liters (800 gallons) were recovered in cleanup operations. Approximately, 114 liters (30 gallons) were conveyed to the powerhouse, of which (20 gallons) went to the ash pits and 38 liters (10 gallons) were observed at the process pond (WIDS Site 316-2). That would leave approximately 38 liters (10 gallons) that may have remained in the soil between the day tanks, the powerhouse facility, piping, the ash pits or process ponds. All values are approximate (as stated in the incident report).

Closure Info: 316-2, 618-12 and UPR-300-7 were addressed as a group. The information below documents information for the group of sites.

Sample analysis identified four "subareas" with results above cleanups standards. These areas were excavated. Surface sampling and sampling from test pits was also done.

Code:	UPR-300-13	Classification:	Accepted
Names:	UPR-300-13; Acid Neutralization Tank Leak East of 333 Building; UN-300-13	Reclassification:	Consolidated (2/12/1999)
Type:	Unplanned Release	Start Date:	1/1/1973
Status:	Inactive	End Date:	1/1/1973

Description: This waste site has been consolidated into the 618-1 Burial Ground waste site. The release site was the soil adjacent to the underground spent acid receiver tank that was located east of the 333 Building and adjacent to the 618-1 Burial Ground. The tank pit depth was 3.05 meters (10 feet) below grade. There is currently no visual evidence of the tank or this release. The 334-A Building was built on top of the area where the tank was removed.

Location: UPR-300-13 occurred adjacent to the underground spent acid receiver tank (WIDS Site 300-21) that had been located east of the 333 Building. The underground tank has been removed. The 334-A Building is now located at this location.

Release Description: The release occurred on July 31, 1973. A chemical operator noted that the liquid level in the 14,383 liter (3800 gallon) tank was below the normal pump suction level. It was known that the tank had been previously pumped down to the 4,542 liter (1200 gallon) heel on the morning of July 31, 1973. In the afternoon of the same day, 1805.45 liters (477 gallons) of liquid waste from the Zircaloy etching tank was added to the heel. In the afternoon of August 1, 1973, the process engineer investigated the tank plug and valve integrity. He found no problems, so he added water to the tank to recheck the possibility of a leak. In the morning of August 2, 1973 a water level check confirmed that 363.4 liters (96 gallons) of liquid had been lost. The test indicated a hole in the tank wall and that approximately 4,920.5 liters (1300 gallons) of liquid waste had been lost to the ground. Spent acid had leaked to the ground through a hole in a koroseal-lined mild steel receiving tank wall. The extent of contamination is not known. The acid receiving tank was isolated. Samples of the lost liquid (collected prior to the leak) were analyzed to characterize the contents of the spill. The sample results showed that 2015 kilograms (4432 pounds) of nitric acid, 44 kilograms (96 pounds) of fluoride, 217 kilograms (477 pounds) of copper and 1.4 kilograms (3 pounds) equivalent to 0.0005 curies of uranium were lost to the ground. 870 kilograms (1910 pounds) of caustic was added to the leaking tank and allowed to leak into the soil to neutralize the acid that had escaped into the ground. The leak rate of the tank was 582.9 liters (154 gallons) per hour.

Process Description: At the time of this release (1973), waste etch acid from the 333-N Fuel Fabrication process drained to an underground tank filled with limestone. The limestone was used to neutralize the acid. The tank had been in service since the start up of the 333 Building.

Related Sites/ Structures: UPR-300-13 was associated with the underground spent acid receiver tank (WIDS Site 300-21), the 333 Building (WIDS Site 300-32), and the 618-1 Burial Ground.

Waste Type: Process Effluent

Waste Description: The waste contained process acid that included 4,432 pounds (2,012 kilograms) of nitrate, 447 pounds (202.9 kilograms) of copper, and 3 pounds (1.4 kilograms) of uranium.

The Site Was Consolidated With:

Code: 618-1

Names: 618-1; Solid Waste Burial Ground No. 1; 300 Area Burial Ground No. 1; 318-1

Code: UPR-300-14

Classification: Accepted

Names: UPR-300-14; Acid Leak at 334 Tank Farm; UN-300-14

Reclassification: Consolidated (2/12/1999)

Type: Unplanned Release

Start Date: 1/1/1975

Status: Inactive

End Date: 1/1/1975

Description: This waste site has been consolidated into the 618-1 Burial Ground waste site. The release site was a limestone pit designed to neutralize spilled acid before the acid was released to the underlying ground.

Location: UPR-300-14 occurred at the 334 tank farm and traveled through a trench to an open-bottomed limestone pit (See WIDS Site 300-246) located over the 618-1 Burial Ground .

Release Description: On July 18,1975, a line break in the fill line to Tank No. 32 from the 23,000-liter (6,000 gallon) #3 high tank in the 334 tank farms caused the loss of 4,540 liters (1,200 gallons) of 93% sulfuric acid solution. The solution traveled through a concrete trench to a limestone pit that had been designed to neutralize spilled acid. The limestone pit drained to the soil in the 618-1 Burial Ground.

Process Description: A trench sump was installed below the 334 Tank Farm to collect solutions from chemical spills, including the elevated acid storage tanks, the safety showers, and rainwater, etc. The trench sump drained to an open limestone pit located about 6.1 meters (20 feet) east of the 334 Tank Farm. The limestone pit had an open bottom and drained to the 618-1 Burial Ground soil beneath the pit. The limestone pit was isolated after this unplanned release. The 334 Tank Farm pipe trench and sump were sealed from the drain line to the limestone pit and connected to the process sewer.

Related Sites/ Structures: The site is associated with the 334 Tank Farm and its sump trench, which is connected to the 333 East Pipe Trench (See WIDS Site 300-224) which drained to the Limestone Neutralization Pit and which in turn drained to the 618-1 Burial Ground.

Waste Type: Chemicals

Waste Description: The release consisted of 93% sulfuric acid.

The Site Was Consolidated With:

Code: 618-1

Names: 618-1; Solid Waste Burial Ground No. 1; 300 Area Burial Ground No. 1; 318-1

Code: UPR-300-18

Classification: Not Accepted

Names: UPR-300-18; Release at 321 Tank Farms; UN-300-18 **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1962

Status: Inactive **End Date:** 1/1/1962

Description: On August 27, 1962, an employee was sprayed by a release from a low-level cesium-134 waste line.

Location: UPR-300-18 was located inside one of the 321 Tank Farms.

Release Description: The release occurred on August 27, 1962. In the process of removing a drain plug from a low-level cesium-134 waste line, a pipefitter received general protective clothing contamination up to 10,000 counts per minute (shoes 1,000 counts per minute and coveralls 10,000 counts per minute) when solution unexpectedly squirted out of the drain. The main valve had been turned off and the solution in the line was purportedly at near static pressure at the time of the release. The pipefitter immediately replaced the plug and prevented further contamination spread. The employee reported that he felt liquid strike his face and mouth. A whole body radiation survey detected contamination to the employee's coveralls and shoes but no skin contamination. A subsequent whole body count proved negative. A follow up inspection by operations personnel revealed that the main valve had failed to seat properly. The fault was corrected and the lines flushed of all foreign solid material. The amount released to the ground was not mentioned in the report.

Related Sites/ Structures: UPR-300-18 was associated with a drain plug from a low-level cesium-134 waste line.

Waste Type: Process Effluent

Waste Description: The Occurrence Report states that the waste line carried low-level cesium-134, but the emitter isotope was cesium-137.

Code: UPR-300-31 **Classification:** Not Accepted

Description: This site is a duplicate of UPR-300-40 (See Site Comment Section).

Code: UPR-300-43 **Classification:** Accepted

Names: UPR-300-43; 300 Area Solvent Refined Coal Spill; UN-300-43 **Reclassification:** Rejected (9/22/1998)

Type: Unplanned Release **Start Date:** 1/1/1986

Status: Inactive **End Date:** 1/1/1986

Description: The site is an unplanned release to the soil adjacent to the 329 Building. All discolored soil was removed from the site. No occurrence report could be found for this site.

Location: The release occurred in the soil outside the 329 Building in the 300 Area.

Release Description: UPR-300-43 occurred when solvent refined coal was spilled to the ground. The spill was caused by failure of a corroded container.

Process Description: During the time of the oil crisis (1980s), the coal liquifaction process was developed to produce

an alternative fuel source. Full scale production pilot plants were developed to liquify coal through fractional distillation. Each of the pilot plants developed their own process for liquifying coal. Solvents were used to liquify the coal. Pacific Northwest Laboratory's (PNL's) task was to study the effects of fractional distillation on the genotoxic potential of solvent refined coal liquids. PNL received product material from six different source pilot plants. Samples that were taken from the source product were subjected to initial chemical analysis, chemical fractionation, and in vitro bioassay. The references listed describe the tests and the results.

Related Sites/ Structures: The UPR-300-43 was associated with the 329 Building.

Waste Type: Chemicals

Waste Description: The release consisted of solvent-refined coal (light fraction) that was spilled to the ground.

Code: UPR-300-44	Classification: Accepted
Names: UPR-300-44; Uranium Bearing Waste Etch-Acid Spill; 313 Building; UN-300-44	Reclassification: Consolidated (2/12/1999)
Type: Unplanned Release	Start Date:
Status: Inactive	End Date: 1/1/1985

Description: The release site was to the soil around a section of process sewer line. The information for this site has been incorporated into WIDS Site UPR-300-38. UPR-300-38 addresses the soil contamination under the 313 Building.

Location: UPR-300-44 occurred in a section of the underground process sewer line from the Uranium Recovery Area in the 313 Building.

Release Description: While a new extrusion press was being installed, a leak was discovered in a section of process sewer line. The leak had resulted in a discharge to the ground. The source of the leaking solution was unknown and it was unknown how long the leak had persisted. Spills in the 313 Uranium Recovery Area could have entered this line, resulting in ground disposal of hazardous substances.

Process Description: The 313 Building process sewer collected chemical waste solutions from throughout the chemical processing areas from the start of operations in the 313 Building. The waste solutions drained to the 300 Area ponds until the 1970s when process effluent improvement projects were begun to replace liquid waste discharges to the soil with collection and treatment processes. (See WIDS Site 313 URO).

Related Sites/ Structures: UPR-300-44 was associated with the 313 Building.

Waste Type: Process Effluent

Waste Description: The release consisted of wastewater and possibly uranium-bearing acid (nitric and sulfuric acid with uranium in solution) or waste-etch acid (nitric, hydrofluoric, and chromic acids with uranium, copper, and zirconium metals in solution) to the soil. The spill area was possibly contaminated with byproduct waste material.

The Site Was Consolidated With:

Code: UPR-300-38

Names: UPR-300-38; 313 Slab; Demolished 313 Building Foundation; Soil Contamination Beneath the 313

Building

Code: UPR-400-1 **Classification:** Accepted
Names: UPR-400-1; 400 Area Coolant Spill; UN-400-1 **Reclassification:** Rejected (12/3/1998)
Type: Unplanned Release **Start Date:**

Description: The site was an unplanned release that occurred during the construction of FFTF. This site is located somewhere in a field that is now a vegetation-free, gravel-covered area shaped like a semicircle bordered by an asphalt-covered roadway and parking area. The specific location can not be identified. There is no occurrence report for the site.
Location: The site is located north of the 427 building and east of the FMEF cooling units.
Release Description: In February or March 1984, a solution consisting of approximately 189.3 liters (50 gallons) of 50% water and 50% ethylene glycol (aircraft de-icer mix) was spilled on the ground during construction.
Waste Type: Chemicals
Waste Description: The waste consisted of approximately 189.3 liters (50 gallons) of a coolant solution consisting of 50% water and 50% ethylene glycol.

Code: UPR-600-1 **Classification:** Accepted
Names: UPR-600-1; Contamination Spread at 618-10 Burial Ground; UN-600-1 **Reclassification:** Consolidated (2/24/1999)
Type: Unplanned Release **Start Date:** 1/1/1961
Status: Inactive **End Date:** 1/1/1961
Description: The release originated in the 618-10 Burial Ground. It contaminated the environment in the vicinity of the burial ground, extending 274 meters (300 yards) out from the burial ground fence, with radioactive particulates. The 618-10 Burial Ground has been surface stabilized and vegetated with grasses. The burial ground is fenced and posted as Underground Radioactive Material.
Location: UPR-600-1 occurred in the 618-10 Burial Ground and spread to an area extending approximately 274 meters (300 yards) outside the burial ground fence in the 600 Area.
Release Description: The unplanned release at the 618-10 Burial Ground was caused by a fire within a burial trench. The fire destroyed all flammable material in the affected trench. The fire spread radioactive particulates to the immediate environment. At a distance of 15 to 23 meters (50 to 75 feet) outside the burial ground fence, the particle concentration was approximately 20 particles per 9.3 square meters (100 square feet). Most particles measured in excess of 100,000 counts/minute. At a distance of 274 meters (300 yards) from the fence, the particle concentration was 3 particles per 9.3 square meters (100 square feet) ranging from 4,000 to 20,000 counts/minute. After the fire was extinguished, the trench was covered with dirt.

Related Sites/Structures: UPR-600-1 was associated with the 618-10 Burial Ground.

Waste Type: Chemicals
Waste Description: The waste consisted of approximately 200 boxes of contaminated materials.

Waste Type: Ash

Waste Description: The waste consisted of burned "CWS" filters and an unknown amount of other materials.

Description:

The Site Was Consolidated With:

Code: 618-10

Names: 618-10; 300 North Solid Waste Burial Ground; 318-10

Code: UPR-600-2

Classification: Accepted

Names: UPR-600-2; Contamination Spread at 618-10;
UN-600-2

Reclassification: Consolidated (2/24/1999)

Type: Unplanned Release

Start Date: 1/1/1963

Status: Inactive

End Date: 1/1/1963

Description: Contamination from this incident was identified in a 1.5 meter (5 foot) radius around the burial receptacle in the 618-10 Burial Ground, an area in front of the burial ground access gate, and a spot in front of the 300 Area Powerhouse. The 618-10 Burial Ground has since been stabilized and revegetated. The burial ground is posted with Underground Radioactive Material signs.

Location: Contamination from UPR-600-2 was limited to an estimated 1.5-meter (5 foot) radius around the burial barrel in the 618-10 Burial Ground, an area in front of the burial ground access gate, and a spot on the road in front of the 300 Area Powerhouse.

Release Description: During a routine "milk can" burial, a contamination spread occurred at the 618-10 Burial Ground. An investigation resulted when the truck driver was found to be contaminated after completing the burial. A radiation survey was conducted from the 327 Building to the 618-10 Burial Ground. A spot of contamination was found in front of the 300 Area Powerhouse. Another area of contamination was found in front of the burial ground access gate. No contamination was found on the highway. A 1.5 meter (5 foot) radius around the burial receptacle was found to be contaminated to 80,000 counts per minute.

Related Sites/ Structures: UPR-600-2 was associated with the 618-10 Burial Ground and the 300 Area Powerhouse.

Waste Type: Chemicals

Waste Description: Contamination detected at the time of the release ranged from 60,000 to 80,000 counts per minute around the barrel in the 618-10 Burial Ground, 40,000 counts per minute in front of the 300 Area Powerhouse, and 80,000 counts per minute in front of the burial ground access gate.

The Site Was Consolidated With:

Names: 618-10; 300 North Solid Waste Burial Ground; 318-10

Code: UPR-600-3

Classification: Accepted

Names: UPR-600-3; Contamination Spread at 618-10

Reclassification: Consolidated (2/24/1999)

Type: Unplanned Release

Start Date: 1/1/1963

Status: Inactive

End Date: 1/1/1963

Description: The release site was an area of soil around a burial barrel within the 618-10 Burial Ground. The release area was surface stabilized with the rest of the burial ground in 1983. The burial ground is fenced and posed as an Underground Radioactive Material area.

Location: The release site was approximately 56 square meters (600 square feet) of ground within the 618-

10 Burial Ground in the 600 Area.

Release Description: On September 4, 1963, an improper container was used to dispose of waste into the 618-10 Burial Ground. The lid of the container came off, causing dust to puff out of the barrel and onto the ground. An area approximately 56 square meters (600 square feet) was contaminated to 400 millirads/hour at 5 centimeters (2 inches). The truck and the driver were also slightly contaminated.

Related Sites/ Structures: UPR-600-3 was associated with the 618-10 Burial Ground.

Waste Type: Chemical Release

Waste Description: The waste consisted of radioactive dust that was improperly containerized.

The Site Was Consolidated With:

Reclassification: Consolidated (2/24/1999)

Type: Unplanned Release

Start Date: 1/1/1964

Status: Inactive

End Date: 1/1/1964

Description: The release consisted of an area of soil contamination in the 618-11 Burial Ground. The release site was surface stabilized along with the rest of the burial ground in 1983.

Location: UPR-600-4 contaminated an estimated 93 square meters (1,000 square feet) in the 618-11 Burial Ground in the 600 Area.

Release Description: A trailer truck hauling two waste casks from the 327 Building attempted to deposit waste into the vertical waste barrels at the 300 Wye Burial Ground. As a waste can was dropped into a burial barrel, a "blowback" of radioactive material occurred, contaminating of four employees, the vehicle and approximately 90 square meters (1000 square feet) of ground in the burial ground. Soil contamination levels averaged 10,000 counts per minute. It was also discovered that three of the waste cans had fallen from the cask and were lodged in the drop chute of the second cask. It was determined that the slide on the bottom of the cask had not been properly secured and the waste had vibrated into the drop chute during transit.

Related Sites/ Structures: UPR-600-4 was associated with the 618-11 Burial Ground.

Waste Type: Chemicals

Waste Description: The release consisted of radioactive waste from the High-Level Radiochemistry Facility. The

Description: waste had readings of up to 10,000 counts per minute.

Names: UPR-600-7; Contamination Spread at 618-11

Reclassification: Consolidated (2/24/1999)

Type: Unplanned Release

Start Date: 1/1/1965

Status: Inactive

End Date: 1/1/1965

Description: The release site was an area of ground in the 618-11 Burial Ground. The 618-11 Burial Ground was surface stabilized in 1983. The burial ground is fenced and posted as Underground Radioactive Material.

Location: The release occurred in an area of soil in the 618-11 Burial Ground.

Release Description: During the burial of a wooden box containing a highly contaminated waste filter from the 327 Building, an employee became contaminated. The truck was positioned at the burial trench and the truck bed was tilted. However, the box did not slide off the truck. The employee left the truck cab and noticed clouds of dust emitting out of the box seams, causing spotty contamination in the immediate vicinity and levels of 6,000 counts per minute on the employee.

Related Sites/ Structures: UPR-600-7 was associated with the 618-11 Burial Ground.

Waste Type: Chemicals

Waste Description: The waste was generated at the high-level radiochemistry building (327 Building). The waste consisted of a dust from a highly contaminated filter.

The Site Was Consolidated With:

Code: 618-11

Names: 618-11; Y Burial Ground; 300 Wye Burial Ground; 318-11

Code: UPR-600-8

Classification: Accepted

Names: UPR-600-8; Contamination Spread at 618-11

Reclassification: Consolidated (2/24/1999)

Type: Unplanned Release

Start Date: 1/1/1967

Status: Inactive

End Date: 1/1/1967

Description: The release contaminated an area of soil in the 618-11 Burial Ground. Following the release, area was covered with a layer of clean gravel. The 618-11 Burial Ground was surface stabilized in 1983. The burial ground is fenced and posted as Underground Radioactive Material

Location: UPR-600-8 contaminated soil in the 618-11 Burial Ground.

Release Description: UPR-600-8 occurred on April 7, 1967 during routine burial operations at the 300 Wye Burial Ground (618-11). Waste from the 327 building was being deposited into a vertical waste receptacle through a chute from a cask. The contamination spread occurred as a result of air backup from the waste barrel or loose contamination blown from the release gate of the cask. At the time of the burial, the operation was being conducted from the upwind side of the cask. At the moment the waste was dropped into the chute, the wind reversed in a strong gust, causing the airborne spread of contaminants. An area of ground approximately 2.7 square meters (30 square feet) was contaminated to a maximum of 100,000 counts per minute. Three

employees and the transport truck were also contaminated.

Related Sites/ Structures: UPR-600-8 was associated with the 618-11 Burial Ground.

Waste Type: Chemicals

Waste Description: The waste consisted of, in-part, aluminum rupture cans that had been inspected in the High-Level Radio Chemistry Facility (327 Building). The fact that the airborne contaminant was a "fairly fresh fission product" indicates that it was picked up by the cans during transfer operations through "A" cell in the 327 Building.

The Site Was Consolidated With:

Names: UPR-600-9; Contamination Spread at 618-11

Reclassification: Consolidated (2/24/1999)

Type: Unplanned Release

Start Date: 1/1/1967

Status: Inactive

End Date: 1/1/1967

Description: The contamination spread was a large fan-shaped area extending in a northeast direction from the burial site. The contamination inside the burial ground was covered with gravel. Contamination outside the fence was turned under and the site was released from radiation zone status. The entire 618-11 Burial Ground was surface stabilized in 1983. An area outside the fence known as the "Wind Row" site was released from radiological control in 1972. The rows of soil are still visible, but the area is not marked or posted.

Location: UPR-600-9 contaminated a fan-shaped area that extended northeast from the dump chute in the 618-11 Burial Ground.

Release Description: On April 14, 1967, during routine burial operations in the 618-11 Burial Ground, a piece of waste became wedged in the truck chute causing an airborne release of contamination.

Related Sites/ Structures: UPR-600-9 is associated with the 618-11 Burial Ground and the adjacent "Wind Row" site (600-21 alias UPR-600-22).

Waste Type: Chemicals

Waste Description: The release consisted of airborne contamination from corroded aluminum rupture cans and pieces of an N Reactor safety rod from the 327 Building.

The Site Was Consolidated With:

Code: 618-11

Names: 618-11; Y Burial Ground; 300 Wye Burial Ground; 318-11

Start Date: 1/1/1963

Status: Inactive

End Date: 1/1/1963

Description: The release contaminated an area of soil in the northeast corner of the 618-11 Burial Ground. The 618-11 Burial Ground was surface stabilized in 1983. The burial ground is fenced and posted as Underground Radioactive Contamination.

Location: Barrel 327-2 in the 618-11 Burial Ground.

Release Description: On September 30, 1963, a contamination release occurred during a routine, high level waste burial at the 300 Wye (618-11) Burial Ground. A "Milk Pail" container that was externally contaminated with a significant amount of loose, highly radioactive material, was discharged into the 327-2 vertical waste barrel (caisson) causing a contamination spread. Although the wind was less than 16 kilometers per hour (10 miles per hour), an area of contamination was identified that measured approximately 36 square meters (400 square feet) around the barrel. The cask truck had smearable contamination measuring 180 millirads/hour inside the left rear wheel, 40 millirads/hour on the drop chute and 10 millirads/hour on the top of the cask. The truck was sprayed with a fixing agent and taken to 200 West Area for decontamination. The maximum contamination reading on the ground was 1.4 rads/hour.

Related Sites/ Structures: UPR-600-10 was associated with the 618-11 Burial Ground.

Waste Type: Chemicals

Waste Description: The release consisted of high-level beta and gamma contamination with readings of up to 1.4 rads/hour at 7.6 centimeters (3 inches).

The Site Was Consolidated With:

Code: 618-11

Names: 618-11; Y Burial Ground; 300 Wye Burial Ground; 318-11

Code: UPR-600-17

Classification: Accepted

Names: UPR-600-17; 600 Area Patrol Boat Spill; UN-600-17

Reclassification: Rejected (9/11/2000)

Type: Unplanned Release

Start Date: 1/1/1986

Status: Inactive

End Date: 1/1/1986

Description: The site of the release is a concrete boat ramp and the shoreline, periodically flooded as the Columbia River rises daily and seasonally.

Location: The release occurred at the patrol boat refueling area just south of 100N Area on the Columbia River.

Release Description: Gasoline was spilled inside a patrol boat during refueling operations, and gasoline was discharged from the boat to the shoreline. The release occurred on August 17, 1986.

Waste Type: Oil

Waste Description: The release consisted of 268.4 liters (70.9 gallons) of gasoline.

Description:

Code: UPR-600-18

Classification: Accepted

Names: UPR-600-18; Tank Truck Gasoline Spill; UN-600-18

Reclassification: Rejected (10/1/1997)

Type: Unplanned Release

Start Date: 1/1/1987

Status: Inactive

End Date: 1/1/1987

Description: The site is an area where petroleum products leaked to the soil from a fuel delivery truck accident. The release occurred April 16, 1987 9:00 AM and resulted in the spill of CERCLA reportable materials. Appropriate notifications were made to the Department of Energy,

noted in the list. Lime sulfur: Foliar application as a fungicide only."

Code: WESF **Classification:** Accepted
Names: WESF; 225-B; Waste Encapsulation and Storage Facility **Reclassification:** None
Type: Storage **Start Date:** 1/1/1974
Status: Active **End Date:**

Description: The Waste Encapsulation and Storage Facility is a TSD site within the 225-B Building, which is on the west side of 221-B Building (B Plant).

Location: The building addition is located on the west end of the 221-B canyon building. It was built on top of the 216-B-60 crib.

Process Description: Two areas within WESF are permitted in the Hanford Facility Dangerous Waste Part A Permit Application (Rev. 0, 12/19/97) to store capsules and/or unencapsulated salts. Pool cells number 1 through 8 and 12, located on the west side of the 225-B building, provide underwater storage for radiological protection from cesium-137 and strontium-90 capsules. Process cells A through G, in the south side of the 225-B Building, provide interim dry storage of capsules and/or unencapsulated salts. The maximum process design capacity for miscellaneous storage in pool cells 1 through 8 and 12 is approximately 4,484 liters (1,184.55 gallons) and for process cells A through G is approximately 56 liters (14.79 gallons).

Related Sites/ Structures: The WESF is within the 225-B Building, which is attached to the west side of the 221-B Building (B Plant).

This Site has the Following SubSites:

Code: WESF:1
Names: WESF:1; Waste Encapsulation and Storage Facility Tank 100 System; WESF TK-100 System

Code: WESF:1 **Classification:** Accepted
Names: WESF:1; Waste Encapsulation and Storage Facility Tank 100 System; WESF TK-100 System **Reclassification:** None
Type: Storage **Start Date:**
Status: Active **End Date:**

Description: The TK-100 System was used as a catch tank to transfer low-level radioactive liquid waste from WESF through B-Plant to the Double-Shell Tank System. Closure activities were completed in September 1998 and included sampling and analysis of the piping rinsate, removing the tank to a permitted TSD facility (B Plant Complex), removing any waste residues from the vault, and decontaminating and visually inspecting the vault. Piping (floor drains and sump) rinsate was sampled on July 14 and 15, 1998, and analyzed for 1,1,1-tri-chloroethane. All eight samples (KON378 through KON385) had less than detectable levels of 1,1,1-trichloroethane.

The SubSite is Part Of:

Code: WESF
Names: WESF; 225-B; Waste Encapsulation and Storage Facility

Code: WRAP **Classification:** Accepted
Names: WRAP; Waste Receiving and Processing Facility **Reclassification:** None

Status: Inactive**End Date:** 1/1/1968**Description:** The site consisted of the 105-B Reactor Building complex which originally included the inactive plutonium production reactor block with associated shielding and controls, an irradiated fuel storage basin, and contaminated portions of the reactor building. See the subsites for detailed information.**Release Description:** It is suspected that the irradiated fuel storage basin leaked for a number of years prior to deactivation. The leak rate was small, and the location of the leak was never identified. The soil has not been characterized, but the radionuclide inventory is estimated to be low when compared to the total inventory in the reactor.**Process Description:** Water from the Columbia River was extensively treated before passing through the reactor. The water was then circulated in a single pass through the reactor process tubes, cooling tubes imbedded in the thermal shield, and reactor horizontal control rods. After exiting the reactor, the cooling water passed through a retention basin and was then discharged to the river. During reactor operations, fuel cladding failures sometimes occurred while the fuel element were in the process tubes. Over the operational lifetime of the reactor, there were several hundred such cladding failures. When fuel cladding failed, the cooling water in the affected process tubes became highly contaminated and elevated radiation levels were observed in the cooling water exiting the reactor core. This highly contaminated water was diverted to a trench for ground disposal rather than to the Columbia River. During reactor operations and reactor shutdowns, large quantities of decontamination solutions were used routinely to remove radionuclides from reactor equipment and facility surfaces. Decontamination activities took place at the dummy decontamination facility wash pad, which was adjacent to the fuel storage basin. Known decontamination solutions included chromic acid, citric acid, oxalic acid, nitric acid, sulfamic acid, sulfuric acid, and sodium fluoride. Other chemicals, including organic solvents were also used for some decontamination processes. The reactor had many safety and control mechanisms. The function of the horizontal control rods (HCRs) was to control the equilibrium and transient power levels of the reactor during routine operations and to maintain the desired neutron flux distribution. The HCRs were each about 11.0 meters (36 feet) long, with the poison (neutron absorbing) segment being about 8.96 meters (29.4 feet) long. Two of the rods were electrically driven and seven were hydraulically driven. The latter were known as shim rods and were used to achieve ongoing operation control and desired fluctuations. The vertical safety rods (VSRs) were 11.9 meter (39 foot) long, stainless steel sleeves with 0.74 millimeter (3/16 inch) thick boron stainless steel sleeves inside. Each VSR was inserted and withdrawn from the reactor via two separate cables wound around a winch located 12.2 meters (40 feet) above the top of the reactor. In cases of automatic shutdown ("scram") of the reactor, the electromagnetic clutch holding each rod would be deenergized (demagnetized), and the rods would free fall by gravity into channels penetrating the reactor. A "last ditch" safety system, a boric acid solution, was held in a large pedestal tank at the top of each reactor and connected to each of the 29 VSR channels via 1.27-centimeter (0.5-inch) pipes. The liquid boron system was later replaced by a system that used solid boron steel and carbon steel balls (Ball 3X System). The normal method for reactor refueling was displacement charge-discharge during reactor shutdown. During a refueling operation, the tubes to be discharged had their rear nozzle caps removed. New fuel elements were pushed into the process tube by a charging machine which caused the irradiated fuel elements in the tube to be displaced. The displaced irradiated fuel elements dropped into a water filled discharge chute and slid down into the metal pickup area at the end of the storage basin. The 6.1 meters (20 feet) of water in the chute area provided shielding as the elements accumulated and were sorted into buckets using long, hand-operated tongs. The buckets were then transferred by an overhead monorail system to the storage aisles where they were held for a time to allow the decay of short-lived radionuclides. Following the storage period, the buckets of fuel elements were moved by the overhead monorail system to the transfer area. At the transfer area, the irradiated fuel was loaded into casks, then raised by a crane and placed in special railroad cars for shipment to the chemical reprocessing facilities in the 200 Area.

Waste Type: Equipment
Waste Description: This Reactor building contained an estimated 23,500 curies of radionuclides, 79,800 kilograms (88 tons) of lead, and 227 kilograms (500 pounds) of cadmium.

Waste Type: Asbestos (friable)
Waste Description: The Reactor Building is estimated to contain 85.0 cubic meters (3000 cubic feet) of asbestos.

This Site has the Following SubSites:

Code: 118-B-8:1
Names: 118-B-8:1; 105-B Reactor Building

Code: 118-B-8:2
Names: 118-B-8:2; 105-B French Drains

Type: Reactor	Start Date:
Status: Inactive	End Date:

Description: The reactor rested on a 7.0-meter (23-foot) thick concrete foundation topped with cast iron blocks that served as a thermal shield. The building walls consisted of reinforced concrete in the lower portions and concrete blocks in the upper portions with thickness varying from 0.9 to 1.5 meters (3 to 5 feet). The roof was composed of precast concrete roof tiles, except for the discharge area enclosure and inner horizontal rod room where the roof was composed of 1.8-meter (6-foot) thick reinforced concrete. The reactor core consisted of a graphite "stack" that measured 8.5 meters (28 feet) from front to rear, 11.0 meters (36 feet) from side to side, and 11.0 meters (36 feet) from top to bottom. The stack was pierced front to rear by 2,004 process channels that held the fuel elements. Nine horizontal channels for control rods entered from the left side and 29 vertical channels for safety rods entered from the top. Six test holes labeled A through F, leading from the right, existed for irradiation of experiments, foils, counters, ionization chambers, and special samples. The horizontal control rod (HCR) and vertical safety rod (VSR) channels, as well as the test holes, were lined with a thin sheet of aluminum known as a "thimble". The graphite core was surrounded by a cast iron thermal shield layer. Cooling for the top, side, and bottom shields were provided by circulating water tubes imbedded in the blocks. The entire reactor block was then enclosed in a welded steel box that functioned to confine the inert gas atmosphere within the reactor. Expansion joints were placed on the corners of the block to allow for thermal expansion and expansion bellows were located at each process tube opening. The bellows served as gas seals as the process tubes expanded and contracted with temperature and with the distortions of the graphite. The fuel storage basin was located at the rear of the reactor. The concrete basin area served as a collection, storage, and transfer facility for the irradiated fuel elements discharged from the reactor. The water in the basins served both as coolant and as shielding. The basin consisted of a discharge chute and fuel element pickup area, a storage area, a transfer area, and a wash pad area.

Location: The 105-B Reactor is near the center of the 100-B/C Area, and about 0.9 kilometers (0.6 miles) south of the Columbia River.

Waste Type: Not Specified
Waste Description: This Reactor building contains an estimated 23,500 curies of radionuclides, 79,800 kilograms

Description: (88 tons) of lead, and 227 kilograms (500 pounds) of cadmium. The Reactor Building is estimated to contain 85.0 cubic meters (3000 cubic feet) of asbestos.

Start Date:

Status: Inactive

End Date:

Description: The subsite consists of French drains around the periphery of the 105-B Reactor Building. During two walk downs in September 2004, 14 suspect French drain locations were recorded using global positioning system (GPS) instrumentation and were photographed.

No information could be found to corroborate what liquid waste streams from the building were discharged to each of these suspect drains. Because B Reactor was a first-of-a-kind operation and a national priority, it is prudent to assume that any of these suspect drains could have received unplanned and/or unrecorded releases of both radioactive and nonradioactive CERCLA wastes. It should be noted that the soil associated with some of the French drains at both D Reactor and F Reactor have tested positive for heavy metals and fission products. (See sites 100-F-10, 116-D-6 and 116-F-11.)

French drains were designed to receive nonradioactive liquids from the 105-B Reactor Building, via over-ground and/or underground piping. The discharges included steam condensate and floor drain wastes. The liquids would percolate through the gravel/soil fill, and out the open end at the bottom of the drain into the native soil.

Because of variables, each of the suspect drain sites will require further investigation prior to cleanup activities, including removal of covers and visual inspection and sampling of drain fill material and surrounding native soil.

During walkdowns on 9/7/04 by M. R. Schwab and J. C. Womack and 9/13/04 by J. P. Kiesler and W. Coffin around the periphery of the 105-B Building, 14 suspect French drain locations were recorded using global positioning system (GPS) instrumentation and were photographed. Most of the suspect drains had protective covers, and no visual inspection was attempted beneath those covers. Some of the covers had been penetrated by over-ground piping, and others had holes that suggested previous discharge points. Other French drains may have received discharges from underground piping.

Contaminants of potential concern (COPCs) for the French Drains included gamma emission analysis (GEA), gross alpha, gross beta, hexavalent chrome, inductively coupled plasma (ICP) metals, and polychlorinated biphenyls (PCBs). Several of these are methods for determining general fission products; however, the statement is consistent with current cleanup practices as listed in the sampling and analysis plans (SAPs).

Location: French Drain #1 (field personnel assigned numbering to correspond to photos) is a concrete box with a wooden cover, less than 1 square meter (10.8 square feet) in cross-section. It is located adjacent to the northeast corner of the 105-B Building, under a sign painted on the concrete block wall labeled Drain 1, and has a pink-colored steam condensate line coming out of the wall, which disappears into the soil directly adjacent to the box. It was located at E 565331, N 144524.

French Drain #4 is a concrete box with a wooden cover, less than 1 square meter (10.8 square feet) in cross-section. It is located adjacent to the southeast corner of the 105-B Building, under a sign painted on the concrete block wall labeled Drain 4, the cover is penetrated by a 10 centimeter (4 inch) pipeline that emanates from a larger line. It is located at E 565331, N 144502.

French Drain #11 is a confined space about 5 meters (16 feet) from a northeast corner of the 105 B Building, with a red, metal manhole cover with no over-ground lines to it. It is located at E 565320, N 144531.

French Drain #12 is a confined space near a northeast corner of the 105-B Building, with a metal manhole cover penetrated by a 1.3 centimeter (0.5 inch) and a 2.5 centimeter (1 inch) pink-colored pipeline. It is located at E 565310, N 144533.

French Drain #13 appears to be a clay or concrete pipe adjacent to a northeast corner of the 105 B Building, less than 1 meter (3 feet) in diameter, with only soil visible on its surface, and penetrated by 10.2 centimeter (4 inch) pipeline. It is located at E 565310, N 144535.

French Drain #14 is a 1.4 meter (4.6 foot) diameter concrete pipe, 2.5 meters (8 feet) from the northeast corner of the 105-B Building. It appears to have a cover (a lifting ring is shown in the photo) and has no over-ground pipelines to it. It is located at E 565299, N 144562.

French Drain #15 is a 20 centimeter (8 inch) clay pipe on the northwest corner of the 105 B Building, apparently filled with soil, no cover, and with no over-ground lines to it. It is located at E 565263, N 144545.

French Drain #16 is a 1 meter (3 foot) diameter concrete pipe near the northwest corner of the 105-B Building, with only soil visible on its inside, and with one 2.5 centimeter (1 inch) pipe penetrating the top of the drain, and a second, capped line terminating just above its surface. It is located at E 565262, N 144541.

French Drain #18 is a 1 meter (3 foot) diameter confined space along the west wall of the 105 B Building, and has a metal cover. The cover has a 7.6 centimeter (3 inch) hole in it, and a similar-sized pipe terminates near the surface of the cover. It is located at E 565252, N 144499.

French Drain #19 is a 1.4 meter (4.6 foot) diameter concrete confined space along the west wall of the 105-B Building. It has a solid, concrete cover with no over-ground lines running to it. It is located at E 565252, N 144491.

French Drain #20 is a 1 meter (3 foot) diameter concrete pipe near the southwest corner of the 105-B Building, and has a metal cover. A 2.5 centimeter (1 inch) pipe penetrates the cover, and a similar-sized pipeline terminates just above a second hole in the cover. It is located at E 565255, N 144473.

French Drain #21 is a 1 meter (3 foot) diameter concrete pipe along the south wall of the 105 B Building just outside a door marked Inner Inst. Room. It has a metal cover, penetrated by a pink-colored 1.3 centimeter (0.5 inch) pipeline. It is located at E 565284, N 144495.

French Drain #22 is a 1 meter (3 foot) diameter confined space along the south wall of the 105 B Building, and has a metal cover. A pink-colored 2.5 centimeter (1 inch) pipeline penetrates the cover, and two other lines enter the soil near the confined space. It is located at E 565299, N 144492.

French Drain #23 is a white-painted, insulated pipe that directly enters the soil along the south wall of the 105-B Building. It is located at E 565308, N 144492.

Waste Type: Not Specified
Waste Description: The waste are the french drains, piping to the french drains, and potentially contaminated soil associated with the french drains.

The SubSite is Part Of:

Code: 118-B-8
Names: 118-B-8; B Reactor; 105-B Reactor Building

Code: 118-B-8:3
Classification: Accepted
Names: 118-B-8:3; 105-B Miscellaneous Pipeline Segments
Reclassification: None
Type: Reactor
Start Date:
Status: Inactive
End Date:

Description: The subsite consists of pipeline segments (DS-100BC-013, 014, 017, and 018, 024, 025, 026, 027, 028, 035, 041 and 043), that were deferred from 100-B-21. Documentation states that the segments were within the 7.6 meter (25 foot) buffer zone and identified during removal of effluent pipelines and site characterization in the 100-B/C Area. Pipelines that went toward the reactor were cut approximately 15.2 meters (50 feet) from the reactor footprint so as not to disturb the 105-B Reactor structure. The numbering system for the segments was created and assigned by the subcontractor as they were recorded in the field.

There were two pipelines associated with the 120-B-1 Battery Acid Sump inlet and outlet pipelines that were left in place. They were cut off and grouted at the edge of the 120-B-1 remediation footprint. These have been assigned to the 118-B-8:3 subsite (RSVP-2006-057).

Other pipelines in this subsite were the southern most part of the 1607-B2 septic system collection lines. They were not remediated with the 1607-B2 site because of their proximity to the reactor facility. They will be addressed with disposition of the 105-B facility (RSVP-2006-055).

Location: The coordinates were recorded using a Trimble survey grade Global Positioning Satellite (GPS) instrument, (centimeter accuracy), location coordinates were described in terms of Washington State Plane easting (E), northing (N), and elevation in NAVD88 (meters). For selected sites, Ground-Penetrating Radar (GPR) was also utilized. Dimensions were noted during site characterization. Contaminants of Potential Concern were listed only for segments known to have contaminants. The sample data results have not been loaded into HEIS.

DS-100BC-013 pipeline segment was 20 centimeters (8 inches) diameter steel line, length unknown. The coordinates at the cut end were E 565322.97, N 144540.94, and elevation 141.71 meters. It was discovered during the excavation of the 16.5 meter (54 inch) cross-tie effluent pipeline. The pipeline segment was shallow and did not appear on project drawings. It has been cut off, the end pinched closed, and the site backfilled. No sampling was conducted.

DS-100BC-014 pipeline segment was a 20 centimeter (8 inch) diameter (estimated), steel line, length unknown. The coordinates at the cut end were E 565337.60, N 144532.97, and elevation 142.22. This pipeline was located approximately 14.5 meters (47.6 feet) east of the DS-100BC-013 segment. It was discovered during the excavation of the effluent pipelines northeast of 105-B. The pipeline was shallow and not apparent on project drawings. It has been cut off, the end pinched closed, and the site backfilled.

DS-100BC-017 pipeline segment was a 20 centimeter (8 inch) diameter (estimated), steel pipeline that entered a junction box, length unknown. The coordinates at the cut end were E 565313.35, N 144550.66, and elevation 141.01 meters. It was pinched closed and backfilled in

place. The pipeline was not apparent on project drawings. No sampling was conducted.

DS-100BC-018 pipeline segment was a 30.5 centimeter (12 inch) diameter (estimated) steel pipeline, length unknown. It ran at a diagonal to the former junction box. The coordinates at the exposed ends were (E 565311.85, N 144550.88) and elevation 142.84 meters and E 565317.95, N 144542.72, and elevation 142.98 meters. The pipeline, which was left intact, could not be found on project drawings. No sampling was conducted.

DS-100BC-024 pipeline segment was a large-diameter pipeline (actual diameter and length were unknown). The coordinates at the cut end were E 565320.28, N 144549.81, and elevation 141.25 meters. It has been cut off, covered with plastic and plywood, and backfilled. No sampling was conducted.

DS-100BC-025 pipeline segment was a large-diameter pipeline (actual diameter and length were unknown). The coordinates at the cut end were E 565320.71, N 144545.69, and elevation 138.25. It has been cut off, covered with plastic and plywood, and backfilled. No sampling was conducted.

DS-100BC-026 pipeline segment was a large-diameter pipeline (actual diameter and length were unknown). The coordinates at the capped end of the pipeline were E 565331.46, N 144547.78, and elevation 138.05 meters. The pipeline entered the excavation from the south sidewall and angled northeast toward a large diversion box. The pipeline was found capped with a steel plate. It was not identified on project drawings. No sampling was conducted.

DS-100BC-027 pipeline segment was a concrete pipeline (actual diameter and length were unknown). The coordinates at the end of the segment were E 565341.83, N 144535.68, and elevation 139.28 meters. On 6/16/2003 field screening for radiological control was performed. No analytical samples were collected.

DS-100BC-028 pipeline segment was a vitreous clay pipeline (actual diameter and length were unknown), embedded in concrete in tandem with DS-100BC-027, entering the pipeline excavation south of a junction box. The pipeline coordinates at the end were E 565340.04, N 144536.38, and elevation 139.19 meters. Sections of this pipeline to the south have not been removed. This pipeline was not identified on project drawings. Fine-grained sediment was observed along the bottom of the pipeline. It was unclear if the material was from processes associated with the pipeline or washed in from dust-suppression efforts during remediation. On 6/16/2003 field screening for radiological control was performed, however, no analytical samples were collected.

DS-100BC-035 pipeline segment was a 137.2 centimeters (54 inches) large-diameter concrete pipeline (length unknown) encased in concrete. The coordinates were E 565306.48, N 144581.69, and elevation 139.80 meters. The structure was capped with plastic and plywood and had a tar/asbestos gasket at the cold joint of the concrete encasement. Contaminants of concern was asbestos. On 3/5/2003, sample J00J04 was collected from the gasket material and sent for asbestos analysis.

DS-100BC-041 pipeline segment was of undetermined diameter [at least 30.5 centimeters (12 inches), actual diameter and length were unknown], just below grade. The coordinates were E 565327.99, N 144535.81, and elevation 142.68 meters. No sampling was conducted. This pipeline was believed to travel in a southwest direction toward a metal plate covered structure on the northeast of the 105-B Reactor Building. The pipeline was not found on project drawings.

DS-100BC-43 consisted of a group of pipelines around the south and southwest sides of the 105-B Reactor. The following alpha characters have been added as an indicator for a specific pipeline. The pipeline coordinates were estimated from the center (not accounting for bends) of

lines. The diameters of these pipelines were unknown; the lengths were: A - E 565341, N 144510, 58.7 meters (192.6 feet) long; B - E 565335, N 144523, 12.6 meters (41.3 feet) long; C - E 565336, N 144508, 12.7 meters (41.7 feet) long; D - E 565335, N 144504, 10.6 meters (34.8 feet); E - E 565335 N 144492, 12.7 meters (41.6 feet) long; F - E 565335, N 144486, 11.5 meters (37.8 feet); G - E 565313; N 144480, 73 meters (239.5 feet) long. No sampling was conducted.

Waste Type: Not Specified

Waste Description: The waste is mixed (chemically and radiologically) contaminated piping (concrete, steel and

vitrified clay) and piping contents (scale and sediment), and contaminated soil.

The SubSite is Part Of:

Code: 118-B-8

Names: 118-B-8; B Reactor; 105-B Reactor Building

Code: 100-C-10

Classification: Discovery

Names: 100-C-10; Yellow Stained Soil Northwest of 183-C Headhouse

Reclassification: None

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: A yellow stained area was discovered in the layback of the western end of the 100-C-7:1 waste site while excavating in May 2011.

Location: The waste site is located west of the intersection of Burnett Road and Belle Street.

Code: 118-C-3

Classification: Accepted

Names: 118-C-3; 105-C Reactor Building

Reclassification: None

Type: Reactor

Start Date: 1/1/1952

Status: Inactive

End Date: 1/1/1969

Description: The site consists of three subsites: 1) the inactive plutonium production 105-C Reactor Core and ISS Project, 2) 105-C Reactor Building Below-Grade Structures and Underlying Soils, 3) 105-C French Drains.

Location: The site is located in the 100 B/C Area, south of the 105-B reactor.

Release Description: There may have been some seepage from the fuel storage basins, in which case the soil column under the basins may be contaminated. The soil has not been characterized, but the radionuclide inventory is estimated to be low when compared to the total inventory in the reactor.

Process Description: The facility was a water cooled, graphite moderated nuclear reactor that irradiated uranium fuel rods. The plutonium by-product was extracted from the irradiated rods in the 200 Area Fuel Separations plants. Before the reactor was placed into interim safe storage, the original facility consisted of the reactor block, which included the graphite core, biological and thermal shields, pressure tubes, and the safety and control systems. The irradiated fuel storage basin was constructed below grade. The reactor building was constructed with 0.9 to 1.5-meter (3 to 5-foot) thick concrete walls around the reactor core and corrugated asbestos/cement siding upper walls. The original roof construction was reinforced concrete over the inner rod room and the rear face enclosure and poured insulating concrete over the rest of the building.

Waste Type: Equipment

waste type: equipment

Waste Description: In 1987, the facility was estimated to contain approximately 25,000 curies of radionuclides, 95,000 kilograms (105 tons) of lead, and 200 cubic meters (7000 cubic feet) of asbestos. During the Interim Safe Storage project, approximately 198 cubic meters (6600 cubic feet) of asbestos was removed along with 500 tons of interior and exterior transite panels. During 1996 through 1998, the total estimated inventory of lead was increased to 203 tons. Seventy tons of lead was removed. Material that was radioactively contaminated was take to the Environmental Restoration Disposal Facility (ERDF).

This Site has the Following SubSites:

Code: 118-C-3:1

Names: 118-C-3:1; 105-C Reactor Core and ISS Project

Code: 118-C-3:2

Names: 118-C-3:2; 105-C Reactor Building Below-Grade Structures and Underlying Soils

Code: 118-C-3:3

Names: 118-C-3:3; 105-C French Drains

Code: 118-C-3:1

Classification: Accepted

Names: 118-C-3:1; 105-C Reactor Core and ISS Project

Reclassification: None

Type: Reactor

Start Date:

Status: Inactive

End Date:

Description: Beginning in 1996, decommission activities removed portions of the building, leaving only the reactor core and shield walls. The footprint of the building was reduced 81% during the Interim Safe Storage project from 5,528 square meters (59,500 square feet) to 1,059 square meters (11,400 square feet).

Location: The site is located in the 100 B/C Area, south of the 105-B reactor.

The SubSite is Part Of:

Code: 118-C-3

Names: 118-C-3; 105-C Reactor Building

Code: 118-C-3:2

Classification: Accepted

Names: 118-C-3:2; 105-C Reactor Building Below-Grade Structures and Underlying Soils

Reclassification: Closed Out (8/7/2000)

Type: Reactor

Start Date:

Status: Inactive

End Date:

Description: The remedial action involved the decommissioning and decontamination of associated structures and soils at the 105-C Reactor to the extent required leaving only the reactor core to be placed in Interim Safe Storage status. Remediation included the removal of hazardous and radiologically contaminated material from below grade rooms, tunnels and contaminated soils. Contaminated material was disposed of in the Environmental Restoration Disposal Facility (ERDF). The excavated areas were backfilled to grade with clean material.

Location: The site is located in the 100 B/C Area, south of the 105-B reactor.

Closure Info: The remedial action involved the decommissioning and decontamination of associated structures and soils at the 105-C Reactor to the extent required leaving only the reactor core to be placed in Interim Safe Storage status. Remediation included the removal of hazardous and radiologically contaminated material from below grade rooms, tunnels and contaminated soils.

Contaminated material was disposed of in the Environmental Restoration Disposal Facility (ERDF). The excavated areas were backfilled to grade with clean material.

The SubSite is Part Of:

Code: 118-C-3

Names: 118-C-3; 105-C Reactor Building

Code: 118-C-3:3

Classification: Accepted

Names: 118-C-3:3; 105-C French Drains

Reclassification: Interim Closed Out (4/24/2006)

Type: Reactor

Start Date:

Status: Inactive

End Date:

Description: The subsite is a collection of four french drains roughly located at the four corners of the 105-C Reactor Building. Each french drain was approximately 40.6 centimeters to 61 centimeters (16 inches to 24 inches) in diameter and had a 3.8 centimeter (1.5 inch) pipeline that ran to the french drain.

Closure Info: The Remaining Sites Verification Package, (RSVP-2006-016) and the confirmatory sampling results support a reclassification of this site to interim closed out. The current site conditions have achieved the objectives for interim closed out as established in the Remedial Design Report/Remedial Action Work Plan for the 100 Area (RDR) and the Interim Action Record of Decision for the 100-BC-1, 100-BC-2, 100-DR-1, 100-DR-2, 100-FR-1, 100-FR-2, 100-HR-1, 100-HR-2, 100-KR-1, 100-KR-2, 100-IU-2, 100-IU-6, and 200-CW-3 Operable Units.(ROD).

The area around all four drains was disturbed and/or excavated during 105-C Reactor decommissioning activities. The area around the french drain to the southeast of the reactor was extensively excavated during the remediation of the 100-B/C south effluent pipelines. The entire area was backfilled and smoothed to grade after the various excavations. Prior to confirmatory sampling no visual surface indicators of the french drains remained, but no record of their removal or remediation could be found. To ensure complete cleanup of the Hanford Site a document search was conducted and found evidence of a potential liquid waste site. The french drains were likely condensate drains from the sealed steam heating system that would not have been subject to contamination from within the reactor building. However, the exact history of the drains is unknown, hence the need for the confirmatory sampling.

Confirmatory sampling was conducted on January 4, 2005. Excavations at the four french drain locations found three of the four drains partially intact. The fourth drain, #4 to the southeast, was not found in the excavation. The three french drains found were excavated and sampled just below the bottom of the drain. The southeast location was excavated to 4.6 m (15 ft) below ground surface and sampled at the bottom of the excavation. This sample design follows an agreement with the U.S. Environmental Protection Agency for sampling an analogous french drain at the 105-F Reactor, which was also removed during decontamination and decommissioning activities.

The contaminants of potential concern (COPCs) were developed for the 100-B/C south effluent pipelines, based on the 100 Area Remedial Action Sampling and Analysis Plan (SAP), they included americium-241, cesium-137, cobalt-60, europium-152, europium-154, europium-155, plutonium-238, plutonium-239/240, strontium-90, uranium-238, lead, mercury, total chromium, and hexavalent chromium. Because of some uncertainty and knowledge of previous investigations, the following analytical methods were also performed: polychlorinated biphenyls (PCBs), semivolatile organic analysis (SVOA), and the expanded inductively coupled plasma (ICP) metals list (antimony, arsenic, barium, beryllium, boron, cadmium, chromium [total], cobalt, copper, lead, manganese, molybdenum, nickel, silver, selenium, vanadium, and zinc). During confirmatory sampling, field screening for volatile organic compounds was

performed to assess the need for volatile organic analysis (VOA). No volatile organic compounds were detected, and VOA was not performed on any of the samples.

Per the 105-C Reactor Interim Safe Storage Project Final Report, the walls of the structures within the area described were removed to 4.6 meters (15 feet) below grade. The Cleanup Verification Package for the 105-C Reactor Building Below-Grade Structures and Underlying Soils released the soils under the reactor. The french drains were not included in cleanup activities associated with the Cleanup Verification Package for the 100 B 8:1 and 100-C-6:1 100-B/C South Effluent Pipelines.

These results show that residual soil concentrations support future land uses that can be represented (or bounded) by a rural-residential scenario. The results also demonstrate that residual contaminant concentrations support unrestricted future use of shallow zone soil (i.e., surface to 4.6 m [15 ft]) and that contaminant levels remaining in the soil are protective of groundwater and the Columbia River. This site does not have a deep zone; therefore, no deep zone institutional controls are required.

The SubSite is Part Of:

Code: 118-C-3

Names: 118-C-3; 105-C Reactor Building

Code: 100-D-64

Classification: Accepted

Names: 100-D-64; 105-DR Reactor Exhaust Stack Sampling Building; 119-DR; 119-DR Sample Building

Reclassification: Interim Closed Out (3/4/2004)

Type: Laboratory

Start Date:

Status: Inactive

End Date:

Description: The site has been remediated and closed-out. The site consisted of a single-story 33.4 meters squared (360 square feet), pre-fabricated metal structure on a concrete slab.

Related Sites/ Structures: 122-DR-1 the 105-DR Large Sodium Fire Facility and the 116-DR- Reactor Exhaust Stack (132-DR-2/122-DR-1:5).

Closure Info: 122-DR-1:2, 100-D-53, 122-DR-1:4, 132-DR-2, 122-DR-1:5, 100-D-64, 100-D-23 and 100-D-54 were addressed as a group. The information below documents information for the group of sites.

Remedial or removal objectives and goals for the components of the LSFF TSD unit pre-filter exhaust tunnel [122-DR-1:2], the 117-DR Exhaust Filter Building [100-D-53/122-DR-1:4], 116DR reactor exhaust stack(132 DR 2/122-DR-1:5), were obtained from the Action Memorandum, USDOE Hanford 100 Area National Priorities List (NPL) 105-F and 105 DR Reactor Buildings and Ancillary Facilities (Action Memorandum). The objectives and goals were also included in the Phase III SAP (DOE/RL-99-35) and the Remedial Design Report/Remedial Action Work Plan for the 100 Area (RDR/RAWP) (DOE/RL-96-17), which was referenced in the Action Memorandum.

Based on consideration of the requirements of CERCLA and detailed analysis of alternatives, the Tri-Parties have selected the remove/dispose alternative under a rural-residential land use scenario for the 117-DR facilities site.

The objective for the structures included the removal of the structure to a minimum of 0.9 meters (3 feet) below surface grade. Excavation was driven by remedial action objectives for direct exposure, protection of groundwater, and protection of the Columbia River. For the

respective points of compliance, remedial action goals (RAGs) were established to identify radionuclide and no radionuclide contaminants of concern (COCs) and contaminants of potential concern.

Waste site COCs for the 117 DR facilities site were identified through process knowledge and are specified in the Phase III SAP (DOE/RL-99-35). The COC list was further refined and amended with the 117 DR Exhaust Filter Building Proposed Additional Soil Sampling and 1720-HA Arsenal Removal/ Disposal Summary (CNN 106839). The COCs consist of the following: americium-241, arsenic, carbon-14, barium, cesium-137, cadmium, cobalt-60, total chromium, europium-152, hexavalent chromium, europium-154, lead, europium-155, lithium, niel-63, mercury, plutonium-238, selenium, plutonium-239/240, silver, strontium-90, sodium, uranium-234, uranium-235 and uranium-238.

At the completion of the remedial action, the total excavation was approximately 1,010 meters squared (10,872 square feet) in area with an approximate depth of 5 meters (16.4 feet). Approximately 14,011 metric tons (15,412 tons) of material from the site were disposed of at the Environmental Restoration Disposal Facility.

The 117-DR facilities site is verified to be remediated in accordance with the RAOs and RAGs of the Action Memorandum and the Remaining Sites ROD and may be backfilled.

In addition, demonstration that remedial action at the 117-DR facilities site has achieved the RAOs and corresponding RAGs established in the Action Memorandum and the Remaining Sites ROD meets the RCRA closure requirements for the underlying soils. Final RCRA TSD certification of closure is pending.

Code: 100-D-105	Classification: Accepted
Names: 100-D-105; D/DR-Area Pipelines Discovered During Remediation	Reclassification: None
Type: Product Piping	Start Date:
Status: Inactive	End Date:
Description: The site consists of all the D/DR-Area Pipelines discovered during remediation but were not associated with an existing waste site. Additional pipeline segments were assigned to this grouping following a spatial analysis of the pipeline geographic information system (GIS) assignments with those contained in regulator approved work instructions and closure documents. Some of these pipeline segments were either not assigned to a waste site or incorrectly assigned to a waste site when compared to the documents.	

The following pipeline segments have been included in this waste site. The first six were mapped using a geophysical survey. The survey included tracing the pipeline exposed in the side of an excavation by electromagnetic induction with direct coupling.

1) A metal pipe was discovered while excavating 100-D-31:3. It is located between 108-D and 1703-D and runs a distance of at least 28 m (92 ft) north/south. The diameter of the pipe was not documented. This pipe was identified as feature "A" in the geophysics data.

2) A 20 cm (8 in) metal pipe was discovered while excavating 100-D-31:3. It was located between the 1727-D building and the 187-D1 water tower. The pipeline is approximately 95 m (312 ft) long. The northern most 20 m (66 ft) of pipe was removed during remediation of 100-D-31:3. The pipe was identified as feature "3_091509" in the geophysics data. The pipe is in line with feature "A" separated by a gap of 9 m (30 ft). The two pipes also appear to be of similar size and construction suggesting that the two pipelines might be the same.

3) A metal pipe was discovered while excavating 100-D-31:3. It is located 8 m (26 ft) south of the 1731-D Building and runs a distance of at least 11 m (36 ft) east/west. The diameter of the pipe was not documented. This pipe was identified as feature "D" in the geophysics data.

4) A metal pipe was discovered while excavating 100-D-31:3. It ran from the north end of the 1731-D building south for 32 m (105 ft) before turning west. From there it traveled another 53 m (174 ft) before turning south again and traveling under the 1726-D building. The diameter of the pipe was not documented. This pipe was identified as feature "F" in the geophysics data. The pipe has a post indicating valve connected to it, suggesting that this is a pressurized service water line. It also runs parallel to a 76.2 cm (30 in) steel filtered water line (100-D-63) in an area where construction drawings (W-75014, M-1901 Sheet 5) show the line reducing in diameter from 30 in to 6 in. It is unclear if the discovered pipe was the same service line but abandoned in place when the 76.2 cm (30 in) steel filtered water line was installed. Drawing H-1-12186 shows a 6 inch fire protection line connecting to the 1760-D Building in the same area as this metal pipe.

5) A metal pipe was discovered while excavating 100-D-31:3. It is located just east of the 1726-D building adjacent to another discovery pipe (feature "F"). The pipe was identified as segment "G" in the geophysics data. The diameter of the pipe was not documented. Drawing H-1-12186 shows a sanitary water line connecting to the 1760-D Building in the same area as this metal pipe.

6) A 15 cm (6 in) metal pipe was discovered while excavating 100-D-31:3. It was located just west of the 1701-DA building and traveled 14 m (46 ft) to the west. The pipe was identified as segment "4_091509" in the geophysics data.

7) An 8 cm (3 in) pipe was discovered while excavating 100-D-31:1. It is located in the 100-D-31:1 excavation approximately 141 m (463 ft) north of D Avenue. It runs east/west. This pipe was identified as Miscellaneous Pipeline Number "MP-1" in the Remaining Sites Verification Package for 100-D-31:1 and 100-D-31:2 (154031).

8) A 20 cm (8 in) pipe was discovered while excavating 100-D-31:2. It is located in the 100-D-31:2 excavation approximately 19 m (62 ft) east of the 1713-D building. It runs north/south. This pipe was identified as Miscellaneous Pipeline Number "MP-3" in the Remaining Sites Verification Package for 100-D-31:1 and 100-D-31:2 (154031).

9) A 15 cm (6 in) cast iron pipe was discovered while excavating 100-D-31:2. It is located in the 100-D-31:2 excavation approximately 6 m (20 ft) west of the 1713-D building. It runs north/south. This pipe was identified as Miscellaneous Pipeline Number "MP-5" in the Remaining Sites Verification Package for 100-D-31:1 and 100-D-31:2 (154031). It is possible that this is the Fire Protection Line shown on drawing H-1-1452 just north of the 2 inch service water line to the 1713-D Building.

10) A 10 cm (4 in) pipe was discovered while excavating 100-D-31:2. It is located in the 100-D-31:2 excavation approximately 10 m (33 ft) west of the southeast corner of the 1717-D building. It runs north/south. This pipe was identified as Miscellaneous Pipeline Number "MP-8" in the Remaining Sites Verification Package for 100-D-31:1 and 100-D-31:2 (154031).

11) A 25 cm (10 in) steel pipe was discovered while excavating 100-D-31:6. It is located in the 100-D-31:6 excavation approximately 72 m (236 ft) east of the 1901-D water tower. It runs north/south. This pipe was identified as Miscellaneous Pipeline Number "MP-6" in the Remaining Sites Verification Package for 100-D-31:6 (147171).

12) A 10 cm (4 in) cast iron pipe was discovered while excavating 100-D-8. The line was

estimated to be at least 74 m (243 ft) long based on ground penetrating radar geophysics data. It is located approximately 100 m (328 ft) south of the 1907-DR outfall structure.

13) A 76 cm (30 in) french drain not previously assigned to a waste site was observed on drawing H-1-9006. It received drainage from the desert cooler and drinking fountain. The french drain was connected to the 1702-DR Badge House by a 3.8 cm (1.5 in) drain line.

14) A steel pipe was discovered while excavating 100-D-32 (Figure 10). It was uncovered along the southwest corner of the 100-D-32 excavation sidewall at Washington State Plane coordinates N151417, E573849, approximately 0.61 m (2 ft) below grade. It is located in the vicinity of a temporary sanitary water line (100-D-63). It is not known whether the two are the same line.

15) A 30.48 cm (12 in) pipe was discovered while excavating 100-D-1. It was initially thought to be associated with 100-D-65 (1904-D Spillway). There is not enough information to support that premise at this time. The pipe is located at Washington State Plane coordinates E573546.6 N152352.8 to E573550.5 N152353.7.

16) A 1.9 cm (0.75 in) sodium silicate line from the storage tank to the 187-D1 Elevated Water Tower and the 30 cm (12 in) filtered water line to the 187-D1 Elevated Water Tower (H-1-13252).

17) A 1.9 cm (0.75 in) sodium silicate line from the storage tank to the 30 cm (12 in) filtered water lines that lead to the 187-DR1 and 187-DR2 Elevated Water Towers (H-1-13252).

Location: The pipeline segments are located throughout the 100-D/DR Area.

Process Description: There is no process history associated with the 100-D-105 waste site.

Code: 100-D-106	Classification: Accepted
Names: 100-D-106; 1607-D1 Influent Pipelines	Reclassification: None
Type: Sanitary Sewer	Start Date:
Status: Inactive	End Date:

Description: The site consists of the sanitary sewer pipelines that connected the service buildings at the 100-D main gate to the 1607-D1 septic tank. It also includes a french drain approximately 21 m (70 ft) north of the 1709-D building (H-1-701).

Location: The 100-D main gate is located approximately 1 Km (0.6 miles) southeast of the 105-D Reactor Building.

Process Description: The site provided sanitary service for patrol and fire personnel located at the entrance to the 100-D/DR Reactor Area.

Related Sites/ Structures: 1701-D Gate House, 1709-D Fire Headquarters and 1720-D Patrol Headquarters.

Code: 100-D-107	Classification: Discovery
Names: 100-D-107; Soil beneath the 1713-DA Essential Materials Warehouse	Reclassification: None
Type: Unplanned Release	Start Date:

Status: Inactive**End Date:****Description:** The site consists of the soil beneath and surrounding the demolished 1713-DA Essential Materials Warehouse. The 1713-DA Essential Materials Warehouse is analogous in operation to 1713-BA. The sodium dichromate contamination at 1713-BA (100-B-27) was directly related to operations in the 1713-BA Building. It is unknown whether or not there are any releases at 1713-DA from the operations involving sodium dichromate.**Location:** The 1713-DA building had been located near the intersection of Pump House Loop and Puyallup Street.

Code: 118-D-6**Classification:** Accepted**Names:** 118-D-6; 105-D Reactor Building**Reclassification:** None**Type:** Reactor**Start Date:** 1/1/1944**Status:** Inactive**End Date:** 1/1/1967**Description:** The unit consists of: 1) a reactor block, which includes the graphite moderator stack, biological and thermal shields, pressure tubes, and the safety and control systems; 2) Ancillary Support Areas, Below-Grade Structures and Underlying Soils the irradiated fuel storage basin; and 3) 118-D-6:3, Fuel Storage Basin and Underlying Soils and 4) 105-D Fuel Storage Basin Side Slope Soils.**Location:** The 105-D Reactor site is located in the 100-D Area approximately 250 meters (820 feet) north of the 105-DR Reactor.**Release Description:** It is suspected that the irradiated fuel storage basin leaked for a number of years prior to deactivation.**Process Description:** Between 1942 and 1955, eight water-cooled, graphite-moderated production reactors were constructed along the Columbia River in the 100 Areas of the Hanford Site. The construction of the first three Hanford reactor facilities (B, D, and F Reactors) utilized the same design drawings. The 105-D Reactor facility is located in the 100-D Area of the Hanford Site. Construction of the D Reactor was initiated in November 1943. Initial startup of the reactor was achieved on December 17, 1944. The D Reactor was shut down on June 26, 1967. Since deactivation, the 105-D Reactor has been in a condition of minimum surveillance and maintenance (S&M). Significant deterioration had occurred, particularly in the roof sections over the fan room and work area. Permanent decommissioning alternatives for the Hanford Site production reactors were assessed in the Final Environmental Impact Statement, Decommissioning of the Eight Surplus Production Reactors at the Hanford Site (DOE 1992). A Record of Decision (ROD) was issued by the U.S. Department of Energy (DOE) (58 Federal Register 48509). The ROD alternative selected was to place the reactors into a safe storage condition for up to 75 years. After Interim Safe Storage (ISS), the reactors would be transported in one piece to a specially prepared burial facility in the 200 West Area of the Hanford Site. The original footprint area of the 105-D Reactor Building was approximately 4,994 meters squared (53,750 square feet). The final ground-level footprint area of the safe storage enclosure (SSE) is 999 meters squared (10,750 square feet). The areas of the reactor building that have been removed to ERDF represent 80% of the original footprint of the reactor building, outside of the reactor block shield walls.**Waste Type:** Equipment**Waste Description:** This unit contained an estimated 21,500 curies of radionuclides, 85,000 kilograms (94 tons) of lead, and 2.8 cubic meters (100 cubic feet) of asbestos. The primary source of contamination at the 105-D site was reactor coolant water and water in the FSB (118-D-6:3) that became contaminated through contact with irradiated and ruptured fuel elements and components from

the reactor cooling system. The water was believed to have contaminated the concrete surfaces of the FSB. No documentation of basin water leakage into the underlying soils was discovered during the cleanup activities .

End Date:

Description: The safe storage enclosure (SSE) consists of the area within the shield walls, included the reactor block; the front-face work area; the elevator; the rear-face work area; and miscellaneous areas 113a, 115a, and 254. This part of the reactor building will remain in place to act as temporary storage for the reactor block. As much as was practical, all objects and surface contamination were removed. A new roof was added as part of the interim safe storage (ISS) effort. All doors were permanently sealed except for one door that remains locked and is welded shut. The only planned entrance to this structure is for surveillance and maintenance activities that occur approximately every 5 years. The original footprint area of the 105-D Reactor Building was approximately 4,994 meters squared (53,750 square feet). The final ground-level footprint area of the safe storage enclosure (SSE) is 999 meters squared (10,750 square feet). The areas of the reactor building that have been removed to ERDF represent 80% of the original footprint of the reactor building.

Location: The 105-D Reactor site is located in the 100-D Area approximately 250 meters (820 feet) north of the 105-DR Reactor.

Status: Inactive

End Date:

Description: For the purpose of removal, the reactor facility was divided into several areas, known as Demolition Zones. The descriptions of the demolition zones in subsite 118-D-6:2 are:

Demolition zone 1, located on the north side of the original reactor building, consisted of the water tower pedestal, the 103-D Unirradiated Fuel Element Storage Building, miscellaneous storage room 210, and room 215 on the ground level.

Demolition zone 2 was located on the west side of the original reactor building. At ground level this zone consisted of the 230a valve pit; the 310 supply fan room; the 231d tool room; the 231b laundry storage room; the 230b elevator; and the 228a, 228b, 228c, 228d, 229a, and 229b offices.

Demolition zone 3 was located on the south side of the original reactor building. At ground level this zone consisted of the 311, 312, 313, and 314 fan rooms; 315 exhaust plenum; 114a clean storage room; 114b contaminated storage room; 213 stairway/corridor; 233a sample room; and miscellaneous rooms 234 and 235. The seal pit was originally part of this demolition zone. However, the seal pit was removed, remediated, and closed by a CVP along with its associated pipelines. (zone 4 is part of subsite 118-D-6-6:3)

Demolition zone 5 was located on the north side of the original reactor building. At ground level this zone consisted of the 211, 212, 218, and 219 miscellaneous rooms; the 220 control room; the inner horizontal control rod room; the outer horizontal control rod room; and miscellaneous rooms numbered 222, 223, 224, 225, and 227.

Location: The 105-D Reactor site is located in the 100-D Area approximately 250 meters (820 feet) north of the 105-DR Reactor.

Closure Info: 118-D-6:2, 118-D-6:3 and 132-D-4 were addressed as a group. The information below documents information for the group of sites.

The Cleanup Verification Package (CVP) for the 118-D-6:2, 105-D Reactor Ancillary Support Areas, Below-Grade Structures, and Underlying Soils; the 118-D-6:3, 105-D Reactor Fuel Storage Basin and Underlying Soils; and the 132-D-4, 105-D Reactor Exhaust Stack Foundation (CVP) demonstrated that removal action at the 105-D Reactor subsites 118-D-6:2, 118 D-6:3, and 132-D-4 has achieved the removal action objectives established in the applicable action memorandums and has achieved the corresponding RAGs established in the Removal Action Work Plan for 105-D and 105-H Building Interim Safe Storage Projects and Ancillary Buildings, the Sampling and Analysis Plan for Interim Closure of the 105-D and 105 H Reactor Below-Grade Structures and Underlying Soils (SAP), and the Remedial Design Report/Remedial Action Work Plan for the 100 Area (RDR/RAWP).

The FSB water level was lowered upon closure of the reactor and further cleaned out during 1984. Ruptured fuel elements had caused the shielding water to become highly contaminated. The remaining water was processed and released to 116-D-10 pond. Then an asphalt emulsion was applied to the floors and walls of the basin to fix loose contamination. The remaining basin hardware, perfs, buckets, and sludge were packaged and disposed of as low-level radioactive waste in the 200 Area burial grounds.

These areas were surveyed, and local contamination was removed in preparation for clean demolition. With the exception of the FSB walls and floor below 4.6 meters (15 feet), all structures in this zone were removed due to surface contamination being present. Sampling of underlying soils was not required because structures in this zone were not subjected to standing contaminated water and there was no mechanism for residual surface contamination to penetrate into the concrete and the underlying soil. The above- and below-grade structures were demolished and the demolition debris sent to ERDF. A section of 100 D-48:4 effluent pipeline remains buried under what was room 210. This section of pipeline will be considered separately from demolition zone 1 and deferred to the Remedial Action Project.

It was determined in the Sampling and Analysis Plan for Interim Closure of the 105-D and 105-

H Reactor Below-Grade Structures and Underlying Soils that the 105-D FSB would not be cored to sample the underlying soils because this FSB was not known to have leaked (water level variations were consistent with evaporation), coring was very difficult and potentially unsafe, and the soils beneath the 100-C and 105-DR FSBs were found to be clean. The 100-D Reactor Site Technical Baseline Report suggests that all of the FSBs had leaked. However, this statement is not supported by the process history of the 105-D FSB, and sampling of the underlying soils at the 105-C and 105-DR FSBs showed that they had not leaked. The FSB concrete floors from all of the previously decommissioned reactors were found to have various types of contamination that penetrated only a maximum of a few millimeters into the concrete. Sampling showed the contamination had not penetrated through the 0.3 to 0.6 meters (1 to 2 feet) of concrete in the FSB floors.

The 105-D Reactor subsites 118-D-6:2, 118-D-6:3, and 132-D-4 have been verified to be remediated in accordance with the applicable action memorandums and can be interim closed. The CVP does not demonstrate the acceptability of unrestricted access to deep zone soils (i.e., below 4.6 meters [15 feet]); therefore, institutional controls to prevent uncontrolled drilling or excavation into deep zone soils are required

The 105-D Reactor subsites 118-D-6:2, 118-D-6:3, and 132-D-4 have been verified to be remediated in accordance with the applicable action memorandums and can be interim closed. The CVP does not demonstrate the acceptability of unrestricted access to deep zone soils (i.e., below 4.6 meters [15 feet]); therefore, institutional controls to prevent uncontrolled drilling or excavation into deep zone soils are required

The SubSite is Part Of:

Code: 118-D-6

Names: 118-D-6; 105-D Reactor Building

Code: 118-D-6:4

Classification: Accepted

Names: 118-D-6:4; 105-D Fuel Storage Basin Side Slope Soils

Reclassification: Interim Closed Out (12/21/2011)

Type: Reactor

Start Date:

Status: Inactive

End Date:

Description: This subsite has been remediated. The subsite consists of the side slope soils associated with the Fuel Storage Basin, a former decontamination pad and one segment of an effluent pipeline.

The Fuel Storage Basin (FSB) side slopes were located just outside of the remaining structure of the 105-D FSB, on the east side of the original reactor building. The side slopes could not be completely remediated during the demolition of the Fuel Storage Basin (118-D-6:3). Subsequent characterization identified a contamination plume in the adjacent soil.

The decontamination areas consisted of two pads that were located on the north and south sides of the reactor for the purpose of equipment decontamination during D&D. The two areas were

considered together during variance and verification sampling. During field screening and sampling, the area of the north decontamination pad was found to be larger than addressed for the sample design. On the north side of the decontamination pad area, a segment of the 100-D-48:4 effluent pipeline (beneath room 210) could not be removed during the reactor D&D activities. The contamination from the pipeline was not fully remediated during that remedial action because of interferences with reactor removal activities and the potential to cause structural problems for the foundation of the reactor. Both the remaining effluent pipeline segment and the remaining area for the north decontamination pad were included in the 118-D-6:4 subsite and deferred to the Remedial Action Project for remediation and cleanup verification.

Location: The 105-D Reactor site is located in the 100-D Area approximately 250 m (820 ft) north of the 105-DR Reactor. The fuel storage basin was on the east side of the reactor.

Closure Info: The Fuel Storage Basin (FSB) side slopes could not be completely remediated during demolition of the 118-D-6:3 FSB. The side slopes were placed in a separate subsite (118-D-6:4) for future remedial action. Part of the northern decontamination pad and the area adjacent to a remaining section of effluent pipeline beneath 105-D Reactor Room 210, that could not be removed during remediation of the 100-D-48 pipelines, were also included in remediation of the 118-D-6:4 subsite. Remediation of the 118-D-6:4 subsite was performed from May 5, 2008 through August 24, 2009. The FSB remediation was halted in 2003 and clean fill was used to stabilize the excavation in support of the 105-D Reactor safe storage enclosure roof installation. It was documented that residual radiological contamination remained below the clean fill. The comparison of the 2008-2009 excavation footprint and the 2003 remediation was performed to confirm that the current activities were comprehensive in removing the volume of clean fill and accessing the remaining contaminated material. All material excavated from the 2008-2009 118-D-6:4 subsite remediation was removed and disposed at ERDF. There was no overburden material associated with the waste site. Borehole sampling was performed within the 118-D-6:4 excavation to support the remedial investigation. Borehole #C7857 was drilled in January 2011 to a depth of approximately 27 meters (90 ft) below ground surface.

Code: 118-D-6

Names: 118-D-6; 105-D Reactor Building

Code: 118-DR-2

Classification: Accepted

Names: 118-DR-2; 105-DR; 105-DR Reactor Building

Reclassification: None

Type: Reactor

Start Date: 1/1/1950

Status: Inactive

End Date: 1/1/1964

Description: The unit consists of: 1) a reactor block, which includes the graphite moderator stack, biological and thermal shields, pressure tubes, and the safety and control systems; 2) 105-DR Reactor below-grade structures and underlying soil.

Location: The site was located at the south end of the 100 D/DR Exclusion Fence.

Release Description: It was suspected that the irradiated fuel storage basin leaked for a number of years prior to deactivation. The leakage rate was minimal, and the location of the leaks were never identified, with the exception of one leak outside of Door 14, that was identified and repaired in 1957.

Process Description: Construction of the 105-DR Reactor began in December 1947 and startup was achieved on October 3, 1950. The facility was a water cooled, graphite moderated nuclear reactor that irradiated uranium fuel rods. The design of the facility was based on the earlier Hanford Site reactors (118-D-6 and 118-F-8), and drawings of the older facilities were modified to form the design drawings for the 105-DR Reactor. The 105-DR Reactor was shut down on December 30,

1964. Deactivation of the reactor was completed in early 1971. Between 1972 and 1986, the southwest portion of the 105-DR Reactor building was used as a research laboratory known as the 105-DR Large Sodium Fire Facility (LSFF). Since deactivation, the 105-DR Reactor has been in a condition of minimum surveillance and maintenance (S&M). Significant deterioration had occurred, particularly in the roof sections over the fan room and work area. Permanent decommissioning alternatives for the Hanford Site production reactors were assessed in the Final Environmental Impact Statement, Decommissioning of the Eight Surplus Production Reactors at the Hanford Site (DOE 1992). A Record of Decision (ROD) was issued by the U.S. Department of Energy (DOE) (58 Federal Register 48509). The ROD alternative selected was to place the reactors into a safe storage condition for up to 75 years. After Interim Safe Storage (ISS), the reactors would be transported in one piece to a specially prepared burial facility in the 200 West Area of the Hanford Site.

Waste Type: Equipment
Waste This unit contained radiation levels estimated at 13,500 curies, 85,300 kilograms (94 tons) of
Description: lead, 2.8 cubic meters (100 cubic feet) of asbestos, and 230 kilograms (500 pounds) of cadmium.

End Date:

Description: Deactivation of the reactor was completed in early 1971. Subsequently the 105-DR ISS Project was completed in January 2003. This process is designed to safely contain the reactor for up to 75 years. The final footprint was reduced by 78% after the safe storage enclosure project was completed.

Location: The site was located at the south end of the 100 D/DR Exclusion Fence.

The SubSite is Part Of:

Code: 118-DR-2

Names: 118-DR-2; 105-DR; 105-DR Reactor Building

Code: 118-DR-2:2

Classification: Accepted

Names: 118-DR-2:2; 105-DR Reactor Below-Grade
Structures and Soil

Reclassification: Interim Closed Out (1/15/2004)

Type: Reactor

Start Date:

Status: Inactive

End Date:

Description: 105-DR Phase III Below Grade Structures and Underlying Soils

Zone 1 consisted of the Fuel Storage Basin (FSB), storage and transfer area, storage area, and the transfer bay; and the soils underlying the FSB, collectively referred to as the FSB area. The

FSB area was located on the east side of the 105 DR Reactor building and served as an underwater collection, storage, and transfer facility for the irradiated fuel elements discharged from the reactor. This zone was located entirely within the deep zone.

Zone 2 consisted of the valve pit that received wastewater from the reactor building. Zone 2 was entirely within the deep zone.

Zone 3 consisted of the solids feed area, the north water tunnel, and the trench under the accumulator room. The below-grade rooms, tunnel, and trench have been wetted by isolated spills and standing rainwater that may have acted as a hydraulic driver for potential contamination. Zone 3 was within the shallow zone

Zone 4 consisted of the gas tunnel, exhaust plenum, gas recirculation tunnel, and the instrument room. Similar to Zone 3, these rooms and tunnels would have been wetted by isolated spills and standing rainwater, which may have acted as a hydraulic driver for potential contamination. Zone 4 was entirely within the deep zone.

Zone 5 consisted of the side slope soils around the FSB, the south effluent pipeline, and the soil under the slab.

Also included in Zone 5 was a section of 105-DR process effluent pipeline located adjacent to the south side of the FSB. This area was included in Zone 5 because of its proximity to the side slopes of the FSB. Zone 5 was within the shallow zone.

The three decon areas were located around the reactor for the purpose of equipment decontamination. The northwest decon area was approximately 8.0 meters by 8.8 meters (26 feet by 29 feet). The northeast decon area was approximately 12 meters by 9.8 meters (39 feet by 32 feet), and the south decon area was approximately 16 meters by 17 meters (52 feet by 56 feet).

Closure Info: 118-DR-2:2 and 100-D-49:4 were addressed as a group. The information below documents information for the group of sites.

The Cleanup verification package, (CVP-2003-00016), documents completion of removal action for this subsite in support of the 105-DR Reactor Interim Safe Storage Project. The 100-D-49:4 region consisted of the north effluent pipe tunnel, which has been removed. The soil beneath the floor and the side slopes were sampled for cleanup verification purposes

Waste site contaminants of concern (COCs) identified through process knowledge were identified in the Sampling and Analysis Plan for the 105-F and 105-DR Phase III Below Grade Structures and Underlying Soils (105-DR SAP) (DOE/RL-99-35). The 105-DR SAP classified the different areas and structures into affected media that were similar in characteristics and contaminants.

The COCs for subsite 100-D-49:4 included: americium-241, barium-133, carbon-14, cobalt-60, cesium-137, europium-152, europium-154, europium-155, nickel-63, plutonium 238, plutonium-239/240, strontium-90, technitium-99, uranium-234, uranium-235, uranium-238, hexavalent chromium, lead, mercury and polychlorinated biphenyls.

The COCs for subsite 118-DR-2:2 included: americium-241, barium-133, carbon-14, cesium-137, cobalt-60, europium-152, europium-154, europium-155, nickel-63, plutonium-238, plutonium-239/240, strontium-90, technetium-99, tritium, uranium 233/234, uranium 235, and uranium 238. For cleanup verification the different areas were designated as "zones," based on the type of deposition, depth, and/or type of use. Refer to Appendix A of the CVP-2003-00016 for sample numbers and results.

Zone 1 consisted of the Fuel Storage Basin (FSB), storage and transfer area, storage area, and the transfer bay; and the soils underlying the FSB, collectively referred to as the FSB area. The FSB area was located on the east side of the 105 DR Reactor building and served as an underwater collection, storage, and transfer facility for the irradiated fuel elements discharged from the reactor. This zone was located entirely within the deep zone.

Zone 2 consisted of the valve pit that received wastewater from the reactor building. During the cleanup verification sampling, high levels of hexavalent chromium and polychlorinated biphenyls (PCBs) were discovered on the valve pit concrete floor. Therefore, the floor was removed and disposed of at the ERDF, then the valve pit walls and soil underneath the concrete floor were sampled and analyzed for hexavalent chromium and PCBs for verification purposes. Zone 2 was entirely within the deep zone.

Zone 3 consisted of the solids feed area, the north water tunnel, and the trench under the accumulator room. The below-grade rooms, tunnel, and trench have been wetted by isolated spills and standing rainwater that may have acted as a hydraulic driver for potential contamination. Only concrete floors were sampled and analyzed for these areas, as the walls are expected to contain little or no contamination. Ceilings were removed and disposed of at the ERDF. Zone 3 was within the shallow zone

Zone 4 consisted of the gas tunnel, exhaust plenum, gas recirculation tunnel, and the instrument room. Similar to Zone 3, these rooms and tunnels would have been wetted by isolated spills and standing rainwater, which may have acted as a hydraulic driver for potential contamination. Therefore, only the concrete floors were sampled and analyzed. Zone 4 was entirely within the deep zone.

Zone 5 consisted of the side slope soils around the FSB, the south effluent pipeline, and the soil under the slab. The soils adjacent to the 105-DR FSB were sampled to verify that shallow zone soil cleanup levels would be met if the walls of the FSB were removed. The soils beneath the slab were sampled for mercury because of the potential for mercury contamination from a floor drain in the slab.

Also included in Zone 5 was a section of 105-DR process effluent pipeline located adjacent to the south side of the FSB that was removed and the soil was sampled as part of the adjacent soils beneath the FSB. The concrete was removed from this location and the soil was sampled for verification purposes. This area was included in Zone 5 because of its proximity to the side slopes of the FSB. Zone 5 was within the shallow zone.

The three decon areas were located around the reactor for the purpose of equipment decontamination. The northwest decon area was approximately 8.0 meters by 8.8 meters (26 feet by 29 feet). The northeast decon area was approximately 12 meters by 9.8 meters (39 feet by 32 feet), and the south decon area was approximately 16 meters by 17 meters (52 feet by 56 feet).

An individual calculation of contaminated material removed for cleanup of the pipeline area was not provided in the CVP. A total of approximately 7,220 cubic meters (25,500 cubic feet) of contaminated materials were disposed at the ERDF. The results of this effort indicated that the materials from the site containing COCs at concentrations exceeding RAGs have been excavated and disposed at the ERDF.

These results also indicate that residual concentrations in the shallow zone will support future land uses that can be represented (or bounded) by a rural-residential scenario, and that residual concentrations throughout the site pose no threat to groundwater or the Columbia River. The site is verified to be remediated in accordance with the Action Memorandum (EPA et al. 1998)

and can be backfilled.

The SubSite is Part Of:

Code: 118-DR-2

Names: 118-DR-2; 105-DR; 105-DR Reactor Building

Code: 100-F-52

Classification: Accepted

Names: 100-F-52; 146-FR Radioecology/Aquatic Biology Laboratory Soil

Reclassification: No Action (6/27/2008)

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The site consisted of the soil under and around the former 146-FR Radioecology and Aquatic Biology Laboratory. After remediation, the site was level to grade with no visual indication of the former facility.

Location: The 146-FR Radioecology and Aquatic Biology Laboratory was located approximately 457 meters (1500 feet) northeast of the 105-F Reactor Building and about 122 meters (400 feet) southwest of the 1904-F Outfall.

Process Description: Process liquids were supplied to the 146-F Fish Laboratory from several sources. Raw water was pumped from the 181-F River Pump House; chemically treated, pre-reactor process water was pumped from the 190-F Main Process Pump House and Annex; and reactor effluent process water was pumped from the 107-F Retention Basin. Aquatic river creatures were exposed to varying amounts of process effluents from 100 F Area operations, and the facility process wastes exited the south end of the building and passed through the 1904-F Outfall to the Columbia River.

Related Sites/Structures: The facility was associated with the 181-F River Pump House, the 190-F Main Process Pump House and Annex, the 107-F Retention Basin, and the 1904-F Outfall.

Waste Type: Soil

Waste Description: During research of the site history, no reports were found of unplanned discharges to the soil from this building. However, because of the open-pond operations within the building, it is prudent to assume such discharges may have occurred. Confirmatory sampling should be considered.

Contaminants of concern/potential concern are based on those for the 1904-F Outfall (116-F-8). Contaminants of concern include cobalt 60, europium 152, europium 154, europium 155, and hexavalent chromium. Contaminants of potential concern include carbon 14, cesium 137, nickel 63, and strontium 90.

Closure Info: The current site conditions, as documented in the Remaining Sites Verification Package 2008-022, have achieved the remedial action objectives and the corresponding remedial action goals as established in the Remedial Design Report/Remedial Action Work Plan for the 100 Area and the Interim Action Record of Decision for the 100-BC-1, 100-BC-2, 100-DR-1, 100-DR-2, 100-FR-1, 100-FR-2, 100-HR-1, 100-HR-2, 100-KR-1, 100-KR-2, 100-IU-2, 100-IU-6, and 200-CW-3 Operable Units, Hanford Site (Remaining Sites ROD).

Previous remediation efforts for several sites had partially overlapped the 100-F-52 waste site. A small area along the northern edge of the 146-FR Laboratory footprint was removed along with pipelines associated with the 100-F-33 and 100-F-19 waste sites. Soils that were adjacent to the eastern edge of the 146-FR Laboratory footprint were excavated when pipelines associated with the 1607-F6 waste site were removed. When pipelines associated with the 100-

F-19 waste site were removed, the entire southern edge of the 146-FR Laboratory footprint was removed. Excavation associated with the 100-F-26:12 Main Process Sewer Pipeline removed soils underlying the entire southern edge of the 146-FR Laboratory footprint.

No indication of the former facility or concrete footprint was found during a March 2007 site visit. The site was partially covered with excavation stockpiles derived from the 100-F-26:12 Main Process Sewer Pipeline excavation. That excavation had removed all of the shallow zone soils from the southern 5 meters (16 feet) of the 146-FR Laboratory footprint.

Geophysical surveys over several sections of the 146-FR Radioecology and Aquatic Biology Laboratory footprint were performed as part of the investigations of adjacent waste sites. In order to get a complete survey for the site, several surveys were merged to get an overall geophysical interpretation map of the 100-F-52 waste site.

The resulting survey revealed an area of scattered debris and three pipeline segments. Two of the pipeline segments were just outside of the 146-FR Laboratory footprint. Those two pipeline segments were part of the 100-F-41 pipeline site and were rejected as a waste site because they were used for treated water. A third section of pipe, within the footprint of the 146-FR Laboratory, was approximately 22 meters (72 feet) long and 2 meters (3.3 feet) below ground surface. This section of pipe may also belong with 100-F-41; however, its location was not well documented. Therefore, the pipe was included as part of the 100-F-52 waste site.

A circular subsurface feature, approximately 12 meters (39 feet) north of the 146-FR Laboratory, can also be seen in the geophysical interpretation. The location of the circular subsurface feature clearly identified it as the remnants of the circular pond that was closed as part of the 100-F-33 waste site. Work Instruction for Confirmatory Sampling of the 100-F-52 (146-FR) Radioecology and Aquatic Biology Laboratory Soil, 0100F-WI-G0051.

Confirmatory sampling was performed on November 28, 2007 and February 20, 2008 in accordance with Work Instruction for Confirmatory Sampling of the 100-F-52 (146-FR) Radioecology and Aquatic Biology Laboratory Soil. A 5 centimeter (2-inch) diameter carbon steel pipe was discovered in each of two trenches, both trenches were sampled and backfilled. On February 20, 2008, the trenches were re-excavated, the pipes breached, revealing scale or sediment in one pipe which was sampled.

Contaminants of potential concern (COPCs) were identified based on COPCs developed for the 100-F-33, 146-F Aquatic Biology Fish Ponds utilizing the protocol in the 100 Area Remedial Action Sampling and Analysis Plan and historical information about activities at the 146-F Fish Laboratory and 146-F Aquatic Biology Fish Ponds. COPCs included: cobalt-60, cesium-137, europium-152, europium-154, europium-155, plutonium-238, plutonium-239/240, strontium-90, uranium-234, uranium-235, hexavalent chromium, mercury, lead, and polycyclic aromatic hydrocarbons (PAHs). Further site-specific evaluation identified arsenic, barium, cadmium, total chromium, selenium, silver, and polychlorinated biphenyls (PCBs) as COPCs. Carbon-14 and nickel-63 were also identified as COPCs due to the use of reactor process water at these facilities. Also, petroleum hydrocarbons were added due to the repeated mention of the use of water-soluble lubricating oil (Calol) in the reactor process water.

Confirmatory samples were analyzed using U.S. Environmental Protection Agency-approved analytical methods. The laboratory-reported data results for all constituents were stored in the WCH Environmental Remediation System (ENRE) project-specific database prior to submission for archival in the Hanford Environmental Information System (HEIS) site-wide database and were summarized in Appendix B of the RSVP.

The results of confirmatory sampling show that residual contaminant concentrations do not preclude any future uses (as bounded by the rural-residential scenario) and allow for

unrestricted use of shallow-zone soils (i.e., surface to 4.6 meters [15 feet] deep). The results also demonstrated that residual contaminant concentrations were protective of groundwater and the Columbia River. Site contamination did not extend into the deep-zone soils; therefore, no institutional controls to prevent uncontrolled drilling or excavation into the deep zone are required.

Code: 100-F-64 **Classification:** Accepted
Names: 100-F-64; Yellow and Red Stained Soil Along Railroad Tracks Near 1713-FA **Reclassification:** None
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**
Description: The site is red and yellow stained soil straddling railroad tracks with elevated concentrations of lead (157856).
Location: This area is approximately 27 meters (90 feet) east of the 100-F-47 WIDS boundary and north of the 1713-FA Essential Materials Building

Code: 100-F-65 **Classification:** Accepted
Names: 100-F-65; Green Stained Area Near Tracks Immediately West of 190-F **Reclassification:** None
Type: Product Piping **Start Date:**
Status: Inactive **End Date:**
Description: The site consists of green stained soil along the railroad tracks immediately west of the 190-F Building. The site was discovered on March 28, 2011 while remediating 100-F-57.
Location: This area is approximately 20 meters (66 feet) west of the northwest corner of the 190-F Building along the railroad tracks.

Code: 118-F-8 **Classification:** Accepted
Names: 118-F-8; 105-F Reactor Building **Reclassification:** None
Type: Reactor **Start Date:** 1/1/1944
Status: Inactive **End Date:** 1/1/1965
Description: The site is an inactive plutonium production reactor that has been placed in Interim Safe Storage. The unit consists of a reactor block with associated shielding and controls, and contaminated portions of the reactor building.
Location: The site is located in the southeastern corner of the 100F Area.
Process Description: Water from the Columbia River was extensively treated before passing through the reactor. It then circulated in a single pass through the reactor process tubes, cooling tubes imbedded in the thermal shield, and reactor horizontal control rods. After exiting the reactor, the cooling water passed through a retention basin and was then discharged to the river. During reactor operations, fuel cladding failures sometimes occurred while the fuel elements were in the process tubes. The first such cladding failure in any reactor occurred at the F Reactor in 1948. Over the operational lifetime of the reactor, there were several hundred such cladding failures. When fuel cladding failed, the cooling water in the affected process tubes became highly contaminated and elevated radiation levels were observed in the cooling water exiting the reactor core. This highly contaminated water was diverted to a trench for ground disposal rather than to the Columbia River. During reactor operations and reactor shutdowns, large

quantities of decontamination solutions were used routinely to remove radionuclides from reactor equipment and facility surfaces. Decontamination activities took place at the dummy decontamination facility wash pad, which was adjacent to the fuel storage basin. Known decontamination solutions included chromic acid, citric acid, oxalic acid, nitric acid, sulfamic acid, sulfuric acid, and sodium fluoride. Other chemicals, including organic solvents, were also used for some decontamination processes. The reactor had many safety and control mechanisms. The function of the horizontal control rods (HCRs) was to control the equilibrium and transient power levels of the reactor during routine operations and to maintain the desired neutron flux distribution. The HCRs were each about 11.0 meters (36 feet) long, with the poison (neutron absorbing) segment being about 8.96 meters (29.4 feet) long. Two of the rods were electrically driven and seven were hydraulically driven. The latter were known as shim rods and were used to achieve ongoing operational control and desired fluctuations. The vertical safety rods (VSRs) were 11.9-meter (39-foot) long, stainless steel sleeves with 0.74-millimeter (3/16-inch) thick boron stainless steel sleeves inside. Each VSR was inserted and withdrawn from the reactor via two separate cables wound around a winch located 12.2 meters (40 feet) above the top of the reactor. In cases of automatic shutdown ("scram") of the reactor, the electromagnetic clutch holding each rod would be deenergized (demagnetized), and the rods would free fall by gravity into channels penetrating the reactor. A "last ditch" safety system, a boric acid solution, was held in a large pedestal tank at the top of each reactor and connected to each of the 29 VSR channels via 1.27-centimeter (0.5-inch) pipes. The liquid boron system was later replaced by a system that used solid boron steel and carbon steel balls (Ball 3X System). The normal method for reactor refueling was displacement charge-discharge during reactor shutdown. During a refueling operation, the tubes to be discharged had their rear nozzle caps removed. New fuel elements were pushed into the process tube by a charging machine which caused the irradiated fuel elements in the tube to be displaced. The displaced irradiated fuel elements dropped into a water filled discharge chute and slid down into the metal pickup area at the end of the storage basin. The 6.1 meters (20 feet) of water in the chute area provided shielding as the elements accumulated and were sorted into buckets using long, hand-operated tongs. The buckets were then transferred by an overhead monorail system to the storage aisles where they were held for a time to allow the decay of short-lived radionuclides. Following the storage period, the buckets of fuel elements were moved by the overhead monorail system to the transfer area. At the transfer area, the irradiated fuel was loaded into a cask, then raised by a crane and placed in special railroad cars for shipment to the chemical reprocessing facilities in the 200 Area.

Waste Type: Asbestos (friable)

Waste Description: The site was estimated to contain less than 2.83 cubic meters (100 cubic feet) of asbestos.

Waste Type: Equipment

Waste Description: Before remediation and ISS the unit contained an estimated 16,000 curies of radionuclides, 85,300 kilograms (94 tons) of lead, and 13.6 kilograms (30 pounds) of cadmium.

This Site has the Following SubSites:

Code: 118-F-8:1

Names: 118-F-8:1; 105-F Below-Grade Structures and Underlying Soils; 105-F Reactor Ancillary Support Areas

Code: 118-F-8:2

Names: 118-F-8:2; 105-F Reactor Core and ISS Project

Code: 118-F-8:3

Names: 118-F-8:3; 105-F Reactor Fuel Storage Basin and Underlying Soils

the underlying soils of the former FSB, was zone 1. The 118-F-8:1 subsite was divided into three zones (zones 2, 3, and 4), and also included the equipment decontamination areas, which were used during 105-F D and ISS activities.

Cleanup verification samples, including QA/QC samples, were collected and analyzed for the established contaminants of concern (COC) from 1999 to December 2003. Components of each zone were summarized, including structure floor depths and contaminants of concern (COCs). Floor depths were below ground surface. COCs were identified through process knowledge and were listed in the 105-F SAP and the FSB SAP. For the following zones 118-F-8:3; Zone 1 - FSB and underlying soils, 118-F-8:1; Zone 2 - Valve pit, and the 118-F-8:1; Equipment Decontamination Areas the COCs were: americium-241, barium-133, carbon-14, cobalt-60, cesium-137, europium-152, europium -154, europium-155, nickel-63, plutonium-238, plutonium-239/240, strontium-90, technetium-99, uranium-234, uranium-235, uranium 238, hexavalent chromium, barium lead, mercury and PCBs.

For subsites 118-F-8:1; Zone 3 (Gas recirculation tunnel, solids feed area, flow laboratory basement, East water tunnel, trench under accumulator room) and 118-F-8:1; Zone 4, (West inlet water tunnel, east inlet water tunnel, 315 exhaust plenum, 316 exhaust plenum, pipe tunnel, southeast tunnel) the COCs were: americium-241, barium-133, carbon-14, cobalt-60, cesium-137, europium-152, europium -154, europium-155, nickel-63, plutonium-238, plutonium-239/240, strontium-90, hexavalent chromium and lead.

The CVP-2003-00017 demonstrated that the removal action at the 105-F Reactor subsites 1 and 3 have achieved the objectives established in the Action Memorandum and have achieved the corresponding cleanup standards established in the 105-F SAP, the FSB SAP, and the 100 Area RDR/RAWP.

The remaining soils and concrete at the 105 F Reactor site have been sampled, analyzed, and modeled. The results of this effort indicate that the materials from the 105 F Reactor site containing COCs at concentrations exceeding the cleanup standards have been excavated and disposed of at ERDF. These results also indicated that residual concentrations in the shallow zone will support future land uses. However, the acceptability of unrestricted direct exposure to deep zone soils has not been demonstrated; therefore, institutional controls to prevent uncontrolled excavation into the deep zone (i.e., below 4.6 meters [15 feet]) are required. The 105-F Reactor subsites 1 and 3 are verified to meet protectiveness standards in accordance with the Action Memorandum.

The SubSite is Part Of:

Code: 118-F-8

Names: 118-F-8; 105-F Reactor Building

Code: 118-F-8:2

Classification: Accepted

Names: 118-F-8:2; 105-F Reactor Core and ISS Project

Reclassification: None

Type: Reactor

Start Date:

Status: Inactive

End Date:

Description: Construction of the F Reactor was initiated in December 1943. Initial startup of the reactor was achieved on February 25, 1945. The F Reactor was shut down on June 25, 1965. Until the start of the Interim Safe Storage (ISS) Project, the F Reactor had been in a condition of minimum surveillance and maintenance (S&M). The primary objective of the 105-F Reactor ISS Project is to provide storage for up to 75 years with minimal maintenance required. Design objectives are summarized as follows: safe storage for up to 75 years, no credible releases of radionuclides to the environment under normal design conditions, interim inspection required only on a 5-year

frequency, further evaluation of extending this frequency will be done by the project group upon completion of the first 5-year surveillance. Access to the 105-F Reactor SSE is through the utility room. During periods of storage, the door to the SSE (located inside the utility room) will be locked and welded shut. The door to the utility room will be locked except during routine S&M activities. The SSE is entered only for periodic S&M activities. The 0.9 to 1.5-meter (3 to 5-foot)-thick concrete walls and the welded door provide the security barrier for the facility; therefore, a locked fence around the SSE is not required. The original footprint area of the reactor building was approximately 4,994 meters squared (53,750 square feet). The final footprint area of the safe storage enclosure is 999 meters squared (10,750 square feet). Thus, the footprint area of the reactor was reduced by 80%. To avoid confusion, the footprint area is strictly the at-grade area and does not include the square footage of any above-grade rooms (e.g., sample rooms, ready room, upper electrical room, or exhaust plenums) or below-grade rooms/tunnels. The new steel roof decking was covered with foam and two applications of silicon rubber.

Location: The site is located in the southeastern corner of the 100F Area.

The SubSite is Part Of:

Code: 118-F-8

Names: 118-F-8; 105-F Reactor Building

Code: 118-F-8:3

Classification: Accepted

Names: 118-F-8:3; 105-F Reactor Fuel Storage Basin and Underlying Soils

Reclassification: Interim Closed Out (5/6/2004)

Type: Reactor

Start Date:

Status: Inactive

End Date:

Description: The fuel storage basin, located on the south side of the 105-F Building, was the underwater collection, storage, and transfer facility for irradiated fuel elements discharged from the reactor. This area included the fuel element discharge pickup area, fuel storage area (basin), fuel transfer area, wash pad area and underlying soils.

In 1970 the basin was pumped until 0.6 meters (2 feet) of water remained, where sediment/sludge and miscellaneous items were found (fuel buckets, fuel spacers, process tubes, tongs, wooden floor decking, and monorail pieces). Fine streambed sand was then placed into the remainder of the basin (5.4 meters [18 feet]).

Closure Info: 118-F-8:1, 118-F-8:3 and 100-F-10 were addressed as a group. The information below documents information for the group of sites.

Demolition of the facilities in subsites 1 and 3 began in fiscal year 1998. In 2004 the Cleanup Verification Package (CVP) 2003-00017 documented completion of the removal action and verified the protectiveness of subsites 118-F-8:1 (105-F Reactor Ancillary Support Areas, Below-Grade Structures and Underlying Soils) and 118-F-8:3 (105-F Fuel Storage Basin (FSB) and underlying soils).

Removal action "applicable or relevant and appropriate requirements" (ARARs) and cleanup standards for the 105-F site were established by the U.S. Environmental Protection Agency and the U.S. Department of Energy, Richland Operations Office, in concurrence with the Washington State Department of Ecology. These ARARs and cleanup standards for the subsites were documented in the Action Memorandum.

Removal of below grade structures to a minimum of 0.9 meters (3 feet) below surrounding grade outside of the 105 F Reactor core shield walls, verification that structures and soil left in

place achieved specified cleanup standards, and disposal of contaminated excavation materials at the Environmental Restoration Disposal Facility in the 200 Area of the Hanford Site. In some cases, the floors of the below-grade structure (i.e., the valve pit and the solids feed area) or the entire structure (i.e., the FSB) were removed.

The subsite was divided into areas or zones as specified in the 105-F SAP and the FSB SAP according to process history and structure depth. These zones were treated as separate units such that cleanup evaluations were conducted on each individual area or zone. The 118-F-8:3, the underlying soils of the former FSB, was zone 1. The 118-F-8:1 subsite was divided into three zones (zones 2, 3, and 4), and also included the equipment decontamination areas, which were used during 105-F D and ISS activities.

Cleanup verification samples, including QA/QC samples, were collected and analyzed for the established contaminants of concern (COC) from 1999 to December 2003. Components of each zone were summarized, including structure floor depths and contaminants of concern (COCs). Floor depths were below ground surface. COCs were identified through process knowledge and were listed in the 105-F SAP and the FSB SAP. For the following zones 118-F-8:3; Zone 1 - FSB and underlying soils, 118-F-8:1; Zone 2 - Valve pit, and the 118-F-8:1; Equipment Decontamination Areas the COCs were: americium-241, barium-133, carbon-14, cobalt-60, cesium-137, europium-152, europium -154, europium-155, nickel-63, plutonium-238, plutonium-239/240, strontium-90, technetium-99, uranium-234, uranium-235, uranium 238, hexavalent chromium, barium lead, mercury and PCBs.

For subsites 118-F-8:1; Zone 3 (Gas recirculation tunnel, solids feed area, flow laboratory basement, East water tunnel, trench under accumulator room) and 118-F-8:1; Zone 4, (West inlet water tunnel, east inlet water tunnel, 315 exhaust plenum, 316 exhaust plenum, pipe tunnel, southeast tunnel) the COCs were: americium-241, barium-133, carbon-14, cobalt-60, cesium-137, europium-152, europium -154, europium-155, nickel-63, plutonium-238, plutonium-239/240, strontium-90, hexavalent chromium and lead.

The CVP-2003-00017 demonstrated that the removal action at the 105-F Reactor subsites 1 and 3 have achieved the objectives established in the Action Memorandum and have achieved the corresponding cleanup standards established in the 105-F SAP, the FSB SAP, and the 100 Area RDR/RAWP.

The remaining soils and concrete at the 105 F Reactor site have been sampled, analyzed, and modeled. The results of this effort indicate that the materials from the 105 F Reactor site containing COCs at concentrations exceeding the cleanup standards have been excavated and disposed of at ERDF. These results also indicated that residual concentrations in the shallow zone will support future land uses. However, the acceptability of unrestricted direct exposure to deep zone soils has not been demonstrated; therefore, institutional controls to prevent uncontrolled excavation into the deep zone (i.e., below 4.6 meters [15 feet]) are required. The 105-F Reactor subsites 1 and 3 are verified to meet protectiveness standards in accordance with the Action Memorandum.

The SubSite is Part Of:

Code: 118-F-8

Names: 118-F-8; 105-F Reactor Building

Code: 118-F-8:4

Classification: Accepted

Names: 118-F-8:4; 105-F Fuel Storage Basin West Side
Adjacent and Side Slope Soils

Reclassification: Interim Closed Out (3/4/2008)

Type: Reactor

Start Date:

Status: Inactive**End Date:****Description:** This subsite consists of an area of soil at the western boundary of the 118-F-8:3, FSB excavation. It was identified during the remediation of subsites 1 and 3.**Closure Info:** The Cleanup Verification Package for the 118-F-8:4 Fuel Storage Basin (FSB) West Side Adjacent and Side Slope Soils documents that the subsite has been remediated in accordance with the Removal Action Work Plan for 105-DR and 105-F Building Interim Safe Storage Projects and Ancillary Buildings and meets the remedial action objectives and goals for interim closure as established in the Action Memorandum and, by reference, the 100 Area Remedial Action Sampling and Analysis Plan (SAP) and the Remedial Design Report/Remedial Action Work Plan for the 100 Area (RDR/RAWP).

Remediation of the subsite began on March 14, 2007, and was completed on June 22, 2007. Remedial action activities involved removing the uncontaminated overburden, the buried contaminated material, and the underlying contaminated soil for disposal. Following remediation and field screening of the waste site, verification sampling was conducted between May 31 and June 22, 2007.

The 118-F-8:4 subsite has been verified to meet protectiveness standards in accordance with the Action Memorandum. In accordance with this evaluation, the verification sampling and modeling results support a reclassification of the site to Interim Closed Out.

The SubSite is Part Of:**Code:** 118-F-8**Names:** 118-F-8; 105-F Reactor Building

Code: 100-H-54**Classification:** Discovery**Names:** 100-H-54; GPERS 100-H Shoreline Survey
Unplanned Release**Reclassification:** None**Type:** Unplanned Release**Start Date:****Status:** Inactive**End Date:****Description:** On June 3, 2004, a radiological field survey of the 100-H Shoreline was conducted. The system used to collect the data was a man-carried back pack with walking stick system called the Global Positioning Environmental Radiological Surveyor (GPERS). The survey was performed as part of the risk assessment work performed by Bechtel Hanford, Inc. (BHI).**Location:** The site is located in the 100-HR-1 Operable Unit, approximately 150 meters (432 feet) southeast of the 107-H Retention Basin. The site is along the Columbia River embankment. The site is located at E 578294.96, N 152528.72. This is the location with the maximum gamma reading.**Process Description:** The GPERS equipment enables the operator to document scanning measurements, stationary radiological measurements, and sample locations of surfaces with the radiological readings and exact coordinates (with 2 cm [0.8 in]) automatically logged in real time. (See photo #1). Approximately 4,030 radiological field screening survey points were collected in the detailed image (See image #3). This detailed area is 100-H-54. Image #2 represents 25,928 readings that were collected over a larger area. The green points to the north 100-H-54 are the approximate location of 100-H-36 Spillway site.**Waste Type:** Soil**Waste Description:** The site is an area of systematically elevated radiological activity, generally less than twice background measurements, as shown in the GPERS plot (Image #1, Image #2). No survey data

has been located for the area between the survey area shown in the images (Image #1, Image #2) and the 116-H-7 (107-H Retention Basin) remediation footprint.

Code: 100-H-56	Classification: Accepted
Names: 100-H-56; H-Area Miscellaneous Pipelines	Reclassification: None
Type: Product Piping	Start Date:
Status: Inactive	End Date:
Description: The site consists of all the 100-H Area miscellaneous pipelines not associated with an existing waste site.	

These pipeline segments were discovered during a spatial analysis of the pipeline geographic information system (GIS) assignments with those contained in regulator approved work instructions and closure documents. Some of these pipeline segments were either not assigned to waste sites or incorrectly assigned to a waste site when compared to the documents. Additional pipeline segments were discovered in the field during field remediation activities.

The following pipeline segments have been included in this waste site:

- 1) The 15.2 cm (6 in) cast iron sanitary sewer services the 181-H building. It carried sanitary waste to the 1607-H4 septic tank and drainfield (M-1904-H sh 1, P-1211).
- 2) The 5.08 cm (2 in) steel pipeline carried filtered water from the Brine Pump House to the coal conveyor. The water supply originated from the 184-H Power House and traveled to the Brine Pump House through a 7.62 cm (3 in) steel filtered water line (100-H-51:3) before connecting to the 5.08 cm (2 in) steel filtered water pipeline (P-1418, P-1419).
- 3) The 2.54 cm (1 in) soft water line from the elevated water tower to the 184-H power house (P-1426, P-1216).
- 4) The 10.16 cm (4 in) schedule 40 steel water line supplied filtered water from the elevated water tank 187-H1 to the 119-H Sample Building (H-1-19805, H-1-19812, H-1-19849).
- 5) The 30.48 cm (12 in) filtered water line supplies water from the elevated storage tank 187-H1 to the 105-H Building (H-1-13254).
- 6) The 40.64 cm (16 in) filtered water line supplies water from the elevated storage tank 187-H1 and the 105-H Building (H-1-13254, P-4750, P-1221). Purportedly a 500 parts per million dichromate solution was added to the water left in the pipeline during descaling of the 105 High Tank piping in 1960 (HW-65726 SUPD).
- 7) The 15.2 cm (6 in) vitrified clay pipe sanitary sewer connects the south side of the 105-H building with 100-H-28:4 (H-1-19805).
- 8) The 15.2 cm (6 in) vitrified clay pipe connects the 110-H building with the sanitary sewer trench (100-H-30) (H-1-19824).
- 9) The 3.8 cm (1.5 in) steel sanitary water pipe connects the 110-H building with the sanitary water supply leading into the east side of the 1608-H building (H-1-19805, H-1-19812, H-1-70246).
- 10) The 40.6 cm (16 in) steel filtered water line supplies water from the elevated storage tank 187-H2 to the 105-H Building (H-1-13254, P-1220). Purportedly a 500 parts per million dichromate solution was added to the water left in the pipeline during descaling of the 105 High Tank piping in 1960 (HW-65726 SUPD).
- 11) The 10.16 cm (4 in) sanitary sewer connects the paint shop (1722-H) with 100-H-28:2.
- 12) The 2.54 cm (1 in) pipeline near 100-H-55. It is assumed to be a service water line. Refer to photograph taken on 10/26/2009.
- 13) A concrete encased pipe was discovered running between 577797 E by 152419 N and 577831 E by 152418 N. It was discovered during remediation of the 105-H Decontamination Pads (118-H-6:5) in July 2009.
- 14) A 10.16 cm (4 in) thin walled aluminum pipeline set in concrete running east/west near 600-

152. It resembles an irrigation pipe. Refer to photograph taken on 2/25/2009.
- 15) Temporary construction sewer line, septic tank and drain field west of 151-H (HW-24800-2, photo 2045).
- 16) A 15.2 cm (6 in) cast iron pipe discovered during excavation of 100-H-4 in January 2010. Refer to photograph taken on 1/18/2010.
- 17) A 1.9 cm (0.75 in) sodium silicate line from the storage tank in the 190-H Building to the 187-H2 Elevated Water Tower (H-1-13254).

Location: The pipeline segments are located throughout the 100-H Area.

Process There is no process history associated with the 100-H-56 waste site.

Description:

Code: 100-H-59 **Classification:** Accepted

Names: 100-H-59; 100-H Area Railroad Track Soil Contamination Area **Reclassification:** None

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: The site consists of contaminated soil discovered during the removal of the rail at the 100-H project. A 213 meter (700 foot) long trench of contaminated railroad bed, including 39 rails, 700 ties, and scattered debris in 25 piles, remains. The contaminated area is about 3,250 square meters (35,000 square feet). The railroad berm tapers from 2.6 meters (8.5 feet) to 0.3 meters (1 foot) above original grade.

Location: This site is along a railroad bed in the 100-H Area south and west of the 105-H Reactor.

Process There is no process history associated with the 100-H-59 waste site.

Description:

Code: 118-H-6 **Classification:** Accepted

Names: 118-H-6; 105-H Reactor Building **Reclassification:** None

Type: Reactor **Start Date:** 1/1/1949

Status: Inactive **End Date:** 1/1/1965

Description: The unit consisted the 105-H Reactor which is represented the following subsites: 1, 105-H Reactor Core and ISS Project which includes the graphite moderator stack, biological and thermal shields, pressure tubes, safety and control systems; 2, 105-H Reactor Ancillary Support Areas, Below-Grade Structures and Underlying Soils; 3, 105-H Reactor Fuel Storage Basin and Underlying Soils; 4, 105-H Fuel Storage Basin Shallow Zone Side Slope Soils; 5, 105-H Decontamination Pads, 6, Deep Zone Side Slopes.

Location: The 105-H Reactor was located in the 100-H Area of the Hanford Site in southeastern Washington State.

Release It was suspected that the irradiated fuel storage basin leaked for a number of years prior to deactivation. The leak rate was small, and the location of the leak was never identified.

Description:

Process The 105-H Reactor was one of eight single-pass plutonium production reactors built along the Columbia River. Construction of the 105-H Reactor began in March 1948 with operations commencing on October 29, 1949. The 105-H Reactor was shut down in April 1965. During the shutdown activities it was determined that the FSB had leaked. A Record of Decision (ROD) was issued by the U.S. Department of Energy (DOE) (58 Federal Register 48509). The ROD alternative selected was to place the reactors into a safe storage condition for up to 75

years. After Interim Safe Storage (ISS), the reactors would be transported in one piece to a specially prepared burial facility in the 200 West Area of the Hanford Site. Miscellaneous process equipment and sludge was left in the basin, and the sludge was stabilized in place in 1970 with approximately 6 meters (20 feet) of soil backfill. In the years following deactivation, several other significant cleanup efforts were completed at the 105-H Reactor complex. These included the 1983 demolition of the 116-H reactor exhaust stack and above-grade exhaust ducting and the 1984 demolition of the 117-H exhaust air filter building.

Waste Type: Equipment

Waste Description: The primary source of contamination at the site was reactor coolant water and water in the FSB that became contaminated through contact with irradiated and ruptured fuel elements and components from the reactor cooling system. In 1987 this unit contained an estimated 15,000 curies of radionuclides, 102,000 kilograms (112 tons) of lead, less than 2.8 cubic meters (100 cubic feet) of asbestos, and 9 kilograms (20 pounds) of cadmium.

This Site has the Following SubSites:

Code: 118-H-6:1

Names: 118-H-6:1; 105-H Reactor Block and ISS Project

Code: 118-H-6:2

Names: 118-H-6:2; Below-Grade Structures and Underlying Soils; 105-H Reactor Ancillary Support Areas

Code: 118-H-6:3

Names: 118-H-6:3; 105-H Reactor Fuel Storage Basin and Underlying Soils

Code: 118-H-6:4

Names: 118-H-6:4; 105-H Fuel Storage Basin Shallow Zone Side Slope Soils

Code: 118-H-6:5

Names: 118-H-6:5; 105-H Decontamination Pads

Code: 118-H-6:6

Names: 118-H-6:6; 118-H-6:6 Deep Zone Side Slope Soils

Code: 118-H-6:1

Classification: Accepted

Names: 118-H-6:1; 105-H Reactor Block and ISS Project

Reclassification: None

Type: Reactor

Start Date:

Status: Inactive

End Date:

Description: The CVP-2006-00003 documents the decontamination and decommissioning (D) and the interim safe storage (ISS) activities of the reactor facility. The safe storage enclosure (SSE) consists of the area within the shield walls, including the reactor block; the front-face work area; the elevator; the rear-face work area; ancillary support areas, and below-grade structures and soils. This part of the reactor building will remain in place to act as temporary storage for the reactor block in accordance with the Removal Action Work Plan for 105-D and 105-H Building Interim Safe Storage Projects and Ancillary Buildings. The original footprint area of the 105-H Reactor Building was approximately 6,934 square meters (74,640 square feet). The final ground-level footprint area of the safe storage enclosure (SSE) is 1,387 square meters (14,928 square feet). The areas of the reactor building that have been removed to ERDF represent 80% of the original footprint of the reactor building.

As much as was practical, all objects and surface contamination were removed. A new roof was added as part of the ISS effort. All doors were permanently sealed except for one door that remains locked and is welded shut. The only planned entrance to this structure is for

surveillance and maintenance activities that will occur approximately every 5 years. The entirety of the below-grade portion of the facility outside the SSE has been completely demolished, removed, and all below-grade areas were backfilled to eliminate future subsidence.

Location: The 105-H Reactor was located in the 100-H Area.

The SubSite is Part Of:

Code: 118-H-6

Names: 118-H-6; 105-H Reactor Building

Code: 118-H-6:2	Classification: Accepted
Names: 118-H-6:2; Below-Grade Structures and Underlying Soils; 105-H Reactor Ancillary Support Areas	Reclassification: Interim Closed Out (6/22/2006)
Type: Reactor	Start Date:
Status: Inactive	End Date:

Description: The 118-H-6:2 site consists of the 105-H Reactor ancillary support areas, below-grade structures, and underlying soils and has been remediated.

Closure Info: 118-H-6:2, 118-H-6:3, 118-H-6:6, 100-H-9, 100-H-10, 100-H-13, 100-H-11, 100-H-12, 100-H-14 and 100-H-31 were addressed as a group. The information below documents information for the group of sites.

The CVP-2006-00003 documents that removal action at the 105-H Reactor subsites (118-H-6:2, 118 H-6:3, and 118-H-6:6) has achieved the removal action objectives and remedial action goals (RAO/RAGs) established in The Action Memorandum for the 105-D and 105-H Reactor Buildings and Ancillary Facilities and the Removal Action Work Plan for 105-D and 105-H Building Interim Safe Storage Projects and Ancillary Buildings. The RAGs were further detailed in the Sampling and Analysis Plan for Interim Closure of 105-D and 105-H Reactor Below-Grade Structures and Underlying Soils (SAP), the 100 Area Remedial Action Sampling and Analysis Plan, and the Remedial Design Report/Remedial Action Work Plan for the 100 Area.

Per the Sampling and Analysis Plan for Interim Closure of 105-D and 105-H Reactor Below-Grade Structures and Underlying Soils (SAP), the 105 H Reactor ancillary support areas and below-grade structures (118-H-6:2) did not require sampling and analysis because the structures were removed in their entirety and then disposed at the Environmental Restoration Disposal Facility (ERDF).

During D activities additional evaluation was required in order to determine if the soils underlying the former FSB floor (118-H-6:3) had achieved the RAGs. Therefore, the evaluation of the FSB soils and deep zone side-slope soils also refer to the soils underlying waste sites 100-H-11, 100-H-12, and 100 H 14.) To determine compliance with the RAGs, and in accordance with the 105-H Reactor SAP, radiological surveys and verification sampling analysis were performed on the FSB underlying soils and deep zone side-slope soils.

These data were used in the RESRAD computer model to verify that cleanup criteria were satisfied. The local contamination was removed in preparation for clean demolition, and a fixative was applied as required. With one exception, there are no below-grade structures remaining. A portion of the FSB floor, at its northern end between the two access labyrinths to the D elevator, remains.

Verification soil samples were collected from soils underlying the former FSB floor in

conformance with the 105-H Reactor SAP. Samples numbers All demolition debris from excavations associated with the area was sent to ERDF. Final cleanup verification samples for the FSB underlying soils and deep zone side-slope soils were collected following evaluation of field screening for radiological contaminants using global positioning environmental radiological surveyor (GPERS) and laser-assisted ranging and data system (LARADS) surveys. This field screening was performed in order to obtain an initial assessment of attainment of radiological cleanup levels

The sample design for the FSB underlying soils was developed specifically to address potential contamination from the known leakage of the FSB. Samples were collected from 10 random sample locations and 3 judgmental sample locations. At each location, soil grab samples were collected from two intervals: the first native soils below the FSB over a 0.3 meter (1 foot) interval and also at 2.4 meters (8 feet) to 3.1 meters (10 feet) below the surface. Soil samples were collected on March 24 and 25, 2004, and on April 6, 2004. The results of the focused sampling (i.e., 3 judgmental samples) are consistent with the statistical sampling results (i.e., the 10 random sample locations) and are provided in Appendix A of the CVP-2006-00003. As yet the results from the HEIS sample numbers have not been loaded into the database.

The verification sample design for the deep zone side-slope soils in 118-H-6:6 consisted of dividing the area into three equal sections, with a composite of four soil grab samples being collected within each area. Soil samples were collected on March 29, 2004. The verification sample design for the deep zone side-slope soils was in accordance with the 100 Area SAP and was detailed in the SAP.

Waste site contaminants of concern (COCs) identified in the SAP through process knowledge classified the different areas and structures into affected media, a summary list of the COCs included: Americium-241, Carbon-14, Cesium-137, Cobalt-60, Europium-152, Europium-154, Europium-155, Neptunium-237, Nickel-63, Plutonium-238, Plutonium-239/240, Strontium-90, Thorium-228, Thorium-232, Tritium (H-3), Uranium-234, Uranium-235, Uranium-238, Hexavalent chromium, Lead, Mercury, and PCBs.

The remaining soils at the 105 H Reactor site have either been deferred to the Field Remediation Closure Project or have been shown to meet the applicable RAGs through verification sampling, analysis, and RESRAD modeling. All excavated materials generated during the D activities were disposed at ERDF, and the area was backfilled to grade with clean backfill. These results also indicate that residual concentrations in the shallow zone will support future land uses that can be represented (or bounded) by a rural-residential scenario and that residual concentrations throughout the site pose no threat to groundwater or the Columbia River.

The subsite has been verified to be remediated in accordance with the Removal Action Work Plan for 105-D and 105 H Building Interim Safe Storage Projects and Ancillary Buildings and the Remedial Design Report/Remedial Action Work Plan for the 100 Area and can be interim closed. The CVP does not demonstrate the acceptability of unrestricted access to deep zone soils (i.e., below 4.6 meters [15 feet]) therefore, institutional controls to prevent uncontrolled drilling or excavation into these deep zone soils are required.

Code: 118-H-6

Names: 118-H-6; 105-H Reactor Building

Code: 118-H-6:4

Classification: Accepted

Names: 118-H-6:4; 105-H Fuel Storage Basin Shallow Zone Side Slope Soils

Reclassification: Interim Closed Out (11/10/2010)

Type: Reactor

Start Date:

Status: Inactive

End Date:

Description: The waste site encompasses the 118-H-6:4, 105-H Fuel Storage Basin Shallow Zone Side Slope Soils. The 118-H-6:4 waste site is located in the 100-HR-1 Operable Unit of the 100-H Area, on the south side of the 105-H Reactor Building. The verification sampling results support a reclassification to Interim Closed Out.

Closure Info: The cleanup verification package (CVP-2010-00005) has demonstrated that remedial action at the 118-H-6:4 subsite has met the Remedial Action Objectives (RAOs) and corresponding Remedial Action Goals (RAGs) as established in the approved Interim Action Record of Decision (ROD) and Remedial Design Report/Remedial Action Work Plan for the 100 Area (RDR/RAWP).

In April 2004, the 118-H-6:4 Fuel Storage Basin (FSB) Shallow Zone Soil subsite was deferred to the Remedial Action Program in order to support the safe storage enclosure (SSE) subcontractor replacement of the 105-H Building roof structure in accordance with the Action Memorandum for the 105-D & 105-H Reactor Facilities and Ancillary Facilities (Action Memorandum) (Ecology 2001). Backfill and stabilization of the FSB excavation was required to accommodate the roof replacement.

In March 2009, further remediation was performed at the 118-H-6:4 waste site, in accordance with the Remaining Sites ROD (EPA 1999), resulting in newly exposed shallow zone side-slope soils requiring verification sampling to interim close this waste site. The side-slope soils in the 105-H FSB shallow zone are at grade level to 4.6 m (15 ft) below grade level.

The contaminants of potential concern (COPCs) were specified in the Sampling and Analysis Plan for Interim Closure of the 105-D and 105-H Reactor Below-Grade Structures and Underlying Soils (DOE-RL 2001) and included radionuclides, lead, mercury, hexavalent chromium, and polychlorinated biphenyls (PCBs). The radionuclides include americium-241, carbon-14, cesium-137, cobalt-60, europium-152, europium-154, europium-155, nickel-63, neptunium-237, plutonium-238, plutonium-239/240, strontium-90, thorium-228, thorium-232, tritium, uranium-233/234, uranium-235, and uranium-238.

Remedial actions occurred in two stages. The first stage of remedial action was conducted in 2004 during D of the 105-H Reactor ancillary facilities and the FSB. In March 2004, verification samples indicated that radiological cleanup criteria had not been met in the FSB side-slope shallow zone (CVP-2006-00003). Further remediation was deferred to the Remedial Action Program to allow backfill and stabilization of the FSB excavation for construction of the SSE for the reactor core (WCH CCN 113402). Excavation of the subsite was resumed by the Field Remediation Project on March 17, 2009, and continued through June 29, 2009.

Approximately 4,096 bank cubic meters (BCM) (5,358 bank cubic yards [BCY]) of clean overburden material were removed and stockpiled east and west of the excavation to access the original 2004 excavation side-slope soil. Approximately 2,682 BCM (3,508 BCY) of contaminated shallow zone side-slope soil was excavated and direct loaded for disposal at the ERDF. No debris or anomalous material was found during the 2009 excavation.

The results also show that contaminant levels remaining in the soil are protective of groundwater and the Columbia River. This waste site does not have a deep zone; therefore, no deep zone institutional controls are required.

The SubSite is Part Of:

Code: 118-H-6

Names: 118-H-6; 105-H Reactor Building

Code: 118-H-6:5

Classification: Accepted

Names: 118-H-6:5; 105-H Decontamination Pads

Reclassification: Interim Closed Out (10/18/2011)

Type: Reactor

Start Date:

Status: Inactive

End Date:

Description: The waste site consists of three, irregularly shaped, decontamination (decon) pads that were created by the Environmental Restoration Contractor Decommissioning and Demolition Project during remedial activities. The decon pads consisted of compact level gravel areas where cranes and heavy equipment were staged to support the movement and decontamination of parts and equipment in support of the 105-H Reactor interim safe storage activities.

Location: The decon pads were arranged in an arc on the south-southeast side of the 105-H SSE.

Closure Info: Remediation of the 118-H-6:5 waste subsite was performed from April 30 through September 30, 2009. Most of the soil was removed and disposed at the ERDF. The original size of each decon pad was slightly smaller than the area excavated. The excavation depth for each pad was approximately 1.0 to 2.0 meters (3.3 to 6.6 ft). Twelve samples were collected from each of the three pads. In March 2009, oily soil was excavated from the surface of the decon pads and the area between and around the decon pads, and stockpiled separately on the decon pad for waste characterization and removal. Following the main excavation, from July 15 through September 30, 2009, focused stained soil excavations occurred to a depth of 3.0 to 4.0 meters (9.8 to 13.1 ft) in the center decon pad.

Following sample analysis of the original excavation, it was determined that additional remediation was needed because three sample locations exceeded direct exposure cleanup criteria. On October 11, 2010 approximately 0.5 meters (2 ft) of soil was removed from a 3 meters (10 ft) diameter area at the west decon pad, WDP-12 sample location.

A portion of the west decon pad was excavated on November 16, 2009 to perform confirmatory sampling at the 100-H-39 (Rejected waste site). Two focused samples were collected from a test pit. The excavated soil was placed back into the test pit, and the area was leveled to match the grade of the remediated 118-H-6:5 west decon pad excavation.

Code: 118-H-6

Names: 118-H-6; 105-H Reactor Building

Code: 118-H-6:6

Classification: Accepted

Names: 118-H-6:6; 118-H-6:6 Deep Zone Side Slope Soils

Reclassification: Interim Closed Out (6/22/2006)

Type: Reactor

Start Date:

Status: Inactive

End Date:

Description: The 118-H-6:6 site consists of the fuel storage basin deep zone side-slope soils. This subsite has been remediated.

Closure Info: 118-H-6:2, 118-H-6:3, 118-H-6:6, 100-H-9, 100-H-10, 100-H-13, 100-H-11, 100-H-12, 100-H-14 and 100-H-31 were addressed as a group. The information below documents information for the group of sites.

The CVP-2006-00003 documents that removal action at the 105-H Reactor subsites (118-H-6:2, 118 H-6:3, and 118-H-6:6) has achieved the removal action objectives and remedial action goals (RAO/RAGs) established in The Action Memorandum for the 105-D and 105-H Reactor Buildings and Ancillary Facilities and the Removal Action Work Plan for 105-D and 105-H Building Interim Safe Storage Projects and Ancillary Buildings. The RAGs were further detailed in the Sampling and Analysis Plan for Interim Closure of 105-D and 105-H Reactor Below-Grade Structures and Underlying Soils (SAP), the 100 Area Remedial Action Sampling and Analysis Plan, and the Remedial Design Report/Remedial Action Work Plan for the 100 Area.

Per the Sampling and Analysis Plan for Interim Closure of 105-D and 105-H Reactor Below-Grade Structures and Underlying Soils (SAP), the 105 H Reactor ancillary support areas and below-grade structures (118-H-6:2) did not require sampling and analysis because the structures

were removed in their entirety and then disposed at the Environmental Restoration Disposal Facility (ERDF).

During D activities additional evaluation was required in order to determine if the soils underlying the former FSB floor (118-H-6:3) had achieved the RAGs. Therefore, the evaluation of the FSB soils and deep zone side-slope soils also refer to the soils underlying waste sites 100-H-11, 100-H-12, and 100 H 14.) To determine compliance with the RAGs, and in accordance with the 105-H Reactor SAP, radiological surveys and verification sampling analysis were performed on the FSB underlying soils and deep zone side-slope soils.

These data were used in the RESRAD computer model to verify that cleanup criteria were satisfied. The local contamination was removed in preparation for clean demolition, and a fixative was applied as required. With one exception, there are no below-grade structures remaining. A portion of the FSB floor, at its northern end between the two access labyrinths to the D elevator, remains.

Verification soil samples were collected from soils underlying the former FSB floor in conformance with the 105-H Reactor SAP. Samples numbers All demolition debris from excavations associated with the area was sent to ERDF. Final cleanup verification samples for the FSB underlying soils and deep zone side-slope soils were collected following evaluation of field screening for radiological contaminants using global positioning environmental radiological surveyor (GPERS) and laser-assisted ranging and data system (LARADS) surveys. This field screening was performed in order to obtain an initial assessment of attainment of radiological cleanup levels

The sample design for the FSB underlying soils was developed specifically to address potential contamination from the known leakage of the FSB. Samples were collected from 10 random sample locations and 3 judgmental sample locations. At each location, soil grab samples were collected from two intervals: the first native soils below the FSB over a 0.3 meter (1 foot) interval and also at 2.4 meters (8 feet) to 3.1 meters (10 feet) below the surface. Soil samples were collected on March 24 and 25, 2004, and on April 6, 2004. The results of the focused sampling (i.e., 3 judgmental samples) are consistent with the statistical sampling results (i.e., the 10 random sample locations) and are provided in Appendix A of the CVP-2006-00003. As yet the results from the HEIS sample numbers have not been loaded into the database.

The verification sample design for the deep zone side-slope soils in 118-H-6:6 consisted of dividing the area into three equal sections, with a composite of four soil grab samples being collected within each area. Soil samples were collected on March 29, 2004. The verification sample design for the deep zone side-slope soils was in accordance with the 100 Area SAP and was detailed in the SAP.

Waste site contaminants of concern (COCs) identified in the SAP through process knowledge classified the different areas and structures into affected media, a summary list of the COCs included: Americium-241, Carbon-14, Cesium-137, Cobalt-60, Europium-152, Europium-154, Europium-155, Neptunium-237, Nickel-63, Plutonium-238, Plutonium-239/240, Strontium-90, Thorium-228, Thorium-232, Tritium (H-3), Uranium-234, Uranium-235, Uranium-238, Hexavalent chromium, Lead, Mercury, and PCBs.

The remaining soils at the 105 H Reactor site have either been deferred to the Field Remediation Closure Project or have been shown to meet the applicable RAGs through verification sampling, analysis, and RESRAD modeling. All excavated materials generated during the D activities were disposed at ERDF, and the area was backfilled to grade with clean backfill. These results also indicate that residual concentrations in the shallow zone will support future land uses that can be represented (or bounded) by a rural-residential scenario and that residual concentrations throughout the site pose no threat to groundwater or the Columbia River.

The subsite has been verified to be remediated in accordance with the Removal Action Work Plan for 105-D and 105 H Building Interim Safe Storage Projects and Ancillary Buildings and the Remedial Design Report/Remedial Action Work Plan for the 100 Area and can be interim closed. The CVP does not demonstrate the acceptability of unrestricted access to deep zone soils (i.e., below 4.6 meters [15 feet]) therefore, institutional controls to prevent uncontrolled drilling or excavation into these deep zone soils are required.

The SubSite is Part Of:

Code: 118-H-6

Names: 118-H-6; 105-H Reactor Building

Code: 100-K-84

Classification: Accepted

Names: 100-K-84; Red Soil Found Southwest of 118-K-1 **Reclassification:** None

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The site consists of red stained soil. Five small areas were identified. Some of the material appeared crushed while other pieces looked like "slag". Similar piles of material have been found south of the 200 West Area, 100BC Area, and Riverland (McGee Ranch) Area.

Location: The site is located near the 118-K-1 Burial Ground. Three of the small areas were located in the gravel road that runs just southwest of the 118-K-1 Burial Ground. A fourth area is located on the berm between the gravel road and 126-K-1 Gravel Pit. The fifth area is located 154 m (505 ft) northeast of 126-K-1. The center of the five areas are: E569632.1, N146821.3; E569555.7, N146785.5; E569539.4, N146760.7; E569533.9, N146733.1; E569721.1, N147078.5.

Process Description: Crushed iron ore was a component of the concrete used in reactor and other facility construction, as it provided additional shielding. The material is highly magnetic. See photo #4 from the 100BC Area anomalies. Note that one sample result indicates 74,400 mg/kg iron, while the other sample indicates 103,000 mg/kg iron.

Waste Type: Soil

Waste Description: The waste is areas of red stained soil. X-ray diffraction (XRF) was performed immediately upon identification of the site. The XRF results indicated the presence of arsenic and lead. Later, the site was sampled for inorganics at Lionville. The sample numbers are J15DV5 and J15DV6. Sample number J15DV5 indicated 62.9 mg/kg arsenic and sample number J15DV6 indicated 116 mg/kg arsenic. Lead was not indicated as a contaminant in these two samples. Eberline performed a gamma scan for selected radionuclides. All results were below cleanup limits. The site contaminant of potential concern (COPC) is arsenic.

Code: 100-K-96

Classification: Accepted

Names: 100-K-96; 100KE River Effluent Pipeline; 100KE River Line; River Line (East) from 116-K-3 Outfall

Reclassification: None

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date: 4/14/2011

Description: This site is one of two adjacent, 213 centimeters (84 inches) diameter, carbon steel river effluent pipelines that extend 400 meters (1313 feet) from the face of 116-K-3 outfall structure to the Columbia River shoreline.

Both pipelines are exposed along most of the run, protruding 0.3 to 0.9 meters (1 to 3 feet) above the riverbed. The pipelines are approximately 122 centimeters (48 inches) apart. They were originally covered by a minimum of 0.6 meter (2 feet) of soil over their entire length. The initial 142 meters (467 feet) (from the reactors to the outfall inlet) are concrete piping, and the remainder welded steel piping.

Location: The 100-K-96 river pipeline is located on the Columbia River shore, adjacent to the 100K Area. It is east of the adjacent, inactive 100-K-80 pipeline.

Process Description: 105-KE reactor cooling water was collected and temporarily stored in the 107-KE Retention Basins. The cooling water was discharged to the river, bypassing (underneath) the 116-K-3 outfall structure, through the 100-K-96 river pipeline. Process sewer waste, from both 100-KE and 100-KW facilities, entered the outfall structure and dropped into the 100-KE river pipeline through large-diameter, vertical standpipes welded onto the river pipelines.

Retention basins lines (100-K-55 and 100-K-56) did not discharge through the outfall structure, but passed under it. They are continuous lines from each reactor that become the river effluent pipelines downstream of the outfall structure. The pipelines discharge into a recessed, sloped riprap river bed structure, measuring 9 meters (30 feet) wide by 12 meters (40 feet) long and 1 meter (3 feet) thick. The total drop from the face of the outfall structure to the discharge end of the pipelines is 18 meters (60 feet).

In 1955, the lines began to float and break. Both lines were damaged. To remedy the problem, a 2 to 3 meter (6 to 10 feet) thick riprap jetty was placed over the lines from the shoreline to a point approximately 320 meters (1050 feet) from the face of the outfall structure.

Related Sites/Structures: The pipeline site is associated with the 116-K-3 Outfall Structure, the 100-K-83 Spillway, the 100-K-47 process sewer, 100-K-56 process effluent lines, the 100-K-55 process effluent lines the 100-K-60 process sewer, the 116-KW-3 Retention Basins, the 100-K-80 river pipelines, and the 100-K-114 pipeline segment.

Waste Type: Process Effluent

Waste Description: The waste includes the pipeline and the contaminated scale contained within it. The effluent included both reactor cooling water and process sewer waste.

The Contaminants of Potential Concern are based on the 116-K-3 outfall, and include Co-60, Cs-137, Eu-152, Eu-154, Pu-239/240, and Sr-90.

Code: 100-K-110 **Classification:** Accepted

Names: 100-K-110; Soil beneath 183.2-KW Flocculation and Sedimentation Basins; the 183.3-KW Sand Filter Basins **Reclassification:** None

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: The site consists of the soil beneath the removed structures of the 183.2-KW Sedimentation Basins and 183.3 KW Sand Filter Basins.

Location: The site is located south of the 105-KW Reactor.

Code: 100-K-111 **Classification:** Accepted

Names: 100-K-111; Effluent Seepage Area from 116-K-2 **Reclassification:** None

Type:	Contamination Migration	Start Date:	
Status:	Inactive	End Date:	
Description:	The site is an area along the Columbia River shoreline appears to have been impacted by effluent from the 116-K-2 trench. This suspicion is evidenced by surface features visible in historical photographs (e.g. 37465-10CN).		
Location:	The site is 363 meters (1,191 ft) northeast of 116-KE-4 (107-KE Retention Basins).		
Process Description:	The 116-K-2 trench received contaminated effluent from floor drains and the metal storage basin overflows in the 105-KE and 105-KW Reactors, as well as emergency discharges from the KE and KW Retention Basins. Until 105-KE and 105-KW shut down around February 1, 1970, an undetermined amount of Retention Basin effluent (believed to be up to 37,854 LPM (10,000 GPM)) leaked through 107 cm (42 in) butterfly valves in the tank bottoms. Other periodic flows included low volume, neutralized, dummy decontamination waste, process-cooling water during charge/discharge; occasional special disposals; and an occasional tank of process cooling water that was collected after a fuel cladding failure. In 1978, the radioactive inventory of the trench was calculated at 2,100 curies (UNI-946).		
	Prior to 1977, surface contamination extended several hundred feet along the river side of the unit. This surface contamination was covered with up to 1.2 m (4 ft) feet of soil and gravel during the summer of 1977, and posted with AC-5-40 concrete markers (DC-0023). The concrete post locations have been surveyed. The entire site was posted as underground radioactive material.		
	The K Area geology and hydrology were such that liquid discharges to the soil within the operating area routinely bled out the shore line as it sloped to the river. Also within this area is the leach trench that was installed to drain the cobble filled trench from waste site 116-K-1 to the river (DOE/RL-94-61).		
	In September 1996 contaminated soil was removed from the site. In 1997, a single test pit was excavated on the south side of 116-K-2 (approximate coordinates were N147260/E569400). Radiological surveys of the soil did not identify any contamination.		
Related Sites/ Structures:	The surface liquids are northwest of the mile long trench (116-K-2). This trench was associated with 116-KE-4 and 116-KW-3 Retention Basins via the 100-K-55 and 100-K-56 pipelines.		

Code:	100-K-112	Classification:	Accepted

Description:	The waste site is a posted Surface Contamination Area remaining after waste stored in this area was removed. Nothing is currently stored within the boundaries of the posted area.		
Location:	The waste site is located north of 105-KW, adjacent to the 100-K Area perimeter fence. It is north of Wakefiled Loop.		

Code:	118-KE-1	Classification:	Accepted
Names:	118-KE-1; 105-KE Reactor Building	Reclassification:	None
Type:	Reactor	Start Date:	1/1/1955

system. The 105-N Reactor Building is 137.77 meters (452 feet) by 78.94 meters (259 feet) with a stepped roof to 21.34 meters (70 feet). Additionally, a 55.78 meters (183 feet) by 21.34 meters (70 feet) basin and transfer area extend west at the southwest corner. The breakdown of the facility is 29 offices: 467.29 square meters (5,030 square feet); 4 shops: 1,009.82 square meters (10,870 square feet); storage: 295.42 square meters (3,180 square feet); common: 467.29 square meters (5,030 square feet); process, operating and fuel storage: 13,006 square meters (1.4E+05 square feet). The 109-N Building is a reinforced concrete, structural steel building with channeled steel siding. It is immediately adjacent to and shares a common wall (south wall of 109-N) with the 105-N Building. The 109-N Building contains a large pipe gallery on the north side which receives the primary reactor coolant system piping from the reactor for distribution into five separate cells each housing two large heat exchangers, a primary circulating pump and associated piping. A sixth cell contains a heat exchanger system for the moderator cooling system. The pipe gallery and steam generator cells are located in a reinforced concrete enclosure which, as in the case of the reactor, defines a confinement zone. Located outside of the confinement zone are the pump drive systems, dump condensers for disposal of export steam, condensate return pumps, other auxiliary equipment, a small chemical laboratory, and water sampling and monitoring facilities. A Service Bay has facilities for decontaminating the primary coolant system and contains the heating and ventilation equipment, shop areas, office and common space. The 109-N Building is 62.79 meters (206 feet) by 116.74 meters (383 feet) by 11.89 meters (39 feet) high. The breakdown of the facility is 3 offices: 75.25 square meters (810 square feet); 2 shops: 197.88 square meters (2,130 square feet); common: 111.48 square meters (1,200 square feet); processing area: 11,148 square meters (1.23E+05 square feet).

Location: The buildings (105-N and 109-N) are centrally (approximately) located within the 100-N Area of the Hanford Site.

Process Description: The N Reactor is a graphite-moderated, light-water cooled, horizontal-pressure-tube nuclear reactor. The reactor piping was designed for 13,000 kilopascals (1,825 pounds per square inch) and 320 degrees Celsius (600 degrees Fahrenheit) maximum operating conditions. Normal operating parameters were 11,000 kilopascals (1,600 pounds per square inch) and approximately 290 degrees Celsius (550 degrees Fahrenheit). The reactor coolant circulating pumps are single-stage, horizontal, centrifugal pumps with high pressure water injection seals to prevent reactor coolant loss. For special nuclear material production (no steam generation to the Hanford Generating Plant [HGP]), steam from the secondary side of ten steam generators was routed through 16 river water-cooled dump condensers. Condensate from the dump condensers was routed back to steam generators for regeneration. For dual-purpose operation, byproduct steam from the steam generators was supplied to the HGP to produce 860 megawatts (electrical). For either single- or dual-purpose operation, there were 12 steam generators. Ten of the steam generators were used during five-cell operation and eight for four-cell operation. During dual-purpose operation, most of the steam produced was available for use by HGP to generate electricity, with some reserved to power the reactor coolant system pump drive turbines and the in-plant turbine generator. The N Reactor used a confinement system based on the concept to release the initial burst of steam resulting from a postulated reactor coolant pipe break. When the confinement pressure subsided, the steam vents were closed and ventilation valves opened. The ventilated steam was filtered through charcoal and high efficiency filters to prevent any release of fission products from fuel failure. The 1312-N Liquid Effluent Retention Facility (LERF) was constructed as part of the safety enhancement program initiated in 1987. This facility served as a backup to the existing containment system and was designed to receive primary cooling water in the event of an emergency, such as fuel failure. The LERF facility consists of a high-density polyethylene bladder contained within a lined berm impoundment. The facility has never been used. The portion of the reactor coolant system within the N Reactor building consists of 16 parallel lines that conducted cooling water from an inlet water manifold in the 109-N Heat Exchanger Building to the reactor. Each of these 16 lines terminates in a vertical header to which is attached 54 to 66 individual pressure tube header-to-inlet nozzle connectors. Similar outlet risers and parallel lines conducted the coolant from the

pressure tube outlet nozzle-to-header connectors to an outlet water manifold. In the 109-N Heat Exchanger Building, which is immediately adjacent to the N Reactor building, the reactor coolant system consisted of six cells in parallel, each containing two steam generators (in parallel), a circulating pump and associated valves and instrumentation. Piping and steam generators in each of the six cells could be isolated from the main header piping by means of isolation valves. Reactor coolant pressure and temperature were controlled to prevent boiling at any point in the system. A surge vessel (pressurizer) controlled system pressure and volume surges resulting from normal coolant density changes during reactor transient heat output conditions. The pressurizer consists of a cylindrical pressure vessel with a useful volume of about 34 cubic meters (1,200 cubic feet) and was connected directly to the reactor outlet piping. Two electric immersion heater systems maintained the pressurizer at saturation temperature and pressure retaining approximately 40% useful surge volume during normal operations. During outsurges of water from the pressurizer, the drop in pressure was compensated for by flashing steam from the saturated water. Increases in system pressure were limited by injecting a water spray into the steam space to condense some of the steam. This spray was reactor coolant fed from either reactor inlet water or from the high pressure injection pumps. The secondary steam system for the N Reactor removed the reactor heat from the reactor coolant system by boiling secondary water in the shell side of the steam generator. During operation solely for the production of special nuclear material the major fraction of this steam was routed to 16 dump condensers which were arranged in parallel and cooled by untreated Columbia River water. These condensers operated at a pressure near that of the steam generators and eliminated the need for steam pressure reducing stations. Condensate was pumped from the dump condensers back to the steam generators for recycling. To achieve maximum single purpose productions operation, the steam temperature and pressures were maintained as low as practicable. A portion of the steam generated was utilized by the coolant pump drive turbines and by the turbine generator for local station service. During dual purpose operation, the major fraction of steam generated was routed to the HGP. A portion of the steam generated was used to drive the reactor coolant pumps, the onsite turbine generator and to keep the dump condensers warm so they were ready to accept full steam load in the event of an HGP turbine generator shutdown. Strained untreated water from the Columbia River was supplied as coolant to the dump condensers as well as the reactor coolant pump drive turbine surface condensers and the local turbine generator condensers. This condenser cooling water was then returned to the river. The fuel used for operation of the N Reactor was slightly enriched uranium-235 (0.94% to 1.25%), clad with a zirconium alloy. At shutdown, a concentric tube-in-tube fuel design was in use. In the past, other materials have been used as a target in connection with an enriched uranium driver fuel element to produce useable isotopes such as tritium and plutonium-238. The fuel cladding is zircaloy-2 metallurgically bonded to the uranium by a co-extrusion process. The fuel elements used in N Reactor were manufactured by United Nuclear Corporation and ranged from 38 to 66 centimeters (15 to 26 inches) in length.

- Related Sites/
Structures:** Structures associated with the 105-N Reactor Building are the 1734-N Building, a 83.61-square meter (900-square foot) structure for storage of gas bottles, the 117-N Filter Building of 398.54 square meters (4,290 square feet), and a stack used for discharge of reactor ventilation air, a 3.4E+06 liter (9E+05 gallon) chemical waste storage tank for decontamination solutions, crib, and tile field. Structures associated with the 109-N Building are the dump tank for emergency discharge of primary coolant located on the west side of the building, sealwell and outfall system to return condenser cooling and condensate water to the Columbia River.
- Waste Type:** Equipment
- Waste
Description:** The waste is the 105-N/109-N Building complex, including the reactor core. The 105-N and 109-N Building complex is radioactively contaminated or potentially contaminated within all confinement zones, irradiated fuel storage areas, primary and secondary coolant piping systems, and confinement ventilation systems.

Code: 100-N-79 **Classification:** Accepted

Names: 100-N-79; 1908 N Outfall Structure; 1908-N Spillway; 100-N-77:1 Flume **Reclassification:** None

Type: Outfall **Start Date:**

Status: Inactive **End Date:**

Description: The site consists of a spillway (also referred to as an emergency outfall) and is constructed of reinforced concrete.

Location: The site is located west of the 109-N Building and the 1300-N Emergency Dump Basin, and south of the 1301-N Emergency Dump tank on a steep bank which leads to the river.

Process Description: The spillway was an emergency discharge point for the 1908-N Outfall structure. It was planned to be used only if the 100-N-77 river effluent pipelines were blocked, damaged, or undergoing maintenance. There is no corroborated physical or historical evidence that the spillway was ever used.

Related Sites/ Structures: The site is associated with 100-N-77 (100-N River Effluent Pipeline) and the 1908-N Outfall Structure.

Waste Type: Construction Debris

Waste Description: There is anecdotal evidence that the spillway was never intended or expected to be used, as it was never permitted. An unknown level of radioactive contamination exists within the structure because the discharge lines were associated with the reactor's secondary steam system.

Code: 100-N-104 **Classification:** Accepted

Names: 100-N-104; Raw Water Overflow Spillway **Reclassification:** None

Type: Outfall **Start Date:**

Status: Inactive **End Date:**

Description: The site is a raw water overflow spillway made up of a concrete chute and stilling basin. A 36 inch raw water return line (100-N-61) empties into this site.

Location: The 100-N-104 spillway is located 119 m (390 ft) downstream of the Hanford Generating Plant River Pumphouse (181-NE).
E 570939.9 N 149367.9

Process Description: The system was designed to collect in a 91 cm (36 in) line (100-N-61), the overflow and drainage from four water storage tanks and dispose the waste water to the river. The four water storage tanks (1900-N) were an afterheat removal system storage tank, an emergency raw water storage tank, a filtered water storage tank and a demineralized water storage tank. The system is comprised of an overflow and a drain piping from each of the water storage tanks, and a 30.5 cm (12 in) raw water return line (100-N-61) from the 182-N Building. The effluent from the 91 cm (36 in) line spills into a sloped concrete chute, into the stilling basin and thence to the river (HW-69000 Volume II, Page 8.2.6-2). The afterheat removal system storage tank was designed as a reservoir of demineralized water for makeup to the secondary loop for normal operation and for flooding of the secondary loop in the water-to-water operation. It also served as storage for water spilled for level control of the secondary loop, water not needed in the secondary loop after the water-to-water operation, and condensate returns from various plant heaters (HW-69000 Volume II, Page 3.1.3-2).

The emergency raw water storage tank was designed as a reservoir of tempered raw water for reactor emergency once-through cooling (HW-69000 Volume II, Page 1.2.3-2). The a filtered

water storage tank was designed for storage of filtered water pumped to it from the 183-N Building (HW -69000 Volume II, Page 2.1.5-2). The demineralized water storage tank was designed as a reservoir of effluent water from the demineralizer plant, and as the normal supply to the high and low pressure injection pumps. It was served as an emergency supply to the pumps of the afterheat removal fill system, the fog spray and fire protection pumping systems, the high lift emergency raw water pumping system, and the emergency raw water storage tank (HW-69000 Volume II, Page 3.1.1-2).

Related Sites/ Structures: 1900-N Water Supply Tanks and 182-N High-Lift Pump House.

Code: 100-N-105 **Classification:** Discovery
Names: 100-N-105; Contaminated Soil beneath 1900-N Supply Tanks; Paint Chips near 1900-N **Reclassification:** None
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**
Description: The site consists of the concrete foundations beneath the former 1900-N water supply tanks (four large steel tanks and silo) and surrounding contaminated soils. The soils beneath the tanks were described as having been stained with oil. However it was paint flakes that fell from the tanks during demolition that are the primary concern at this site. The paint on at least one of the tanks had elevated lead concentrations.
Location: The tanks were located on the south side of 182-N High-Life Pump House.

Code: 244-A CT **Classification:** Accepted
Names: 244-A CT; 244-A DCRT; 244-A Receiver Tank; 244-A RT; 244-A-TK/SMP; 244-A Catch Tank **Reclassification:** None
Type: Catch Tank **Start Date:** 1/1/1975
Status: Inactive **End Date:** 1/1/2005
Description: The unit is an underground structure constructed of carbon steel. It sits vertically inside a reinforced concrete, steel-lined vault. Above the tank is the lift station (sitecode 244-A LS).
Location: This site is located west of the 241-AZ Tank Farm and south of the 241-C Tank Farm. It is inside the 244-A Lift Station fence.
Process Description: The 244-A RT is located at the 244-A Lift Station (244-A LS) and provided lag storage for waste transferred from the 241-ER-153 diversion box to the 241-A valve pits.

Related Sites/ Structures: Structures associated with the 241-A DCRT are the 244-A Lift Station, 241-ER-153 diversion box and the 241-A valve pits. See Sitecode 244-A LS.

Waste Type: Chemicals
Waste Description: The 244-A Catch Tank/Double-Containment Receiver Tank is located at the 244-A lift station and provides lag storage for waste transferred from the 241-ER-153 diversion box to the 241-A valve pits. Waste routed through the lift station includes 200 West Area waste; 241-B, 241-BX, 241-BY, and 241-C Single-Shell Tank waste; and waste transferred from B Plant. Waste transferred out of the 244-A lift station can be routed to any of the 200 East Area Double-Shell Tanks. This tank did not receive saltwell pumping like other DCRT's.

Code: 244-A LS **Classification:** Accepted
Names: 244-A LS; 244-AR Lift Station; 244-AR LS; SN-232, SN-233 and SN-234; 244-A Lift Station **Reclassification:** None
Type: Control Structure **Start Date:** 1/1/1975
Status: Inactive **End Date:** 1/1/2005

Description: The lift station is surrounded with a chain link fence. The surface is covered with gravel. The lift station consists of an underground concrete structure containing a filter pit, pump pit, and vault in which the catch tank (244-A DCRT) is installed. This site includes the exhaust fan and stack, instrument enclosure, caisson, flush pit, service pit, and vacuum pump pad. The structure is posted with multiple radiological postings, including Radiation Area, Underground Radioactive Material Area, Radioactive Material Area and Contamination Area.

Location: This site is located south of 7th Street, west of the 241-AZ Tank Farm and south of the 241-C Tank Farm.

Process Description: The 244-A LS provides lag storage for waste transferred from the 241-ER-153 diversion box, via lines SN-232, SN-233 and SN-234. The waste was then sent to the 241-A valve pit.

Related Sites/Structures: The 244-A LS is associated with the 241-ER-153 diversion box, the 244-A DCRT, lines SN-232, SN-233, SN-234 and the 241-A valve pits. Per drawing H-2-38203, structures related to the 244-A Lift Station also include the exhaust fan and stack, instrument enclosure, caisson, flush pit, service pit, vacuum pump pad and transfer piping. The lift station is also associated with UPR-200-E-70, UPR-200-E-100, UPR-200-E-143, 200-E-144-PL, 200-E-145-PL, 200-E-147-PL and 200-E-167-PL.

Waste Type: Process Effluent

Waste Description: The 244-A Double-Containment Receiver Tank is located at the 244-A Lift Station and provides lag storage for waste transferred from the 241-ER-153 diversion box to the 241-A valve pits. Waste routed through the lift station includes 200 West Area waste; 241-B, 241-BX, 241-BY, and 241-C Single-Shell Tank waste; and waste transferred from B Plant. Waste transferred out of the 244-A lift station can be routed to any of the 200 East Area Double-Shell Tanks.

This Site has the Following SubSites:

Type: Control Structure **Start Date:**
Status: Inactive **End Date:**
Description: Subsite 2 is the transfer piping between the 241-ER-153 Diversion Box and the 244-A Lift Station (lines SN-232, SN-233 and SN-234). The total length of the pipeline segments is 55 meters, calculated with the Geospatial data in ArcGIS.

The SubSite is Part Of:

Code: 244-A LS
Names: 244-A LS; 244-AR Lift Station; 244-AR LS; SN-232, SN-233 and SN-234; 244-A Lift Station

Code: 241-AR-151 **Classification:** Accepted
Names: 241-AR-151; 241-AR-151 Diversion Box **Reclassification:** None
Type: Diversion Box **Start Date:** 1/1/1976
Status: Inactive **End Date:**
Description: The 241-AR-151 diversion box is a reinforced concrete structure. The walls and floor of the diversion box are lined with 11-gage stainless steel. The box drains to the 244-AR Vault and is equipped with a leak detector that alarms inside 242-A evaporator building. The structure is covered with a weather protective cover.
Location: The diversion box is located north of the 244-AR Vault facility, east of 291-AR. It is on the west side of Buffalo Ave.
Process Description: The unit is utilized for the transfer of liquid mixed waste generated at PUREX to the AY and AZ Tank Farms.
Related Sites/Structures: This unit is associated with 241-AY and -AZ tank farms and the 244-AR Vault. A pipeline associated with this diversion box is 200-E-206-PL. The drain line is V717.
Waste Type: Process Effluent
Waste Description: The diversion box is used to transfer waste from the 241-AY and 241-AZ Tank Farms. This waste includes aging waste, high-level B Plant waste, B Plant cesium feed waste, non-complexed, concentrated complexed and cesium and strontium recovery waste.

Code: 244-AR VAULT **Classification:** Accepted
Names: 244-AR Vault; 244-AR VAULT **Reclassification:** None
Type: Receiving Vault **Start Date:** 1/1/1966
Status: Inactive **End Date:** 1/1/1978
Description: The 244-AR Vault facilities include a canyon building, a service building, two concrete housings, and a change room. The canyon building is a reinforced concrete, two level, multi-cell structure. The lower process cells contain four tanks and a failed equipment cell, while the upper cells contain the associated piping and equipment. The upper and lower cells are separated by cover blocks with recessed lifting bails. The facility is posted with multiple radiological postings including Internally Contaminated Systems, Radiation Area, Underground Radioactive Material Area, Radiological Buffer Area, Radioactive Material Area, Contamination Area, High Contamination Area, and Fixed Contamination Area.
Location: The building is located west of the 241-A Tank Farm. at the corner of 4th Street and Buffalo

Ave.

Process Description: The unit received waste sluiced from the 241-A and -AX Tank Farms. Processing took place, then the waste was shipped to B Plant. The facility was the focal point for reprocessing and routing of PUREX-generated waste between tank farms and B Plant facilities in the late 1960's and between the tank farms and the Waste Encapsulation Storage Facility in the late 1970's. In 1984, a decision was made to upgrade the 244-AR vault for use as a waste transfer facility. The extensive upgrading effort provided improved features for the safe and efficient transferring of PUREX-generated waste between the tank farms and B Plant. The waste consisted of cladding removal waste enroute to B Plant and transuranic waste from B Plant/Waste Encapsulation Storage Facility to the tank farms.

Related Sites/ Structures: The facility includes a crane, control room, two ventilation systems, a sluicing system (no longer in use), and a solution piping system.

Waste Type: Storage Tank

Waste Description: The 244-AR Vault was originally used to process radioactive waste that was being removed ("sluiced") from storage tanks. The waste was eventually transferred to the B Plant for removal of cesium and strontium. All of the liquid waste in the facility was transferred to 241-AY-102 in 2003. The vault was interim stabilized in 2003. There is an estimated 660 gallons of sludge and up to 194 gallons of liquid in the tank (RPP-12051, 244-AR Vault Interim Stabilization Completion Report, Page 3-2) Tank-001 cell 1. The tank is thought to be dry, but there may be up to 2 gallons of waste in the sump (RPP-12051). In Tank-002 Cell 2, there is an estimated 2080 gallons of sludge and up to 194 gallons of liquid in the tank (RPP-12051 page 3-3). The cell is thought to be dry, but there may be up to 2 gallons of waste in the sump RPP-12051).

Code: 241-AZ-301 **Classification:** Accepted

Names: 241-AZ-301; Condensate Receiver Tank **Reclassification:** None

Type: Receiver Tank **Start Date:** 1/1/2005

Status: Active **End Date:**

Description: The site is an above ground tank. It is posted with Radiation Area and Contamination Area signs.

Location: The site is located west of the 241-AZ Tank Farm fence, adjacent to the 241-AZ-702 Ventilation Building.

Process Description: The 241-AZ-301 receiver vessel was built to replace the 241-AZ-151 catch tank. The vessel receives condensate from the 241-AZ-702 Aging Waste ventilation system, which is the primary filter building for the 241-AY and 241-AZ tank farms.

Related Sites/ Structures: The site is associated with the 241-AZ-702 Aging Waste ventilation system.

Code: 201-C **Classification:** Accepted

Names: 201-C; 201-C Process Building **Reclassification:** None

Type: Process Unit/Plant **Start Date:** 1/1/1949

Status: Inactive **End Date:** 1/1/1967

Description: Demolition activities removed the aboveground features of 201-C from 1983 through 1986. The below grade features and remains of the 201-C facility was entombed in concrete and has been

Structures: stored within the building.

Waste Type: Equipment

Waste Description: The unit consists of a previously radioactively contaminated structure. The building was decontaminated in 1985, and was subsequently used to store equipment. The Semiworks Aggregate Area Management Study Report (DOE/RL-92-18) does not show any remaining radionuclide waste inventory for the 215-C Building.

Code: 291-C **Classification:** Accepted

Names: 291-C; 291-C Fan and Filter Building; 291-C Filter/Fan House; 201-C Air Tunnel **Reclassification:** None

Type: Process Unit/Plant **Start Date:** 1/1/1949

Status: Inactive **End Date:** 1/1/1987

Description: This building was demolished prior to the 291-C-1 Stack demolition in 1988. The unit consisted of an air tunnel from the 201-C Cells, fiber glass filters, high-efficiency particulate air (HEPA) filters, and the Fan House. The Fan House and HEPA Filter 2 were located above ground. HEPA Filter 1 and the concrete air tunnel were constructed below grade. The air tunnel connected the 201-C Building with the 291-C-1 Stack. The first 31 meters (100 feet) of the tunnel are 6 meters (20 feet) below grade. The second 31 meters (100 feet) of the tunnel are 1.5 meters (5 feet) below grade. There were forty removable aluminum cartridge glass fiber filters and an array of HEPA filters. The fan house building was a wood frame structure on a concrete slab. It contained two electric fans and one steam turbine fan.

Location: The 291-C Fan House building was located east of the 291-C Stack base, south of 7th Street.

Process Description: The structure provided exhaust air ventilation for the operating cells and process vessel vents of the 201-C Facility.

Related Sites/Structures: The building was associated with the 291-C Exhaust Stack. Also see pipeline sitecodes 200-E-251-PL and 200-E-252-PL that drained these structures to the 216-C-2 reverse well.

Waste Type: Equipment

Waste Description:

Waste Type: Equipment

Waste Description:

Code: 200-E-27 **Classification:** Accepted

Names: 200-E-27; 242-AC; 242AC Pipefitter Shop Lead Cutting Area **Reclassification:** None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The 242AC Pipefitter Shop had a lead cutting area and an area used to store lead sheets and pipe for use on various construction projects. The area is no longer used for lead cutting, but is used by the shop as an equipment and material storage area. The lead cutting area has sandy soil and contains pieces of lead. The area surrounding the lead cutting area is covered with crushed rock. Tank farm equipment, lead material covers, and a heavy duty table are currently stored in the lead cutting area. The entire 242AC Pipefitter Shop area is surrounded by a chain-link

fence.

Location: The site is located at the corner of 4th Street and Buffalo Avenue. The Lead Cutting Area is on the east side of the 242 AC pipefitter shop.

Release Description: Lead was cut at the facility using piano wire, a cutting torch, and a skil saw with the blade turned backwards. The skil saw created the small lead particles

Related Sites/ Structures: The site is associated with the 242-AC Pipefitter Shop.

Waste Type: Soil

Waste Description: Soil at the site is contaminated with lead.

Code: 200-E-41 **Classification:** Accepted

Names: 200-E-41; Stabilized Hot Semiworks Area; Strontium Semi-Works Stabilized Area; UN-216-E-38 **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1949

Status: Inactive **End Date:** 1/1/1992

Description: This site is a large area posted with chain and Underground Radioactive Material signs. An area within the posted boundaries has been covered with fly ash. The ash-covered area encompasses the decommissioned 201-C Building, the 291-C Stack Burial Trench and the 216-C-2 French Drain. Waste sites and facilities buried beneath the ash are not individually distinguishable.

Location: The site is located in 200 East Area, south of 7th Street. It is east of the 209-E security fence.

Release Description: Two waste line leaks have been documented in WIDS files 200-E-56 and 200-E-57.

Process Description: The 201-C Processing Building was the main processing facility for the Hot Semiworks Area. It was originally built in 1949 as a pilot plant for the Reduction Oxidation (REDOX) process. In 1954, the building was used as a pilot plant for the Plutonium Uranium Extraction (PUREX) process. The plant was converted to recover strontium from process wastes in 1961.

Related Sites/ Structures: The area is associated with the 201-C building, CX-70, CX-71, CX-72, 241-C-154, 216-C-2 and WIDS site codes 200-E-56 and 200-E-57.

Waste Type: Soil

Waste Description: The area covered with clean backfill contained residual contamination from the operation of the Hot Semiworks facility.

The Following Sites Were Consolidated With This Site:

Code: UPR-200-E-36

Names: UPR-200-E-36; Contamination Spread North of Semi-Works; Road Contamination North of Semiworks; UN-200-E-36

Code: 200-E-44 **Classification:** Accepted

Names: 200-E-44; PUREX Railroad Cut **Reclassification:** None

Type: Unplanned Release **Start Date:**

Status: Inactive

End Date:

Description: The Railroad Cut is approximately 240 meters (800 feet) of track extending from the tunnel door northward to the isolation area gate. Two large berms of soil were placed along both sides of the track within the fenced portion of the spur to provide radiation shielding. A turnout siding (Donkey Track) is also located within the fenced Railroad Cut. The railroad cut is posted as a Contamination Area.

Location: The PUREX Railroad Cut is located on the northeast corner of the 202-A building. A railroad spur extends from the PUREX main lead to the tunnel entrance door.

Process Description: The railroad cut provides access to the PUREX tunnel and also to the burial tunnels south of the PUREX facility (218-E-14 and 218-E-15).

Related Sites/ Structures: The site is associated with UPR-200-E-10, UPR-200-E-11, UPR-200-E-12, UPR-200-E-20 and UPR-200-E-33.

Waste Type: Soil

Waste Description: The contamination in the soil and gravel in the railroad cut is from many years of contaminated equipment and waste being transported on rail cars into and out of the PUREX facility.

Code: 200-E-102

Classification: Accepted

Names: 200-E-102; Contaminated Soil Trench

Reclassification: None

Type: Trench

Start Date: 1/1/1958

Status: Inactive

End Date: 1/1/1958

Description: The trench is inside the surface stabilized Underground Radioactive Material area south of PUREX that is known as WIDS Sitecode 200-E-103. The trench is not separately marked or posted.

Location: The site is located 20.7 meters (68 feet) south of the south boundary of 216-A-4 Crib. It is currently covered with clean gravel and cannot be visually identified.

Process Description: The trench was used to bury contaminated soil from an unplanned release (WIDS Site UPR-200-E-15). When the 216-A-4 Crib plugged in 1958, it caused the ground between the 216-A-4 crib and the 291-A Turbine House to flood. The contaminated soil was scraped up and placed into a slit trench near the south end of the crib. The trench was covered with 0.3 meters (one foot) of clean dirt.

Related Sites/ Structures: The site is related to UPR-200-E-15, 216-A-4 Crib, 291-A Turbine House and 200-E-103.

Waste Type: Soil

Waste Description: The waste is contaminated soil caused by the plugging of the 216-A-4 Crib. It resulted in a flood of contaminated water in the 291-A Turbine House floor drains. The turbine house floor was contaminated to 20 rads/hour at 25.4 centimeters (10 inches). An area of ground and blacktop outside the turbine house was contaminated up to 8 rads/hour. The 216-A-4 Crib received waste solution from the 216-A-2 Waste Collection Tank, the U-3 and U-4 Laboratory Waste Receiver Tanks (located in the acid storage vault), the dissolver off-gas scrubbers and the 241-A-151 Diversion Box Catch Tank. 216-A-4 Crib was intended to receive a maximum of [284 liters (75 gallons) per minute] low level radioactive liquid waste.

Code: 200-E-111-PL

Classification: Accepted

Names: 200-E-111-PL; 3-38 Encasement; Encased Pipeline from 241-ER-151 Diversion Box to 241-C Tank Farm and 244-AR Vault; Lines V108/V837/8618/8653/8901PAS, 809, 818, V836 and V834

Reclassification: None

Type: Encased Tank Farm Pipeline

Status: Inactive

Description: The site is an underground piping encasement that contains three 7.5 centimeter (3 inch) diameter stainless steel waste transfer pipelines, numbered V108, 8618, 8653, that run from the 241-ER-151 diversion box through a "Y," which branches to the 241-C Tank Farm and the 244-AR Vault. The section from the "Y" junction to the 244-AR Vault contains two 7.5 centimeter (3 inch) pipelines numbered 809 and 818. There is a posted Contamination Area on top of the line at the Y Junction where the line branches to the 241-C Tank Farm and the 244-AR Vault. Line 8653 was replaced with V836. V836 is a direct buried carbon steel line that runs parallel to the encased lines. The entire length of the pipeline is marked with steel fence posts and posted as an Underground Radioactive Materials area. The ground surface above the pipeline is bare in spots, other sections are vegetated with crested wheatgrass, tumbleweeds, and native grass species.

Location: The encased pipeline runs eastward from the 241-ER-151 Diversion Box, south of 7th Street, and branches off in two directions (forming a Y) at a point southeast of the 216-C-10 Crib. From the Y, it branches to the 241-CR-151 Diversion Box inside 241-C Tank Farm and to the 244-AR Vault.

Process Description: The underground, encased pipeline was used to transfer waste from 241-ER-151 to the 241-C Tank Farm and the 244-AR Vault. Line V837 is a single direct buried line that terminates at the 200-E-111 PL encasement. Line V837 ties into line V108 in the encasement.

Related Sites/Structures: The waste transfer encasement is connected to the 241-ER-151 Diversion Box, 241-ER-152 Diversion Box, 241-CR-151, 241-C Tank Farm and the 244-AR Vault.

Waste Type: Process Effluent

Waste Description: The pipeline transported liquid effluent from the 241-ER-151 Diversion Box to the tank farms. Some adjacent soil has been contaminated from pipeline leaks.

Code: 200-E-112-PL

Classification: Accepted

Names: 200-E-112-PL; 24-Inch VP Line; 2904-E-1; B Plant Process Sewer; Pipeline from B Plant to 207-B Retention Basin

Reclassification: None

Type: Radioactive Process Sewer

Status: Inactive

Description: The site is the 61 centimeter (24 inch) diameter, underground process sewer from B-Plant to the 207-B Retention Basin. The pipeline is also known as 2904-E-1. The pipelines are marked above ground with steel posts and marked as "Underground Radioactive Material/Pipeline". Access manholes are located at intervals along the length of pipelines. Vegetation over the pipelines consists of grass and tumbleweeds, with several areas of bare soil.

Location: The waste site is an underground vitrified clay pipelines connect B Plant and the 207-B Retention Basin. It extends eastward from the southeast corner of B-Plant, then turns northward, connecting to the west side of the 207-B Retention Basin.

Release Description: UPR-200-E-32 is associated with this pipeline.

Description:

Process Description: B-Plant routinely discharged process effluent, containing small amounts of radioactivity, to the 207-B Retention Basin via an underground process sewer pipeline. The 2904-E-1 sewer line extends eastward from the south side of 221-B and turns north to connect to the west side of the 207-B Retention Basin. On several occasions large, unplanned amounts of radioactive material were released to the underground sewer lines. The process sewers are 0.6 meters (24 inches) in diameter clay pipelines that include a cast iron pipe from the 221-B building to the first manhole of the process sewer. The remainder of the sewer pipelines are constructed of vitrified pipe.

Related Sites/ Structures: The process sewers are associated with 221-B (B Plant) and the 207-B Retention Basin.

Waste Type: Process Effluent

Waste Description: The process sewer pipelines transferred liquid process effluent and cooling water to the retention basin and the 216-B-2 ditches. The radioactivity levels were normally low and the water was discharged from the retention basin to ditches that connected to the 216-B-3 Pond. However, in 1963 and 1970, Unplanned Releases UPR-200-E-32 and UPR-200-E-138 released significant amounts of cerium-144 and strontium-90 to the process sewer pipelines.

This Site has the Following SubSites:

Code: 200-E-112-PL:1

Names: 200-E-112-PL:1; North/South 24-Inch VCP Pipeline to 207-B

Code: 200-E-112-PL:2

Names: 200-E-112-PL:2; East/West 24-Inch Cast Iron Pipeline from B Plant Facilities Connecting to the North/South 24-Inch VCP Pipeline

Code: 200-E-112-PL:3

Names: 200-E-112-PL:3; 10-Inch Cast Iron Pipeline from 224-B Connecting to the East/West 24-Inch Cast Iron Pipeline

Code: 200-E-112-PL:4

Names: 200-E-112-PL:4; 2-Inch Cast Iron Pipe from 212-B to East/West 24-Inch Cast Iron Pipeline

Code: 200-E-112-PL:1

Classification: Accepted

Names: 200-E-112-PL:1; North/South 24-Inch VCP Pipeline to 207-B

Reclassification: None

Type: Radioactive Process Sewer

Names: 200-E-112-PL; 24-Inch VP Line; 2904-E-1; B Plant Process Sewer; Pipeline from B Plant to 207-B Retention Basin

Code: 200-E-113-PL

Classification: Accepted

Names: 200-E-113-PL; 216-A-42C Valve Box; Line 8824; Pipeline from PUREX to 216-A-6 and 216-A-30 Crib

Reclassification: None

Type: Process Sewer

Start Date:

Status: Inactive

End Date:

Description: The site is an underground 41 centimeter (16 inch) diameter carbon steel pipeline that extends from the PUREX Plant to a distribution box located on the west side of the 216-A-6 Crib and continues eastward to the 216-A-30 Crib. The pipeline is marked with steel fence posts, posted as "Underground Radioactive Material" (URM) and "Pipeline" over its entire length. The 216-A-42C Valve Box is located on the pipeline, inside a domed cover. It is surrounded by a broken, wood fence. A small area just west of the 216-A-42C Valve Box has been stabilized with cobbles and separately posted as URM. Most of the pipeline is free of vegetation except for tumbleweeds near the 216-A-30 Crib.

Location: The site extends in an easterly direction from the southeast end of the PUREX plant to the 216-

A-6 and 216-A-30 Crib.

Process Description: The pipeline transported steam condensate waste from the PUREX facility to the 216-A-30 Crib via Distribution Box 1. The effluent from this line had the capability of being sent to the 216-A-6 Crib or the 216-A-30 Crib. From 1961 to 1966 the 216-A-6 and 216-A-30 Crib operated in parallel. After the 216-A-6 Crib was abandoned in 1970, all the effluent in this pipeline was diverted to the 216-A-30 Crib. The distribution box was filled with concrete in 1995. The effluent was monitored for radionuclides with an in-line monitoring system. If concentrations exceeded the discharge limits, an alarm was sounded in the dispatcher's office, a verification sample was collected, and the stream automatically diverted to the 216-A-42 Retention Basin.

Related Sites/ Structures: The pipeline is associated with the PUREX facility, the 216-A-6 Crib, the 216-A-42 Retention Basin and the 216-A-42C Valve Box.

Waste Type: Process Effluent

Waste Description: The waste is the pipeline and adjacent soil contaminated from pipeline leaks.

Code: 200-E-116-PL **Classification:** Accepted

Names: 200-E-116-PL; Direct Buried Pipelines V111/V210/V130, 8902, and V122; Pipelines from 241-B-154 Diversion Box to 241-C-151 and 241-C-152 Diversion Boxes **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The pipeline is posted as an Underground Radioactive Pipeline that extends from the 241-B-154 Diversion Box to the 241-C-151 and 241-C-152 Diversion Boxes. Vegetation over the pipeline has been crushed due to vehicle traffic. An area located just north of the 241-B-154 Diversion Box was posted as a High Contamination Area in September 2000, but was covered with a bio-barrier and gravel in February 2001. It is now a rectangular posted URM area over a portion of the pipeline. Another area of contamination was found on this pipeline in June 2001. This area was covered with gravel and posted as a URM in August 2001.

Location: The site is located north of and runs parallel to 7th Street, between B Plant and the 241-C Tank Farm in 200 East Area.

Release Description: The Dyncorp Integrated Soil, Vegetation and Animal Control group submitted a posted High Contamination Area site to WIDS as a Discovery Site. They have determined that the area was posted due to growing, contaminated vegetation on the underground pipeline. The contaminated rabbitbrush was surrounded with High Contamination postings. In September 2000, contamination levels inside the posted area ranged from 1200 to 50,000 counts per minute. This area was later covered with a bio-barrier and gravel. In June 2001, another area of growing contaminated vegetation was found adjacent to the area recently stabilized. Contamination levels on the vegetation ranged from 1000 to 50,000 counts per minute.

Process Description: The pipelines transported radioactive mixed waste solutions originating from B Plant to the 241-C Tank Farm. This is a direct buried pipeline, not encased in concrete.

Related Sites/ Structures: B Plant, 241-B-154 Diversion Box, 241-C-151 Diversion Box, 241-C-152 Diversion Box, and 241-C Tank Farm. UPR-200-E-82 is also associated with this transfer line.

Waste Type: Process Effluent

Waste Description: The pipeline transported process effluent from B Plant. Some adjacent soil has been

Waste Description: contaminated from pipeline leaks.

Code: 200-E-118 **Classification:** Accepted
Names: 200-E-118; 216A271 Shack; 216-B-3 Diverter Station; Diverter Station #3; Main Diverter Structure #3 **Reclassification:** None
Type: Control Structure **Start Date:**
Status: Inactive **End Date:** 1/1/1994

Description: The site is a small building (shack) that is labeled Main Diverter Structure #3. Inside the shack, the floor is made of metal grating. Below grade pipes and valves are visible through the grate. A section of the floor is open to the pipes below, and has a radiation rope across the opening. The rope had been posted with an old Surface Contamination Area sign. There had been a posted Contamination Area around a portion of the outside of the shack. In April 2007, the contamination was backfilled with clean dirt and the area posting was changed to Underground Radioactive Material. Just outside of the posted Contamination Area is a valve, labeled 216-B-3-3 Diverter Valve. Two concrete manholes are present, one on each side of the diverter valve.

Location: The site is located east of the 200 East Area fence, near the head end of the 216-B-3-3 Ditch.

Process Description: Water from B Plant and PUREX could be diverted to the 216-B-3 Pond lobes or to Gable Mountain Pond (216-A-25) via valves in the diverter station. Gable Pond became inactive in 1984 and was backfilled. The 216-B-3-3 Ditch was active until 1994.

Related Sites/Structures: The site is associated with the underground pipelines to 216-B-3 ponds and 216-A-25 pond (see sitecodes 200-E-126-PL and 200-E-127-PL)

Waste Type: Equipment

Waste Description: The site is an abandoned shed posted with Contamination Area signs.

Code: 200-E-126-PL-B **Classification:** Accepted
Names: 200-E-126-PL-B; Segments of 200-E-126-PL Pipeline Located in the Inner Area **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**

Description: Due to the restructuring of Operable Units, as described in the Agreement for Central Plateau Cleanup, the original pipeline site has been split into segments. 200-E-126-PL-B is the segments of 200-E-126-PL piping located in the Inner Area. The segments of pipelines associated with 200-E-126-B include a twenty two inch diameter poly pipe extending from 207-B to Diverter Station 2, a twenty one inch diameter vitrified clay pipe extending from Diverter Station 2 to the Head End of 216-B-3 Ditches and a twenty four inch corrugated metal pipe extending from Diverter Station #2 to Diverter Station #3.

Location: The pipeline segments in this waste site are located inside 200 East Area, west of the Inner/Outer Area boundary. The waste site begins at the 207-B retention basin and terminates at the Inner/Outer Area boundary.

Process Description: The pipeline conveyed B Plant effluent to the 216-B-3 Pond and Ditch system. B Plant cooling water effluent was originally routed through the 207-B Retention Basin to the 216-B-2-1, 216-B-2-2 and 216-B-2-3 ditches. In 1987, the 216-B-2-3 ditch was closed and was replaced by this,

22 inch diameter plastic underground pipeline. It extended from the 207-B basin to Diverter Station #2. By 1994, all of the open ditches (216-B-2-1, 216-B-2-2, 216-B-2-3, 216-B-3-1, 216-B-3-2 and 216-B-3-3) had been backfilled and surface stabilized. After 1994, all the effluent was conveyed to the 216-B-3A and 216-B-3C pond lobes only through underground pipelines. In 1995 the ponds were closed. The remaining effluent was transferred the Treated Effluent Disposal Facility (TEDF). Parts of the pipelines east of 200 East Area, that had fed the ponds, were re-used to feed the TEDF disposal basin. The TEDF portion begins at Manhole #8 and extends to Pump Station #3. In the event of a failure at Pump Station #3, the effluent can be routed to 216-B-3C (C lobe). The section that connects the southeast corner of 216-B-3A to the northwest corner of 216-B-3C is constructed of 76 centimeter (30 inch) corrugated metal pipe.

Related Sites/ Structures: This portion of pipeline is associated with the 207-B Retention Basin and Diverter Station #2

Code: 200-E-127-PL-B	Classification: Accepted
Names: 200-E-127-PL-B; Segments of Gable Mountain Pond Pipeline Located in the Inner Area	Reclassification: None
Type: Radioactive Process Sewer	Start Date:
Status: Inactive	End Date:
Description: Due to the restructuring of Operable Units, as described in the Agreement for Central Plateau Cleanup, the original pipeline site has been split into segments. 200-E-127-PL-B is the segments of pipeline located in the Inner Area. The majority of this pipeline is 36 inch corrugated metal pipe. When the 241-AP Tank Farm was constructed, a portion of this pipe was re-routed to the east of the new tank farm. The original pipe that was within the boundary of the 241-AP tank farm property was removed during the tank farm construction.	
Location: 200-E-127-PL-B is the segments of pipe located in the Inner Area. It extends from the 241-A-201 Pump Pit, located east of the PUREX facility to the 207-A Retention Basins, located east of Canton Ave., east of the 242-A Evaporator building.	
Process Description: The pipeline conveyed PUREX and B Plant effluent to the (216-A-25) Gable Pond or the (216-B-3) B Pond system. The effluent stream was directed to the preferred pond via Diverter Station #3. The pipeline south of Diverter Station #3 is constructed of 91 centimeter (36 inch) diameter corrugated metal. The portion of the pipeline between the 241-A-201 cooling water storage tanks and the 216-A-42 basin (30 inch VCP) was taken out of service in June 1992.	

Code: 200-E-135	Classification: Accepted
Names: 200-E-135; Contamination Area South of 241-C Tank Farm	Reclassification: None
Type: Unplanned Release	Start Date:
Status: Inactive	End Date:
Description: The site is surrounded with steel posts and chain with Underground Radioactive Material signs attached to the chain. It has been covered with clean gravel. An abandoned, above ground steam pipe is located inside the posted area.	
Location: The site is located south of 7th Street and southwest of the 241-C Tank Farm.	
Release Description: In September 2000, three growing, contaminated tumbleweeds were found inside the posted area. The maxim contamination level was 1000 counts per minute above background.	

Related Sites/ Structures: Underground pipelines 200-E-148-PL, 200-E-150-PL and 200-E-153-PL cross beneath this area of growing, contaminated vegetation.

Code: 200-E-141 **Classification:** Accepted
Names: 200-E-141; 2715EC Paint Shop French Drain; Miscellaneous Stream #223 **Reclassification:** None
Type: French Drain **Start Date:**
Status: Inactive **End Date:**
Description: The site consists of a french drain behind the 2715EC paint shop.
Location: The drain is 3.05 meters (10 feet) west and 7.62 meters (25 feet) north of the northeast corner of the 2715EC paint shop.
Process Description: The french drain received effluent from a sink located inside the paint shop. The sink was used to wash latex paint brushes. In 1995, the sink effluent was connected to the sanitary sewer. In March 2007, Curt Clement verified the sink water did not discharge to the french drain.

Related Sites/ Structures: The drain is associated with the 2715EC Paint Shop

Code: 200-E-142 **Classification:** Accepted
Names: 200-E-142; Paint Brush Cleaning Station **Reclassification:** None
Type: Depression/Pit (nonspecific) **Start Date:**
Status: Inactive **End Date:**
Description: The site consists of soil cover with gravel and scattered vegetation. There is no visual evidence of the chemicals disposed here. It is possible the site extends northward, beyond the steamline.
Location: The contaminated soil is located north of the 2241-B building foundation (demolished), between the concrete pad and the steam line. The area is south of the 224-B Building.
Process Description: The 2241-B building had a concrete pad that included an old paint brush cleaning station. The painters had a 3-brush cleaning station on a cement pad on the north side of the building. An open top drum was used to soak paint buckets. The excess liquid drained off of the concrete pad and out of the drum onto the soil.

Related Sites/ Structures: The cleaning station is associated with 2241-B Building (demolished structure).

Waste Type: Chemical Release
Waste Description: The waste includes chemicals used to clean paint brushes and buckets.

Code: 200-E-143-PL **Classification:** Accepted
Names: 200-E-143-PL; Encased Transfer Line from 241-AX-151 Diversion Box to 241-A Tank Farms and 244-CR Vault in 241-C Tank Farm; Tank Farm Transfer Lines 4101, 4102, 4103, 4104, 4105, 4106, 4107/V033, 4017, 4018 and 8656 **Reclassification:** None

Type: Encased Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: The waste site is an underground concrete encased transfer line containing nine, 10 centimeter (4 inch) diameter, stainless steel pipes. Groups of lines divert from the encasement at various points along the route to 244-CR Vault. Lines 4101, 4102 and 4103 divert into the south end of 241-A Tank Farm to feed tanks 241-A-101, 241-A-102 and 241-A-103. Lines 4104, 4105, 4106, 4017 and 4018 divert from the encasement at the north end of 241-A Tank farm to feed tanks 241-A-104, 241-A-105, 241-A-106 and 241-AX-152 Diversion Box. Line 4107 diverts to 241-A-152 Diversion box. North of 241-A Tank Farm, line 8656 continues to the 244-CR Vault, inside 241-C Tank Farm.

Location: The concrete encased transfer line extends from the 241-AX-151 Diverter Station, near the corner of Route 4 and Buffalo Ave. to 244-CR Vault, inside 241-C Tank Farm.

Related Sites/ Structures: The concrete encasement is associated with 241-AX-151, 241-A Tank Farm and 241-C Tank Farm.

Code: 200-E-144-PL

Classification: Accepted

Names: 200-E-144-PL; Encased Transfer Line from 241-CR-152 and 241-CR-153 to 241-AX-151; Lines 4006 and 4007 from 244-AR Vault to 241-AX-151; Tank Farm Transfer Line 4012; Transfer Line 4013 (A-4013)

Reclassification: None

Type: Encased Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: The transfer line is radiologically posted as an Underground Radioactive Material Area. Two, stainless steel pipelines are inside the pipe trench. Lines 4012 and 4013 (A-4013) originate inside the 241-C Farm at the 241-CR-152 and 241-CR-153 Diversion Boxes, passes through the 241-ER-153 Diversion Box, and terminate at the 241-AX-151 Diverter Station. Both lines are 7.6 centimeter (3 inch) in diameter pipes.

Location: The pipeline extends from 241-C tank farm to 241-AX-151 diversion box, located south of 204 AR, near the corner of 4th Street and Buffalo Ave at the 244-AR Vault facility.

Code: 200-E-145-PL

Classification: Accepted

Names: 200-E-145-PL; 241-ER-152 and 241-ER-151; Interplant Transfer Line; Tank Farm Transfer Line V228; Transfer Pipeline from 241-CR-153 to 241-ER-153

Reclassification: None

Type: Encased Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: The trench that contains lines V228 and PAS-244 is radiologically posted as an Underground Radioactive Material Area. The trench contains two, 3 inch diameter stainless steel pipes.

Location: Line V228 originates in 241-C Farm at the 241-CR-153 Diversion Box, passes through the 241-ER-153 Diversion Box south of 241-C Farm and continues to the 241-ER-152 Diversion Box. Line 244 originates at B Plant, and is connected to both 241-ER-151 and 241-ER-152 Diversion Boxes. Line 244 is in the same trench as V228 from 241-ER-152 to 241-ER-153. Both lines continue into 241-C tank farm at the 241-CR-153 diversion box.

Process Pipelines V-228 and PAS-244 are inside the same pipe trench. The 241-ER-152 Diversion Box

Description: is located on the west side of the pipeline. The 241-ER-153 Diversion Box is located on the east side of the pipeline. From 244-A to 241-C, lines V228 and PAS-244 join lines 4012 and 4013 (see 200-E-144-PL).

Related Sites/ Structures: The pipelines are associated with diversion boxes 241-ER-151, 241-ER-152, 241-ER-153, 241-CR-153 and pipeline sitecodes 200-E-144-PL and 200-E-147-PL.

Waste Type: Process Effluent

Waste Description: Line V228 transported Purex Supernate (PSN). It contained three curies per gallon of cesium-137, one curie per gallon of strontium 89 and 90 and one curie per gallon of cerium.

Code: 200-E-147-PL

Classification: Accepted

Names: 200-E-147-PL; Interplant Transfer Line; Tank Farm Transfer Line PAS-244; Transfer Line from 244-CR-TK-003 to 241-ER-153

Reclassification: None

Type: Direct Buried Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: Transfer line PAS-244 is located in the Interplant Transfer pipe trench, per drawing H-2-44501, sheet 92. The pipeline is radiologically posted as an Underground Radioactive Material Area.

Location: Line PAS-244 originates inside 241-C Tank Farm, at the 244-CR Vault (244-CR-TK-003), and terminates at the 241-ER-153 Diversion Box south of 241-C Farm and west 241-AZ Farm.

Process Description: The stainless steel pipelines, V-228 and PAS-244, are inside the same pipe trench. The 241-ER-152 Diversion Box is located on the west side of the pipeline. The 241-ER-153 Diversion Box is located on the east side of the pipeline. From 244-A to 241-C, lines V228 and PAS-244 join lines 4012 and 4013 (see 200-E-144-PL).

Related Sites/ Structures: The pipeline is associated with 200-E-144-PL, 200-E-145-PL, 241-ER-152 and 241-ER-153.

Waste Type: Process Effluent

Waste Description: Line 224 transported Purex Acid Sludge (PAS). It contained one curie per gallon of cesium-137, twenty curies per gallon of strontium 89 and 90 and one curie per gallon of cerium.

Code: 200-E-148-PL

Classification: Accepted

Names: 200-E-148-PL; Direct Buried Transfer Line from 241-C-151 to 241-A-01A; Tank Farm Transfer Line V109

Reclassification: None

Type: Direct Buried Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: Transfer Line V109 is a 5 centimeter (2 inch) diameter, direct buried line, that is radiologically posted as an Underground Radioactive Material Area.

Location: Line V109 originates inside the 241-C Farm at the 241-C-151 Diversion Box and terminates at 241-A-01A Pump Pit inside 241-A Farm.

Related Sites/ Structures: This pipeline passes beneath the Contamination Area known as 200-E-135. Growing contaminated vegetation was found in this area in 2000.

Code: 200-E-149-PL **Classification:** Accepted

Names: 200-E-149-PL; Direct Buried Transfer Line from 241-C-252 to 201-C Hot Semi Works; Tank Farm Pipeline; Tank Farm Transfer Line V175 **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: Tank Farm Transfer Line V175 is a 2 inch diameter, direct buried, stainless steel Tank Farm process waste pipe. The site is radiologically posted as an Underground Radioactive Material Area.

Location: Line V175 originates inside 241-C Farm at the 241-C-252 Diversion Box and terminates at the 241-C-201-C Diversion Box in the 201-C Hot Semi Works complex.

Release Description: WIDS sitecode 200-E-56 says HW-52860 states that teflon flange gaskets on the stainless steel underground waste line from 201-C to 241-C Tank Farm developed leaks. The leaks caused the underground area next to the east side of the 201-C Building and an underground area near the east facility fence to become contaminated. Radiation readings in 1957 were greater than 100 rad per hour at a depth of 3.66 meters (12 feet) adjacent to the 201-C Building and near the fence. The underground waste line was abandoned and by pass sections installed. New sections of pipeline were installed south of the leaking sections.

Related Sites/ Structures: This pipeline is associated with 201-C and WIDS sitecode 200-E-56 soil contamination event.

Code: 200-E-150-PL **Classification:** Accepted

Names: 200-E-150-PL; Direct Buried Transfer Line from 244-CR-TK-003 to 201-C Hot Semi Works Valve Box; Tank Farm Pipeline; Tank Farm Transfer Line 8900 **Reclassification:** None

Description: Tank Farm Transfer Line 8900 is a direct buried Tank Farm process waste pipe. The site is radiologically posted as an Underground Radioactive Material Area.

Location: Line 8900 originates inside 241-C Farm at 244-CR-TK-003 in 244-CR Vault and terminates at the 201-C Valve Box in the 201-C Hot Semi Works complex.

Related Sites/ Structures: This pipeline passes beneath the Contamination Area known as 200-E-135. Growing contaminated vegetation was found in this area in 2000.

Code: 200-E-151-PL **Classification:** Accepted

Names: 200-E-151-PL; Direct Buried Transfer Line from 241-C-104 to 241-A-152; Tank Farm Pipeline; Tank Farm Transfer Line V050 **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: Tank Farm Transfer Line V050 is a 3 inch diameter, schedule 40 steel, Tank Farm process waste pipe. Most of this pipeline is direct buried. 48 meters (160 feet) of the line is encased in concrete. The site is radiologically posted as an Underground Radioactive Material Area.

Location: Line V050 originates inside 241-C Tank Farm at the 241-C-104 tank and terminates at the 241-A-152 Diversion Box, inside 241-A Tank Farm.

Related Sites/ Structures: The line is associated with 241-C-104, 241-A-152 and pipeline sitecode 200-E-152-PL.

Code: 200-E-152-PL **Classification:** Accepted

Names: 200-E-152-PL; Direct Buried Transfer Line from 241-C-104 to 241-A-152; Tank Farm Pipeline; Tank Farm Transfer Line V051 **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: Tank Farm Transfer Line V051 is a 3 inch diameter, schedule 40 steel, Tank Farm process waste pipe. Most of the line is direct buried. Forty eight meters (160 feet) is encased in concrete. The site is radiologically posted as an Underground Radioactive Material Area.

Location: Line V051 originates inside 241-C Tank Farm at the 241-C-104 tank and terminates at the 241-A-152 Diversion Box inside 241-A Tank Farm.

Related Sites/ Structures: The line is associated with 241-C-104, 241-A-152 and pipeline sitecode 200-E-151-PL.

Code: 200-E-153-PL **Classification:** Accepted

Names: 200-E-153-PL; Direct Buried Transfer Line from 241-C-151 to 244-AR-TK-002; Tank Farm Pipeline; Tank Farm Transfer Line V108/812 **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: Tank Farm Transfer Line V108/812 are 3 inch diameter, direct buried, Tank Farm process waste pipes. Line V108 is a stainless steel pipe. Line 812 is a carbon steel pipe. The site is radiologically posted as an Underground Radioactive Material Area.

Location: Line V108/812 originates inside 241-C Tank Farm at the 241-C-151 Diversion Box and terminates at 244-AR-TK-002 in 244-AR Vault.

Release Description: UPR-200-E-86 states that routine line (leak detection) monitoring equipment detected a leak in the vicinity of transfer line number 812. The line was being used to transfer process waste (containing approximately 25,000 curies of cesium-137) from the 244-AR Vault to the 241-C Tank Farm. The leak was identified on February 25, 1971. Eight test wells were drilled to determine the extent of the subsurface contamination. Wells 4, 5 and 8 found subsurface contaminated soil. Well number 4 found a maximum contamination of 5 rad per hour at the 3 foot and 6 foot levels. No contamination was found below the 20 foot level.

Related Sites/ Structures: Line 812 is associated with UPR-200-E-86. It is a line leak that occurred in 1971. A posted Underground Radioactive Material Area, covered with shotcrete, remains. This pipeline also passes beneath the Contamination Area known as 200-E-135, south of 7th Street. Growing contaminated vegetation was found in this area in 2000.

The Following Sites Were Consolidated With This Site:

Code: UPR-200-E-86

Names: UPR-200-E-86; 241-C Tank Farm Line (V812) Break Southwest Corner; UN-200-E-86; UN-216-E-14

Code: 200-E-154-PL **Classification:** Accepted
Names: 200-E-154-PL; Direct Buried Transfer Line from 241-C-151 to 241-AX-01A; Tank Farm Pipeline; Tank Farm Transfer Line V113 **Reclassification:** None
Type: Direct Buried Tank Farm Pipeline **Start Date:**
Status: Inactive **End Date:**
Description: Tank Farm Transfer Line V113 is a 3 inch diameter, direct buried Tank Farm process waste pipe. The site is radiologically posted as an Underground Radioactive Material Area.
Location: Line V113 originates inside 241-C Tank Farm at the 241-C-151 Diversion Box and terminates at 241-AX-01A Pump Pit inside 241-A Tank farm.

Code: 200-E-155-PL **Classification:** Accepted
Names: 200-E-155-PL; Pipeline from 241-C Fence to Radioactive Process Sewer Line 2904-CR-1 **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The site is an underground, 5 centimeter (2 inch) diameter, carbon steel pipeline.
Location: The pipeline originates at the 241-C-03A Pump Pit inside the 241-C tank farm and connects to the 30 inch corrugated metal pipe (200-E-237-PL) outside the northeast corner of the 241-C tank farm.
Process Description: 241-C farm condensate was transported to the disposal pond system through this pipeline, that connected to the 30 inch corrugated metal pipe (sitecode 200-E-237-PL).

Related Sites/ Structures: The pipeline is associated with the 241-C-03A pump pit and the 200-E-237-PL pipeline.

Code: 200-E-156-PL **Classification:** Accepted
Names: 200-E-156-PL; 216-C-1 Pipelines; Pipelines from 201-C to 216-C-1 **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The site is the underground pipeline that fed the 216-C-1 crib. The eastern portion of the pipeline is a 5 centimeter (2 inch) diameter stainless steel pipe. It connects to a 10 centimeter (4 inch) diameter stainless steel pipe as it enters the crib. It is not separately marked or posted. The pipeline is under the 200-E-41 stabilization cover material.
Location: The pipeline is located inside 200 East Area, south of 7th Street, within the Hot Semiworks stabilized area (sitecode 200-E-41).
Process Description: The original crib line is a 10 centimeter (4 inch) diameter stainless steel line extending from the south wall of 201-C to the 216-C-1 crib. In 1954, the 201-C waste was rerouted through a 5 centimeter (2 inch) diameter stainless steel line extending out of the southeast corner of 201-C. The 5 centimeter (2 inch) diameter stainless steel replacement line ties into the original 10 centimeter (4 inch) diameter line north of the 216-C-1 crib. The original 10 centimeter (4 inch) diameter line was re-routed to the 216-C-9 Pond.

Related Sites/ Structures: The pipeline is associated with the demolished 201-C facility, the 216-C-1 crib and the 200-E-41 stabilized area.

Code: 200-E-157-PL **Classification:** Accepted
Names: 200-E-157-PL; 216-C-10 Pipeline; Pipeline from 201-C to 216-C-10 Crib **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The site is two underground, 5 centimeter (2 inch) diameter stainless steel pipelines that fed the 216-C-10 crib. The original pipeline extended from 201-C to 216-C-10. A second pipeline, from 241-CX vault, tied into the original 216-C-10 crib line after the 216-C-6 crib was deactivated.
Location: The 216-C-10 crib is located east of the Hot Semiworks stabilized area (sitecode 200-E-41). The crib pipeline extends from the demolished 201-C facility, located with the 200-E-41 area, to the 216-C-10 crib.
Process Description: The 216-C-10 crib received process condensate and liquid waste from the 201-C Building via this pipeline. A gate valve is located at approximately the mid point of the line, between 201-C and 216-C-10. The line was blanked where it tied into the 216-C-6 crib line (see sitecode 200-E-171-PL).

Related Sites/ Structures: The site is associated with 200-E-41, the 216-C-10 crib and the 200-E-171-PL pipeline.

End Date:

Description: The site is an underground pipeline. It is not separately marked or posted on the surface.

Location: Sample Pit #3, the 216-A-1 crib and associated pipeline are located east of the 241-A tank farm, on the east side of Canton Ave.

Process Description: The pipeline is constructed of six inch diameter, extra strong, vitrified clay.

Related Sites/ Structures: The pipeline is associated with the 216-A-1 crib.

Code: 200-E-159-PL

Classification: Accepted

Names: 200-E-159-PL; Pipeline from 203-A to 216-A-22; Pipeline from 203-A to 216-A-28 Crib; Pipeline from UNH Truck Apron to 216-A-22

Reclassification: None

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: The waste site is a series of underground pipelines from the 203-A facility to the 216-A-22 and 216-A-28 cribs and drainage from the UNH Truck Apron. The pipeline is a 10 centimeter (4-inch) stainless steel 304 perforated pipe. It is 1.2 meters (4 feet) below grade.

Location: The pipeline and crib are located north of PUREX, and north of the 203-A tank storage area.

Process Description: The 203-A tank farm was used for storage and shipping of uranyl nitrate hexahydrate (UNH) product and concentration of UNH waste. It consisted of 460,000 liter (100,000 gallon) stainless steel tanks for UNH storage and three smaller nitric acid tanks. The 216-A-22 crib received liquid waste from the 203-A sumps and heating coil condensate from the uranyl nitrate tanks and the truck apron. The effluent was routed to the 216-A-28 crib in 1958. The effluent piping to 216-A-28 was blanked off in November 1976 when the flow rate exceeded the infiltration capacity of the 216-A-28 crib.

Related Sites/ Structures: The pipelines are associated with 216-A-22, the UNH Truck Apron sump and 216-A-28.

The contamination was found above an existing 38 centimeter (15 inch) vitrified clay pipe, which was suspected to be the source.**Process Description:** The 216-A-34 ditch received cooling water from the contact condenser in the 241-A-431 building via a VCP pipeline.**Related Sites/ Structures:** The site is associated with the 216-A-8 Sample Pit (control structure) and the 216-A-34 ditch. UPR-200-E-145 found contamination associated with this pipeline.**Code:** 200-E-167-PL**Classification:** Accepted**Names:** 200-E-167-PL; Lines SN-215 and SN-216; Underground Pipelines from 244-A Lift Station to 241-A-A and 241-A-B Valve Pits**Reclassification:** None**Type:** Encased Tank Farm Pipeline**Start Date:****Status:** Inactive**End Date:****Description:** The waste site is two underground, carbon steel pipelines.**Location:** The pipeline is located south of 7th Street and west of Buffalo Ave., inside 200 East Area.**Process Description:** Lines SN-215 and SN-216 are in the same trench that connects 244-A Lift Station with the 241-A-A and 241-A-B Valve Pits. They are double contained (pipe-in-pipe), carbon steel lines that are surrounded by a minimum of 7.6 centimeters (3 inches) of polyurethane insulation. The interior pipe is 7.6 centimeter (3 inch diameter) schedule 40 pipe. The outer pipe is 15.2 centimeter (6 inch diameter) schedule 40 pipe.**Related Sites/ Structures:** The pipelines are associated with the 244-A Lift Station and the 241-A Tank Farm.**Code:** 200-E-168-PL**Classification:** Accepted**Names:** 200-E-168-PL; Underground Pipeline to 216-A-3**Reclassification:** None**Type:** Radioactive Process Sewer**Start Date:** 1/1/1956

Process Description: The 216-C-6 crib received radioactive REDOX and PUREX type process condensate from 201-C and 241-CX vault floor drainage via this pipeline. When the 216-C-6 crib was discontinued, the effluent was diverted to the 216-C-10 crib via pipeline 200-E-157-PL.

Related Sites/ Structures: The pipeline is associated with the 216-C-6 crib, the 241-CX vault and the 200-E-157-PL pipeline.

Code: 200-E-172-PL **Classification:** Accepted

Names: 200-E-172-PL; Pipeline from 209-E to the 216-C-7 Crib **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The site is an underground 5 centimeter (2 inch) stainless steel pipeline.

Location: The pipeline is located south of the 209-E building.

Process Description: The 209-E building was designed to perform critical mass experiments using plutonium nitrate solutions and enriched uranium. At the completion of an experiment, the waste in the Neutron Reflector Tanks was discharged to a 222 liter (60 gallon) buried waste tank outside the building (Critical Mass Laboratory Valve Pit and Hold Up Tank (209-E-TK-111)). After sampling, the tank contents that were below levels of concern were discharged to the 216-C-7 crib.

Related Sites/ Structures: The pipeline is associated with the 216-C-7 crib.

Code: 200-E-173-PL **Classification:** Accepted

Names: 200-E-173-PL; Pipeline from 241-CX-71 to 216-C-5 Crib **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The site is an underground 5 centimeter (2 inch) diameter, carbon steel pipeline.

Location: The pipeline is located south of the demolished 201-C facility. It curves around the 216-C-1 crib area.

Process Description: The pipeline carried High Salt Waste that had passed through the 241-CX-71 neutralization tank to the 216-C-5 crib.

Code: 200-E-174-PL **Classification:** Accepted

Names: 200-E-174-PL; 216-B-10 (A&B) Pipeline; Pipeline from 221-BC and 222-B to 216-B-10 A&B Cribs **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 9 centimeter (3.5 inch) diameter, stainless steel pipeline. The pipeline extends north and south from the 221-BC building and east to west from the 222-B

building to connect to the 216-B-10 A&B cribs.

Location: The pipeline is located south of the 221-B building.

Process Description: In 1949, the pipeline began to carry waste from the 222-B laboratory sink and sample slupper to the 216-B-10A and 10B cribs. In 1969, flow to the 216-B-10A crib was terminated. The pipeline was rerouted to feed only the 216-B-10B crib (see subsite 3). An in-line catch tank was added to the pipeline (see sitecode 200-E-179). The pipeline was extended northward to provide drainage from the 221-BC building. The pipeline and catch tank were abandoned in 1974.

Related Sites/ Structures: The pipeline is associated with the 216-B-10 A & B cribs, 200-E-179 catch tank, the 222-B laboratory and the 221-BC building.

This Site has the Following SubSites:

Code: 200-E-174-PL:1

Description: The waste site is an underground, 9 centimeter (3.5 inch) diameter, stainless steel tubing pipeline.

Location: The pipeline is located southeast of the 221-B building. It runs diagonally from the 292-B building to the 216-B-10 A crib.

Process Description: The pipeline carried floor drainage waste from the 292-B building to the 216-B-10 A crib.

Related Sites/ Structures: The pipeline is associated with the 216-B-10A crib.

Code: 200-E-176-PL

Classification: Not Accepted

Names: 200-E-176-PL; Pipeline from 242-B to 216-B-11-A&B

Reclassification: None

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: Due to the restructuring of Operable Units, as described in the Tentative Agreement for Central Plateau Cleanup, this pipeline has been split into segments (see 200-E-176-PL-A and 200-E-176-PL-B). The waste site is an underground, 7.6 centimeter (3 inch) diameter, carbon steel pipeline.

Location: The pipeline extends northward from the 242-B Evaporator building to the 216-B-11 A cribs.

Process Description: The pipeline transported evaporator condensate waste to the cribs.

Related Sites/ Structures: The pipeline is associated with the 242-B evaporator and the 216-B-11 A&B cribs.

Structures:

Code: 200-E-176-PL-A **Classification:** Accepted
Names: 200-E-176-PL-A; Pipeline from 242-B to 216-B-11-A&B, Portion of pipeline outside the 241-B fence **Reclassification:** None
Type: Direct Buried Tank Farm Pipeline **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 7.6 centimeter (3 inch) diameter, carbon steel pipeline.
Location: The pipeline extends northward from the 242-B Evaporator building to the 216-B-11 A cribs, crossing through the 241-B tank farm. This waste site is two segments of pipeline (north portion and south portion) that are outside the 241-B tank farm fence. The north portion of this pipeline extends from the north 241-B fence to the 216-B-11A & B reverse wells. The south portion extends from the 242-B building to the tank farm fence.

Code: 200-E-176-PL-B **Classification:** Accepted
Names: 200-E-176-PL-B; Pipeline from 242-B to 216-B-11-A&B, Portion of pipeline inside the 241-B fence **Reclassification:** None
Type: Direct Buried Tank Farm Pipeline **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 7.6 centimeter (3 inch) diameter, carbon steel pipeline. The majority of the pipeline is located inside the 241-B tank farm.
Location: The pipeline extends northward from the 242-B Evaporator building to the 216-B-11 A cribs, crossing through the 241-B tank farm. This waste site represents the portion of the pipeline that is located inside the 241-B tank farm fence.

Code: 200-E-177-PL **Classification:** Accepted
Names: 200-E-177-PL; Pipeline Rerouting Waste from 216-B-8 Crib Pipeline to 216-B-11A&B Reverse Wells **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 7.6 centimeter (3 inch) diameter carbon steel pipeline.
Location: The pipeline extends eastward from the 216-B-8 pipeline (200-E-178-PL), north of the 241-B Tank Farm, to 216-B-11A.
Process Description: This pipeline was installed to reroute the 216-B-8 crib waste to the 216-B-11 A&B cribs.
Related Sites/Structures: The pipeline is associated with the 216-B-11 A&B cribs and the pipeline that fed the 216-B-8 crib (200-E-178-PL).

Code: 200-E-178-PL **Classification:** Accepted
Names: 200-E-178-PL; Pipeline from Tank 241-B-110 to **Reclassification:** None

Related Sites/ Structures: The pipeline is associated with the 216-B-61 crib.

Code: 200-E-182-PL **Classification:** Accepted
Names: 200-E-182-PL; 216-A-7 Crib Pipeline **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**

Description: The site is an underground, 15 centimeter (6 inch) diameter, vitrified clay pipe.

Location: The pipeline extends eastward from the 241-A-302B Catch Tank, under Canton Ave., to the 216-A-7 crib. A portion of the pipeline is inside the 241-A Tank Farm.

Related Sites/ Structures: The pipeline is associated with the 241-A-152 Diversion Box, the 241-A-302B Catch Tank and the 216-A-7 crib.

Code: 200-E-183-PL **Classification:** Accepted
Names: 200-E-183-PL; Lines V010 and V011; Pipelines from 241-A-151 Diversion Box to 216-A-2 **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**

Description: The waste site consists of two, stainless steel pipelines, direct buried in the same soil trench. V010 and V011 are 7.6 (3 inch) stainless steel pipes. Lines V014 and V016 are buried adjacent to lines V010 and V011 (see sitecode 200-E-185-PL).

Location: The pipelines are located south of PUREX. They extend southward from the 241-A-151 Diversion Box to the 216-A-2 and 216-A-4 Cribs.

Process Description: Lines V010, V011, V014 and V016 extend from the 241-A-151 diversion box in the same soil trench. At a point just north of the 216-A-4 crib, the lines separate. Lines V010 and V011 split off and tie into the 216-A-2 crib structure. Lines V014 and V016 tie into the 216-A-4 crib structure.

Related Sites/ Structures: The lines are associated with the 241-A-151 Diversion Box, 216-A-2 crib, 216-A-4 crib, 200-E-184-PL, 200-E-185-PL and 200-E-196-PL.

Code: 200-E-184-PL **Classification:** Accepted
Names: 200-E-184-PL; 216-A-2 Crib Pipelines; V010 and V011 **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**

Description: The waste site is two parallel, 10 centimeter (4 inch) diameter, vitrified clay pipes that fed the 216-A-2 crib. The two lines are direct buried in the same soil trench.

Location: The pipelines are located south of the 202-A facility and west of the 216-A-4 crib.

Process Description: Waste lines V010 and V011 originated at the 241-A-151 Diversion Box (see sitecode 200-E-183-PL). They are direct buried in the same soil trench with lines V014, V016 and T167. At a point just north of the 216-A-4 crib, the lines separate. Three lines (V014, V016 and T167) tie into the 216-A-4 crib structure. Lines V010 and V011 split off and tie into the 216-A-2 crib

structure. The line numbers V010 and V011 indicate the specific waste stream. When the 216-A-2 crib was abandoned, the pipelines were cut. The effluent was redirected to the 216-A-31 crib by extending lines V010 and V011 (see sitecode 200-E-186-PL)

Related Sites/ Structures: The pipelines are associated with the 241-A-151 Diversion Box, 200-E-183-PL, 200-E-186-PL and the 216-A-2 crib.

Code: 200-E-185-PL **Classification:** Accepted

Names: 200-E-185-PL; 216-A-4 Crib Pipelines; V014 and V016 **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site consists of two, stainless steel pipelines, direct buried in the same soil trench. Lines V014 and V016 are 7.6 (3 inch) stainless steel pipes. Lines V010 and V011 are buried adjacent to lines V014 and V016 in the same soil trench (see sitecode 200-E-183-PL). Lines V014 and V016 connect into the 216-A-4 crib structure using a Double Y Connection to connect into the vitrified clay crib distribution pipes. Line T167 enters the soil trench just north of the 216-A-4 crib (see sitecode 200-E-196-PL).

Location: The 216-A-4 crib lines are located south of 202-A. They enter the north side of the crib structure.

Process Description: The line numbers indicate a specific waste stream. Waste lines V014, V016 originate at the 241-A-151 Diversion Box. They are direct buried in the same soil trench with lines V010, V011. At a point just north of the 216-A-4 crib, the lines separate. Near the north side of the 216-A-4 crib, line T022 from the 291-A Control House, enters the pipe trench and ties into line T167, becoming part of line T167 (see sitecode 200-E-196-PL). Line T167 is connected to the 216-A Sample Pit. These three lines (V014, V016 and T167) tie into the 216-A-4 crib structure. Lines V010 and V011 split off and tie into the 216-A-2 crib structure. Line V014 was later rerouted to 216-A-TK-2 and blanked off.

Related Sites/ Structures: The pipelines are associated with the 241-A-151 Diversion Box, 216-A-TK-2, 200-E-183-PL, 200-E-196-PL and the 216-A-4 crib.

Code: 200-E-186-PL **Classification:** Accepted

Names: 200-E-186-PL; 216-A-31 Crib Pipelines; V010 and V011 **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is two underground, 7.6 centimeter (3 inch) diameter, stainless steel pipes that are buried in the same soil trench.

Location: The pipelines are located south of 202-A. The 216-A-31 crib pipelines originate at a point where the 216-A-2 crib lines were abandoned.

Process Description: When discharge to the 216-A-2 crib was discontinued, flow was diverted to the 216-A-31 crib through two stainless steel pipelines. The line numbers V010 and V011 indicate the waste stream was diverted from 216-A-2 to 216-A-31.

Related Sites/ Structures: The site is associated with the 216-A-31 crib and pipeline 200-E-184-PL.

Structures.

Code: 200-E-187-PL **Classification:** Accepted

Names: 200-E-187-PL; Chemical Sewer from 202-A to 216-A-29 Ditch; Lines 8819, 5802 and 5701; PUREX Chemical Sewer (CSL) **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground chemical sewer pipeline. The pipeline begins as a 30 centimeter (12 inch) diameter vitrified clay line but increases to a 38 centimeter (15 inch) diameter vitrified clay line about midway before reaching the 216-A-29 ditch. The original chemical sewer line connected to a 183 centimeter (36 inch) diameter corrugated metal pipe prior to entering the 216-A-29 ditch head wall. Eight manholes and the 216-A-42E control structure are located along the pipeline. A section of this sewer near 216-A-42 basin is constructed of polyethylene plastic.

Location: The chemical sewer line extends from the north side of the 202-A facility and runs eastward to the head end of the 216-A-29 ditch.

Process Description: The pipeline carried PUREX chemical sewer waste to the 216-A-29 ditch. The 241-A Tank Farm was constructed during 1984 and 1985. The head end of the 216-A-29 ditch was relocated and a portion of the chemical sewer was re-routed north of the new tank farm on the north side of 4th Street. A short piece of the original 183 centimeter (36 inch) diameter corrugated metal pipe remains near the north side of the 272-AW building.

Related Sites/ Structures: The waste site is associated with the PUREX facility and the 216-A-29 ditch.

Code: 200-E-188-PL **Classification:** Accepted

Names: 200-E-188-PL; 2904-E-2; B Plant Chemical Sewer Line; BCE; 15-Inch VP Line **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The site is the underground 38 centimeter (15 inch) diameter vitrified clay pipe and a section of 40 centimeter (16 inch) diameter steel piping, from B-Plant to the valve box east of the 207-B Retention Basin. The pipeline is also known as 2904-E-2 and the B Plant Chemical Sewer. The pipelines are marked above ground with steel posts and "Underground Radioactive Material/Pipeline" signs. Access manholes are located at intervals along the length of pipelines. Vegetation over the pipelines consists of grass and tumbleweeds, with several areas of bare soil.

Location: The 2904-E-2 chemical sewer line runs from the north side of 221-B to the east side of the 207-B Retention Basin. The 2904-E-2 pipeline bypasses the retention basin to discharge directly into the 216-B-2 ditches.

Release Description: UPR-200-E-138 is associated with the B Plant chemical sewer pipeline. On March 22, 1970, a leaking manometer sensing line from the 8-1 Tank inside the 221-B Building was flushed down a floor drain connected to a chemical sewer that contaminated the 216-B-2-2 Ditch and the 216-B-3 Pond. The pipeline bypasses the 207-B Retention Basin so the retention basin was not contaminated as a result of this release, but the release did contaminate the 216-B-2-2 ditch. On March 23, 1970 at 6:00 am, a dose rate of 5 R/hr was noted at check point number one of

the 216-B-2-2 Ditch.

Process Description: The 200-E-188-PL (2904-E-2) pipeline bypassed the retention basin to discharge directly into the 216-B-2 ditches. H-2-35495 shows the chemical sewer pipe being cut and plugged south of the valve pit in 1970. Two new 40 centimeter (16 inch) diameter steel pipes (see sitecode 200-E-205-PL) were installed to route effluent to the 216-B-2-3 ditch (see 200-E-205-PL). The piping and valve configuration allowed flow to be diverted to the 216-B-63 ditch (See 200-E-191-PL) or the 216-B-2-3 ditch.

Related Sites/ Structures: The pipeline is associated with 221-B, 225-B, 211-B, 212-B, 276-B, 224-B, 222-B, the 216-B-2 ditches, 216-B-63 ditch, 200-E-191-PL, 200-E-204-PL, 200-E-205-PL.

Code: 200-E-189 **Classification:** Accepted

Names: 200-E-189; 216-A-TK-1 Carbonate Neutralization Tank **Reclassification:** None

Type: Neutralization Tank **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground neutralization tank.

Location: The tank is located south of PUREX, south of the 291-A stack.

Process Description: The tank held calcium carbonate that changed the pH of the 291-A stack condensate waste via line T021.

Related Sites/ Structures: The tank is associated with the 291-A stack and the 216-A-TK-2 catch tank.

Code: 200-E-190 **Classification:** Accepted

Names: 200-E-190; 216-A-TK-2 Catch Tank **Reclassification:** None

Type: Catch Tank **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground catch tank.

Location: The catch tank is located south of PUREX and west of the 216-A Sample Pit.

Process Description: Multiple waste lines from the 216-A Sample Pit fed the catch tank. Waste was jetted from the catch tank to the 216-A-21 crib.

Related Sites/ Structures: Line V014 is described in sitecode 200-E-185-PL.

Code: 200-E-191-PL **Classification:** Accepted

Names: 200-E-191-PL; 216-B-63 Pipeline; Pipeline from 207-B Valve Pit to 216-B-63 Ditch **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground 38 centimeter (15 inch) diameter vitrified clay pipeline. The

Description: vitrified clay pipeline is connected to the valve pit on the east side of the 207-B Retention basin by a short piece of 41 centimeter (16 inch) diameter carbon steel pipe.

Location: The pipeline is located northeast of the 207-B Retention Basin.

Process Description: The pipeline fed the 216-B-63 ditch.

Related Sites/ Structures: The pipeline is associated with the 216-B-63 ditch and the 207-B Retention Basin.

Code: 200-E-192-PL **Classification:** Accepted

Names: 200-E-192-PL; 216-A-10 Pipelines; Lines from Sample Pit 4 to 216-A-10 Crib **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:** 1/1/1956

Status: Inactive **End Date:** 1/1/1987

Description: The original pipeline to 216-A-10 crib is an underground, 20 centimeter (8 inch) diameter, vitrified clay pipe. The original pipe connected to the center crib distribution line. The 216-A-10 replacement pipeline is an underground, 20 centimeter (8 inch) diameter stainless steel pipeline. The replacement pipeline connected to a new distribution pipe, east of the original distribution pipe.

Location: The pipelines to the 216-A-10 crib are located south of PUREX, southwest of 216-A-5.

Process Description: On April 19, 1962, the clay distributor pipe to the 216-A-10 crib collapsed and caused a surface depression. A new distributor (replacement) line was installed parallel to the collapsed line. The replacement line failed in 1966.

Related Sites/ Structures: The pipeline is associated with the 216-A-10 crib and Sample Pit number 4.

This Site has the Following SubSites:

Status: Inactive **End Date:**

Description: B-361 Settling Tank that was later extended to the 216-B-9 crib. Line V204 begins at the 241-B-154 Diversion Box. Line 204 is in the same soil trench as several other tank farm lines (see sitecode 200-E-199-PL), but diverted to the 241-B-361 Settling Tank and later routed to the 216-B-9 crib.

Location: The pipeline is located northeast of 221-B, north of the 216-B-5 Reverse Well.

Release Description: UPR-200-E-7 states that a process waste line leak from 221-B caused the ground to cave-in near the 361-B crib (216-B-9). Approximately 5000 gallons of liquid was lost to the ground over an area approximately 30 square feet. The maximum dose rate was 1.7 rads/hour. The contamination was covered in 1954 and delineated with a chain. It was posted as Underground Contamination. This release is known as UPR-200-E-7.

Process Description: The 216-B-9 Crib and Tile Field were built in 1947 to replace the 241-B-361 Settling Tank and the 216-B-5 Reverse well. Line V204 was cut and rerouted to the 216-B-9 crib.

Related Sites/ Structures: The pipeline is associated with 221-B, the 216-B-9 crib, 241-B-361 and pipeline 200-E-199-PL.

The SubSite is Part Of:

Code: 200-E-195-PL

Names: 200-E-195-PL; 241-B-361 Settling Tank and 216-B-9 Crib Pipelines; Line V204

Code: 200-E-196-PL

Classification: Accepted

Names: 200-E-196-PL; 216-A-21 and 216-A-27 Cribs; Lines T167 and T022; Stainless Steel Line to 216-A-4

Reclassification: None

Type: Radioactive Process Sewer

Status: Inactive

Description: The waste site is an underground stainless steel pipeline that fed the 216-A-4, 216-A-21 and 216-A-27 cribs. Portions of the line range in diameter from 5 centimeters (2 inch) to 7.6 centimeter (3 inch) diameter and 10 centimeter (4 inch) diameter.

Location: The pipeline is located south of 202-A. It originates at the 216-A-4 Sample Pit. The line originally fed the 216-A-4 crib, but later was extended further south (twice) to feed the 216-A-21 and 216-A-27 cribs.

Process Description: Line numbers indicate a specific waste stream. The T167 pipeline originally fed the 216-A-4 crib from the 216-A-4 sample building. Line T022 from the 291-A Fan Control House tied into T167 just north of the 216-A-4 crib. These lines are buried in the same soil trench as the lines described in 200-E-183-PL (V010, V011, V014 and V016). When the 216-A-4 crib was deactivated, line T167 was rerouted to the 216-A-21 crib. When the 216-A-21 crib was deactivated, line T167 was rerouted to feed the 216-A-27 crib. A branch of this pipeline tied to the 216-A-36 crib pipeline (see sitecode 200-E-253-PL).

Related Sites/Structures: The pipeline is associated with the 216-A-4 Sample Pit, 216-A-TK-2, the 291-A Control House, 216-A-4 crib, 216-A-21 crib, 216-A-27 crib, 216-A-26 crib and pipeline sites 200-E-183-PL, 200-E-185-PL, 200-E-253-PL and 200-E-270-PL.

Code: 200-E-198-PL

Classification: Accepted

Names: 200-E-198-PL; Encased Tank Farm Pipeline from 241-BX-154 Diversion to 241-BX-155 Diversion Box; Lines V282, V283, V284 and V285

Reclassification: None

Type: Encased Tank Farm Pipeline

Status: Inactive

Description: The waste site is an underground concrete transfer line encasement. Lines V282, V283, V284 and V285 are 9 centimeter (3.5 inch) diameter stainless steel lines. Line V285 diverts from the encasement and connects to transfer line 200-E-199-PL.

Location: The encased transfer line extends between 241-BX-154 Diversion Box, on the south side of 221-B to the 241-BX-155 Diversion Box located northeast of 221-B. The majority of this encased line is located on the west side of Baltimore Ave.

Related Sites/Structures: The waste lines are associated with B Plant processes, the 241-BX-154 Diversion Box and the 241-BX-155 Diversion Box.

Code: 200-E-199-PL

Classification: Accepted

Names: 200-E-199-PL; Lines V204, V206, V208, V209, V211, V213, V215, and V285; Tank Farm Lines from 241-B-154 Diversion Box to 241-B Tank Farm

Reclassification: None

Type: Direct Buried Tank Farm Pipeline

Status: Inactive

Description: The waste site is a group of underground stainless steel transfer lines buried in a common soil

Description:	trench. All of the pipelines are 9 centimeter (3.5 inch) diameter stainless steel lines.
Location:	The transfer line extends between the 241-B-154 Diversion Box, located at the corner of 7th Street and Baltimore Ave. and the 241-B Tank Farm. This transfer line is located on the east side of Baltimore Ave.
Release Description:	The exact location of the UPR-200-E-7 cave-in on the process line can not be determined from the available documentation. HW-60807 states that in 1954 a cave in occurred near the 361-B crib (alias 216-B-9 crib). The hand drawn sketch in HW-60807 shows the Unplanned Release location as being south and slightly west of the 361-B Reverse Well (216-B-5), approximately where the 241-B-361 tank is located. This location is approximately 125 meters (400 feet) southwest of the south edge of the posted 216-B-9 crib. It is near where pipelines 200-E-199-PL and 200-E-195-PL connect.
Process Description:	Lines V208, V209 and V211 extend between 241-B-154 Diversion Box and 241-B-152 Diversion Box (inside 241-B Tank Farm). Lines V213 and V215 extend between 241-B-154 Diversion Box and 241-B-151 Diversion Box (inside the 241-B Tank Farm). Line V285 enters the 200-E-199-PL encasement north of 241-B-154 Diversion Box from the encasement described in 200-E-198-PL. Line V204 diverted to the 241-B-361 Settling tank and was later extended to the 216-B-9 crib (see sitecode 200-E-195-PL).
Related Sites/Structures:	The waste site is associated with the 241-B-151, 241-B-152, 241-B-154 Diversion Boxes, UPR-200-E-7 and pipelines 200-E-195-PL, 200-E-198-PL and 200-E-277-PL.

Code:	200-E-201-PL	Classification:	Accepted
Names:	200-E-201-PL; Lines V315 and V319; Transfer Lines from 241-BX-155 to Diversion Boxes in 241-B Tank Farm	Reclassification:	None

Type:	Direct Buried Tank Farm Pipeline	Start Date:	
Status:	Inactive	End Date:	
Description:	The waste site is five underground, 9 centimeter (3.5 inch) diameter stainless steel pipelines buried in the same soil trench. Lines V316, V317 and V318 connect to the 241-BX-153 Diversion Box in 241-BX Tank Farm. Lines V315 and V319 divert eastward north of the 241-		

BX-155 Diversion Box to connect to the 241-B Tank Farm (see sitecode 200-E-201-PL).

Location: The transfer lines extend from 241-BX-155 Diversion Box to 241-BX-153 Diversion Box in the 241-BX Tank Farm. These lines are on the west side of Baltimore Ave.

Related Sites/ Structures: The transfer lines are associated with B Plant process, 241-BX-155 and 241-BX-153 Diversion Boxes and pipeline sitecode 200-E-201-PL.

Code: 200-E-203-PL **Classification:** Accepted

Names: 200-E-203-PL; Line 9712; Pipeline from 241-BYR-154 Diversion Box to 216-B-2-2 Ditch **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 15 centimeter (6 inch) diameter carbon steel pipe that fed the 216-B-2-2 ditch from diversion box 241-BY-154, located inside 241-BY Tank Farm.

Location: The pipeline extends eastward from the 241-BY-154 Diversion Box, located inside the 241-BY Tank Farm. It crosses under Baltimore Ave. and connects with the head end of the 216-B-2-2 ditch.

Related Sites/ Structures: The site is associated with 241-BY-154, 216-B-2-2 and pipeline site 200-E-204-PL.

Code: 200-E-204-PL **Classification:** Accepted

Names: 200-E-204-PL; Pipeline to 216-B-2-1 and 216-B-2-2 Ditches **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 76 centimeter (30 inch) diameter vitrified clay pipeline that extends from the valve pit east of 207-B Retention Basin to the head end of the 216-B-2-1 and 216-B-2-2 ditches. The site also includes a short section of 61 centimeter (24 inch) diameter clay pipe from the east retention basin outlet to the valve box.

Location: The pipeline is located northeast of the 207-B Retention Basin.

Release Description: UPR-200-E-32: On November 7, 1963, a coil leak developed in the 221-B Building 6-1 Tank (utilized for storing the cerium-rare earth fraction of the fission product stream) which resulted in gross contamination of the 207-B Water Retention Basin and the head end of this unit. After damming off the site approximately 705 meters (1,000 feet) downstream from the head end discharge pipe, the contaminated basin water was flushed into the unit. General dose rates were 500 mr/hr. Tumbleweed that had blown into the 216-B-2-1 ditch were found to be reading 50 R/hr. UPR-200-E-138: In March 1970, approximately 1000 curies of strontium-90 was released to the 216-B-2-2 ditch via the Chemical Sewer.

Related Sites/ Structures: The pipeline is associated with the 207-B Retention Basin and the 216-B-2-1 and 216-B-2 ditches.

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is three underground, 7.6 centimeter (3 inch) diameter, stainless steel pipes buried in the same soil trench extending from the north wall of the 244-AR Vault building to the 241-AR-151 Diversion Box. The pipes are double contained within a larger diameter pipe.

Location: The diversion box is located north of the 244-AR Vault facility, east of the 291-AR ventilation system. The pipes extend eastward along the north wall of the 244-AR building.

Process Description: Two of the pipe originate in cell 3 of the 244-AR vault.

Related Sites/ Structures: The pipeline is associated with the 241-AR-151 Diversion Box and the 244-AR Vault facility.

Code: 200-E-207-PL **Classification:** Accepted

Names: 200-E-207-PL; Encased Transfer Line from 241-A-151 Diversion Box to 241-A-152 Diversion Box; Lines V004, V005, V006, V007 and V008 **Reclassification:** None

Type: Encased Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: Each of the five pipelines is a 9 centimeter (3.5 inch) diameter stainless steel line.

Location: The concrete encasement originates at the 241-A-151 Diversion Box, on the south side of the PUREX building. It runs eastward and turns north to connect with the 241-A-152 Diversion Box, located inside the 241-A Tank Farm. The line crosses under both Canton Ave. and 4th Street.

Release Description: UPR-200-E-67 states that a release occurred on May 7, 1984. An old, contaminated pipe encasement, located under 4th Street north of the 272-AW parking lot, was encountered during the excavation. Contamination levels ranged from 1 to 1.5 milirad per hour.

Related Sites/ Structures: The pipelines are associated with the 241-A-151 and 241-A-152 Diversion Boxes.

Description: Subsite 2 is the 5 centimeter (2 inch) diameter carbon steel by-pass drain line located at the 216-B-50 crib.

The SubSite is Part Of:

Code: 200-E-219-PL

Names: 200-E-219-PL; BY Crib Distribution Pipelines; Pipelines from 216-BY-201 Flush Tank to 216-B-43, 216-B-44, 216-B-45, 216-B-46, 216-B-47, 216-B-48, 216-B-49, and 216-B-50 Cribs

Code: 200-E-220-PL **Classification:** Accepted
Names: 200-E-220-PL; Pipeline from 241-BY Tank Farm to 216-BY-201 Flush Tank and Monitoring Pit **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**

Description: The waste site is an underground, 5 centimeter (2 inch) diameter, carbon steel pipeline and a concrete monitoring pit. The pipeline runs through the monitoring pit before connecting to the 216-BY-201 flush tank.

Location: The pipeline extends from inside 241-BY Tank Farm, north of 241-BY-101, to the 216-BY-201 Flush Tank. It crosses under the tank farm gravel access road diagonally and enters the flush tank at the southeast corner of the tank. The monitoring pit is located approximately 1.5 meters (5 feet) southeast of the flush tank.

Related Sites/ Structures: The pipeline is associated with the 241-BY tank farm and the 216-BY-201 flush tank.

This Site has the Following SubSites:

Code: 200-E-220-PL:1
Names: 200-E-220-PL:1; Flush Pit Drain Line
Code: 200-E-220-PL:2
Names: 200-E-220-PL:2; Concrete Monitoring Pit Structure

Status: Inactive **End Date:**

Description: Subsite 2 is the 1.8 meter (6 foot) diameter concrete monitoring pit that the pipeline runs through.

The SubSite is Part Of:

Code: 200-E-220-PL
Names: 200-E-220-PL; Pipeline from 241-BY Tank Farm to 216-BY-201 Flush Tank and Monitoring Pit

Code: 200-E-221-PL **Classification:** Accepted

Names: 200-E-221-PL; BC Crib Pipeline Drain Line; Pipeline to 216-B-51 French Drain **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 2.5 centimeter (1 inch) diameter, carbon steel drain line.

Location: The drain line from 200-E-114-PL to the 216-B-51 French Drain is located south of 12th Street and east of Baltimore Ave.

Process Description: The pipeline carried flush drainage from the BC pipeline (200-E-114-PL) to the 216-B-51 french drain.

Related Sites/ Structures: The pipeline is associated with the 200-E-114-PL pipeline to the BC cribs and the 216-B-51 french drain.

Code: 200-E-222-PL **Classification:** Accepted

Names: 200-E-222-PL; Distribution Pipelines from 216-BC-201 Siphon Tank to BC Cribs **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 35.5 centimeter (14 inch) diameter, carbon steel distribution line that fed the six BC cribs. A 5 centimeter (2 inch) diameter carbon steel by-pass drain line is located at 216-B-18 crib.

Location: The pipelines are located south of Route 4A. The lines extend from the 216-BC-201 Siphon Tank to the six BC cribs.

Related Sites/ Structures: The lines are associated with the 216-BC-201 Siphon Tank, 216-B-14, 216-B-15, 216-B-16, 216-B-17, 216-B-18, 216-B-19 cribs.

Names: 200-E-223; BC Pipeline Valve Pit; 200-E-114-PL **Reclassification:** None
Valve Pit

Type: Valve Pit **Start Date:**

Status: Inactive **End Date:**

Description: The concrete valve pit. In 2001 it was surrounded with posts and chain and posted with radiological warning signs. In 2010, it was sealed and surface stabilized. It was reposted with Underground Radioactive Material Area signs.

Location: The valve pit is located north of 7th Street and east of the 216-B-59 basin.

Process Description: The valve pit regulated flow of the Uranium Recovery Process waste being transferred to the BC Cribs and Trenches. The valve pit contains six iron gate valves. The entire scavenging mission necessitated the construction of the transfer system using pipelines 2805-E1, 2805-E2, 2805-E3 and 2805-E4 (sitecode 200-E-114-PL). The entire system can be traced on the series of H-2-2900 thru 2909. The valve box allowed waste to move north to BY or south to BC cribs.

Related Sites/ Structures: The valve pit is associated with the 200-E-114-PL pipeline.

Code: 200-E-224-PL **Classification:** Accepted

Names: 200-E-224-PL; 241-A-151 Diversion Box Drain **Reclassification:** None
Line to 241-A-302A Catch Tank; Line V027

Type: Encased Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 9 centimeter (3.5 inch) diameter, stainless steel drain line that is encased in concrete.

Location: The 241-A-151 diversion box and 241-A-302A catch tank are located on the south side of the PUREX facility. The drain line extends between the two structures.

Related Sites/ Structures: The drain line is associated with the 241-A-151 Diversion Box and the 241-A-302A catch tank.

Code: 200-E-225-PL **Classification:** Accepted

Names: 200-E-225-PL; Line V720; Transfer Line from **Reclassification:** None
241-AR-151 Diversion Box to 241-AY-102 Tank

Type: Direct Buried Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: The waste site is three underground drain lines that connect the 241-ER-151 Diversion Box to the 241-ER-311 and 241-ER-311A Catch Tanks. Line V224 is a 7.6 centimeter (3 inch) diameter stainless steel line. Lines V226 and V226-1 are 10 centimeter (4 inch) diameter stainless steel lines.

Location: The pipelines are located southwest of B Plant, west of Atlanta Ave., inside the 241-ER-151 Diversion Box chain link fence.

Related Sites/ Structures: The lines are associated with the 241-ER-151 Diversion Box, 241-ER-311 and 241-ER-311A Catch Tanks.

This Site has the Following SubSites:

Code: 200-E-228-PL:1

Between tank 241-AP-102 and 241-A-B Valve Pit
Type: Direct Buried Tank Farm Pipeline **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 7.6 centimeter (3 inch) diameter stainless steel line that is double encased within a 15 centimeter (6 inch) diameter pipe.
Location: The line extend north out of the 241-AP Tank Farm. It crosses under 4th Street and travels east on the north side of 4th Street. The line turns north on the west side of the 242-A Evaporator. The line terminates at the 241-A-B Valve Pit, inside the 241-A Tank Farm.
Related Sites/ Structures: The pipeline is associated with the 241-AP-102 tank and the 241-A-B valve pit.

Code: 200-E-230-PL **Classification:** Accepted
Names: 200-E-230-PL; Pipeline from 292-B to 216-B-4 **Reclassification:** None
Reverse Well
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 15 centimeter (6 inch) diameter, vitrified clay pipe that fed the 216-B-4 Reverse well.
Location: The pipeline is located southeast of B Plant, extending north from the 292-B building.
Process Description: The pipeline transferred floor drainage from 292-B to 216-B-4.
Related Sites/ Structures: The pipeline is associated with the 292-B building and the 216-B-4 well.

Code: 200-E-231-PL **Classification:** Accepted
Names: 200-E-231-PL; 216-A-45 Crib Pipeline **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**

Description: the 216-A-45 crib.

Location: The pipeline is located south of the PUREX security fence and south of the 216-A-10 crib.

Process Description: The 216-A-45 crib was built to replace the 216-A-10 crib.

Related Sites/ Structures: The pipeline is associated with the 216-A-45 crib and the 216-A-10 pipeline (200-E-192-PL).

Code: 200-E-232-PL **Classification:** Accepted

Names: 200-E-232-PL; Pipeline from 207-A Basins to 216-A-30 and 216-A-37-1 Cribs **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 10 centimeter (4 inch) diameter, cast iron pipeline that fed the 216-A-37-1 crib through a distribution box. A 20 centimeter (8 inch) cement pipe extends from the 216-A-37-1 crib distribution box to the 216-A-30 crib distribution box. (see subsite 2).

Location: The pipeline is located northeast of the PUREX facility. It extends from the 207-A Basins to the 216-A-37-1 distribution box.

Related Sites/ Structures: The pipeline is associated with the 216-A-37-1 and 216-A-30 crib distribution boxes.

This Site has the Following SubSites:

Description: This is a 20 centimeter (8 inch) diameter cement pipe.

The SubSite is Part Of:

the same soil trench, terminating at the 207-A pump pit. One extra line (505) has been stubbed.

Process Description: Line 300 (alias DR-300) is the effluent return line. It connects to tank 241-A-350, inside the 241-A Tank Farm.

The SubSite is Part Of:

Code: 200-E-234-PL

Names: 200-E-234-PL; Lines 300, 501, 505, and 557; Pipelines from 242-A Evaporator Building to the 207-A Basins

Code: 200-E-234-PL:2

Classification: Accepted

Names: 200-E-234-PL:2; Line 505 (Stub)

Reclassification: None

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: The subsite is a 10 centimeter (4 inch) diameter carbon steel spare pipeline. It is stubbed off west of the 207-A Retention Basins at the pump pit.

The SubSite is Part Of:

Code: 200-E-234-PL

Names: 200-E-234-PL; Lines 300, 501, 505, and 557; Pipelines from 242-A Evaporator Building to the 207-A Basins

Code: 200-E-237-PL

Classification: Accepted (Proposed)

Names: 200-E-237-PL; 2904-E-24; Line 2904-E-1; Pipeline to 200 East Powerhouse Ditch and Pipeline from Powerhouse Ditch to 216-B-3 Ditches

Reclassification: None

Type: Process Sewer

Start Date:

Status: Active

End Date:

Description: The waste site is the 106 centimeter (42 inch) diameter reinforced concrete pipe that feeds the powerhouse ditch and the 76 centimeter (30 inch) diameter corrugated metal pipe that drained the powerhouse ditch to the B Pond system. The piping was later reused to feed the TEDF system. The mapped detail of this piping system includes the feeder pipes from the 284-E Powerhouse and the 282-E water reservoir.

Location: The pipeline is located north of 4th Street and south of 7th Street, east of Baltimore Ave. in 200 East Area.

Process Description: Drainage from the 282-E reservoir and the 284-E Powerhouse has been sent to the 200-E Powerhouse Ditch via the reinforced concrete portion of this pipeline. The powerhouse ditch is unlined and allows the effluent to percolate into the soil of the ditch. The ditch drainage was conveyed to the 216-B-3 ditches and ponds via the corrugated metal pipe at the distal of the powerhouse ditch. A small diameter pipeline from 241-C tank farm joined the corrugated metal pipe (see 200-E-155-PL). 200-E-155-PL has now been isolated at the 241-C-03A pump pit. Later the effluent was diverted to the TEDF system by reusing the existing powerhouse ditch and piping. In 2010, discharge from 282E, 282EC and 283E continued to use this pipeline for relatively small amounts of discharge.

Related Sites/ Structures: The pipeline is associated with the 200-E Power House ditch, 200-E-155-PL and the TEDF

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive**End Date:****Description:** The waste site is an underground, 5 centimeter diameter (2 inch) stainless steel pipeline that fed the 241-CX-72 tank. A portion of the pipeline, near the 201-C building, is inside a 46 centimeter (18 inch) diameter corrugated pipe encasement. The pipeline to the 241-CX-70 tank (sitecode 200-E-244-PL, is buried along side of the pipeline to 241-CX-72 tank.**Location:** The pipeline is located southeast of the 201-C building. It extends to the 241-CX-72 tank.**Related Sites/ Structures:** The pipeline is associated with 200-E-41 Stabilized Area, 200-E-244-PL, the Hot Semiworks Valve Pit (HSVP) and the 241-CX-72 tank.

Code: 200-E-247-PL**Classification:** Accepted**Names:** 200-E-247-PL; Pipelines to the 209-E-WS-2 French Drain**Reclassification:** None**Type:** Radioactive Process Sewer**Start Date:****Status:** Inactive**End Date:****Description:** The waste site is two underground pipelines from the 209-E facility that fed the 209-E-WS-2 french drain. One line is constructed of 2.5 centimeter (1 inch) diameter carbon steel. The other is constructed of 5 centimeter (2 inch) diameter stainless steel.**Location:** The pipelines are located on the east side of the 209-E building.**Related Sites/ Structures:** The pipelines are associated with the 209-E laboratory building and the 209-E-WS-2 french drain.**This Site has the Following SubSites:****Code:** 200-E-247-PL:1**Names:** 200-E-247-PL:1; 1-Inch Carbon Steel Pipeline**Code:** 200-E-247-PL:2**Names:** 200-E-247-PL:2; 2-Inch Stainless Steel Pipeline

Names: 200-E-249-PL; Pipelines to 200-E-4 French Drain **Reclassification:** None
Type: Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 3.8 centimeter (1.5 inch) diameter pipeline that extends from the north side of 209-E to the 200-E-4 dry well. A drain line from a valve box, containing steam condensate and fire water lines, also connects to the 200-E-4 French Drain (subsite 2).

Location: The pipelines are located south of 7th Street and north of the 209-E building.
Process Description: The waste carried by this pipeline was steam condensate from the steam trap in the valve pit plus steam condensate from 209-E the equipment room.

Related Sites/ Structures: The pipeline is associated with the 209-E Criticality Lab and the 200-E-4 french drain.

This Site has the Following SubSites:

Names: 200-E-250-PL; Pipeline from 2704-C to 2704-C-WS-1 Quench Tank **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 2.5 centimeter (1 inch) diameter carbon steel line that extended from the south side of the 2704-C building to the 2704-C quench tank.

Location: The pipeline is located south of 7th Street, within the 200-E-41 Stabilized Area.

Related Sites/ Structures: The pipeline is associated with the demolished 2704-C building and the 2704-C-WS-1 quench tank.

Structures: tank.

Code: 200-E-251-PL **Classification:** Accepted
Names: 200-E-251-PL; Pipeline from 291-C Stack to 216-C-2 Reverse Well **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 10 centimeter (4 inch) diameter carbon steel pipeline that connected the 291-C stack to the 216-C-2 reverse well.
Location: The pipeline is located south of 7th Street, in the Hot Semiworks Stabilized Area (see 200-E-41).
Related Sites/Structures: The pipeline is associated with the 291-C stack, the 216-C-2 reverse well and the 200-E-41 stabilized area.

Code: 200-E-252-PL **Classification:** Accepted
Names: 200-E-252-PL; Pipeline from 291-C Air Filter Building to 216-C-2 Reverse Well **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 5 centimeter (2 inch) diameter cast iron pipeline from the 291-C Air Filter building to the 216-C-2 reverse well. Part of this line lies beneath the 200-E-251-PL pipeline.
Location: The pipeline is located south of 7th Street in the 200-E-41 Stabilized Area.
Related Sites/Structures: The pipeline is associated with the 291-C filter building, the 216-C-2 stack and the 200-E-41 Stabilized Area.

Code: 200-E-253-PL **Classification:** Accepted
Names: 200-E-253-PL; Pipeline from 202-A to 216-A-36A and 216-A-36B Cribs **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 15 centimeter (6 inch) diameter stainless steel pipeline that connected the ASD Valve Pit and 295-A Sample Pit with the 216-A-36A and 216-A-36B cribs. When the 216-A-36A crib was extended to create the 216-A-36B crib, the distribution pipe was lengthened by inserting a 12 centimeter (5 inch) diameter pipe through the original 15 centimeter (6 inch) diameter crib pipe.
Location: The pipeline is located south of the PUREX facility.
Release Description: UPR-200-E-39 is described as a release that occurred on February 6, 1968. Pressurized ammonia scrubber liquid was found to be spewing from the vent filter at the 216-A-36B Crib Sampling Shack (295-A). The contaminated ammonia scrubber water erupted through the vent and filter and onto the ground around the outside of the sample shack. Approximately 60.4 square meters (650 square feet) of ground and blacktop was affected. Contamination levels ranged from 20 to 450 millirad/hour. The cause was determined to be that the export pressure

was too high, resulting in back-pressure through the vent.

Process Description: The 216-A-36A portion of the crib was terminated in March 1966. The existing pipeline was extended to the 216-A-36B portion of the crib by inserting a 12 centimeter (5 inch) diameter pipe inside the existing 15 centimeter (6 inch) diameter distribution pipe. A 29 meter (95 foot) concrete dam was placed between the 216-A-36A and 216-A-36B crib sections.

Related Sites/ Structures: The pipeline is associated with the 295-A Sample Building and the 216-A-36A and 216-A-36B cribs.

Code: 200-E-254-PL **Classification:** Accepted
Names: 200-E-254-PL; Pipeline from 209-E to 216-C-9 Pond **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 10 centimeter (4 inch) diameter pipeline that fed the 216-C-9 Pond. Part of the line is constructed of vitrified clay and part is cast iron.
Location: The pipeline runs north and south, between the 209-E building and the 216-C-9 Pond site. The pipeline crosses under 7th Street.
Related Sites/ Structures: The pipeline is associated with the 209-E Criticality Lab facility and the 216-C-9 Pond.

Code: 200-E-255-PL **Classification:** Accepted
Names: 200-E-255-PL; Pipeline Connecting 216-C-9 Pond to Pipeline 200-E-169-PL **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 15 centimeter (6 inch) diameter vitrified clay pipe that fed the 216-C-9 Pond.
Location: The pipeline is located north of the 276-C building. It runs north and south and runs under 7th Street.
Related Sites/ Structures: This line is associated with the 216-C-9 Pond and the 200-E-169-PL pipeline.

Code: 200-E-256-PL **Classification:** Accepted
Names: 200-E-256-PL; Pipelines from 201-C (South Side) to 216-C-9 Pond **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site majority of the waste site is an underground, 15 centimeter (6 inch) diameter vitrified clay pipe from the demolished 201-C building to the 216-C-9 Pond. Two 10 centimeter (4 inch) diameter saran lined steel pipes extend from the south side of 201-C and connect to the 15 centimeter VCP line. A drain line from the 241-CX-71 vault ties into this line

with a "Y" connection.

Location: The pipeline(s) extend south from the demolished 201-C building. The line extends east and north to discharge into the 216-C-9 Pond. The pipeline crosses under 7th Street.

Related Sites/ Structures: The pipeline is associated with 201-C and 216-C-9 Pond.

Code: 200-E-257-PL **Classification:** Accepted

Names: 200-E-257-PL; Pipeline from 201-C (East Side) to 216-C-9 Pond **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 7.6 centimeter (3 inch) diameter stainless steel pipeline that fed the 216-C-9 Pond.

Location: The pipeline is located northeast of the demolished 201-C building. It runs north and south and runs under 7th Street.

Related Sites/ Structures: The pipeline is associated with 201-C and 216-C-9 Pond.

Code: 200-E-258-PL **Classification:** Accepted

Names: 200-E-258-PL; 216-C-9 Pond Lobe Distribution Piping **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground carbon steel pipeline that diverted effluent to the various sections of the 216-C-9 Pond. The majority of the piping system is constructed of 15 centimeter (6 inch) diameter carbon steel pipe.

Location: The pipeline runs east and west along the north side of 7th Street. Four distribution lines extend to various lobes of the 216-C-9 Pond.

Process Description: The 216-C-9 Pond (old 221-C facility excavation) was divided into sections with dikes. Piping was arranged to provide three discharge points, one to each section.

Related Sites/ Structures: The pipelines are associated with the 216-C-9 Pond.

Code: 200-E-259-PL **Classification:** Accepted

Names: 200-E-259-PL; Pipeline from 291-C Fan House to 216-C-9 Pond **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 5 centimeter (2 inch) diameter carbon steel pipeline that fed the 216-C-9 Pond.

Location: The pipeline is located northeast of the demolished 201-C building. It extended north from the

demolished 291-C Fan House to the 216-C-9 Pond. The pipeline crosses under 7th Street.

Related Sites/ Structures: The pipeline is associated with the 291-C stack operation and the 216-C-9 Pond.

Code: 200-E-260-PL **Classification:** Accepted
Names: 200-E-260-PL; Line 8824A; Steam Condensate By-Pass Line from PUREX to 216-A-30 **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 20 centimeter (8 inch) diameter carbon steel pipeline from PUREX to the 216-A-30 crib.
Location: The pipeline extends east from the PUREX facility, beyond the 200 East Area fence and terminates at the head end of the 216-A-30 crib.
Process Description: The pipeline was used as a steam condensate bypass line.

Related Sites/ Structures: The pipeline is associated with PUREX and the 216-A-30 crib.

Code: 200-E-261-PL **Classification:** Accepted
Names: 200-E-261-PL; Effluent Recycle Line from 216-A-42 Basin to PUREX **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 10 centimeter (4 inch) diameter cast iron pipeline. The pipeline returned contaminated effluent from the 216-A-42 Basin back to the PUREX facility.
Location: The pipeline extends from the 216-A-42 basin, located south of 241-AP Tank Farm, to the 202-A (PUREX) facility.

Related Sites/ Structures: The pipeline is associated with the 216-A-42 Basin and the 216-A-42A Pump Station.

Code: 200-E-262-PL **Classification:** Accepted
Names: 200-E-262-PL; 216-A-42A Pump Station; 216-A-42B Valve Box and 216-A-42C Diversion Box; Pipelines Associated with 216-A-42 Basin **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 10 centimeter (4 inch) diameter cast iron pipeline that transferred effluent out of the 216-A-42 Retention Basin.
Location: The 216-A-42 Basin is located south of the 241-AP Tank Farm. The pipelines and 216-A-42A Pump Station are on the west side of the 216-A-42 Basin.
Process Description: The 216-A-42 Retention Basin was built to hold cooling water or steam condensate that was contaminated above standard release limits and prevent its disposal to the Gable and B Pond

systems. After the retained effluent contents were analyzed, a built-in recovery system provided the capability of pumping solutions back into the PUREX facility for reprocessing (see sitecode 200-E-261-PL) or to cribs for disposal.

Related Sites/ Structures: The pipelines are associated with the 216-A-42 retention basin, the 216-A-42A pump station, the 216-A-42B valve box and the 216-A-42C diverter station.

Code: 200-E-263-PL **Classification:** Accepted
Names: 200-E-263-PL; 216-A-42 Basin Pipeline to 216-A-42C Diversion Box **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 20 centimeter (8 inch) diameter cast iron pipeline that connected the 216-A-42 Retention Basin to the 216-A-42C Diversion Box.
Location: The pipeline is located southeast of the 241-AP Tank Farm. The pipeline extends from the south end of the 216-A-42 Basin to the 216-A-42C Diversion Box.
Related Sites/ Structures: The pipeline is associated with the 216-A-42 basin, the 216-A-42C diversion box and the 200-E-113-PL pipeline.

Code: 200-E-264-PL **Classification:** Accepted
Names: 200-E-264-PL; Pipeline from 242-B Evaporator Building to 207-B Retention Basin **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 10 centimeter (4 inch) diameter cast iron pipeline that connected the 242-B Evaporator building to the 207-B Retention Basin.
Location: The pipeline is located east of Baltimore Ave. It extends south from the 242-B Evaporator building to the 207-B retention basin.
Release Description: UPR-200-E-79 describes a release that occurred in June 1953. Five leaks were discovered in the waste line that runs from 242-B to 207-B. Contamination levels up to 2,500 counts per minute were measured at the points of emission of water from the ground.
Related Sites/ Structures: The pipeline is associated with 242-B Evaporator, 207-B Retention Basin and UPR-200-E-79.

Code: 200-E-265-PL **Classification:** Accepted
Names: 200-E-265-PL; 241-BY and 241-BX Tank Farm Cooling Water Pipeline to 207-B Retention Basin **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 10 centimeter (4 inch) diameter carbon steel pipeline that transferred In-Tank Solidification process cooling water to the 207-B Retention Basin. A new pipeline segment was added that by passed the retention basin and connected to the B Ditches.
Location: Portions of the pipeline are located inside the 241-B, BY and BX tank farms. It crosses under

Location: Baltimore Ave. One segment of the pipeline connects with the west side of the 207-B Retention Basin and one segment connects with the east side of the 207-B Retention Basin.

Process Description: The pipeline carried cooling water from the In-Tank Solidification (ITS) process to the 207-B retention basin.

Related Sites/ Structures: The pipeline is associated with the ITS process in 241-BY Tank Farm, the In Tank Solidification Systems (ITS 1 and ITS 2) and the 207-B Retention Basin.

Location: The pipeline is located west of Buffalo Ave. and north of the 244-AR Vault.

Process Description: The pipeline carried stack drainage to the 216-A-41 crib.

Description:

Related Sites/ Structures: The pipeline is associated with the 216-A-41 crib.

Code: 200-E-277-PL **Classification:** Accepted
Names: 200-E-277-PL; 216-B-59 and 216-B-59B **Reclassification:** None

Pipelines

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: The waste site is an underground pipeline that connected 221-B to the 216-B-59 Retention Basin. The majority of the pipeline is constructed of varied diameters of carbon steel pipe. The section of pipe that extends from the 221-BA sampling building to the head end of the basin is constructed of 38 centimeter (15 inch) diameter vitrified clay pipe. The by-pass line that connects to the center of the basin is constructed and the pipeline re-routing basin effluent to 241-B Tank farm are constructed of 5 centimeter (2 inch) diameter carbon steel. (see subsites)

Location: The pipeline extends from the south side of 221-B to 216-B-59 Retention Basin. It crosses under Baltimore Ave.

Process Description: In 1978, a new pipeline was added that connected the 216-B-59B basin to pipeline 200-E-199-PL, allowing effluent to be directed into the tank farm system.

Related Sites/ Structures: The pipeline is associated with B Plant operations and the 216-B-59 Retention Basin and pipeline 200-E-199-PL.

This Site has the Following SubSites:

Code: 200-E-277-PL:1

Names: 200-E-277-PL:1; Carbon Steel Portion of Pipeline South of 221-B

Code: 200-E-277-PL:2

Names: 200-E-277-PL:2; 15-Inch VCP Portion of Pipeline

Code: 200-E-277-PL:3

Names: 200-E-277-PL:3; 2-Inch Carbon Steel Bypass Line from a Pump at the Center Section of the Basin and Two 3-Inch CS Lines from the Basin to the Pump

Code: 200-E-277-PL:4

Names: 200-E-277-PL:4; 2-Inch Carbon Steel Line Re-Routing 216-B-59 Basin Effluent to the 200-E-199-PL Encased Tank Farm Line

Code: 200-E-277-PL:1

Classification: Accepted

Names: 200-E-277-PL:1; Carbon Steel Portion of Pipeline South of 221-B

Reclassification: None

Type: Radioactive Process Sewer

The SubSite is Part Of:

Code: 200-E-277-PL
Names: 200-E-277-PL; 216-B-59 and 216-B-59B Pipelines

Code: 200-E-278-PL **Classification:** Accepted
Names: 200-E-278-PL; Pipeline to Chemical Tile Field North of 2703E; Process Sewer Pipeline from 272-E to CTFN 2703E **Reclassification:** None
Type: Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is various diameters of underground vitrified clay pipe connecting 200 East Area shop facilities to the chemical drain field located north of 2703E.
Location: The pipeline is located in central 200 East Area. It is west of Baltimore Ave. and crosses under 4th Street.
Related Sites/ Structures: The pipeline is associated with 272-E and 2703-E and the Chemical Tile Field North of 2703-E.

Code: 200-E-279-PL **Classification:** Accepted
Names: 200-E-279-PL; Pipeline from 241-B-361 Settling Tank to 216-B-5 Reverse Well **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**

Status: Inactive

End Date:

Description: The waste site is an underground, 5 centimeter (2 inch) diameter stainless steel pipeline that carried waste from the 241-B-361 Settling Tank to the 216-B-5 Reverse Well.

Location: The pipeline is located on the east side of Baltimore Ave., northeast of the 241-B-361 Settling Tank.

Related Sites/ Structures: The pipeline is associated with the 241-B-361 Settling Tank and the 216-B-5 Reverse Well.

Code: 200-E-280

Classification: Not Accepted (Proposed)

Names: 200-E-280; 2711E Parking Lot; Oil Spots

Reclassification: None

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The site is the parking lot for 2711E (200 East Garage/Automotive Shop). The site is suspected to be contaminated with oil that has dripped from vehicles awaiting maintenance and from a spill of used oil (see releases). Areas of oil-stained soil are scattered throughout the parking lot.

Location: The parking lot surrounds the 2711E facility. It is bounded on the east by Alabama Avenue, on the west by railroad tracks, and on the south by 4th Street. The northern edge of the parking lot is approximately 160 meters (525 feet) north of 4th street (estimated using aerial photography in QMAP).

Waste Type: Oil

Waste Description: Areas of oil-stained soil are scattered throughout the parking lot.

Code: 200-E-281-PL

Classification: Accepted

Names: 200-E-281-PL; Line V306; Pipeline from 241-B Tank Farm to 216-B-7A and 216-B-7B Cribs

Reclassification: None

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: The waste site is an underground, 7.6 centimeter (3 inch) diameter stainless steel pipeline that connects the 241-B-202 and 241-B-202 tanks to the 216-B-7A and 216-B-7B cribs.

Location: The pipeline is located north of the 241-B Tank Farm.

Related Sites/ Structures: The pipeline is associated with the 241-B-201 and 241-B-202 tanks and the 216-B-7A and B cribs.

Code: 200-E-282-PL

Classification: Accepted

Names: 200-E-282-PL; Lines 4001, 4002, 4003 and 4004; Process Waste Lines from 202-A to 241-AX-151 Diversion Box

Reclassification: None

Type: Encased Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: The concrete encased pipeline contains four, 7.6 centimeter (3 inch) diameter stainless steel pipelines.

Location: The pipeline encasement originates on the south side of the PUREX facility. It extends

Location: westward beyond the facility footprint and turns north in between the double security fences on the west side of PUREX. The pipeline continues under 4th Street and angles east until it terminates at the 241-AX-151 Diversion Box.

Code: 200-E-283-PL **Classification:** Accepted

Names: 200-E-283-PL; Line 395; Pipeline from 242-A Bldg to 600-291-PL (TEDF Line) **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground 15 centimeter (6 inch) diameter carbon steel pipeline that connects 242-A to the 600-291-PL TEDF pipeline.

Location: The pipeline is located on the east side of the 242-A Evaporator Building.

Process Description: Prior to the construction of the LERF and TEDF systems, the pipeline originally transferred waste from 242-A Evaporator to the Gable and B Ponds via pipeline 200-E-127-PL. Later, this effluent was transferred to the TEDF system via the 600-291-PL pipeline. The portion of the 200-E-127-PL pipeline where 200-E-283-PL connects was re-used to feed the TEDF system. The sitecode for this section of pipeline was changed to 600-291-PL.

Related Sites/Structures: The pipeline is associated with the 200-E-127-PL and 600-291-PL pipelines and the 242-A Evaporator building.

Code: 200-E-284 **Classification:** Accepted

Names: 200-E-284; Septic Tank East of 241-BY-102 **Reclassification:** None

Type: Septic Tank **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground septic tank.

Location: The septic tank is located east of 241-BY Tank Farm, on the west side of Baltimore Ave. It is outside the tank farm fence.

Process Description: The septic tank serviced the In Tank Solidification (ITS) #1 Compressor House. The Compressor House was located inside the tank farm fence.

Code: 200-E-285 **Classification:** Accepted

Names: 200-E-285; 216-A-8 Control Structure; 216-A-8 Sample Pit; Sample Pit #2 **Reclassification:** None

Type: Control Structure **Start Date:**

Status: Inactive **End Date:**

Description: The sampler pit is a concrete structure with three valves, two vent stacks and one curved, metal bonnet extending from the structure. The structure is surrounded with post and chain with Underground Radioactive Material and Contamination Area signs. The area around the structure is gravel and asphalt.

Location: The sample pit is located on the east side of 241-A tank farm, outside the tank farm fence.

Release: In 1959, contaminated moisture dripping from a vent pipe bonnet at the 216-A-8 Proportional

Description: Sample Pit contaminated the ground around the cement pad. (see UPR-200-E-18)

Related Sites/ Structures: The sample pit is associated with the 216-A-8 crib, 216-A-34, 241-A Tank farm, 200-E-164-PL, 200-E-166-PL and UPR-200-E-18.

Code: 200-E-287 **Classification:** Accepted

Names: 200-E-287; Posted Contamination Areas on Pipe Berm east of 241-A, AN, AX, AY and AZ Tank Farms **Reclassification:** None

Type: Contamination Migration **Start Date:**

Status: Unknown **End Date:**

Description: The waste site is a long, posted Soil Contamination Area located on the both sides of the gravel covered berm.

Location: The berm is located east of the 241-A Tank Farm Complex. It extends southeast from 241-AN Farm, crosses Canton Ave. and continues beyond the 200 East perimeter fence to the Vitrification Plant that is currently under construction.

Code: 200-E-288-PL **Classification:** Accepted

Names: 200-E-288-PL; PC-5000; Pipeline from 242-A Evaporator to Liquid Effluent Retention Facility **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Active **End Date:**

Description: The waste site is an underground, fiberglass reinforced epoxy pipeline. It is a 7.6 centimeter (3 inch) pipe inside a 15.2 (6 inch) pipe.

Location: The pipeline extends from the north side of the 242-A Evaporator building to the Liquid Effluent Retention Facility fence.

Process Description: The PC-5000 pipeline carries process condensate waste from the 242-A Evaporator to the Liquid Effluent Retention Facility (LERF) basin 242AL-43. If radiation level exceed established limits, an alarm is received and interlocks divert the stream back to the condensate collection tank and the pump is shut off. This ensures that excessive radionuclides are not accidentally transferred to LERF. Electronic leak detectors and swab risers are provided at 305 meter (1000 foot) intervals along the pipeline.

Waste Type: Steam Condensate

Waste Description: Process condensate from the 242-A Evaporator is a mixed waste stream. It is a dilute aqueous solution containing ammonia, volatile organics and trace quantities of radionuclide and inorganic constituents.

Code: 200-E-289-PL **Classification:** Accepted

Names: 200-E-289-PL; Lines 637, SN-700 and SN-701; Pipelines between AP-02D Pit and WTP **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is three underground, stainless steel pipes (each encased in a carbon steel pipe).

Each line (637, SN-700 and SN-701) is a 7.6 centimeter (3 inch) pipe inside a 15.2 (6 inch) pipe.

Location: The pipelines extend from the east side of the 241-AP Tank Farm towards the Waste Treatment Plant (WTP).

Process Description: These pipelines are currently capped outside the 241-AP Tank Farm. They will retain the inactive status until lines is connected to the Waste Treatment Plant (WTP) that is currently under construction. Line SN-700 and SN-701 extend from the 241-AP-02D pump pit and currently terminate near the west side of the WTP. Pipeline SN-637 extends from the east side of the 241-AZ Tank Farm and terminates near the west side of the WTP. These lines will later be tied into piping that connects to the WTP and will be utilized to support supplying waste to and receiving waste from the WTP.

Related Sites/ Structures: The lines are associated with the 241 AP 02D pump pit and the WTP (future).

Waste Type: Process Effluent

Waste Description: In the future, the waste transferred through the pipelines will be Waste Tretment Plant feed and return effluent.

Code: 200-E-290-PL **Classification:** Accepted

Names: 200-E-290-PL; Pipeline from 271-CR to 216-C-8 French Drain **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is a 4 inch diameter Vitrified Clay Pipe that extends from the 271-CR building to the 216-C-8 french drain. The 216-C-8 french drain is also known as the 271-CR crib.

Location: The pipeline is located north of 7th Street. A portion of the pipeline is inside the 241-C tank farm fence. It extends eastward, beyond the 241-C tank farm fence to the 216-C-8 french drain.

Code: 200-E-291-PL **Classification:** Accepted

Names: 200-E-291-PL; Pipeline from 241-C-106 to 241-AY-102, SN-200, SL-100, 241-C-106 Sluice line **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is two 4 inch diameter stainless steel pipelines buried in the same soil trench. Each stainless steel line is encased within a 6 inch diameter carbon steel pipe.

Location: The pipelines extend from the 241-C tank farm to the 241-AY tank farm, on the east side of Buffalo Ave.

Process Description: Line SN-200 extends from 241-C-106-06C Sluice Pit to the 241-AY-102-02E Sluice Pit. The pump was electrically isolated, but remains in place. Line SL-100 extends from the 241-C-106-A pump pit to the 241-AY-102-02A pump pit. SL-100 was isolated at 241-C-106.

Code: 200-E-292 **Classification:** Accepted

Names: 200-E-292; Area of Debris and Subsurface **Reclassification:** None

Anomalies on Unused Portion of 218-E-10 (aka 200-E-20)

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The waste site is an area of interest (on 200-E-20) determined with Ground Ground Penetrating Radar.

Location: The debris area is located in the northern portion of WIDS sitecode 200-E-20. The area is approximately 39.6 X 10 meters (130 by 30 feet).

Related Sites/ Structures: The area is associated with 200-E-20.

Code: 200-E-293

Classification: Accepted (Proposed)

Names: 200-E-293; 2718-E Contaminated Concrete Slab, 2718-E Foundation

Reclassification: None

Type: Foundation

Start Date:

Status: Inactive

End Date:

Description: The surface stabilized slab is associated with building 2718E, in 200 East Area. The metal building atop slab was demolished in November 2011 and the slab was left in place. The slab had a spot of radiological contamination. The contamination on the slab was covered with plastic, plywood and soil and posted as an Underground Radioactive Material Area.

Location: The waste site is inside the 209-E complex. It is located where the 2718-E building once stood.

Code: 2607-E13

Classification: Accepted

Names: 2607-E13; Septic Holding Tank South of 277-A

Reclassification: None

Type: Septic Tank

Start Date:

Status: Active

End Date:

Location: The septic holding tank is located on the west side of Buffalo Ave., south of the 277-A building.

Process Description: The drain field failed in 1996 and was abandoned. The septic tank is currently used as a septic holding tank.

Related Sites/ Structures: This tank services MO-398, MO-919 and MO-570 in 200 East Area.

Code: 2607-EB

Classification: Accepted

Names: 2607-EB; 241-BY-254 (ITS #2) Sanitary Septic System

Reclassification: None

Type: Septic Tank

Start Date: 1/1/1963

Status: Inactive

End Date:

Description: In 1991, the system was marked and roped. A site visit in 1997 (from outside the tank farm fence) could not identify the location of the system. The unit includes a drain field.

Location: The septic system is located inside 241-BY, adjacent to the western 241-BY Tank Farm fence, west of 241-BY-112.

Process Description: The system received sanitary waste from the ITS #2 facility.

Related Sites/Structures: Adjacent to the septic tank is a drain field composed of vitrified clay pipe, concrete pipe, or drain tile forming the main line and laterals from the tank.

Waste Type: Sanitary Sewage

Waste Description: Sanitary wastewater and sewage. Estimated rate of waste generation is 0.02 cu m/d.

Code: 2607-EF **Classification:** Accepted

Names: 2607-EF; Septic Tank West of 241-BX Tank Farm **Reclassification:** None

Type: Septic Tank **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground septic tank.

Location: The septic tank is located on the west side of the 241-BX Tank Farm, outside the fence.

Process Description: The septic tank had serviced the 271 BXR Control House. The Control House building was located inside the tank farm fence.

Code: 2607-ES **Classification:** Accepted

Names: 2607-ES; Septic Tank and Dry Well North of 204-AR **Reclassification:** None

Type: Septic Tank **Start Date:**

Status: Active **End Date:**

Location: The septic tank and dry well are located north of the 204-AR building.

Process Description: The septic tank serviced the 204-AR building. The attached dry well is located north of the septic tank.

Code: 241-ER-153 **Classification:** Accepted

Names: 241-ER-153; 241-ER-153 Diversion Box **Reclassification:** None

Type: Diversion Box **Start Date:** 1/1/1945

Status: Inactive **End Date:**

Description: Most of the diversion box structure is underground. The cover blocks with lifting bails are visible on the surface. The 244-A Lift Station is fenced, marked and radiologically posted.

Location: The 241-ER-153 Diversion Box is located south of Seventh Street, inside the fenced 244-A lift station.

Process Description: Diversion boxes contain jumper piping for routing liquid waste between facilities and the tank farms via underground transfer lines. They are concrete boxes that were designed to contain any waste that leaks from the high-level waste transfer line connections. The diversion boxes generally drain by gravity to nearby catch tanks where any spilled waste is stored. The 241-ER-153 Diversion box is a roughly rectangular reinforced concrete structure. The floors and lower

portions of the walls are lined in stainless steel.

Related Sites/ Structures: The 241-ER-153 diversion box is associated with the 244-A Lift Station, 241-C Tank Farm, and the 241-ER-151, and 241-ER-152 Diversion Boxes and pipelines 200-E-145-PL and 200-E-147-PL.

Waste Type: Process Effluent

Waste Description: The diversion box distributes waste between facilities and tank farms via underground transfer lines. Transfer lines V228, SN232 and SN233 are connected to 241-ER-153. Quantities are variable according to specific plant operations. This diversion box connects the 241-C Tank Farms to the double-shell tanks, and supports the 241-ER-151 Diversion Box in cross-site waste transfers. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 200-W-13

Classification: Accepted

Names: 200-W-13; 2713-WB Green Hut Complex; Regulated Vehicle Maintenance Shop Parking Areas

Reclassification: None

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The waste site is the areas of discolored soil (petroleum possibly) adjacent and near 2713-WB. Miscellaneous regulated equipment has been stored outside and north of 2713-WB in the past. Trash and debris are scattered around 2713-WB (including vitrified clay pipe, wood, metal, glass, cloth, plastic, rubber, brick, and aerosol cans. There is coated (pink) steam line on south side of 2713-WB indicating asbestos.

Location: The site is located within the 200 West Area, north of 19th Street. 2713-WB is approximately 100 meters west of Bridgeport Ave.

Process Description: The site was used for regulated (i.e., containing radioactive material) vehicle maintenance and storage. In 1995, the north parking area and the area on the west side of the building were chained and posted with Contamination Area signs.

Related Sites/ Structures: The site is related to the Minor Construction Area, Paint Shop, Shops, and the Power House.

Waste Type: Soil

Waste Description: There are areas of discolored soil (presumed to be petroleum products) adjacent and near 2713-WB and areas with radiation protection postings. Regulated radioactive material and equipment have been stored outside and north of 2713-WB. The inside of the building was the Regulated Vehicle repair shop during the 1980's.

Code: 200-W-15

Classification: Accepted

Names: 200-W-15; S Plant Project W-087 Hexone Discovery

Reclassification: None

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The pipe trench where the hexone soil was found has been back filled to grade with soil originally removed from the excavation. Hexone contaminated soil was also put back into the excavation. There is currently no visual evidence of this excavation on the surface. The area is

now under asphalt. It is not marked or posted.

Location: The site is located approximately 18 meters (59 feet) southwest of the southwest corner of REDOX (202-S). It is above the 200-W-189-PL pipeline.

Release Description: In June, 1995, while excavating pipe trench for Project W-087 (new transfer lines from 222-S to 244-S), a dark 4.6-centimeter (3-inch) thick layer of soil was noted at about 0.6-meter (2-foot) depth. It was determined to be hexone and surfactants. The hexone soil was stockpiled and returned to the excavation after the pipe was installed in the trench.

Process Description: Hexone was used in the adjacent facility 202-S REDOX.

Related Sites/ Structures: The 202-S, 222-S, and 244-S are associated with the site.

Waste Type: Chemical Release

Waste Description: The waste consists of soil containing hexone and surfactants. The reported date was June 1995.

Code: 200-W-44 **Classification:** Accepted

Names: 200-W-44; 291-U Stack Sand Filter **Reclassification:** None

Type: Sand Filter **Start Date:** 1/1/1948

Status: Inactive **End Date:**

Description: The sand filter is constructed of reinforced concrete that is partially below grade with an asphalt covered, concrete slab roof. The chain link fence was removed in March 2002, when the area was surface stabilized. It is posted as an Underground Radioactive Material area. The sides of the sand filter that extend above grade are covered with gravel.

Location: The sand filter is located east of the 221-U Building and northeast of the 291-U Stack.

Related Sites/ Structures: The 291-U-1 Stack, 291-U Fan Control House, and 291-U Vessel Vent Pit are associated with the unit.

Waste Type: Soil

Waste Description: The sand filter contains low-level fission products, but no plutonium.

Code: 200-W-73 **Classification:** Accepted

Names: 200-W-73; Contaminated Debris Near Railroad Track; URMA East of 218-W-2A **Reclassification:** No Action (6/30/2004)

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:** 1/1/2000

Description: The site is currently covered with gravel and posted as an Underground Radioactive Material Area. It originally had been surrounded with light post and chain and posted as a Contamination Area.

Location: The site is located north of 23rd Street, east of the 218-W-2A Burial Ground. It is adjacent to the railroad track.

Release Description: The contaminated material was identified partly inside and partly outside of a previously posted Contamination Area on April 10, 2000. The posted area appeared to be very old and

abandoned. The site consisted of contaminated wood and metal debris. The maximum direct contamination found on the metal was 12,000 disintegrations per minute. The area was properly reposed and logged into the Contamination Area logbook.

Waste Type: Misc. Trash and Debris

Waste Description: The waste consists of contaminated wood and metal debris.

Closure Info: In June 2000, the scrap wood and angle iron were surveyed with field instruments. The metal that exhibited no detectable radiological contamination was recycled. Contaminated iron and scrap wood was processed as Low-level Waste (LLW). After the debris was removed the area was radiologically surveyed. No contamination was identified in the soil or vegetation. Six inches of gravel was spread over the area and the posting was changed from Contamination Area to Underground Radioactive Material.

Code: 200-W-78-PL **Classification:** Accepted

Names: 200-W-78-PL; 6025; 7624 and 7630; Lines 6012; Pipeline Between 241-TX/TY and 241-T Tank Farms **Reclassification:** None

Type: Encased Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: The site is an encased underground pipeline that runs between the 241-TXR-151 Diversion Box in the 241-TX Tank Farm and the 241-TR-153 Diversion Box in the 241-T Tank Farm. The encasement contains four lines (6012, 6025, 7624 and 7630). Outside the tank farm fence, the line is marked with Radioactive Pipeline signs. There are several stabilized, individually radiologically posted areas on top of (or adjacent to) this pipeline, near the east side of the 241-TY Tank Farm perimeter fence.

Location: The underground line is located in 200 West Area between the 241-T and 241-TX/TY Tank Farms, on the west side of Camden Avenue.

Process Description: The lines inside the tank farm fence are direct buried in a soil trench. The portion of the lines that are outside the tank farm fence are encased in cement. Lines 6012, 6025, 7624 and 7630 are inside this pipe trench and encasement. Lines 6025 and 7630 connect 241-TR-153 Diversion Box with 241-TXR-151 Diversion Box. Line 6012 connects the 241-T-101 salt well pump with 244-TX DCRT. Line 7624 connects the 241-T-111 salt well pump with 244-TX DCRT. The lines inside the tank farm are direct buried, stainless steel.

Related Sites/Structures: The line is associated with 241-T and 241-TX Tank Farms. UPR-200-W-167 was also located in the vicinity of this pipeline.

Waste Type: Process Effluent

Waste Description: The pipeline transported liquid process effluent between the 241-T and 241-TX/TY tank farms.

Description: The contaminated soil and vegetation found above the transfer line was the result of biological intrusion into underground tank farm transfer lines.

Code: 200-W-79-PL **Classification:** Accepted

Names: 200-W-79-PL; 216-T-36 Crib Pipeline; V663 **Reclassification:** None

Type: Radioactive Process Sewer

Start Date: 1/1/1967

Status: Inactive

End Date:

Description: 216-T-36 Crib. There were three separately posted Contamination Areas located on top of this pipeline, west of the 216-T-36 Crib. In November 2000, the Contamination Areas were stabilized and reposted as Underground Radioactive Material areas.

Location: The pipeline is located south of 23rd Street and west of Camden Avenue.

Process Description: The 10 centimeter (4 inch) vitrified clay crib line is connected to the stainless spare line V663 (see 200-W-130-PL). This pipeline carried waste that originated at both T-Plant and U-Plant via the 241-T-151 diversion box. The diversion box is located inside the 241-T tank farm.

Related Sites/ Structures: The site is associated with the 216-T-36 Crib, 241-T-151 Diversion Box and 200-W-130-PL.

Waste Type: Soil

Waste Description: The waste is the vitrified clay pipeline and contaminated soil from apparent pipeline leaks. Contaminated vegetation has been identified growing on this pipeline.

Code: 200-W-88-PL	Classification: Accepted
Names: 200-W-88-PL; 221-T Process Sewer; 24 Inch Process Sewer; T Plant Process Sewer Pipeline; 200-W-88	Reclassification: None
Type: Radioactive Process Sewer	Start Date: 1/1/1944
Status: Inactive	End Date: 1/1/1995

Description: The main waste site is a vitrified clay process sewer pipeline connecting T Plant buildings to the 207-T Retention Basin. The main line is a 61 centimeter (24 inch) diameter, underground vitrified clay pipeline extending from 221-T and 224-T to the 207-T Retention Basin. Feed lines from various support facilities are listed as subsites. There are multiple 1.2 meter (4 foot) diameter, yellow concrete manholes visible at intervals along the sewer line. This site also includes a radiologically posted area around one of the manholes located northwest of 216-T-6 crib. (see subsites)

Location: The Process Sewer pipeline runs west from 221-T to the 207-T Retention Basin on the north side of 23rd Street.

Process Description: The Process Sewer lines transferred process cooling water, air conditioning condensate and floor drain waste from 221-T, 224-T and 2706-T to the 207-T Retention Basin. The retention basin released effluent to ditch that led to the 216-T-4-1 and 216-T-4-2 Ponds.

Related Sites/ Structures: The pipelines are associated with 221-T, 224-T, 2706-T and 207-T.

Waste Type: Process Effluent

Waste Description: The Process Sewer effluent contained chemicals and low level radiological contaminants from T Plant processes.

This Site has the Following SubSites:

Code: 200-W-88-PL:1

Names: 200-W-88-PL:1; 24-Inch VCP Pipeline from Manhole South of 221-T to 207-T Retention Basin

Code: 200-W-88-PL:2

Names: 200-W-88-PL:2; 6-Inch VCP Line That Runs North to South (West of 221-T)

Process Description: The encased 7.6 centimeter (3 inch) diameter pipelines transferred waste from the REDOX facility to the 241-S-151 Diversion Box at the 241-S/SX Tank Farm.

Related Sites/ Structures: The site is associated with 202-S, 203-S, 204-S and 205-S and the 241-S-151 Diversion Box.

Waste Type: Process Effluent

Waste Description: The pipeline transferred REDOX process waste to the 241-S/SX Tank Farm.

Code: 200-W-98-PL **Classification:** Accepted

Names: 200-W-98-PL; Encased Pipeline from 240-S-151 to 241-U-153 Diversion Box; V458, V459, and V460 **Reclassification:** None

Type: Encased Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: The site is a cement encased, underground pipeline. The pipeline is marked with Underground Radioactive Material - Pipeline signs.

Location: The pipeline is located south of 16th Street, extending in a southeast direction from the 241-U-153 Diversion Box to 204-S and the REDOX facility.

Process Description: The pipeline transferred waste between the 241-U-153 Diversion Box (located inside the 241-U Tank Farm) and the 204-S facility. There are three, 7.6 centimeter (3 inch diameter) carbon steel lines inside the concrete encasement.

Related Sites/ Structures: The site is associated with the 204-S Facility and the 241-U-153 Diversion Box.

Waste Type: Process Effluent

Waste Description:

Code: 200-W-99-PL **Classification:** Accepted

Names: 200-W-99-PL; Encased Pipeline from 241-U-151 to 241-S-151 Diversion Boxes; Lines V455 and V456 **Reclassification:** None

Type: Encased Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: The site is a cement encased, underground pipeline. The pipeline is marked with Underground Radioactive Material - Pipeline signs.

Location: The pipeline is located south of 16th Street, extending from the 241-U-151 Diversion Box to the 241-S-151 Diversion Box.

Process Description: The pipeline transferred various wastes between the 241-U and 241-S/SX Tank Farms. The lines are contained within a 3-38 encasement, indicating there are three separate lines inside the cement encasement.

Waste Type: Process Effluent
Waste Description:

Code: 200-W-100-PL **Classification:** Accepted

Names: 200-W-100-PL; Encased Pipeline from 241-UX-154 to 241-SX-152 Diversion Box; Lines 4700, 4701, 4853, V762, V503 and V505 **Reclassification:** None

Type: Encased Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The site is a cement encased, underground pipeline. The pipeline is marked with Underground Radioactive Material - Pipeline signs.

Location: The pipeline begins on the east side of the 221-U building and extends in a southwest direction to terminate at the 241-SX-152 Diversion Box, located on the east side of 241-S/SX Tank Farm.

Process Description: The pipelines transferred U Plant canyon waste to the 241-S/SX Tank Farm via the 241-UX-154 diversion box. The 7.6 centimeter (3 inch) diameter stainless steel lines include lines 4700, 4701, 4853, V762, V503 and V505.

Related Sites/Structures: A short segment of the 216-U-8 pipeline (sitecode 200-W-42-PL) crosses over 200-W-100-PL at the point where both pipelines are under 16th Street. This segment of the crib pipeline was given a separate sitecode (200-W-151-PL). It is anticipated that the segment of crib pipeline under 16th Street (200-W-151-PL) will be addressed with the 200-W-100-PL pipeline.

Waste Type: Process Effluent

Waste Description: The pipeline transferred U Plant canyon waste to the 241-S/SX Tank Farm via the 241-UX-154 diversion box.

Code: 200-W-105-PL **Classification:** Accepted

Names: 200-W-105-PL; Encased Lines V375, V382, and 4859/4703; Encased Transfer Line Between 241-UX-154 Diversion Box and 241-TX-155-Diversion Box **Reclassification:** None

Type: Encased Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The site is a cement encased, underground pipeline. The pipeline is marked with Underground Radioactive Material - Pipeline signs.

Location: The pipeline begins on the east side of the 221-U building and extends in a northwest direction to terminate at the 241-TX-155 Diversion Box. It runs beneath the construction shop complex, north of 19th St. It connects to pipeline 200-W-191-PL, that continues from the diversion box to the 241-TX Tank Farm.

Process Description: The pipeline transferred U Plant canyon waste to the 241-TX Tank Farm via the 241-UX-154 diversion box, 241-TX-155 diversion box and pipeline 200-W-191-PL.

Related Sites/Structures: The encasement includes tank farm lines V375, V382, 4859/4703. The pipeline is associated with 221-U, 241-TX-155 diversion box and pipeline 200-W-191-PL.

Waste Type: Process Effluent

Waste Description: The pipeline transferred waste to the 241-TX Tank Farm.

Code: 200-W-110 **Classification:** Not Accepted (Proposed)

Names: 200-W-110; Miscellaneous Stream #393 **Reclassification:** None

Type: Injection/Reverse Well **Start Date:**

Status: Unknown **End Date:**

Description: Unable to locate from the description provided in DOE/RL-88-11.

Location: The drain was on the east side of the 222-U building. The 222-U building has been demolished. Unable to locate in the field.

Process Description: The drain received storm water run off from the 222 -U facility.

Code: 200-W-114 **Classification:** Discovery

Names: 200-W-114; Miscellaneous Stream #55 **Reclassification:** None

Type: Injection/Reverse Well **Start Date:**

Status: Unknown **End Date:**

Description: Unable to located based on the description provided in DOE/RL-88-11.

Location: The steam condensate drain was located on the southeast side of 224-U. The entire south side of 224-U and 224-UA is covered with asphalt. 224-U has been demolished.

Code: 200-W-125-PL **Classification:** Accepted

Names: 200-W-125-PL; 216-Z-1 Ditch Replacement Pipeline **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The site is an underground buried pipeline. The pipeline is a 0.46 meter (18 inch) diameter vitrified clay pipe. When 216-Z-11 and 216-Z-19 ditches were discontinued, the effluent was diverted to 216-Z-20 via a 38 centimeter (15 inch) diameter polyvinyl chloride pipe.

Location: The pipeline extends east from the 231-Z building and turns south to connect with the head end of the 216-Z-11 Ditch.

Process Description: The pipeline was installed to transfer effluent to the 216-Z-11, 216-Z-19 and 216-Z-20 Ditches after the 216-Z-1 Ditch was abandoned.

Related Sites/ Structures: The site is associated with 216-Z-1 Ditch, 216-Z-11 Ditch, 216-Z-20 crib and the 231-Z building

This Site has the Following SubSites:

Code: 200-W-125-PL:1

Names: 200-W-125-PL:1; 18-Inch VCP Pipeline from 231-Z to 216-Z-11 and 216-Z-19 Ditches

Code: 200-W-125-PL:2

Names: 200-W-125-PL:2; 15-Inch PVC Pipe from Manhole to 216-Z-20

Code: 200-W-125-PL:1 **Classification:** Accepted
Names: 200-W-125-PL:1; 18-Inch VCP Pipeline from 231-Z to 216-Z-11 and 216-Z-19 Ditches **Reclassification:** None

The SubSite is Part Of:

Code: 200-W-125-PL
Names: 200-W-125-PL; 216-Z-1 Ditch Replacement Pipeline

Code: 200-W-126 **Classification:** Accepted
Names: 200-W-126; Tank Farm Vertical Storage Units; Vertical Storage Units West of 241-T Tank Farm **Reclassification:** None
Type: Storage **Start Date:**
Status: Inactive **End Date:**

Description: The site consists of six vertical storage units. The units were constructed of steel pipes approximately 0.3 meters (1 foot) in diameter and 2 meters (6 feet) deep. They extend approximately 0.1 meters (4 inches) above the ground surface.

Location: The six storage units are located near the outside of the 241-T Tank Farm fence. They are approximately 10 meters (30 feet) west of the tank farm and north of 23rd Street. They are located within a large Underground Radioactive Material area that includes the 216-T-7 tile field and the 216-T-5 crib.

Process Description: The Vertical Storage Units (VSU) were used to store dry, radiologically contaminated tank farm equipment, like shield plugs and slurry distributor handles or contaminated soil. The units are currently empty and have been capped.

Related Sites/ Structures: The units are associated with the 241-T Tank Farm.

Waste Type: Equipment

Waste Description: The units were used to store radioactively contaminated pieces of equipment like shield plugs and distributor handles.

Names: 200-W-127; Surface Stabilized Area East of UPR- **Reclassification:** None

200-W-29/UPR-200-W-97 (UN-216-W-5)

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The site is a posted Underground Radioactive Material area that has been covered with gravel.

Location: The site is located on the south side of 23rd Street in 200 West Area. It is west of T Plant and east of UPR-200-W-29/UPR-200-W-97, a posted Underground Radioactive Material area on the corner of 23rd St. and Camden Ave.

Related Sites/ Structures: Encased pipeline 200-W-129-PL crosses this radiologically posted area.

Code: 200-W-128

Classification: Accepted

Names: 200-W-128; Underground Radioactive Material Area East of 218-W-4A

Reclassification: None

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The site is posted with Underground Radioactive Material signs. A considerable amount of sand appears to have blown onto the posted area.

Location: The site is located approximately 100 feet south of 23rd Street, inside 200 West Area. It is adjacent to the 218-W-4A fence.

Related Sites/ Structures: The area is associated with the 218-W-4A burial ground.

Code: 200-W-129-PL

Classification: Accepted

Names: 200-W-129-PL; Encased Pipeline from 241-T-151 and 241-T-152 to 241-TX-155 Diversion Box; Lines V399, V405 and V411

Reclassification: None

Type: Encased Tank Farm Pipeline

Start Date: 1/1/1950

Status: Inactive

End Date:

Description: The site is an underground cement encasement containing three carbon steel pipelines. The encasement is marked and posted with Underground Radioactive Material and Pipeline signs.

Location: The encased pipeline connects the 241-T-151 and 241-T-152 Diversion Boxes, located inside 241-T Tank Farm to the 241-TX-155 Diversion Box, located south of 23rd Street and north of the Powerhouse Pond.

Process Description: The encasement contains lines V399, V405 and V411. Each pipeline is made of 7.6 centimeter (3 inch) diameter carbon steel. The lines connect 241-T-151 and 241-T-152 with 241-TX-155.

Related Sites/ Structures: The pipelines are associated with 241-T-151, 241-T-152 and 241-T-155 diversion boxes and UPR-200-W-113.

Code: 200-W-130-PL

Classification: Accepted

Names: 200-W-130-PL; Lines V445, V663, V601 and V416 and Spare Lines V662, V663, V682 and V683; Pipelines from 241-T-151 and 241-T-152

Reclassification: None

 Diversion Boxes to 241-U-151 Diversion Box
Type: Direct Buried Tank Farm Pipeline**Start Date:****Status:** Inactive**End Date:**

Description: The site is a soil trench that contains multiple stainless steel pipelines exiting the 241-T-151 and 241-T-152 diversion boxes. Each line is 7.6 centimeters (3 inches) in diameter. Three lines (V445, V663, V662) extend south from the 241-T-151 diversion box. Three lines (V601, V682, V683) extend south from 241-T-152 diversion box. One line from each diversion box (V445 and V601) merge together south of 241-T tank farm, south of 23rd Street and continue to 241-U-152 diversion box. The lines are encased in concrete only where they pass under 23rd Street.

Location: The majority of this pipeline is located east of Camden Ave. It connected the 241-T-151 and 241-T-152 Diversion Boxes, located inside 241-T Tank Farm, to the 241-U-151 Diversion Box, located east of 241-U Tank Farm. Lines V445, V663 and V662 extend from 241-T-151 Diversion Box. Lines V601, V682 and V683 extend from 241-T-152 Diversion Box. The two sets of pipelines join together south of 241-T tank farm, south of 23rd Street.

Release Description: See UPR-200-W-29.

Process Description: Lines V445, V662 and V663 exit the 241-T-151. Lines V662 and V663 exit 241-T-151 diversion box in the same trench as V445. V662 and V663 were originally spare lines that were cut and capped south of the diversion box, outside the tank farm fence. Line V663 was later reactivated to connected to the 216-T-36 crib (see sitecode 200-W-79-PL). V445 continues south to 241-U-151. Lines V601, V682 and V683 exit 241-T-152 diversion box. V682 and V683 were spare lines that were cut and capped south of 241-T tank farm, outside the tank farm fence. Line V601 merges with line V445 south of 241-T Tank Farm and shares the same trench until V601 diverts to 241-TX tank farm. Line V416 enters the soil trench from 241-TX tank farm at the point where V601 leaves the trench. South of 241-TX tank farm, line V445 shares the same trench with line V416 until they connect to 241-U-152 diversion box.

Related Sites/Structures: The site is associated with, 200-W-79-PL and 200-W-131-PL. Line V601 is associated with UPR-200-W-29.

Code: 200-W-131-PL**Classification:** Accepted**Names:** 200-W-131-PL; Spur to 241-TX Tank Farm; V601**Reclassification:** None**Type:** Direct Buried Tank Farm Pipeline**Start Date:** 1/1/1944**Status:** Inactive**End Date:**

Description: The site is a 7.6 centimeter (3 inch) diameter, stainless steel pipeline in a soil trench.

Location: The majority of this pipeline is located east of Camden Ave. It connected the 241-T-152 Diversion Box, located inside 241-T Tank Farm, to the 241-U-151 Diversion Box, located east of 241-U Tank Farm. A tee was made to redirect effluent to 241-TX Tank Farm.

Process Description: Line V601 originally connected 241-T-152 and 241-U-151. Line V601 was later cut and rerouted to 241-TX Tank Farm with an east/west pipe spur and a tee connection to 241-TX-153 diversion box. The north portion of the pipeline connected 241-T Tank Farm with 241-TX Tank Farm. The southern portion of the pipeline connected 241-U Tank Farm with 241-TX Tank Farm.

Related Sites/Structures: The site is associated with WIDS site 200-W-130-PL, 241-T-152, 241-T Tank Farm, 241-TX Tank Farm, 241-TX-153 and 241-U Tank Farm.

Code: 200-W-132-PL **Classification:** Accepted

Names: 200-W-132-PL; Pipelines from 221-T to 241-T-151 and 241-T-152; V653, V654, V667, V668, V669, V706, and V707 **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:** 1/1/1945

Status: Inactive **End Date:**

Description: Seven, 7.6 centimeter (3 inch) diameter, pipelines are contained in the same soil trench. Three lines -V653, V654 and V706 are 7.6 centimeter (3 inch) diameter stainless steel lines. Four lines - V667, V668, V669 and V707 are 7.6 centimeter (3 inch) diameter carbon steel line. The group of pipelines is marked with Underground Radioactive Material and Pipeline signs.

Location: The bundle of pipelines begins at 221-T and terminates at the 241-T-151 Diversion Box in the 241-T Tank Farm.

Process Description: The pipelines transported T Plant waste to the 241-T-151 and 241-T-152 diversion boxes, inside 241-T Tank Farm. Some of the lines are stainless steel and others are carbon steel. Line V653 is a 3 inch diameter stainless steel line from section 10 of 221-T. Line V654 is a 3 inch diameter stainless steel line from section 9 of 221-T. Line V667 is a 3 inch diameter carbon steel line from section 5 of 221-T. Line V668 is a 3 inch diameter carbon steel line from section 15 of 221-T. Line V669 is a 3 inch diameter carbon steel line from section 15 of 221-T. Line V706 is a 3 inch diameter stainless steel line from 224-T. Line V707 is a 3 inch diameter carbon steel line from section 10 of 221-T.

Code: 200-W-136 **Classification:** Accepted

Names: 200-W-136; Demolished 203-U Area and Contaminated Soil; Underground Radioactive Material Area Including 222-U Building Foundation **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1947

Status: Inactive **End Date:** 1/1/2005

Description: The site is an irregular shaped gravel area, posted with Underground Radioactive Material Area (URMA) signs. The 222-U building foundation is located within the URMA and is not separately marked or posted. The remnants of the demolished 203-U tanks and 272-U Hot Shop are also beneath the URMA gravel cover. The URMA also covers areas of soil contamination created during the facility demolitions.

Location: The site is located east of the 221-U canyon building, northeast of 224-U and southwest of the 291-U exhaust stack. It is west of Beloit Ave.

Process Description: The 222-U building supported the 221-U canyon as a Sample Preparation Laboratory. The function of the laboratory was to test the 221-U process solutions at various stages to verify the process was working within the process specifications. The 203-U tanks were associated with the 224-U facility Uranium Tri-Oxide process. It consisted of a concrete enclosure containing two 375,000 liter (100,000 gallon) uranyl nitrate feed tanks.

Related Sites/Structures: The laboratory building was associated with the 221-U and 224-U facilities, french drains 200-W-107, 200-W-108, 200-W-109, 200-W-111, and the 216-U-4, 216-U4A and 216-U-4B reverse wells.

Code: 200-W-137-PL **Classification:** Accepted
Names: 200-W-137-PL; Line V533; Pipeline from 241-S-151 Diversion Box to 216-S-1 & 2 Cribs **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The site is an underground pipeline from the 241-S-151 Diversion box to the 216-S-1 & 2 cribs. The pipeline is double contained pipeline. It is constructed of a 8.9 centimeter (3.5 inch), outside diameter 40 gauge stainless steel tubing that is encased in a 15.2 centimeter (6 inch) diameter, schedule 40 steel pipe.
Location: The pipeline and cribs are located east of the 241-SX Tank Farm. A concrete encased portion of the pipeline is located inside the tank farm fence. The double contained pipe to the cribs is located outside the tank farm fence.
Related Sites/ Structures: The pipeline is associated with the 241-S-151 Diversion Box and the 216-S-1&2 cribs.

Code: 200-W-138-PL **Classification:** Accepted
Names: 200-W-138-PL; Pipeline from 240-S-151 to 216-S-7 Crib; V547 **Reclassification:** None

Status: Inactive **End Date:**
Description: The waste site is an underground, 7.6 centimeter (3 inch), stainless steel pipeline to the 216-S-9 crib.
Location: The pipeline is located northwest of the 202-S facility.
Release Description: UPR-200-W-109 occurred on January 24, 1969. UPR-200-W-109 states that after repairing the buckled portions of the waste line near the 216-S-9 crib, a pressure test indicated another leak in the line. Additional hydrostatic testing finally forced the water to bubble to the surface. It surfaced inside the radiation zone marking the 218-W-9 burial trench. Dose rates of the liquid were 450 mR/hr, but as the water sank back into the soil, the dose rate dropped to 20 mR/hr. Excavation of the liquid bubble site disclosed a vertical buckle in the pipeline with a sizable

break in the line at that point. (RHO-CD-673)

Process Description: When the 216-S-9 crib was built to replace the 216-S-7 crib, the extended pipeline was tied into the 216-S-7 pipeline (see 200-W-138-PL). Line V547 emerges from an encased pipeline (200-W-98-PL).

Related Sites/ Structures: The pipeline is associated with UPR-200-W-109, 216-S-7 and 216-S-9 cribs, 200-W-138-PL, the 200-W-98 encased pipeline and the 240-S-151 diversion box.

Code: 200-W-140-PL **Classification:** Accepted

Names: 200-W-140-PL; Pipeline from 292-T(200-W-40) **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is a 8.9 centimeter (3.5 inch) diameter, stainless steel underground pipeline.

Location: The pipeline is located east of the 221-T building.

Process Description: The original 292-T building (21 feet by 16 feet) housed the 291-T stack gas sampling system.

Description: The waste line from 292-T connected to the pipeline to the 216-T-8 crib (see 200-W-142-PL).

Related Sites/ Structures: The pipeline is associated with the 292-T building (sitecode 200-W-40), the 200-W-142-PL pipeline and 216-T-8 crib.

Code: 200-W-141-PL **Classification:** Accepted

Names: 200-W-141-PL; Pipeline Connecting 200-W-139-PL Pipeline to 216-S-23 Crib; V547 **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground pipeline from the 216-S-9 crib pipeline (200-W-139-PL) to the 216-S-23 pipeline. It is a 15.2 centimeter (6 inch) diameter, concrete lined iron pipe.

Location: The waste site is located northwest of the 202-S facility.

Release Description: UPR-200-W-108 states that on January 8, 1969, during the tie-in of the 216-S-9 Crib waste line to the new 216-S-23 Crib, contaminated water was encountered coming from a break at the junction of the two crib lines. Further excavation disclosed a severe expansion buckle in the line at that point, and a similar buckle in the line near the 202-S Building. There is no way of determining how long the line had been leaking or how much waste was discharged to the ground.

Process Description: When the 216-S-23 crib was built to replace the 216-S-9 crib, the 216-S-23 pipeline was tied into the 216-S-9 pipeline (see 200-W-139-PL). The 216-S-9, 7.6 centimeter (3 inch) diameter, stainless steel pipeline was cut, teed and converted to a 15.2 (6 inch) diameter concrete lined iron pipe with flanges for the 216-S-23 crib waste. Line V547 extends from the encased pipeline (200-W-98-PL).

Related Sites/ Structures: The site is associated with UPR-200-W-108, 240-S-151 diversion box, 200-W-98-PL, 216-S-9 crib, 216-S-23 crib and 200-W-139-PL pipeline.

Code: 200-W-142-PL **Classification:** Accepted
Names: 200-W-142-PL; Pipeline from 222-T to 216-T-8 Crib **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The site is an underground, 8.9 centimeter (3.5 inch) diameter, stainless steel pipeline.
Location: The pipeline extends southward from the 222-T building.
Process Description: 222-T laboratory waste was sent to the 216-T-8 crib via this pipeline. In 1949, the effluent line from 292-T (sitecode 200-W-140-PL) was also connected to this crib pipeline.
Related Sites/ Structures: The pipeline is associated with the 222-T building and 292-T (sitecodes 200-W-40 and 200-W-140-PL).

Code: 200-W-143-PL **Classification:** Accepted
Names: 200-W-143-PL; Encased Pipeline from 241-TX-154 Diversion Box to 241-TX-152 and 241-TX-155 Diversion Boxes; Lines V383, V384, V385, V387, V388, V391, V392, and V393 **Reclassification:** None
Type: Encased Tank Farm Pipeline **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, concrete encased pipeline. The pipelines inside the encasement are 9 centimeter (3.5 inch) diameter stainless steel lines. The majority of the encasement contains seven stainless steel pipelines (V383, V384, V385, V387, V388, V391, V392). There is a section of nine stainless steel lines near the 241-TX-154 Diversion Box. This section contains the seven lines (mentioned above) and two, short stub lines - V728 and V729. The section of pipeline near the 241-TX-155 Diversion Box contains ten lines. This section contains the seven main lines (mentioned above), an extra line from the 241-TX-302B catch tank (V393) and two short stub lines (V390 and V386).
Location: The encased pipeline begins at the 241-TX-154 Diversion Box. It runs diagonally south of 23rd Street and terminates at the 241-TX-155 Diversion Box.
Related Sites/ Structures: The site is associated with the 221-T facility operations, the 241-TX-154 diversion box and the 241-TX-152 and 241-TX-155 Diversion Boxes.

Code: 200-W-145 **Classification:** Not Accepted (Proposed)
Names: 200-W-145; Hidden Wells South of U-Plant; U Plant Dry Wells **Reclassification:** None

Type: French Drain **Start Date:**

Status: Inactive **End Date:**

Description: Multiple (more than twenty) concrete dry wells were found in an undeveloped area south of U Plant on the west side of Beloit Ave. The open concrete wells ranged in size from 91.4 centimeters (36 inches) to 106.6 centimeters (42 inches) in diameter. The estimated depths are greater than 1.8 meters (6 feet).

Location: The wells are located south of 16th Street, west of Beloit Ave and southeast of 224-U.

Process Description: A few aerial photographs from the early 1950's indicate a group of temporary construction facilities were located in this area. They apparently were connected to raw water and potable water utilities. They may also have had a buried steam distribution system. Drawings H-2-43235, dated 1951, and H-2-1496, dated 1952 show the plan and profile for the 200 West Area steam distribution system. The drawings indicate a steam connection to temporary construction facilities southeast of U Plant. A 2006 field inspection found one caisson that was open and empty enough to reveal several small diameter pipelines entering the concrete caisson wall approximately 1.2 meters (4 feet) below the ground surface. This supports the concept that they were part of an underground infrastructure system. More open wells were identified in 2010.

Waste Type: Steam Condensate

Waste Description: Drawings H-2-43235, dated 1951, and H-2-1496, dated 1952 show the plan and profile for the 200 West Area steam distribution system. The drawings indicate a steam connection to temporary construction facilities southeast of U Plant.

Code: 200-W-146-PL **Classification:** Accepted

Names: 200-W-146-PL; 216-S-22 Crib Pipeline **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:** 1/1/1957

Status: Inactive **End Date:** 1/1/1967

Description: The pipeline is a 10 centimeter (4 inch) diameter, vitrified clay pipe.

Location: The pipeline extends from the 293-S building to the 216-S-22 crib. It is located east of the 202-S (REDOX) building.

Process Description: The site provided subsurface liquid disposal for the 293-S Building waste. The crib is a gravel structure with a side slope of 1:1.5. A pipe enters the unit below grade, branches out at right angles downwards to the bottom, and runs along the bottom for the length of the unit. The section of pipe along the crib bottom has open joints. The rest of structure is filled with backfill.

Related Sites/ Structures: The pipeline is associated with the 216-S-22 crib.

Code: 200-W-149-PL **Classification:** Accepted

Names: 200-W-149-PL; Pipelines Related to 216-S-20 Crib **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: There are three source facilities that fed the 216-S-20 crib. Each source had separate pipelines to the crib. Two, side by side, 9 centimeter (3.5 inch) diameter stainless steel lines extends from 219-S to the 216-S-20 Crib. One 20 centimeter (8 inch) diameter, carbon steel line extends

from the 207-SL Retention Basin valve pit to the 216-S-20 Crib. Another 15 centimeter (6 inch) diameter carbon steel pipeline extends from the truck unloading station to the 216-S-20 crib. (see subsites)

Location: The 216-S-20 crib and associated pipelines are located northeast of the 222-S laboratory and 207-SL Retention Basin.

Process Description: The 216-S-20 crib received waste from lab hoods and decontamination sinks in the 222-S building via the 219-S Retention Building and the 207-SL Retention Basin. It also received 300 Area laboratory waste via trucks, unloaded into the manhole at the adjacent waste unloading station.

Related Sites/ Structures: The 216-S-20 crib effluent was associated with the 219-S building, the 207-SL Retention Basin and the lab waste truck unloading station.

Names: 200-W-151-PL; 200-W-42 Pipe Remaining **Reclassification:** None
Under 16th Street
Type: Radioactive Process Sewer **Start Date:**

Status: Inactive

End Date:

Description: The piece of pipeline remaining under 16th Street is not visible.

Location: The pipe is located southeast of the 224-UA building, beneath the 16th Street asphalt.

Process Description: WIDS sitecode 200-W-42 is the underground vitrified clay pipeline transferred process condensate from the 221-U and 224-U Buildings and the 291-U Stack to the 216-U-8 and 216-U-12 Cribs.

Related Sites/ Structures: The site is associated with the 221-U and 224-U facilities and the pipeline that fed 216-U-8 and 216-U-12 cribs (see sitecode 200-W-42) and the encased tank farm line 200-W-100-PL.

Waste Type: Process Effluent

Waste Description: From 1952 to 1960, the line transferred waste from 221-U, 224-U and 291-U to the 216-U-8 crib. The 216-U-12 crib replaced the 216-U-8 crib in 1960. The pipeline was extended further south to the 216-U-12 location. From April 1960 to May 1967, the pipeline received waste from the 291-U-1 Stack drainage, 241-WR Vault waste, and 224-U process condensate via C-5 Tank. Disposal of contaminated water from 241-WR Vault was accomplished in October 1965 and included 3.14 kilograms (6.9 pounds) of thorium. From May 1967 to September 1972, the site received the above wastes excluding the 241-WR Vault waste and occasional waste via the C-7 Tank in the 244-U Building. From September 1972 to November 1981, the site was taken out of service. After November 1981, the pipeline received process condensate (corrosive: typical pH range is 0.5-1.5) from the 224-U Building. In the past, this facility also received miscellaneous storm drain wastes from 224-U. A Limited Field Investigation was done in 1994 to characterize selected waste sites in the 200-UP-2 Operable Unit. Fourteen surface and subsurface soil samples along with four vegetation samples were collected to characterize the vitrified clay pipeline (VCP) leading to the 216-U-8 Crib. An attempt was made to determine if the contamination had spread laterally from the pipeline by digging holes with an auger rig where subsurface contamination had been identified. An increase in activity was noted at approximately 3 meters (10 feet). At a depth of 3.3 meters (11 feet) the auger was stopped by large cobbles. The samples were analyzed for cesium-137, strontium-90, gross alpha and gross beta. Specific sample data is documented in BHI-00033.

Code: 200-W-152-PL

Classification: Accepted

Names: 200-W-152-PL; 207-S Retention Basin and 216-S-17 Pond; Pipeline from 202-S to 2904-S-170; REDOX Process Sewer

Reclassification: None

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: The site is an underground, 61 centimeter (24 inch) diameter vitrified clay pipe that begins at the 202-S (REDOX) building. The pipeline is not visible, but a metal sample shack is located over the western end, above the 2904-S-170 control structure. Seven manholes are visible on the surface along the pipeline.

Location: The pipeline is located west and southwest of the 202-S (REDOX) building.

Process Description: The pipeline carried liquid waste from the REDOX facility to the 2904-S-170 control structure, before it was sent to the liquid waste disposal sites (207-S, 216-S-16, 216-S-17)

Related Sites/ Structures: The pipeline was associated with 202-S (Redox building), 207-S Retention Basin, 216-S-17 Pond, and 2904-S-170.

Code: 200-W-153-PL **Classification:** Accepted

Control Structures

Code: 200-W-154-PL **Classification:** Accepted

Names: 200-W-154-PL; Pipeline from 200-W-152-PL to 216-S-5 Crib **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground 61 centimeter (24 inch) diameter vitrified clay pipeline that feeds the 216-S-5 crib. The pipeline connects to the 200-W-152-PL.

Location: The pipeline is located outside the 200 West Area perimeter fence, southwest of 207-S.

Process Description: The 216-S-5 crib was built as a replacement for the grossly contaminated 216-S-17 pond. The 216-S-5 crib received the process vessel cooling water and steam condensate from the 202-S (REDOX) building.

Related Sites/ Structures: The site is associated with the REDOX cooling water effluent stream (202-S Redox Building) and the 200-W-152-PL pipeline and the 216-S-5 Crib.

Code: 200-W-155-PL-A **Classification:** Accepted

Names: 200-W-155-PL-A; Portion of 200-W-155-PL Pipeline in the Outer Area **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: Due to the restructuring of Operable Units, as described in the Agreement for Central Plateau Cleanup, the original pipeline site (200-W-155-PL) has been split into segments (200-W-155-PL-A and 200-W-155-PL-B). The original pipeline was an underground 61 centimeter (24 inch) diameter vitrified clay pipe. It extends from the 2904-S-160 Control Structure to the head end of the 216-S-16 Ditch. 200-W-155-PL-A is the portion of the pipeline that is located in the Central Plateau Outer Area.

Location: This portion of pipeline extends from the Inner/Outer Area boundary to the head end of the 216-S-16 Ditch.

Process Description: In 1954, the original 61 centimeter (24 inch) process sewer line (sitecode 200-W-152-PL) was plugged and the flow to the 216-S-17 Pond was abandoned. The effluent was directed to the 216-S-6 crib and later to the 216-S-16 Pond via the 2904-S-160 Control Structure. Flow could be directed to 216-S-6 crib at Manhole 8 via pipeline 200-W-156-PL or to the 216-S-16 Ditch and Pond via pipeline 200-W-155-PL-A and B.

Related Sites/ Structures: The waste site is associated with the 216-S-16 ditch and the 200-W-155-PL-B pipeline.

Code: 200-W-155-PL-B **Classification:** Accepted

Names: 200-W-155-PL-B; Portion of Pipeline 200-W-155-PL that is located in the Central Plateau Inner Area **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive

End Date:

Description: Due to the restructuring of Operable Units, as described in the Agreement for Central Plateau Cleanup, the original pipeline site (200-W-155-PL) has been split into segments. It extends from the 2904-S-160 Control Structure to the Inner/Outer Area boundary. 200-W-155-PL-B is the portion of the pipeline that is located in the Central Plateau Inner Area. The original pipeline was an underground 61 centimeter (24 inch) diameter vitrified clay pipe.

Location: 200-W-155-PL-B is the portion of pipeline that extends from the 2904-S-160 Control Structure to the Inner/Outer Area boundary.

Process Description: In 1954, the original 61 centimeter (24 inch) process sewer line (sitecode 200-W-152-PL) was plugged and the flow to the 216-S-17 Pond was abandoned. The effluent was directed to the 216-S-6 crib and later to the 216-S-16 Pond via the 2904-S-160 Control Structure. Flow could be directed to 216-S-6 crib at Manhole 8 via pipeline 200-W-156-PL or to the 216-S-16 Ditch and Pond via pipeline 200-W-155-PL-A and B.

Related Sites/ Structures: The waste site is associated with the 2904-S-160 control Structure and the 200-W-155-PL-A pipeline.

Code: 200-W-156-PL

Classification: Accepted

Names: 200-W-156-PL; 216-S-6 Crib Pipeline; Pipeline from 200-W-155-PL to the 2904-S-171 Control Structure

Reclassification: None

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: The waste site is an underground 46 centimeter (18 inch) diameter vitrified clay pipeline extending from Manhole 8 on the 200-W-155-PL pipeline to the 2904-S-171 Control Structure and the 216-S-6 crib.

Location: The pipeline is located outside the 200-West Area fence, southwest of the 202-S (REDOX) building.

Process Description: This 216-S-6 crib operated from November 1954 to July 1972. The crib was constructed as part of the Segregation Project. REDOX effluent with a high potential for contamination was diverted to the 216-S-6 Crib. Effluent with a low potential for contamination was sent to the 216-S-5 Crib.

Related Sites/ Structures: The pipeline is associated with 200-W-155-PL, 200-W-153-PL, 2904-S-171 Control Structure and the 216-S-6 crib.

Code: 200-W-157-PL

Classification: Accepted

Names: 200-W-157-PL; Pipeline from 202-S to 200-W-152-PL; Pipeline from 205-S to REDOX Chemical Sewer; REDOX Chemical Sewer

Reclassification: None

Type: Process Sewer

Start Date:

Status: Inactive

End Date:

Description: The site is an underground vitrified clay pipeline with diameters of 20 centimeters (8 inch) and 30 centimeters (12 inch). A 10 centimeter (4 inch) diameter vitrified clay pipe extends from the 205-S building to the main chemical sewer line.

Location: the south side of 211-S and south of the 205-S building. The chemical sewer extends beyond the 200 West Area fence, southwest of 202-S.

Process Description: The REDOX chemical sewer connected to manhole number 3, southwest of 202-S. It

Description: connected to the 216-S-10 ditch at Manhole number 2.

Related Sites/ Structures: The waste site is associated with the 216-S-10 ditch and pond and the REDOX process sewer (sitecode 200-W-152-PL).

Description: The waste site is an underground, 46 centimeter (18 inch) diameter, corrugated metal pipe.

Location: The pipeline is located southwest of the corner of 16th Street and Dayton Ave. It extends westward from the northwest corner of the 216-U-10 pond to the 216-U-11 trench. The pipeline crosses under Dayton Ave.

Process Description: The pipeline transferred 216-U-10 Pond water to the 216-U-11 trench.

**Related Sites/
Structures:**

Code: 200-W-170-PL **Classification:** Accepted
Names: 200-W-170-PL; 216-U-16 Crib Pipeline **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground, 30.5 centimeter (12 inch) diameter, polyvinyl chloride pipe.
Location: The pipeline is located south of 16th Street. The vitrified clay crib pipe attaches to the U Plant Process Sewer (sitecode 200-W-84).
**Related Sites/
Structures:** The pipeline is associated with the U Plant Process Sewer (200-W-84-PL) and the 216-U-16 crib.

Code: 200-W-171 **Classification:** Accepted
Names: 200-W-171; 200-W-219-PL Line Leak; Leak from 234-5Z Pipe Trench to 241-Z Tank D-6 **Reclassification:** None
Type: Unplanned Release **Start Date:** 1/1/1969
Status: Inactive **End Date:**
Description: The concrete pipe trench is a subsurface feature extending from 234-5Z to 241-Z (see sitecode 200-W-219-PL).
Location: The release occurred in the pipe trench located south of 234-5Z that extended to the 241-Z tank enclosure.
**Release
Description:** ARH-1048 states that on 2/18/69, approximately 114,000 liters (30,000 gallons) was sent to the 241-Z D-6 tank but it never got to the tank. To help find the cause of the unaccounted waste, water from 880 room 19 (button line) and the incinerator was sent to the D-6 tank. Only the water from the incinerator reached the D-6 tank, indicating a leak in the common waste line from 880 and the button line. Further checks showed that the concrete trench was cracked and the sump pipe was broken near the north side of the road.

**Related Sites/
Structures:** The release is associated with pipeline 200-W-219-PL.

Waste Type: Water
**Waste
Description:** Based on available plant records, leakage into the pipe trench ranged from 11,400 liters (3,000 gallons) to 114,000 liters (30,000 gallons) containing between 3 and 30 grams of plutonium.

Code: 200-W-172 **Classification:** Accepted
Names: 200-W-172; Liquid Leaking from Drain Laterals Below 234-5Z Floor Slab **Reclassification:** None
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is a series of underground pipes. Secondary drain laterals conveyed liquid from various points in the 234-5Z building to the main drain lines in the subsurface pipe tunnels. Visual observations in the pipe tunnels revealed little evidence of substantial leakage.
Location: The release location is the soil underneath the 234-5Z building.

Location:

Process Fifty-two side lateral pipes conveyed process liquids into the main 234-5Z tunnel drain lines.
Description: Approximately fifteen lateral lines appear to have possibly leaked.

Related Sites/ Structures: The release is associated with the Plutonium Finishing Plant processes.

Waste Type: Process Effluent
Waste Description: Small pipe leaks in the tunnels over time may have accumulated a quantity of less than 3 grams of plutonium.

Code: 200-W-173-PL **Classification:** Accepted
Names: 200-W-173-PL; 216-T-33 Crib Pipeline; Pipeline from 2706-T to 216-T-33 Crib **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The majority of the waste site is an underground, 20 centimeter (8 inch) diameter, vitrified clay pipeline that fed the 216-T-33 crib. A portion of the pipeline from 2706-T to the weir pit is an underground 15 centimeter (6 inch diameter) vitrified clay pipe.
Location: The pipeline is located west of 221-T and south of 2706-T.
Process Description: The 2706-T facility decontaminated vehicles, rail cars and large pieces of equipment. Water containing chemicals and radionuclide contamination went down the facility drains.

Code: 200-W-174-PL **Classification:** Accepted
Names: 200-W-174-PL; 216-Z-1A Modified Pipeline; Lines 1035 and 1036; Pipelines from 234-5Z to 216-Z-1A and 216-Z-18 Crib **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is two parallel underground, 5 centimeter (2 inch) diameter stainless steel lines that diverted from a concrete encasement to feed 216-Z-1A and the 216-Z-18 crib. This pipeline bypassed the 241-Z-361 settling tank. The line numbers are 1035 and 1036.
Location: The pipeline extends south from the 234-5Z facility to the 216-Z-1A tile field. Part of the pipeline is located inside the PFP security fence and part is located outside the security fence.
Release Description: See UPR-200-W-103
Process Description: Lines 1035 and 1036 divert out of a concrete encasement that connected 242-Z with 234-5Z. Lines 1035 and 1036 bypass the 216-Z-1, 216-Z-2 and 216-Z-3 cribs and route the waste directly into the 216-Z-1A tile field (see subsite 1). Later the effluent was directed to the 216-Z-18 crib (see subsite 2).

Related Sites/ Structures: The waste lines are associated with 234-5Z and 216-Z-1A and 216-Z-18.

Code: 200-W-147-PL-B **Classification:** Accepted
Names: 200-W-147-PL-B; Portion of Pipeline in the 200 West Inner Area **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: Due to the restructuring of Operable Units, as described in the Agreement for Central Plateau Cleanup, the original pipeline site (200-W-147-PL) has been split into segments. It was an underground 20 centimeter (8 inch) diameter vitrified clay pipe, extending from the 207-SL retention basin to the 216-S-19 pond. 200-W-147-PL-B is the portion of pipeline that extends from the 207-SL basin to the Outer Area boundary.
Location: This portion of pipeline is located east of the 222-S laboratory facility, inside 200 West Area, in the Inner Area. It extends from the 207-SL basin to the Inner/Outer Area boundary.
Process Description: The pipeline carried waste from the 222-S and 202-S facilities to the 216-S-19 Pond and 216-S-26 crib via the 207-SL Retention Basin.

Related Sites/ This portion of pipeline is associated with the 207-SL basin, 216-S-19 Pond, 216-S-26 crib and

Structures: 200-W-147-PL-A.

Code: 200-W-175-PL **Classification:** Accepted

Names: 200-W-175-PL; Line V681; Pipeline to Route Waste from 241-T-112 to 216-TY-201 Flush Tank and 216-T-26, 216-T-27 and 216-T-28 Cribs **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The site is an underground, 8.9 centimeter (3.5 inch) diameter, carbon steel pipeline extending from the 241-T-112 tank to the 216-TY-201 Flush Tank.

Location: The pipeline extends southeast out of the 241-T Tank Farm. Most of the pipeline is located south of 23rd Street. The line crosses under Camden Ave.. Part of the line is located on the east side of Camden Ave. and part is on the west side of Camden Ave. A portion of the pipeline is inside the 241-T tank farm.

Process Description: The waste to 216-T-26 originally came from the 241-TY tank farm. In 1956, the pipeline from 241-TY tank farm to the 216-T-26 crib was isolated by installing a blank flange in the pipe between the east perimeter fence of the 241-TY Tank Farm and Camden Ave. A portion of an existing pipeline (see 200-W-167-PL) was re-used to create a new pipeline that routed waste from 241-T-112 tank (inside 241-T tank farm) to the 216-T-201 flush tank and the 216-T-26 crib. The 8.9 centimeter (3.5 inch) diameter pipe changes to a 7.6 centimeter (3 inch) diameter pipe where the pipeline turns eastward to connect with the 241-T-201 Flush Tank.

Related Sites/Structures: The site is associated with the 241-T-112 tank, the 216-TY-201 Flush Tank and pipeline 200-W-167-PL.

Code: 200-W-176-PL **Classification:** Accepted

Names: 200-W-176-PL; Encased Transfer Lines Between 241-TX-153 Diversion Box and 241-TX-155 Diversion Box; Lines V396, V397, V401, V403, V407, V409, and V413 **Reclassification:** None

Type: Encased Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground concrete transfer line encasement. All of the lines inside the encasement are 9 centimeter (3.5 inch) diameter stainless steel lines.

Location: The concrete encasement extends eastward from 241-TX tank farm to the 241-TX-155 Diversion Box, located east of Camden Ave.

Related Sites/Structures: The waste site is associated with the 241-TX-153 Diversion Box and the 241-TX-155 Diversion Box.

Code: 200-W-177-PL **Classification:** Accepted

Names: 200-W-177-PL; Direct Buried Tank Farm Lines Between 241-TXR-151 and 241-TX-155 Diversion Boxes; Lines V7616 and V7653 **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive

End Date:

Description: The waste site is two 9 centimeter (3.5 inch) stainless steel lines buried in a common soil trench. Line V7616 extends between the 241-TXR-151 Diversion Box (inside the 241-TX tank farm) to the 241-TX-155 Diversion Box (outside the tank farm). Line V7653 extends from the 244 TXR Vault (inside the 241-TX tank farm) to the 241-TX-155 Diversion Box (outside the tank farm).

Location: The pipelines extend eastward from the 241-TX tank farm to the 241-TX-155 Diversion Box, located east of Camden Ave.

Related Sites/ Structures: The pipelines are associated with the 241-TXR-151 Diversion Box, the 241-TXR Vault and the 241-TX-155 Diversion Box.

Code: 200-W-178-PL

Classification: Accepted

Names: 200-W-178-PL; Lines HSW-202 and HSW-203; Pipeline from 241-Z to 244-TX DCRT

Reclassification: None

Type: Direct Buried Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: The waste site is two, underground, 5 centimeter (2 inch) stainless steel pipelines buried in the same soil trench. The stainless steel lines are double (pipe in pipe) pipe construction.

Location: The pipeline is located west of Camden Ave. The pipeline exits the east side of the Plutonium Finishing Plant security fence and runs north to enter the west side of the 241-TX Tank Farm.

Process Description: The pipeline transported waste from tank D-5, in 241-Z tank farm to the 244-TX Double Contained Receiver Tank (DCRT) in the 241-TX tank farm.

Related Sites/ Structures: The pipeline is associated with the 241-Z tank farm and the 244-TX DCRT in the 241-TX tank farm.

Code: 200-W-179-PL

Classification: Accepted

Names: 200-W-179-PL; Lines SL100, SL101, SN216/281 and DR327; Pipelines Between 241-S-152 Diversion Box and 241-U Tank Farm

Reclassification: None

Type: Direct Buried Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: The waste site is four carbon steel lines buried in the same soil trench. Two lines (SL100 and SL101) are 5 centimeter diameter pipes double contained inside 10 centimeter (4 inch) diameter pipes. Two lines (SN216/281 and DR327) are 7.6 centimeter (3 inch) diameter pipes double contained within 15 centimeter (6 inch) diameter pipes.

Location: The pipelines extend north from 241-S Tank farm to 241-U tank farm, along the east side of Cooper Ave.

Release Description: In 1980, unplanned release number UPR-200-W-115 was assigned to the surface soil contamination along this pipeline.

Code: 200-W-180-PL

Classification: Accepted

Names: 200-W-180-PL; Pipelines from 221-T to 216-T-1

Reclassification: None

Ditch

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: The waste site is an underground, 20 centimeter (8 inch) diameter, vitrified clay pipe that fed the 216-T-1 ditch. The vitrified clay pipes extending out of the 221-T building are smaller diameter (10 centimeter (4 inch) and 15 centimeter (6 inch). A 10 centimeter (4 inch) diameter cast iron pipe from the 277-T building connects to the main vitrified clay line (see subsite).

Location: The pipeline to the 216-T-1 ditch extends north from the northwest corner of the 221-T facility.

Related Sites/ Structures: The pipeline is associated with the 221-T and 277-T buildings and the 216-T-1 ditch.

This Site has the Following SubSites:

Code: 200-W-180-PL:1

Names: 200-W-180-PL:1; VCP Pipeline

Code: 200-W-180-PL:2

Names: 200-W-180-PL:2; Cast Iron Pipe

Code: 200-W-180-PL:1

Classification: Accepted

Names: 200-W-180-PL:1; VCP Pipeline

Reclassification: None

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: Subsite 1 is the main 8 inch VCP pipeline that fed the 216-T-1 ditch and the two smaller diameter VCP pipes (6 inch and 4 inch) that exit the 221-T building.

The SubSite is Part Of:

Code: 200-W-180-PL

Names: 200-W-180-PL; Pipelines from 221-T to 216-T-1 Ditch

Code: 200-W-180-PL:2

Classification: Accepted

Names: 200-W-180-PL:2; Cast Iron Pipe

Reclassification: None

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: Subsite 2 is the 4 inch diameter cast iron pipe from 277-T to the main VCP ditch pipeline.

The SubSite is Part Of:

Code: 200-W-180-PL

Names: 200-W-180-PL; Pipelines from 221-T to 216-T-1 Ditch

Code: 200-W-181-PL

Classification: Accepted

Names: 200-W-181-PL; Lines V426, V427 and V428/V461; Transfer Lines Between 241-U-152 and 241-U-153 Diversion Boxes

Reclassification: None

Type: Direct Buried Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: soil trench.

Location: The lines are located west of U Plant at the intersection of 16th Street and Camden Ave. The lines extend from 241-U-152 Diversion Box, located outside the tank farm, to 241-U-153 Diversion Box, located inside the 241-U tank farm fence. The lines cross under Camden Ave.

Related Sites/ Structures: The lines are associated with 241-U-152 and 241-U-153 diversion boxes.

Code: 200-W-182-PL **Classification:** Accepted

Names: 200-W-182-PL; Encased Transfer Lines Between 241-U-152 Diversion Box and 241-TX-152 and 241-TX-155 Diversion Boxes; Lines V398, V404 and V410 **Reclassification:** None

Type: Encased Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is three underground, 7.6 centimeter (3 inch) diameter, stainless steel lines in the same concrete encasement.

Location: The lines are located on the east side of Camden Ave., west of the 216-U-14 ditch. They extend between the 241-U-152 Diversion Box and the 241-TX-152 and 241-TX-155 Diversion Boxes.

Related Sites/ Structures: The lines are associated with 241-U-152, 241-TX-152 and 241-TX-155 diversion boxes.

Code: 200-W-183-PL **Classification:** Accepted

Names: 200-W-183-PL; Lines V422/V452 and V421/V453; Transfer Lines Between 241-U-151 and 241-U-152 Diversion Boxes **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is two, 7.6 centimeter (3 inch) diameter, carbon steel lines buried in the same soil trench. Each line is double contained inside a 15 centimeter (6 inch) diameter pipe.

Location: The lines are located near the intersection of 16th Street and Camden Ave. They extend between the 241-U-151 and 241-U-152 diversion boxes.

Related Sites/ Structures: The lines are associated with the 241-U-151 and 241-U-152 Diversion Boxes.

Code: 200-W-184-PL **Classification:** Accepted

Names: 200-W-184-PL; 241-U-152 and 241-U-153 Diversion Boxes to 241-U-301 Catch Tank; Drain Lines from 241-U-151; Line V478 **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 10 centimeter (4 inch) diameter, carbon steel pipeline that connects the 241-U-151, 241-U-152 and 241-U 153 Diversion Boxes to the 241-U-301 Catch Tank. Individual 10 centimeter (4 inch) diameter drain lines from the three diversion boxes

connect to the same 10 centimeter (4 inch) diameter pipeline to the catch tank.

Location: The pipeline is near the corner of 16th Street and Camden Ave. It crosses under Camden Ave. Approximately one third of the drain line is located outside of the 241-U Tank Farm, east of the tank farm fence. Approximately two thirds of the pipeline is located inside the 241-U Tank Farm fence.

Process Description: The pipeline provided diversion box drainage to the 241-U-301 catch tank.

Related Sites/ Structures: The pipeline is associated with the 241-U-151, 241-U-152 and 241-U-153 Diversion Boxes and the 241-U-301 Catch Tank.

Code: 200-W-185-PL **Classification:** Accepted

Names: 200-W-185-PL; Lines V450 and V451; Transfer Lines Between 241-U-151 and 241-U-153 Diversion Boxes **Reclassification:** None

Type: Direct Buried Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is two underground, 9 centimeter (3.5 inch) diameter, stainless steel lines buried in the same soil trench.

Location: The lines are located near the corner of 16th Street and Camden Ave. The lines cross under Camden Ave. A portion of these lines is located inside the 241-U Tank Farm.

Process Description: The lines transferred waste between the 241-U-151 and 241-U-153 Diversion Boxes.

Related Sites/ Structures: The lines are associated with the 241-U-151 and 241-U-153 diversion boxes.

Code: 200-W-186-PL **Classification:** Accepted

Names: 200-W-186-PL; Lines 1006 and 1045; Transfer Lines from 240-S-152 Diversion Box to 204-S and 205-S **Reclassification:** None

Type: Encased Tank Farm Pipeline **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground concrete encasement that contains two 9 centimeter (3.5 inch) diameter stainless steel pipelines.

Location: The pipelines originate north of the REDOX, at the 240-S-152 Diversion Box. The extend eastward and connected to the 204-S and 205-S facilities.

Process Description: The pipeline transferred waste from the 240-S-152 Diversion Box to the 205-S process cell. Line 1045 was rerouted to connect directly to the 204-S facility.

Related Sites/ Structures: The pipelines are associated with 240-S-152 Diversion Box and the 204-S and 205-S facilities.

Code: 200-W-187-PL **Classification:** Accepted

Names: 200-W-187-PL; Lines V552, V553 and V555; **Reclassification:** None

Code: 200-W-192-PL **Classification:** Accepted

Names: 200-W-192-PL; Pipeline from 221-U, 222-U and 224-U to the 207-U Retention Basin; U Plant Process Sewer **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The majority of the waste site is an underground, 61 centimeter (24 inch) diameter, vitrified clay pipe that carried waste from U Plant operations to the 207-U Retention Basin. A 61 centimeter (24 inch) cast iron line from 221-U, two 25 centimeter (10 inch) cast iron lines and a 10 centimeter (4 inch) diameter steel line from 224-U feed the main VCP process sewer.

Location: The pipeline is located west of U Plant and north of 16th Street.

Process Description: The 207-U basin received process sewer waste from the 221-U Building and the 224-U Building through this pipeline.

Related Sites/ Structures: The pipeline is associated with the U Plant facilities and the 207-U Basin.

This Site has the Following SubSites:

Status: Inactive **End Date:**

Description: The waste site is an underground, 9 centimeter (3.5 inch) diameter, stainless steel pipeline from

Description: the 241-U-361 Settling Tank to the 216-U-1 and 216-U-2 cribs.

Location: The pipeline is located south west of 221-U and north of 16th Street.

Related Sites/ Structures: The site is associated with 224-U, 221-U and 241-U-361.

Code: 200-W-195-PL **Classification:** Accepted

Names: 200-W-195-PL; Pipeline from U Plant (224-U) to 216-U-17 Crib **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 10 centimeter (6 inch diameter), polyethylene pipeline that fed the 216-U-17 crib.

Location: The pipeline is located east of U Plant. Most of it is north of 16th Street. It crosses under Beloit Ave.

Related Sites/ Structures: The pipeline is associated with 224-U and the 216-U-17 crib.

Code: 200-W-196-PL **Classification:** Accepted

Names: 200-W-196-PL; Pipelines from Railcar Unloading Stations to 216-T-34 Crib **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is two parallel underground pipelines that extend from railcar Unloading Stations 1 and 2 to the 216-T-34 crib. The two lines are buried in the same soil trench. One of the pipelines is constructed of 20 centimeter (8 inch) diameter vitrified clay. The other pipeline is constructed of 15 centimeter (6 inch) diameter polyvinyl chloride. The railcar unloading stations are WIDS sitecode 200-W-21.

Location: The pipelines are located west of T Plant, near the railroad tracks that led into the T Plant area. Railcar Unloading Stations 1 and 2 (see sitecode 200-W-21) were located on the railroad tracks. The pipelines extend from the unloading stations to the crib.

Process Description: The railcar unloading stations were used to unload 300 Area liquid laboratory waste sent in railroad tanker cars from the 340 Facility. The waste was pumped into the adjacent 216-T-34 and 216-T-35 Cribs.

Related Sites/ Structures: The pipelines are associated with sitecodes 200-W-21 and 216-T-34 and 216-T-35 cribs.

Code: 200-W-197-PL **Classification:** Accepted

Names: 200-W-197-PL; Pipelines from Railcar Unloading Stations to 216-T-35 Crib **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is two parallel underground polyvinyl chloride pipelines that extend from the

216-T-34 crib pipeline to the 216-T-35 crib. The two lines are buried in the same soil trench. One of the pipelines is constructed of 20 centimeter (8 inch) diameter polyvinyl chloride. The other pipeline is constructed of 15 centimeter (6 inch) diameter polyvinyl chloride.

Location: The pipelines are located west of T Plant, near the railroad tracks that led into the T Plant area. Railcar Unloading Stations 1 and 2 (see sitecode 200-W-21) were located on the railroad tracks. The pipelines extend west from the 216-T-34 crib feed lines (see 200-W-196-PL).

Process Description: The railcar unloading stations were used to unload 300 Area liquid laboratory waste sent in railroad tanker cars from the 340 Facility. The waste was pumped into the adjacent 216-T-34 and 216-T-35 Cribs.

Related Sites/ Structures: The pipelines are associated with the 216-T-34 crib pipeline (sitecode 200-W-196-PL) and the 216-T-35 crib.

Code: 200-W-198-PL **Classification:** Accepted

Names: 200-W-198-PL; Pipelines from Truck Unloading Station to 216-T-34 and 216-T-35 Cribs **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 15 centimeter (6 inch diameter), polyvinyl chloride pipeline from the truck unloading station to the lines that fed the 216-T-34 and 216-T-35 cribs.

Location: The pipeline is located near the northwest corner of the 216-T-34 crib.

Process Description: Tank trucks of waste emptied into the truck unloading station that fed the 216-T-34 and 216-T-35 cribs.

Related Sites/ Structures: The pipeline is associated with the Truck Unloading Station near 216-T-34 crib and the 200-W-197-PL pipeline.

Code: 200-W-199-PL **Classification:** Accepted

Names: 200-W-199-PL; Pipelines from Building 231-Z to 231-W-151 Vault **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is three underground, 7.6 centimeter (3 inch) diameter, stainless steel pipelines that fed the 231-W-151 vault. The three lines are direct buried in the same soil trench.

Location: The waste site is located east of the 231-Z building.

Related Sites/ Structures: The pipelines are associated with the 231-Z facility, the 231-W-151 vault and 200-W-200-PL.

Code: 200-W-200-PL **Classification:** Accepted

Names: 200-W-200-PL; 216-Z-16 Crib Pipeline **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: 231-Z building to the 216-Z-16 crib. The majority of the pipeline is 10 centimeters (4 inches) in diameter. A short length of pipe is 7.6 centimeters (3 inches) in diameter.

Location: The pipeline extends north and west of the 231-Z building.

Related Sites/ Structures: The pipeline is associated with the 231-Z building, 200-W-199-PL and the 216-Z-16 crib.

Code: 200-W-201-PL **Classification:** Accepted

End Date:

The SubSite is Part Of:

Code: 200-W-205-PL

Names: 200-W-205-PL; Pipelines from 235-5Z to 241-Z-8 Silica Storage Tank and 216-Z-8 French Drain

Code: 200-W-206-PL

Classification: Accepted

Names: 200-W-206-PL; Pipelines from 234-5Z to 216-Z-9 Crib

Reclassification: None

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: The waste site is two underground, 3.8 centimeter (1.5 inch) diameter stainless steel pipes that connected the 234-5Z building with the 216-Z-9 crib.

Location: The pipeline is located east of the Plutonium Finishing Plant main building. It extends beyond the double security fence.

Related Sites/ Structures: The waste site is associated with the 216-Z-9 crib and also the 200-W-205-PL pipeline (the pipeline to the 241-Z-8 tank).

Code: 200-W-207-PL

Classification: Not Accepted

Names: 200-W-207-PL; 216-Z-19 and 216-Z-20 Ditches; Z Plant Radioactive Process Sewer to 216-Z-11

Reclassification: None

Type: Radioactive Process Sewer

Start Date:

Status: Not Specified

End Date:

Description: This pipeline has been split into two separate waste sites (200-W-207-PL-A - Inactive portion and 200-W-207-PL-B - Active portion). The original waste site was multiple branches of underground vitrified clay pipe that connected to manholes that originally discharged to the 216-Z-1, 216-Z-11 and 216-Z-19 ditches and the 216-Z-20 tile field.

Location: The process sewer lines extends south from the 234-5Z building and east to the 216-Z-1, 216-Z-11 and 216-Z-19 ditches. The pipeline was later diverted to the 216-Z-20 tile field.

Process Description: Many of the process sewer branches are active and were connected to the Treated Effluent Disposal Facility (TEDF) system in 1995. (see H-2-140332 and H-2-140336). Parts of the process sewer were lined before connecting to the TEDF system. Some branches of the sewer are not radiologically contaminated, but other portions are known to have carried radioactive waste.

Related Sites/ Structures: The process sewer lines are associated with the 216-Z-1, 216-Z-11 and 216-Z-19 ditches and the 216-Z-20 tile field.

This Site has the Following SubSites:

Code: 200-W-207-PL:1

Names: 200-W-207-PL:1; Process Sewer Main Pipeline

Code: 200-W-207-PL:2

Names: 200-W-207-PL:2; Process Sewer Branch from 236-Z to Manhole 7

Code: 200-W-207-PL:3

Names: 200-W-207-PL:3; Acid Waste Line to Manhole 3

Description: The waste site is three underground pipelines associated with the 207-Z Retention Basin. One 20 centimeter (8 inch) diameter carbon steel pipe extends from 234-5Z to the Retention Basin. One 15 centimeter (6 inch) diameter carbon steel pipe extends from the retention basin to the 241-Z-361 settling tank. One 15 centimeter (6 inch) diameter pipe extends from the 207-Z retention basin to Manhole #7 and flows into the process sewer (200-W-207-PL).

Location: The 207-Z Retention Basin is located southeast of the 234-5Z building and east of the 241-Z facility.

Related Sites/ Structures: The pipelines are associated with 241-Z-361, 234-5Z building and 200-W-207-PL.

This Site has the Following SubSites:

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: The waste site is an underground, 20 centimeter (8 inch) diameter stainless steel pipeline extending from the 241-Z-361 settling tank to the 216-Z-1, 216-Z-2 and 216-Z-1A. A 20 centimeter (8 inch) diameter vitrified clay pipe feed line branches off to the 216-Z-3 crib. Another 20 centimeter (8 inch) diameter vitrified clay pipe is a crib overflow line from 216-Z-3 crib to 216-Z-1A (see subsites).

Location: The pipelines are located south of the 234-5Z facility. The majority of the lines are located south of the PFP security fence.

Related Sites/Structures: The pipeline is associated with the 241-Z-361 settling tank, the 216-Z-1, 216-Z-2 and 216-Z-3 cribs and the 200-W-58 diversion box (diversion box #1). 200-W-174-PL tees off this pipeline.

Code: 200-W-212-PL

Classification: Accepted

Names: 200-W-212-PL; Encased Transfer Line from 240-S-151 Diversion Box to Pipeline 200-W-153-PL; Lines V550, V551, V544, V546, V548 and V549

Reclassification: None

Type: Encased Tank Farm Pipeline

Start Date:

Status: Inactive

End Date:

Description: The waste site is a six line, concrete encasement from the 240-S-151 Diversion Box. Three lines (V546, V549, V551) are stubbed off and were never used. The other three lines (V544, V548 and V550) connect to a reducer, where the three lines become one line. The three lines carried REDOX steam condensate waste. They exit the encasement and feed into 200-W-153-PL.

Location: The pipeline is located northwest of 202-S. It extends west from the 240-S-151 Diversion Box.

Process Description: Lines V546, V549 and V551 were stubbed off and never used. Lines V544, V548 and V550 transferred REDOX steam condensate waste. They tied into a 10 inch line that sent waste to 216-S-6 Crib.

Related Sites/ Structures: The pipeline is associated with the 240-S-151 Diversion Box, 2904-S-171, 216-S-6, 216-S-17 and pipeline 200-W-153-PL.

Code: 200-W-213-PL

Classification: Accepted

Names: 200-W-213-PL; Lines V795, V606 and V605; Pipelines from 241-TX-153 Diversion Box and 241-TX-302A to 216-T-19 Crib

Reclassification: None

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: The waste site is two underground stainless steel pipelines inside a concrete encasement. The lines transferred waste from the 241-TX-153 Diversion Box and the 241-TX-302A Catch Tank to the 216-T-19 crib.

Location: The pipeline is located west of Camden Ave. It extends south from inside the 241-TX tank farm at the 241-TX-153 Diversion box to the 216-T-19 crib.

Related Sites/ Structures: The pipeline is associated with the 241-TX-153 Diversion Box, the 241-TX-302A catch tank and the 216-T-19 crib.

This Site has the Following SubSites:

Code: 200-W-213-PL:1

Names: 200-W-213-PL:1; Two 3.5-Inch Diameter Stainless Steel Lines Encased in Concrete from 241-TX-153 DB and 241-TX-302A to 216-T-19 Crib

Names: 200-W-217-PL; Pipeline from the Counting Box to 216-U-7 French Drain

Reclassification: None

Type: Radioactive Process Sewer

Start Date:

Status: Inactive

End Date:

Description: The waste site is an underground, 7.6 centimeter (3 inch) diameter steel pipe that transferred waste from the Counting Box structure to the 216-U-7 French Drain.

Location: The pipeline is located on the southeast side of the 221-U Building near Section 6. It is northwest of the 241-UX-154 Diversion Box .

Related Sites/ Structures: The pipeline is associated with the 216-U-7 French Drain.

Code: 200-W-218-PL

Classification: Accepted

Names: 200-W-218-PL; Pipeline from 216-U-10 Pond to 216-U-9 Ditch

Reclassification: None

Type: Radioactive Process Sewer

Start Date:

Status: Inactive **End Date:**

Description: The waste site is an underground, 0.8 meter (30 inch) corrugated metal pipe that transferred waste from the 216-U-10 pond to the 216-U-9 ditch.

Location: The pipeline extends from the southwest corner of 216-U-10 pond. It crosses under 13th Street.

Related Sites/ Structures: The pipeline is associated with the 216-U-10 Pond and the 216-U-9 ditch.

Code: 200-W-219-PL **Classification:** Accepted

Names: 200-W-219-PL; 241-Z Primary Pipe Trench; Pipe Tunnel 3; Pipelines from 235-Z to the North Side of 241-Z **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is six underground stainless steel pipes inside a concrete encasement that transferred waste from 234-5Z to the 241-Z tanks. The pipe diameters range from 7.6 centimeters (3 inch) to 20 centimeters (8 inch).

Location: The pipelines inside an encasement, known as a pipe tunnel, that extends from the south wall of 234-5Z to the north side of 241-Z. They are located inside the PFP security fence.

Release Description: Between 11,400 liters (3,000 gallons) and 114,000 liters (30,000 gallons) of waste is estimated to have leaked into the concrete pipe trench and effected the soil below the trench. See sitecode 200-W-171.

Related Sites/ Structures: The pipeline is associated with the 241-Z tanks and Unplanned Release sitecode 200-W-171.

Code: 200-W-220-PL **Classification:** Accepted

Names: 200-W-220-PL; Pipeline from 241-Z to 241-Z-361 Settling Tank **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 15 centimeter (6 inch) diameter stainless steel pipe that transferred waste from the 241-Z tanks to the 241-Z-361 settling tank.

Location: The pipeline is located inside the PFP security fence. It extends from the south wall of the 241-Z tank pit to the 241-Z-361 Settling Tank.

Related Sites/ Structures: The pipeline is associated with the 241-Z Tank Pit and the 241-Z-361 settling tank.

Code: 200-W-221-PL **Classification:** Accepted

Names: 200-W-221-PL; Laundry Waste Crib (LWC) Pipeline **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 20 centimeter (8 inch) diameter vitrified clay pipe that fed the

Laundry Waste Crib (216-W-LWC). It also include the drain line from the Mask Cleaning Station (MO-412).

Location: The pipeline is located south of 20th Street and east of Beloit Ave.

Process Description: Pipeline 200-W-102-PL carried laundry waste to the 216-U-14 ditch. When the laundry effluent was diverted to the 216-W-LWC Crib in 1981, the 200-W-102-PL pipeline was plugged west of the manhole located north of the 2723-W building. The portion of the pipeline that was reused to transfer mask cleaning effluent from 2723-W and laundry waste from 2724-W to the 216-W-LWC (Laundry Waste Crib) became part of sitecode 200-W-221-PL.

Related Sites/ Structures: The pipeline is associated with 216-W-LWC (Laundry Waste Crib) and pipeline 200-W-102-PL.

Code: 200-W-222-PL **Classification:** Accepted

Names: 200-W-222-PL; 207-U Retention Basin Outlet Pipeline to the 216-U-14 Ditch **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 0.61 meter (2 foot) diameter vitrified clay pipe. The pipe carried effluent out of the 207-U Retention Basin to the 216-U-14 Ditch.

Location: The pipeline is located north of 16th Street and east of Camden Ave.. It extends from the west side of the 207-U Retention Basin.

Related Sites/ Structures: The pipe is associated with 207-U and 216-U-14 ditch.

Code: 200-W-223-PL **Classification:** Accepted

Names: 200-W-223-PL; Pipeline from 242-S Evaporator to 216-U-14 Ditch **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an underground, 0.61 meter (2 foot) diameter corrugated metal pipe that transferred effluent from the 242-S Evaporator building to the 216-U-14 ditch.

Location: The pipeline is located on the west side of Cooper Ave. It extends north from the 242-S Evaporator to the 216-U-14 ditch. It crosses under Cooper Ave.

Related Sites/ Structures: The pipeline is associated with the 216-U-14 ditch.

Code: 200-W-224-PL **Classification:** Accepted

Names: 200-W-224-PL; Pipeline from 234-5Z and 236-Z to West Side of 241-Z **Reclassification:** None

Type: Radioactive Process Sewer **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is four underground, 5 centimeter diameter (2 inch) stainless steel pipelines buried in the same soil trench. Each stainless steel line is encased inside a 15 centimeter (6

inch) diameter polyurethane pipe casing.

Location: The pipeline is located inside the Plutonium Finishing Plant security fence. It extends south from 234-5Z and connects to the west side of 241-Z.

Related Sites/ Structures: The pipeline is associated with 234-5Z, 236-Z, and 241-Z.

This Site has the Following SubSites:

Code: 200-W-230-PL **Classification:** Accepted
Names: 200-W-230-PL; Pipeline from Railroad Unloading Station to 276-S-141 and 276-S-142 Hexone Tanks **Reclassification:** None
Type: Radioactive Process Sewer **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is a series of underground carbon steel pipelines associated with the 276-S-141 and 276-S-142 hexone tanks. A 6 centimeter (2.5 inch) diameter carbon steel line extended from the railroad track to the tanks. A 6 centimeter (2.5 inch) diameter outlet line and a 5 centimeter (2 inch) diameter inlet line is associated with each tank.
Location: The pipeline is located northwest of the 202-S canyon building.
Process Description: The tanks stored various liquid mixed wastes until 1992, when most of the waste was transferred to tank cars for off-site incineration. From 1951 to 1967 the tank was used to store reagent-grade hexone for makeup as a solvent at REDOX. The hexone was delivered to REDOX in rail cars that were unloaded into the 276-S-141 and 241-S-142 tanks via underground lines at the railcar unloading station.
Related Sites/ Structures: The pipeline is associated with the 276-S-141 and 276-S-142 hexone tanks.

This Site has the Following SubSites:

Classification: Accepted

Names: 200-W-231; Temporary Facilities Construction Trailer Septic Tank and Tile Field

Reclassification: None

Type: Septic Tank

Start Date: 1/1/1951

Status: Inactive

End Date:

Description: The septic and tile field are not visible. They are not marked or posted. They were noticed on Hanford Site drawing H-2-2289. Exact coordinates are not available.

Location: The septic tank and tile field are located west of Camden Ave. and south of 23rd St. They are approximately 16.7 meters (55 feet) south of the 200-W-79-PL pipeline, the pipeline that feed the 216-T-36 crib.

Process Description: During the 1950's, many Temporary Construction buildings were set up to support construction activities. H-2-2289 was drawn in February 1951. It shows a septic tank and tile field that supported a Temporary Construction office and an X-ray laboratory. The Temporary construction facilities were supporting the construction of 241-TY Tank Farm.

Waste Type: Sanitary Sewage

Waste Description: H-2-2289 was drawn in February 1951. It shows a septic tank and tile field that supported a

Temporary Construction office and an X-ray laboratory. It is possible that x-ray development solutions were discharged to the septic system.

Code: 200-W-232 **Classification:** Accepted
Names: 200-W-232; 2607-WT Replacement Septic Tank and Dry Well **Reclassification:** None
Type: Septic Tank **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an underground septic tank.
Location: The septic tank and dry well are located east of the 241-TY Tank Farm, outside the tank farm fence.
Process Description: The 2607-WT septic system, located inside the tank farm fence, was abandoned. The new system was placed outside the tank farm fence. It consisted of a septic tank and a dry well. It serviced the 242-T Evaporator building.

Code: 200-W-234 **Classification:** Accepted (Proposed)
Names: 200-W-234; 291-U Sand Filter French Drain **Reclassification:** None
Type: French Drain **Start Date:**
Status: Inactive **End Date:**
Description: The french drain is a concrete pipe filled with gravel.
Location: The french drain is located adjacent to the southwest corner of the 291-U sand filter structure.
Process Description: The french drain received condensate drainage from the 291-U sand filter.
Related Sites/ Structures: This drain is associated with the 291-U Sand Filter (WIDS sitecode 200-W-44).

Code: 200-W-235-PL **Classification:** Accepted
Names: 200-W-235-PL; Pipeline from 241-SX-701 Building to S Pit; 200-W-162-PL Replacement Pipeline **Reclassification:** None
Type: Process Sewer **Start Date:** 1/1/1965
Status: Inactive **End Date:**
Description: There is no visual evidence of the pipeline on the surface. It is a 7.6 centimeter (3 inch) diameter, stainless steel pipe.
Location: The pipeline is located east of the 241-S Tank Farm perimeter fence.
Process Description: The pipeline carried effluent from the 241-SX-701 Compressor House to a pit located south of 241-S Tank Farm. The pit is WIDS sitecode 200-W-236.
Related Sites/ Structures: The pipeline is associated with the 241-SX-701 building, the 200-W-236 pit and the 200-W-162-PL pipeline.

Code: 200-W-236 **Classification:** Accepted
Names: 200-W-236; Pit South of 241-SX Tank Farm **Reclassification:** None
Type: Depression/Pit (nonspecific) **Start Date:**
Status: Inactive **End Date:**
Description: The pit is a large, irregular shaped depression.
Location: The pit is located south of the 241-SX tank farm, east of Cooper Ave.
Process Description: Drawing H-2-33593 shows a 3 inch steel line extending from the 241-SX-701 Compressor House to the pit. A note on the drawing says "Discharge to existing pit". This pipeline replaced the pipeline that had sent compressor house effluent to the 241-SX-2 crib (see 200-W-162-PL).
Related Sites/ Structures: The pit is associated with the 200-W-235-PL pipeline.

Code: 200-W-237 **Classification:** Accepted
Names: 200-W-237; Effluent Pond South of T Plant **Reclassification:** None
Type: Pond **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is square, open excavation was visually apparent in January 2011. It is surrounded by several orange stakes. The top of the square excavation is estimated to be approximately 15 by 15 meters (50 by 50 feet) and 1.2 meters (four feet) deep. A grey polyvinyl chloride pipe is visible extending into the excavation in the northeast corner of the hole.
Location: The square excavation is located about 6 meters (20 feet) south of 23rd Street, near Beloit Ave. in 200 West Area.
Process Description: The excavation is labeled "Pond" on H-2-44511, sheet 132. However, the excavation was never assigned a Hanford liquid waste site number. Cribs, ponds and ditches in the 200 Areas were usually assigned a number that began with 216, indicating it was a liquid waste site in the 200 Area (116 indicates a liquid waste site in 100 Areas and 316 indicates a liquid waste site in 300 Area). Since it was not assigned a number, it is possible it was built but never put into service. H-2-44511, sheet 132 says the drain line has been plugged and abandoned.
Related Sites/ Structures: The excavation is fed by a 4 inch PVC pipeline that originates at the 224-T building.

Code: 200-W-238 **Classification:** Accepted
Names: 200-W-238; Large Diameter French Drain North of 241-U **Reclassification:** None
Type: French Drain **Start Date:**
Status: Inactive **End Date:**
Description: The french drain is surrounded with chain and a sign that reads "MISF Area, No Vehicles or Storage, Contact Shift Office prior to Entry". The blue building in the background (inside the tank farm fence) is the 241-U-271 Control House. MISF means Miscellaneous Isolated Storage Facility.

Location: The large diameter french drain is located in 200 West Area, on the west side of Cooper Ave.

Location: adjacent to the north side of the 241-U Tank Farm fence.

Process Description: Drawings H-2-40093 and H-2-40241 show this french drain is connected to the 241-U-271 Control House mechanical equipment room via a 15 centimeter (6 inch) diameter vitrified clay pipeline encased in concrete.

Code: 200-W-239 **Classification:** Accepted

Names: 200-W-239; 211-U, 211-UA Post Remediation Posted Underground Radioactive Material Area **Reclassification:** None

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an irregularly shaped, posted Underground Radioactive Material Area (URMA). The area was defined after the 211-A and 211-UA tank farms were demolished in 2009.

Location: The area is located on the northwest side of 221-U. It is west of Beloit Ave. and north of 16th Street.

Related Sites/ Structures: The demolished tank farm and resulting URMA are associated with 221-U.

Code: 200-W-240 **Classification:** Accepted

Names: 200-W-240; Contaminated Rabbit Feces Area South and West of 272S **Reclassification:** None

Type: Contamination Migration **Start Date:**

Status: Not Specified **End Date:**

Description: The waste site is a large area posted with Contamination Area signs. Contaminated rabbit feces have been found in this area.

Location: The waste site is located on the south and west sides of the 272-S building, on the west side of Cooper Ave. in 200 West Area.

Code: 200-W-241 **Classification:** Accepted

Names: 200-W-241; Contaminated Tumbleweed Fragment Areas West of Cooper Ave. **Reclassification:** None

Type: Contamination Migration **Start Date:**

Status: Not Specified **End Date:**

Description: The waste site is multiple posted Contamination Areas. The areas contain contaminated tumbleweeds and contaminated tumbleweed fragments. One area surrounds several connex boxes and one is located on the north side of the MO-027 trailer. A large posted contamination area extends northward from the MO-633 trailer, into the vacant property. Tumbleweeds are visible beneath the MO-633 trailer.

Location: The areas are located on the west side of Cooper Ave., west of the 242-S Evaporator building.

Code: 200-W-242 **Classification:** Accepted

Names: 200-W-242; Area of Debris and Subsurface **Reclassification:** None

Anomalies on Unused Portion of 218-W-4C
Annex site

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The waste site is an area of partially buried and surface debris. A large lag bolt and a crushed 8 inch diameter pipe were identified.

Location: The debris area is located west of Dayton Ave and north of 16th Street. It is located in northern part of the unused portion of the 218-W-4C Burial ground, known as the 218-W-4C Annex.

Related Sites/ Structures: This area is associated with the unused portion of the 218-W-4C Burial ground, known as the 218-W-4C Annex.

Code: 200-W-243

Classification: Accepted

Names: 200-W-243; Lead Slag near 2727-WA Sodium Storage Building

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The waste site is scattered fragments of lead slag in gravel and soil. The area has been estimated to be 200 feet long by 100 feet wide.

Location: The lead slag area is along an unnamed gravel access road, north of 16th Street, north of the 2727-WA building. It is near a railroad track.

Process Description: The small pieces of lead may be "drips" of lead from old welding operations that were done many years ago, perhaps in the late 1940's or 1950's. A discarded welding rod was found in this area.

Code: 2607-W13

Classification: Discovery

Names: 2607-W13; Construction Trailers Septic; JA Jones/Kaiser Constriction Trailers Septic

Reclassification: None

Type: Septic Tank

Start Date:

Status: Inactive

End Date:

Location: The septic tank is supposed to be located north of 19th Street and west of Beloit Ave, in the Construction Trailer area.

Process Description: There is very little information documented for this septic system.

Code: 2607-W16

Classification: Accepted

Names: 2607-W16; Large Onsite Sewer System (LOSS); 200 West Area Regional Wastewater System

Reclassification: None

Type: Septic Tank

Start Date: 1/1/2003

Status: Active

End Date:

Description: The waste site is an active septic system. The septic tile field is marked and posted.

Location: The septic system is located east of Bridgeport Ave. and north of 20th Street. It is northwest of

the 284-W Powerhouse.

Process Description: The 2607-W16 sanitary septic system was installed to receive the waste volume that was overwhelming the 2607-W1 system. The entire Plutonium Finishing Plant (PFP) sanitary waste volume was redirected to the 2607-W16 sanitary system. An average flow of 6845 gallons per day is sent to the 2607-W16 septic system.

Related Sites/ Structures: This septic system is associated with 2607-Z1 and 2607-W1.

Waste Type: Sanitary Sewage

Waste Description: The entire Plutonium Finishing Plant (PFP) sanitary waste volume was redirected to the 2607-W16 sanitary system. An average flow of 6845 gallons per day is sent to the 2607-W16 septic system.

Code: 2607-WUT **Classification:** Accepted

Names: 2607-WUT; 2607-WUT Septic Tank and Tile Field **Reclassification:** None

Type: Septic Tank **Start Date:** 1/1/1951

Status: Inactive **End Date:**

Description: The 2607-WUT Septic Tank is constructed of steel and includes a drain field. It is surrounded with an "L" shaped chained area and signs that read Sanitary Tile Field. There is a depressed area on the east end, inside the chain, that indicates a cave-in has occurred over the tile field. There is also a corrugated metal caisson, posted with a Confined Space sign, in the northwest corner of the chained tile field.

Location: This unit is located north of the 241-U Tank Farm.

Process Description: The 2607-WUT Septic Tank and drain field were designed to accept sanitary sewer effluent from the associated structures. H-2-40241 states that it is fed by a 15.2 centimeter (6 inch) vitrified clay pipe that is encased in concrete.

Related Sites/ Structures: The 2607-WUT Septic Tank is associated with the 241-U-271 Control House.

Waste Type: Sanitary Sewage

Waste Description: The current flow rates for the 2607-WUT septic system are unknown. This system received sanitary sewer effluent at an estimated rate of 36 cubic feet (1.02 cubic meters) per day in 1987.

Code: 300-37 **Classification:** Accepted

Names: 300-37; PCB Leak to Soil Adjacent to 335A **Reclassification:** Closed Out (1/27/1999)

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: The site was a polychlorinated biphenyl (PCB) leak that contaminated the soil. The leak originated from a rectifier located on a concrete pad outside of the 335-A Building. The rectifier was installed in the early 1970's, but was never activated. There are no signs marking the location of the rectifier. The site can only be determined by the use of detailed maps and archive photographs.

Location: The site is located in the 300 Area, in a gravel area on the north side of building 336. The site is

located inside a fenced area, with the gate open.

Release Description: The polychlorinated biphenyl (PCB) leakage was first identified in April 1993 by the Electrical Utilities personnel. The leakage was observed at two fittings, one being the lower drain valve located near the edge of the concrete pad. The leaks appeared to be small and old, presumably pre-1987. The leaking fittings were covered over with a dirty grease-like coating. There was no visual evidence of oil on the concrete pad or soil surrounding the pad. In addition, there was no distinctive PCB odor at the leak site. The site was immediately roped off and plans for removal of the PCBs were initiated.

Related Sites/ Structures: The site was associated with a rectifier, which has been removed.

Waste Type: Oil

Waste Description: The waste was soil contaminated with polychlorinated biphenyls.

Closure Info: The rectifier was drained on August 2 and 4, 1993. The fluid contained a PCB level of 680,000 parts per million. The amount of oil in the rectifier at delivery was indicated on the unit at 6,113 liters (1,615 gallons). The amount of fluid removed, approximately 5,867 liters (1,550 gallons), was consistent with the fill data provided on the unit. The 246 liter (65 gallon) differential is typical of the quantity of oil that can not be removed from the rectifier cooling coils. This fluid and the drained rectifier were shipped off site to a licensed PCB disposal facility. After removal of this material, the concrete pad was smeared and PCB contamination of 12,000 parts per million was found in the area below the suspect fittings.

On July 19, 1994 the concrete pad was removed, packaged into drums and shipped off site for disposal as PCB contaminated waste. Crews also removed soil, approximately 2.4 meters by 2.4 meters by 0.3 meters (8 feet by 8 feet by 1 foot) deep, and sampled this soil for PCBs.

The soil was also visually inspected during removal. There was no visual evidence of oil in the soil, nor was the distinctive PCB odor present.

The soil sample results were erroneously read as 140 and 190 parts per million but were actually reported parts per billion. Since these analyses are normally reported in parts per million, the results interpreted as parts per million values warranted more sampling. Another 0.3 meters (1 foot) of soil was removed and sampled. (See sample results section.)

The PCB Case Reviewer for the EPA (Environmental Protection Agency) agreed that appropriate action had taken place, and from a Toxic Substances Control Act (TSCA) standpoint, regulations were met as long as the soil was less than 10 parts per million PCBs at a depth of 25 centimeters (10 inches) below the surface.

Code: 300-231	Classification: Accepted
Names: 300-231; Substation C3-S15; Vitrification Test Site Transformer Pad	Reclassification: Closed Out (5/26/1999)
Type: Electrical Substation	Start Date: 1/1/1983
Status: Inactive	End Date: 1/1/1999

Description: The site was a transformer station connected to a 13.8 KVA overhead powerline. The transformers have been removed. The transformers were used to provide electricity for in-situ vitrification tests at the 300 Vitrification Test Site (300 VTS), a separate WIDS site. The transformers were located on a concrete pad and enclosed by a chain link fence. The transformers were numbered as follows: transformer #C4804P, serial #81439, property

#F176743; transformer #C4805P, serial #81441, property #176744; transformer #C4648P, serial #80097, property #176745. The transformers were single phase 200 KVA. The primary voltage for each of the transformers was 14400 and secondary voltage was 240/480. Each transformer weighed 544 kilograms (1200 pounds). Electric fluid capacity was 492.1 liters (130 gallons) and the fluid type was mineral oil.

Location: The transformer pad is located in the southeast corner of the 300 Vitrification Test Site, west of Route Four South, across from the 300 Area.

Release Description: The operating records for the transformers document releases of transformer oil to the exteriors of the units (see Site Comment). The records do not document any releases to the transformer pad or the surrounding soil

Process Description: In-situ vitrification (ISV) was a thermal treatment process that converted contaminated soils and sludges into a glass and crystalline product. An electrical current was passed among an array of four electrodes imbedded in the contaminated soil or sludge, melting and glassifying it.

Related Sites/Structures: The transformer pad was related to the 300 Vitrification Test Site (300 VTS) and the associated Thermal Treatment and Test Facilities (TTTF).

Waste Type: Transformer

Waste Description: The transformers have been removed (5/13/1999). The concrete pad and the surrounding soils are clean. The only remaining waste is the abandoned concrete pad and fence.

Historical data showed that all three transformers were sampled for polychlorinated biphenyls (PCBs) on 8/18/86. Analysis on C4804P indicated 98 parts per million of PCB. Analysis on C4805P indicated 90 parts per million of PCB. Analysis on C4648P indicated 92 parts per million of PCB.

Closure Info: As of 5/13/1999, the transformers had been disconnected and removed from the site. The enclosure associated with the transformers is empty, and the concrete pad is clean.

Code: 300-277	Classification: Accepted
Names: 300-277; 300 Area Queue Contamination	Reclassification: None
Type: Unplanned Release	Start Date:
Status: Inactive	End Date:

Code: 300-279	Classification: Accepted
Names: 300-279; 3716 Automotive Repair Building Fuel Tanks	Reclassification: None
Type: Storage Tank	Start Date:
Status: Inactive	End Date:

Description: This feature consists of the historical location of underground diesel and gasoline storage tanks that were located to the north of the original 313 Bldg. (M-2885 sheet 1 rev 0), and east of the original 3716 Automotive Repair Bldg. location. The northern expansion of the 313 Bldg. was over this area where the tanks were located.

Location: This historical feature is located within WIDS site UPR-300-38 (Accepted), which is contaminated soil beneath the 313 Building, as well as the concrete foundation. The full extent of contamination of UPR-300-38 will not be determined until the 313 Building foundation has been removed and soil remediation occurs. The contamination resulted from multiple unplanned

release events. With the exception of the fuel tanks, the soil contamination is beneath the southern half of the 313 Building. The fuel contamination, if any, would lie in the northern expansion on the eastern side of the building; the 313 Building is located at the north end of the main 300 Area (within the security fence). It is located north of Ginko Street, east of the 303K, 305, and 314 Buildings, and west of the 3712 and 3720 Buildings.

Process Description: Concurrently with the construction of the 313 Building in the 1940's there was a fuel station built to the north of the 313 Building (M-2885 sheet 1 rev 0). The site was used to dispense both gasoline and diesel fuels to power the various pieces of machinery and vehicles used on site for construction (19450108 98026_ [N1619631] and 19450108 P8027_ [N1619634]). The fuel pumps were on a concrete island and were associated with two underground tanks. This fuel station was used until 1947. The following is from Volume 22 of HAN-27990 page 27: "Removed 1947, one gas pump now located at 301 Bldg., one underground tank located at 301 Bldg. Disposition of one gas pump and one underground tank not known." Based on this information, one pump and one tank were

removed and were relocated to the 301 Building. It is not certain if the second tank was removed or not, or if there were any spills or leaks at the site. This work was performed in 1947 prior to the 1950's when the 313 Building was expanded in the northward direction over the site of the two tanks.

WIDS site UPR-300-38 is at the former site of the 313 building. The site 300-279 concerns soil contamination still under the building foundation. The building was demolished in 2005 and the foundation slab was left in-place with a clean gravel layer over it (BHI-01781).

Related Sites/ Structures: 313 Building

Code: 300-280	Classification: Accepted
Names: 300-280; Construction Debris Disposal Pit West of George Washington Way Extension	Reclassification: None
Type: Dumping Area	Start Date:
Status: Inactive	End Date:

Description: The construction debris disposal pit was a rectangular 13 m by 38 m (42 ft by 124 ft) pit aligned northwest to southeast with a 6 m (20 ft) wide gravel road ramping into the northwest end of the pit (M-3904, sheet 16, rev 1).

Location: The disposal pit was located on the west side of the George Washington Extension about 55 m (180 ft) south of the intersection with Cypress Street. It is immediately east of the 300-217 laydown yard.

Process Description: The disposal pit appears to have been used for construction debris during the construction of the 309 Facility in the late 1950's (photo 16998-3).

An interpreted area of buried debris is supported by all the geophysical data sets. The area correlates well with a construction pit shown on Dwg. M-3904 Sht. 16 Rev 1. The trench strikes NW-SE and is about 18-m wide and 35-m long and is roughly centered at N115476/E594298. There is about 0.4-m of overburden above the debris. Several utilities were detected and noted on the interpretation map. Some of the linears/utilities closely border the trench boundaries and should be more thoroughly defined before excavating in this area.

Related Sites/ Structures: Construction debris was associated with the construction of the 309 Building.

Structures.

Code: 300-281 **Classification:** Accepted

Names: 300-281; Septic Tank Near 325 Building **Reclassification:** None

Type: Septic Tank **Start Date:**

Status: Inactive **End Date:**

Description: This is the suspected site of a septic tank that was shown on a drawing (H-3-45154). The drawing calls for removal of the septic tank. However, the entire drawing was placed on hold for future construction and it is unclear if the septic tank was ever removed. The drawing was for a facility that was never built.

Location: The septic is located about 72 meters (236 feet) north of the 3790 building between the north end of the parking lot and the security fence surrounding the 325 building.

Process Description: The source of sanitary waste going to the septic tank has not been determined. However, aerial photographs (16998-1 & 18601-3) taken during the construction of the 309 Facility show a temporary construction building located at the approximate location of the septic tank. This temporary building may have discharged sanitary water to the septic tank. The only drawing (H-3-45154) showing the tank has a sanitary sewer line running north about 8 meters where it tees and then runs east-west where the lines end at sewer clean-outs.

A geophysical investigation was performed in the area of the suspected septic tank. The results were inconclusive (CCN# 0596714). A field walkdown identified a pipe with a plug in it (see photograph DSC02267) as a suspected clean-out. A 1 meter (3 ft) capped vertical 2 inch diameter steel pipe, that was painted yellow, may be a location marker (see logbook EL-1616-02 and photograph number DSC02267).

Code: 300-284 **Classification:** Accepted

Names: 300-284; Sand Blasting Area Near 3221 Building **Reclassification:** None

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: This feature is the historical location of the sand blasting area associated with the former 3221 building location.

Location: The central point of the sand blasting site lies at approximately (E) 594109.22, (N) 116125.96, which is a fenced area on the south side of the 3221 building.

Process Description: The site and associated 3221 building was used for the sand blasting of various items preparatory to these items being painted (DOE/RL-2004-77 Rev.1, Draft A).

Code: 300-283 **Classification:** Accepted

Names: 300-283; Contaminated Light Water Disposal Site #2; Potential Trench Location #2 **Reclassification:** None

Type: Trench **Start Date:**

Status: Inactive **End Date:**

Description: The waste site is an intentional release to soil. The area is currently used as an entry road/parking lot for 300 Area D4 remediation activities

Location: This potential site location is approximately 155 meters (508 ft) southeast of the 309 building, 157 meters (515 ft) south of the 324 building and 47 meters (154 ft) north of Cypress Street.

Process Description: On September 29, 1965, a major contamination event occurred at the 309 building, Plutonium Recycle Test Reactor (PRTR). A fuel element was heated until molten and a process tube burst. The event grossly contaminated the PRTR's heavy water moderator with fission products and with light water from the coolant. Most of the primary coolant and make-up coolant water was disposed via the 340 Building.

Secondary coolant and other normally contamination-free streams were routed directly to the Columbia River. When contamination was detected in this stream, the water was pumped to the ground. About 189,250 liters (50,000 gallons) of liquid waste were disposed to the ground (WHC-MR-0388).

Related Sites/ Structures: This site is associated with 300-2, another potential location of the liquid disposal trench.

Code: 300-286	Classification: Accepted
Names: 300-286; Three 300 Area Potentially Contaminated French Drain/Drywells	Reclassification: None
Type: French Drain	Start Date:
Status: Inactive	End Date:

Description: This site consists of three discrete locations and the underlying soil of a potentially contaminated French drain and drywells and their associated below grade piping components. A drywell and a French drain were discovered during the Orphan Site Evaluation (OSE) historical review, and the remaining drywell was discovered during a field walkdown of the area under investigation. Each of the facilities that the French drains and drywells are associated with, were identified and process or function of the facilities determined. Details of inlet pipes, French drains, drywells and source facilities are provided when available.

Drain number 1 (FD-1) (Orphan site feature 300-FF2-019) is a 61 cm (24 in) diameter drywell constructed in accordance with Hanford standard AC-4-30 (H-3-14950 & H-3-14947). The drain received liquids from two 0.3 m x 0.3 m x 0.3 m (1 ft x 1 ft x 1ft) sumps located in the 309 Building exhaust filter pit. A 2.5 cm (1 in) schedule 40 steel drain line from each sump joined a (2 in) schedule 40 steel line that drained to the French drain. There is a locked metal cover over the drywell.

Drain number 2 (FD-28) is a stormwater catch basin and 4-inch slotted drain pipe (corrugated polyethylene with a smooth interior). It is not visible in the field.

Drain number 3 (FD-33) is a french drain with a 15.2-cm (6-inch) pipe that empties into it. The pipe was traced 11 meters due west using geophysics. The traced end of the pipe is 3 meters (10 feet) east of FD-21 (NFE), which was associated with the 3701-N guardhouse.

Location: Drain number 1 is located about 3.6 meters (12 feet) east of the 309 Building exhaust filter pit.

Drain number 2 is located on the east side of the 3790 Badge House.

Drain number 3 is located about 11 meters east-northeast of the 3701-N Guardhouse.

Process Description: There is a slight potential for contamination being present in drain number 1, as the 309 Building exhaust filter pit is associated the 309 building exhaust stack.

Drain number 2 received stormwater on the east side of the 3790 Badgehouse.

The source for water to drain number 3 is unknown, but thought to be from the 3701-N Guardhouse.

Code: 300-287 **Classification:** Accepted
Names: 300-287; Transite Debris west of Route 4 South **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: This feature consists of broken corrugated transite in a pile approximately 0.5 meters by 1.5 meters.
Location: This feature is located approximately 28 m west of Route 4 South.
Process Description: This feature was discovered during the Orphan Site Evaluation field walkdowns of the 300-FF-2 area on June 24, 2009.

Code: 300-288 **Classification:** Accepted
Names: 300-288; Piles of Garnet Sand/Soil Mixture within Gravel Pit 6 **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: This feature consists of two piles of garnet sand within a 5 m (16.4 ft) diameter area. The total volume is approximately 15 cubic meters (20 cubic yards), and each pile is estimated to be 5% garnet sand and 95% soil.
Location: This feature is located within WIDS 600-249.
Process Description: Garnet grit was commonly used in grit-blasting operations to clean rust, paint, or contamination from the surface of metal components. The garnet material is not a hazardous substance, but there is potential for contamination from the surface material that was removed by grit blasting.

Related Sites/ Structures: Site is located within 600-249 (gravel pit 6).

Code: 300-289 **Classification:** Accepted
Names: 300-289; Stained Soil Area North of 300 Area **Reclassification:** None
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**
Description: This feature consists of bare ground, with crusting and two drum bung plugs.
Location: This feature is located 15 m west of a maintained power line road.
Process Description: There is no process history associated with this waste site.

Code: 300-290 **Classification:** Accepted
Names: 300-290; Radiological Debris Area East of Horn Rapids Disposal Landfill **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**

Description: The site is a posted RMA (Radiological Materials Area) approximately 64 square meters. The material in the RMA consisted mostly of rusted metal automotive parts, scraps of crumpled sheet metal, electrical wire debris and engine gaskets.

Location: This feature is located approximately 32 m NNE of the NE boundary of WIDS HRD (Horn Rapids Disposal).

Process Description: The debris in this feature is consistent with the debris that was deposited in the Horn Rapids Landfill, which operated as an uncontrolled landfill from the late 1940's to the 1970's. The landfill is currently inactive, and was remediated in accordance with EPA/ROD/R10-93/063, Hanford 1100-Area (USDOE). The landfill has been taken off the National Priorities List, and it was capped and put under institutional controls (DOE/RL-2008-68).

Related Sites/ Structures: WIDS- HRD (Horn Rapids Disposal).

Code: 300-291 **Classification:** Accepted
Names: 300-291; Garnet Sand West of 350-A Paint Shop **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**

Description: This feature consists of garnet sand on a gravel road bed.

Location: This feature is located 60 m west of the 350A paint shop.

Related Sites/ Structures: This area likely supported the 350A paint shop.

Code: 300-292 **Classification:** Accepted
Names: 300-292; 315 Water Filter Plant Waste Pipeline Segments **Reclassification:** None
Type: Product Piping **Start Date:**
Status: Inactive **End Date:**

Description: This site includes ten (10) abandoned nonhazardous waste pipeline segments associated with the process sewers from the 315 Water Filter Plant (filter backwash) in the 300 Area (Other 04102010). The site includes pipeline segments identified during the 300-FF-1 Orphan Site Evaluation for disposition with the 300-FF-2 Operable Unit evaluations (038509) and additional undocumented pipeline segments, manholes, sumps and diversion boxes discovered during the 300-FF-2 Orphan Site Evaluation (OSE). The OSE reference number for these segments is 300FF2-266.

The site consists of abandoned pipeline segments and associated features (manholes, junction boxes, sumps, etc.) that transported filter backwash waste solutions from the 315 Water Filter Plant. These waste solutions were routed to Filter Backwash Ponds (e.g. 300 RFBP, 300 FBP:1,

300 FBP:2).

The original 315 Water Filter Plant process sewer ran east from the 315 Building process sewer sump (315-22) to an outfall into the Columbia River. In 1975, the 315 process sewer pipeline to the river outfall was isolated and sealed at a diversion box (315-23) installed to redirect the 315 Building process sewer flow north to discharge into on-site sedimentation ponds (see attached map and tables). The east branch of the 315 Water Filter Plant process sewer from the diversion box (315-23) was accepted as WIDS Waste Site 300-261; it was later closed out ("rejected") with Waste Site Reclassification Form 99-044.

The most recent waste site associated with these pipeline segments was the lined 300 FBP:2 Filter Backwash Pond (aka 315-C Sedimentation Pond) that was shutdown in 1998 (2000-116). During the last period of operation, any filter backwash waste solutions were to be settled in the pond and the pond overflow was to drain into a lift station for discharge to the 300 Area Process Sewer (300-15).

Location: These 315 Water Filter Plant filter backwash waste lines within the 300 Area were mapped in the WCH Geographic Information System (GIS) database.

Process Description: The process waste solutions for this site included nonhazardous solids suspended in water filter backwash waste solutions from the 315 Water Filter Plant that were routed north to the 315-C Sedimentation Pond (300 FBP:2) where the filter backwash sediments settled.

Coal ash and filter backwash waste solutions were determined to be nonhazardous materials and the associated waste sites (pipelines, ditches, and ponds) were designated as either "No Action" or "Rejected" waste sites (DOE/RL-1994-49, DOE/RL-2004-74). These designations were confirmed during the Orphan Sites Evaluation for the 300-FF-1 Operable Unit completed in 2005 (120421).

Plans for the disposal of the settled filter backwash waste solutions in 300 FBP:2 progressed from 1990 to 1997 that involved: (1) a replacement river outfall pipeline (Segment 7) that was installed (1993) but not used, abandoned, and partially removed (1996), (2) a recycle line to the 315 Water Filter Plant for a 10% recycle process that was installed (1996) but not used and abandoned in place, and (3) pumps and piping installed in 1997 to transfer the waste water to the 300 Area process sewer (300-15) at a manhole (PS-47) near the 340 Facility west of the 315-C Sedimentation Pond. The latter included the reuse of some of the 300-295 pipeline segments.

Related Sites/ Structures: The pipelines included in this site are associated with the 315 Water Filter Plant, and the aqueous waste disposal facilities for these facilities including the 315-C Sedimentation Pond (aka 300 FBP:2), the 315-C Lift Station, the 315-D Lift Station, and associated manholes, sumps, valve pits, and diversion boxes. The site is associated with the 300 Area process sewer (300-15). The 315 Water Filter Plant backwash sewer pipelines were transitioned for disposition with the 300-FF-2 Operable Unit Orphan Site Evaluation (WCH CCN 120421).

Code: 300-293 **Classification:** Accepted

Names: 300-293; 300 Area Miscellaneous Pipelines **Reclassification:** None

Type: Product Piping **Start Date:**

Status: Inactive **End Date:**

Description: The site consists of miscellaneous piping in the 300 Area. The site was identified in Section J, Attachment 1 of the River Corridor Closure Contract as Activity ID 0041.01035, Confirmatory Sampling Site - 300 Area Misc Piping (Other 09292004). The scope of the confirmatory sampling site was not defined in the contract. A comprehensive review of historical

construction drawings was performed as part of the 300 Area Orphan Sites Evaluation (OSR-2010-0002). The 300 Area Orphan Site Evaluation identified 278 unidentified underground utility lines (UGL) having a total length of 2755 meters (1.71 miles). Most of the lines have unknown terminal ends (starting and ending points of origin) which suggests that the estimated length is substantially underestimated. The unidentified UGLs may include many non-hazardous telecommunication, compressed gas and electrical related utilities.

The site was divided into two subsites:

- 300-293:1, 300 Area Miscellaneous Pipelines - less than 2.5 ft bgs
- 300-293:2, 300 Area Miscellaneous Pipelines - greater than or equal to 2.5 ft bgs

Location: The miscellaneous pipelines are located throughout the 300-FF-2 operable unit. The individual UGLs are mapped in the WCH Geographic Information System (GIS) database.

This Site has the Following SubSites:

Code: 300-293:1

Names: 300-293:1; 300 Area Miscellaneous Pipelines - Less Than 2.5 Feet Below Ground Surface

Code: 300-293:2

Names: 300-293:2; 300 Area Miscellaneous Pipelines - Greater Than or Equal to 2.5 Feet Below Ground Surface

Code: 300-293:1

Classification: Accepted

Names: 300-293:1; 300 Area Miscellaneous Pipelines - Less Than 2.5 Feet Below Ground Surface

Reclassification: No Action (6/22/2011)

Type: Product Piping

Start Date:

Status: Inactive

End Date:

Description: The subsite consists of 107 underground utility lines (UGL) in the 300 Area that have been identified as being between 1 and 2.5 feet below the ground surface (bgs). Table 1 of the Waste Site Reclassification form lists each of the segments.

Location: The miscellaneous pipelines are located throughout the 300-FF-2 operable unit. The individual UGLs are mapped in the WCH Geographic Information System (GIS) database. The subsite consists of 107 underground utility lines which are known to not be associated with hazardous waste because of their shallow depth. Pipelines with a depth of less than 0.762 m (2.5 ft) bgs are determined not to have been associated with liquid waste processes or facilities that may have contained hazardous materials.

Process Description: The underground lines in this subsite are expected to associated with telecommunications, electrical ductwork, and compressed gas.

The SubSite is Part Of:

Code: 300-293

Names: 300-293; 300 Area Miscellaneous Pipelines

Code: 300-293:2

Classification: Accepted

Names: 300-293:2; 300 Area Miscellaneous Pipelines - Greater Than or Equal to 2.5 Feet Below Ground Surface

Reclassification: None

Type: Product Piping

Start Date:

Status: Inactive

End Date:

Description: The subsite consists of underground utility lines (UGL) in the 300 Area that has been identified as being greater than 2.5 feet below the ground surface (bgs). The UGLs without an approximate depth were also assigned to this subsite.

Location: The miscellaneous pipelines are located throughout the 300-FF-2 operable unit. The individual UGLs are mapped in the WCH Geographic Information System (GIS) database.

The SubSite is Part Of:

Code: 300-293

Names: 300-293; 300 Area Miscellaneous Pipelines

Code: 300-294

Classification: Accepted

Names: 300-294; Garnet Sand East of 350 Building

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: This feature consists of garnet sand on a gravel road bed.

Location: This feature is located approx. 5 m east of the 350 building.

Related Sites/ Structures: The 350 Complex served as the central craft shop for the 300 area, with offices for supervisory and support personnel. The main 350 building contained shop areas for plastics, carpentry, electrical/instrument, machine, welding, grinding, and pipefitting/millwright work. As of 1984, approximately 70 personnel worked either in or out of the facility providing service and craft functions. The 350-A building provided space for spray-painting and sandblasting. The 350-B building was used to store miscellaneous equipment and supplies. The 350-C building functioned as a storage building for lumber used by the various shops. The 350-D building served as a storage location for hazardous chemicals, primarily oil (350, RCC SIS Report).

Code: 300-295

Classification: Accepted

Names: 300-295; 384 Powerhouse Coal Ash Waste Pipeline Segments

Reclassification: None

Type: Product Piping

Start Date:

Status: Inactive

End Date:

Description: This site includes four (4) abandoned nonhazardous waste pipeline segments and associated features (diversion valve box, manholes, etc.) that serviced the 384 Power House coal ash waste disposal by sluicing to the 300 Ash Pits and/or to the 315-C Sedimentation Pond (Other11092009). The site includes pipeline segments identified during the 300-FF-1 Orphan Site Evaluation for disposition with the 300-FF-2 Operable Unit evaluations (038509) and additional undocumented pipeline segments discovered during the 300-FF-2 Orphan Site Evaluation (OSE).

The coal ash waste site (300 Ash Pit) associated with these pipeline segments was reclassified to a status of "No Action" (98-004, Control Number 115) based on the past practice knowledge (DOE/RL-94-49) that the waste streams were nonhazardous and based on post-remediation characterization results for the 300-FF-1 Operable Unit waste sites (CVP 2003-02, DOE/RL-2004-74).

The most recent waste site associated with these pipeline segments was the lined 300 FBP:2 Filter Backwash Pond (aka 315-C Sedimentation Pond) that was shutdown in 1998 (2000-116).

No coal ash slurries were routed to the 315 C Filter Backwash Sedimentation Pond (300 FPB:2) via Segment 14, the most recent coal ash sluicing pipeline (see Site Comments). This site is listed as 300FF2-269 in the Orphan Sites Evaluation Report (OSR-2010-0002).

Location: The 384 Power House coal ash waste lines within the 300 Area were mapped in the WCH Geographic Information System (GIS) database.

Process Description: Water was used to slurry coal ash from the 384 Power House coal ash (aka fly ash) filters to the 300 Ash Pits via a 10 cm (8 in) diameter pipeline to one of the two 300 Ash Pits. The initial coal ash sluicing pipeline (Segment 10) discharged into an open ditch (Segment 11) that drained into the 300 Ash Pits. The subsequent replacement coal ash pipelines (Segments 12 and 13) discharged alternately into one of the two 300 Ash Pits. The 300 Ash Pits were used alternately to allow the water to drain and the accumulations of coal ash to dry before being excavated and disposed as a solid waste. The coal ash slurries were routed to the 300 Ash Pits until about 1995. In 1995, the 384 coal ash sluicing pipeline was extended (segment 14 part of WIDS site 300-292) to the 315-C Sedimentation Pond (300 FPB:2) to support plans to discontinue use of the 300 Ash Pits (H-3-49874). However, before the extended coal ash sluicing line (H-3-49874) was put into service, the coal-fired boilers at the 384 Power House were shut down to reduce stack emissions. No coal ash slurries were routed to the 315-C Filter Backwash Sedimentation Pond (300 FPB:2). However, while Segment 14 was not used for coal ash sluicing, it was used to transfer filter backwash waste solution from the 315-C Sedimentation Pond to the 300 Area Process Sewer (see 315 Miscellaneous Waste Pipelines, 300-292).

Coal ash was determined to be a nonhazardous material and the associated waste sites (pipelines and ditch) were designated as "No Action" waste sites (DOE/RL-1994-49, DOE/RL-2004-74). This designation was confirmed during the Orphan Sites Evaluation for the 300-FF-1 Operable Unit completed in 2005 (120421).

Related Sites/Structures: The pipelines were identified in the WIDS as part of the 300 Area Process Sewer waste site, 300-15. They were associated with the 384 Power House, the 300 Ash Pits, and the 315 Sedimentation Pond; these pipelines were not connected to the 300-15 waste site piping.

Waste Type: Process Effluent

Waste Description: Coal ash waste solutions were determined to be nonhazardous materials and the associated waste sites (pipelines and ditch) were designated as "No Action" waste sites (DOE/RL-94-49, DOE/RL-2004-74). These designations were confirmed during the Orphan Sites Evaluation for the 300-FF-1 Operable Unit completed in 2005 (120421)

Code: 300-296

Classification: Accepted

Names: 300-296; Soil Contamination Under the 324 Building B-Cell

Reclassification: None

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The site consists of contaminated soil beneath the B-Cell of the 324 Building. The lateral and vertical extent of contamination is unknown. The B-Cell was 7.6 m (25 ft) x 6.7 m (22 ft) x 9.3 m (30.5 ft) high. The floor and walls (up to 8.2 m [27 ft] high) were lined with stainless steel (H-3-20195, H-3-20213, H-3-20214 and H-3-20273). The floor sloped to a trench that ran the length of the east side of the cell. The trench emptied into a sump located in the northeast corner of B-Cell (H-3-20195).

Location: The site is located beneath the B-Cell in the north central portion of the 324 Building.

Release Description: On 11/16/10, a cone penetrometer (an enclosed pipe pushed into the soil by a hydraulic ram) was used to identify the presence of radioactive material in the soil approximately 3.5 feet

beneath the 324 Building near the B-cell. A maximum radiation readings of 6,700 R/hr. was identified. The 324 Building is a Nuclear Category 2 facility, currently undergoing deactivation and decommissioning. The 324 Building was constructed in the 1960s to support materials and chemical process research and development activities, and ceased research operations in 1996. The primary operational system remaining in the building is ventilation. In preparation for removal of B-cell, historical research and on-site investigation identified evidence of a potentially breached liner in the sump floor. A leak may have occurred at some point in the operational past of the cell. The 300 Area is posted as an Underground Radioactive Material (URM) Area. This event is being reported as a Management Concern due to the unexpected very high levels of radiation.

Process Description: The 324 Building was constructed between 1964 and 1966 to demonstrate pilot scale processes for converting high level solvent extraction separations plant wastes to solids (HW-74703). The building was divided into five functional areas (BNWL-CC-2028): Radiochemical Engineering Cells (REC), Shielded Materials Facility, Sodium Studies Facility, Engineering Development Laboratory and the Engineering Development Laboratory.

The 300-296 waste site is related to the REC functional area. The REC area is located in the north portion of the 324 Building and consisted of four hot-cells (A, B, C, and D) located around a central airlock. The cells and airlock were joined forming a "T"-shaped structure. The airlock was used primarily as a transition zone for maintenance, decontamination, and transfer of material and equipment into and out of adjoining hot cells (PNL-10890).

The REC area was used for process and equipment development studies using materials with mega curie radioactive levels. All work was accomplished with remote manipulations from the service gallery (BNWL-CC-2028). Major research and development programs undertaken in the REC have included the Waste Solidification Engineering Prototypes (WSEP) Program, the Fabrication of Cesium and Strontium Heat and Radiation Sources Program (Federal Republic of Germany [FRG]), the Nuclear Waste Vitrification Program (NWVP), the Zeolite Vitrification Demonstration Program (ZVDP), and the Nuclear Waste Treatment Program's (NWTP) Pilot Scale Radioactive Liquid-Fed Ceramic Melter (RLFCM) Testing Task (PNL-10890). The REC operations were concluded in 1996.

Related Sites/ Structures: The site is associated with the Radiochemical Engineering Cells (REC) area located in the north portion of the 324 Building.

Waste Type: Soil

Waste Description: The soil is contaminated with radionuclides which are presumed to have originated from a release of concentrated strontium and cesium solution in about 1986. COPCs Cs-137 and Sr-90.

Code: 400-36	Classification: Accepted
Names: 400-36; 4843 Building Temporary Transfer Station; 4843 Waste Inspection Facility; Sanitary Waste Check Station	Reclassification: No Action (1/18/2005)
Type: Storage	Start Date: 1/1/1998
Status: Inactive	End Date: 1/1/2002

Description: The structure is a fully-insulated, bolted steel building on a concrete slab. Heat is provided by ceiling-suspended heaters. Two 3.7 meter (12 foot) roll-up doors are located on the structure's east and west sides and can be used for moving materials into and out of the building. A large fenced laydown area adjacent to the building could be accessed through the west door. The facility also has several other doors and windows. A 8 foot (2.4 meter) wide and 10 foot (3.0

meter) tall portion of the south wall has corroded and appears rust-colored. The bottom edges of the facility's outside walls have also corroded.

Location: The 4843 Building is located in the northwest corner of the 400 Area. A large laydown area is located adjacent to and west of the structure.

Process Description: The building was used as a transfer station to check Hanford garbage (sanitary waste) for radiological or hazardous contaminants prior to transporting the garbage to the Richland Landfill for final disposal.

Related Sites/ Structures: This building was previously known in WIDS as sitecode 4843; 4843 Building, 4843 Alkali Metal Storage Facility, a RCRA Treatment, Storage, and Disposal Facility. When this site was Closed Out under RCRA in 1997, WIDS site code 400-36 was created at the request of EPA to track the building's use as a waste transfer station.

Waste Type: Misc. Trash and Debris

Waste Description: The building was used as a transfer station to check Hanford garbage (sanitary waste) for radiological or hazardous contaminants prior to transporting the garbage to the Richland Landfill for final disposal.

Closure Info: The transfer station operations have ceased. The last load of garbage delivered to the building was on July 31, 2002. Subsequent to cessation of operations, the floor area was surveyed. Direct and removable contamination surveys verified no source term material is present above background levels.

Code: 400-41

Classification: Accepted

Names: 400-41; 4723 Flammable Liquid Storage Building Soil Stains; 400 Area Flammable Liquid Storage Area Soil Stains

Reclassification: None

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The 4723 Building has been demolished. Asphalt currently covers the area where the spills occurred. In April 2010, no visual evidence of the 4723 building or the storage areas could be found.

Location: The soil stains are located between the FMEF perimeter fence and the FFTF exclusion area fence.

Process Description: In 1979 and 1980, the 4723 building stored flammable liquids. Historical photographs show a bermed area outside the building and many containers being stored outside the building. The 4843 Alkali Metal Storage Facility was built and actively began to store dangerous and mixed alkali metal waste in 1986. This building replaced the 4723 building.

Code: 600-58

Classification: Accepted

Names: 600-58; BPA SWMU #13; H.J. Ashe Substation Oil/Water Separator & Drywells

Reclassification: None

Type: French Drain

Start Date: 1/1/1988

Status: Active

End Date:

Description: The oil/water separator is located south of the fuel island and south of the maintenance headquarters building. The oil/water separator receives drainage from eight floor drains in the

maintenance headquarters building shop and two drains located on either side of the fuel island. The oil/water separator is designed to remove petroleum, oil, and lubricants from incoming water. It has a 454 liter (120 gallon) capacity. Drainage from the separator as well as drainage from two catch basins south of the maintenance headquarters building, flow into the dry well south of the maintenance building. The oil-water separator is precast concrete with a bottom elevation of about 4.6 meters (15 feet) below the surface. A site visit on November 20, 1998 found the oil-water separator to be active. It contained water with a small amount of oil sheen floating on the surface.

Location: The Ashe Substation is located 0.5 miles northwest of and adjacent to the Energy Northwest property (formerly known as the Washington Public Power Supply System).

Process Description: This substation is part of the Bonneville Power Administration main transmission grid, that conducts electrical power from the Columbia and Snake Rivers dams to five states (Washington, Oregon, Idaho, western Montana, and northern California). The BPA transmission grid is divided into four subareas. The substations on the Hanford Site are within the Snake River subarea. The substations use petroleum oil, primarily mineral oil, as insulation in electrical equipment. This includes transformers, coupling and potential devices, capacitors, circuit breakers, reclosers, voltage regulators, switches, and cable. Insulating oil is a highly refined, 10-weight petroleum oil with approximately 0.1 percent 2,6-di-tertbutyl-paracresol (an antioxidant known as BHT that is also used as a food additive) and varying amounts of polychlorinated biphenyls (PCBs) to increase dielectric strength. All of the substations have above ground tanks of mineral oil, that is used as make-up oil for equipment maintenance of electrical equipment. Solvents are used for cleaning and degreasing operations. Once maintenance is completed, rags soaked in solvent and all personal protective clothing are to be placed in drums for transport to the generator storage area at the H. J. Ashe Substation. All equipment filled with mineral oil is regularly analyzed for PCB concentration. All untested and unmarked equipment is assumed to be PCB contaminated. Electrical equipment fluid is assumed to be PCB, if the manufacturer's manuals or nameplates do not identify the type of dielectric fluid in the equipment, or if the equipment is known to be PCB according to available information. Drainage from the oil-water separator located adjacent to the fuel island, and stormwater runoff intercepted by two catch basins located south of the maintenance building flow into a drywell located 76 meters (250 feet) south of the maintenance headquarters building. Two other drywells receive stormwater runoff from the blacktop paved areas of the Ashe Substation facility.

Related Sites/ Structures: The site is associated with the H.J. Ashe Substation (Sitecode 600-60).

Waste Type: Water

Waste Description: The drywells received drainage from the oil/water separator. It is likely that water contained some petroleum products.

Waste Type: Oil

Waste Description: The oil/water separator has received petroleum, oil and lubricants.

Description:

Code: 600-59

Classification: Accepted

Names: 600-59; BPA SWMU #12; Generator Storage Area Sump; H.J. Ashe Substation Storage Area

Reclassification: None

Type: Storage

Start Date: 1/1/1976

Status: Active

End Date:

Description: The storage facility is southwest of the maintenance headquarters building. The 6.1 meter (20

foot) by 4.6 meter (15 foot) generator storage area inside the Hazardous Waste Storage portion of the building has a double floor. The top flooring consists of a metal grate. The sub-floor is concrete with no outlet, that acts as a containment basin to catch any spill or release that might occur. The concrete sub-floor is sloped. The low end is considered to be a sump. The sump has no outlet. The building is actively being used by the Bonneville Power Administration (BPA) for storage of waste drums.

Location: The substation is located 0.5 miles northwest of and adjacent to the Energy Northwest property (formerly known as the Washington Public Power Supply System).

Process Description: If a spill occurred, it would collect in the low end of the sloped sub-floor. It would be soaked up and disposed of properly.

Related Sites/ Structures: The site is related to the H. J. Ashe Substation, maintenance headquarters, gas pumps, control house, and switch yards. (See WIDS Sites 600-60 and 600-58).

Waste Type: Chemicals

Waste Description: Annual hazardous waste reports indicate that the following wastes are generated at the Ashe Substation, 1,1,1-Trichloroethane mixture, 1,1,1-Trichloroethane-contaminated soils, acetone waste mixture, spent photographic fluids, fixer, and developer, battery acid and fluid mixture, ferric chloride etching solution waste, methanol waste mixture (Karl Fisher reagent), pentachlorophenol and sodium pentachlorophenol, solvent compound-thinner waste, toluene-isopropanol with potassium hydroxide (titrating solution).

All waste is taken to the generator storage area (SWMU #12). This unit is part of the Flammable, Herbicide, and Toxic Waste Storage Facility Building located southwest of the maintenance headquarters building. Hazardous wastes from maintenance activities at other substations are collected at this location.

Code: 600-60	Classification: Accepted
Names: 600-60; H.J. Ashe Substation Switchyard Facility	Reclassification: None
Type: Electrical Substation	Start Date: 1/1/1976
Status: Active	End Date:

Description: The H.J. Ashe Substation is an active, operating electrical switchyard facility. The H.J. Ashe Substation consists of two large structures, a control house and a maintenance building, and yard areas with smaller buildings used for dry chemical storage and a vehicle fuel station with two underground gasoline tanks. The substation was first energized on December 3, 1976. Structures and equipment include an oil-filled circuit breaker {28, 766 liters (7,600 gallons)}, two underground gasoline tanks {15,140 liters (4,000 gallons) each}, four mineral oil storage tanks {18,925 liters (5,000 gallons)}, hazardous waste, flammable materials, and herbicide storage building {455 kilograms (1,000 pounds)}.

Location: The substation is located 0.5 miles northwest of and adjacent to the Energy Northwest property (formerly known as the Washington Public Power Supply System).

Release Description: Six insulating oil leaks were identified in the switch yard at Reactor #1 on 9-13-90 (C-phase), at CT4885 on 9-13-90 (B-phase), at Reactor #1 on 10-2-90 (I-428), PCB 0-1026 on 4-26-91 and at Reactor #2 on 11-20-90 and 2-20-91 (I-429). There no further documentation on these releases. No cleanup actions were listed. Note that sampling was performed at these areas.

Process Description: The switching substation was built to supply electrical power produced by the Hanford Generating Plant to the Supply System's main electrical grid.

Related Sites/ Structures: There are two Solid Waste Management Units (SWMU) identified at the H. J. Ashe Substation. These are SWMU #12 (sitecode 600-59) - Hazardous and Flammable Storage Area, and SWMU #13 (Sitecode 600-58) Oil and Water Separator.

Waste Type: Chemicals

Waste Description: Annual hazardous waste reports indicate that the following wastes are generated at the Ashe Substation, 1,1,1-Trichloroethane mixture, 1,1,1-Trichloroethane-contaminated soils, acetone waste mixture, spent photographic fluids, fixer, and developer, battery acid and fluid mixture, ferric chloride etching solution waste, methanol waste mixture (Karl Fisher reagent), pentachlorophenol and sodium pentachlorophenol, solvent compound-thinner waste, toluene-isopropanol with potassium hydroxide (titrating solution). Polychlorinated biphenyls (PCBs) are also a potential contaminant of concern at this site because of the releases of insulating oil (See Releases Section).

Code: 600-117 **Classification:** Accepted

Names: 600-117; 300 Area Treated Effluent Disposal Facility (TEDF); 310 Building; 342 Sump **Reclassification:** None

Type: Process Unit/Plant **Start Date:** 1/1/1994

Status: Active **End Date:**

Description: The site includes the main treatment building (310 Building) which is about 27.4 meters (90 feet) wide, 45.7 meters (150 feet) long, 6.7 meters (22 feet) high, and metal in construction; three modular/mobile offices (MO443, MO744, MO745); two exterior Diversion Tanks (19 meters [62 feet] in diameter each); one exterior Equalization Tank (13.7 meters [45 feet] in diameter); two exterior Clarifier Tanks (9.1 meters [30 feet] in diameter each); two drum storage areas; one chemical storage area; all units are surrounded by a chain link fence.

Location: The site address is 780 Uranium St. It is located 1.1 kilometers (0.7 miles) north of 300 Area on the east side of Route 4S and about 0.5 kilometers (0.3 miles) west of the Columbia River.

Process Description: The site treats and disposes of process sewer effluent from the 300 Area. Treatment includes chemical precipitation, selective ion exchange, and UV/peroxide oxidation to destroy organics and cyanide. Pipeline 600-352-PL feeds effluent to the facility. After treatment, the effluent was disposed of at a submerged, single-port outfall in the Columbia River (Site sitecode 600-210). Later, the effluent was returned to the Combined Sewer System via pipeline 300-15. Chemicals used to treat this process sewer discharge include hydrogen peroxide, sodium hydroxide, sulfuric acid, ferric chloride, and ion exchange resins.

Related Sites/ Structures: Facilities associated with 310 Facility TEDF (600-117) operations include the 342 Sump Control Building, the 182-centimeter (72-inch) diversion manhole in the 300 Area, the transfer piping between the 342 sump and the TEDF (see sitecode 600-352-PL), generating facilities that are connected to the 300 Area process sewer, and the TEDF outfall and transfer pipeline (WIDS Site 600-210).

Waste Type: Process Effluent

Waste Description: The 300 Area process sewer discharges via the 342 TEDF Sump to the 310 facility (300 Area TEDF). The wastes discharged to the process sewer is composed of metals, organics, and cyanide. The maximum flow rate the facility is design to accommodate is 1,200 liters per minute (300 gallons per minute). The expected flow rate is approximately 600 liters per minute (150 gallons per minute).

This Site has the Following SubSites:

Code: 600-117:1

Names: 600-117:1; Waste Collection Sump 1; 300 TEDF Sump; 342 Sump

Code: 600-117:1 **Classification:** Accepted

Names: 600-117:1; Waste Collection Sump 1; 300 TEDF Sump; 342 Sump **Reclassification:** None

Type: Process Unit/Plant **Start Date:**

Status: Active **End Date:**

Description: Wastewater from the 300 Area process sewer is collected in a 182-centimeter (72-inch) diameter diversion manhole located just west of Waste Collection Sump 1 via a 41-centimeter (16-inch) ductile iron pipe. A basket strainer on the end of the pipe screens out large objects, protecting the three large pumps. These pumps transfer wastewater to the 310 Facility (300 TEDF) through a 25.4 centimeter (10-inch) high-density polyethylene pipeline. The transfer pipe terminates inside the (300 TEDF) 310 facility at the equalization pipe.

Location: The 600-117:1 sump is about 1.1 kilometers (0.7 miles) southeast of the TEDF facility, and about 115 meters (375 feet) northwest of the 316-1 South Process Pond.

Process Description: The sump contained pumps that transferred wastewater from the 300 Area process sewer to the 300 TEDF.

The SubSite is Part Of:

Code: 600-117

Names: 600-117; 300 Area Treated Effluent Disposal Facility (TEDF); 310 Building; 342 Sump

Code: 600-187 **Classification:** Accepted

Names: 600-187; West Lake Honey Dump Station **Reclassification:** None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site is located in a depression and appears to have been under water as part of West Lake when it was larger. Vegetation in the area is thick and short except for the lowest areas where the soil is very silty and shows desiccation cracks on the surface. There was no visual evidence of sewage waste in the area.

Location: The site is located south of the western portion of Gable Mountain, at the north end of West Lake (216-N-8). The site is 0.9 kilometers (0.6 miles) east of Route 4 North. A well traveled dirt road leads to West Lake from Route 4 North, about 0.8 kilometers (0.5 miles) past milepost 1.

Related Sites/Structures: The water level in West Lake was affected by the water level in Gable Mountain Pond.

Code: 600-235 **Classification:** Accepted

Names: 600-235; Buried Lead Sheathed Telephone Cables **Reclassification:** No Action (3/9/2005)

Type: Dumping Area **Start Date:** 1/1/1943

Status: Inactive **End Date:**

Description: This site includes buried inactive lead-sheathed telephone cable that was abandoned in place as part of the Integrated Voice Data Telephone System (IVDTS), which was installed in 1988 by U. S. West. This system installed new telephone equipment in most buildings and installed new telephone switching facilities. In some cases the IVDTS reused portions of the old cables.

Location:

Process Description: Beginning in the 1940's, the US Army began installing communication systems across the Hanford project property. The switching centers were originally tied together with lead sheathed cables. As communication systems have evolved over the years, many of the old switching centers were removed. In some cases, the old lines were reused, but in many cases the lead sheathed cables were abandoned in place. Lead-sheathed aerial cable lines ran from the 702-Central Telephone Exchange Building at Richland to switchboards housed in the 1720 Patrol Headquarters in the 100 B, D and F Areas and to the 704 Supervisor's Office Buildings in the 200 East and West Areas, and Building 3706 in the 300 Area, with interconnecting trunk lines between the 100 and 200 Process Areas. Details of the cable sizes have been documented in previous reports. No information has been located indicating underground telephone cables on the North Slope.

Waste Type: Equipment

Waste Description: The lead in the cable is considered hazardous but not the cable itself.

Closure Info: Approximately 204 kilometers (127 miles) of buried, lead-sheathed telecommunications cable has been left in place at the Hanford Site. Of concern is the disposition of this cable (Waste Information Data System [WIDS] site 600-235, Lead Sheathed Telephone Cables), and in particular, whether the lead present in the buried cable poses a risk to human health or the environment if left in place.

On September 15, 2003, representatives of the U.S. Department of Energy, Richland Operations Office (RL), the U.S. Environmental Protection Agency (EPA), and the Environmental Restoration Contractor (ERC) performed a field inspection at several buried lead-sheathed cable locations. Six candidate sites representing a variety of environmental conditions were selected for sampling to determine if releases of lead to the soil surrounding the lead-sheathed cable have occurred at levels that pose a risk to human health or the environment.

The results from field inspections and process knowledge identified the following constituents as contaminants of concern (COCs) and potential contaminants of concern (COPCs): lead-sheathed cable - COC is elemental lead, asphalt insulating material - COPCs include asbestos, PCBs, metals, and polycyclic aromatic hydrocarbons (PAHs) associated with the asphalt, paper insulation on copper wires - COPCs include asbestos and PCBs.

To evaluate the soil surrounding the lead cable (BHI-01714), samples were collected and analyzed for the established contaminants of concern. The HEIS samples were collected on 9/8/04 through 9/29/04. The results from the sampling event were reported as HEIS sample numbers J01MH4 through J01MH9, J01T71 through J01T76 and J01T80 through J01T84. The sampling results were used to support a decision regarding reclassifying the site in accordance with the waste site reclassification guideline TPA-MP-14 process (RL-TPA-90-0001). The sampling results show that the buried lead-sheathed cable does not present a risk to human health or the environment and that current site conditions are consistent with remedial action objectives and the corresponding remedial action goals (RAGs) for remedial action occurring in the Remedial Design Report/Remedial Action Work Plan for the 100 Areas (DOE/RL-96-17, Rev. 5). The concentrations of metals detected in the soil associated with the lead-sheathed cable are also below or consistent with Hanford Site background and upstream Columbia River levels.

Code: 600-257

Classification: Accepted

Names: 600-257; 213-J Magazine Waste Storage Cavern; 213-J Vault; 213-J&K Storage Facility

Reclassification: Interim Closed Out (7/19/2011)

Names: 600-261; 601 Structures; Standard Gauge Railroad Track	Reclassification: None
Type: Foundation	Start Date: 1/1/1943
Status: Inactive	End Date: 1/1/1998
Description: The site consists of the railroad track system on the Hanford site (beginning at Horn Rapids road and proceeding North). The section from Horn Rapids Road to Energy Northwest is still active. The rest is inactive. This site does not include any radioactive unplanned releases that may have effected portions of the track during Hanford operations. The documented radioactive releases are separate WIDS entries.	
Location: The Hanford railroad track system extends from the north side of the Horn Rapids road right-of-way to each operating area of the site, and includes railroad spurs, sidings and junctions.	
Process Description: The railroad was used to move supplies, equipment and reactor fuel around the Hanford site. Coal was delivered to the coal fired steam generating plants by rail car. Large pieces of equipment (pumps and centrifuges) needed to operate the canyon separations facilities and tank farm activities were transported on rail cars. Large burial containers of contaminated waste were removed from the canyon buildings, placed on flat bed rail cars and transported to specific burial trenches with railroad access. Oversight of the railroad between Horn Rapids Road and the Energy Northwest switch (except for the 300 lead) is the responsibility of the Port of Benton (POB), under DOE-RL ownership. Fluor Hanford retains oversight of the other sections of the railroad not included as part of facilities (Tank Farms, PUREX, PFP, N Reactor, etc.). This includes all mainline, spurs, and track within the 200 Areas and the 300 Area that are outside plant or project boundaries.	
Related Sites/ Structures: Movement of contaminated material into and out of the canyon facilities in 200 East and 200 West areas on rail cars resulted in several documented Unplanned Releases located on various rail spurs. The documented UPRs associated with railroad tracks include: 300-8, 200-W-21, 200-W-87, 200-E-44, UPR-200-E-10, UPR-200-E-11, UPR-200-E-12, UPR-200-E-101, UPR-200-E-20, UPR-200-E-20, UPR-200-E-33, UPR-200-E-61, UPR-200-E-69, UPR-200-E-88, UPR-200-E-112, UPR-200-W-3, UPR-200-W-4, UPR-200-W-41, UPR-200-W-44, UPR-200-W-46, UPR-200-W-48, UPR-200-W-58, UPR-200-W-60, UPR-200-W-65, UPR-200-W-69, UPR-200-W-73, and UPR-200-W-117.	

Code: 600-270	Classification: Accepted
Names: 600-270; Horseshoe Landfill; Nike Missile Base	Reclassification: Interim Closed Out (5/20/2011)
Type: Dumping Area	Start Date: 1/1/1950
Status: Inactive	End Date: 1/1/1970
Description: The site is a former historical landfill. The site was part of a former Nike missile base consisting of structures which supported missile launch, control, and maintenance functions, living quarters for base personnel, and storage buildings for hazardous substances use in the maintenance of the facilities and missile operations.	
Location: The site was located on the Fitzner-Eberhardt Arid Lands Ecology Reserve, a.k.a., Arid Lands Ecology (ALE) Reserve. Further the site was located on the northeastern slope of Rattlesnake Mountain about 8 kilometers (5.0 miles) west of the intersection of Highways 240 and 225.	
Process Description: During the base's operation, missile maintenance included the use of solvents, fuels, acids, hydraulic fluid, and paints. All wastes generated during operations were disposed of in onsite landfills, or dumped nearby offsite.	

Related Sites/ WIDS Sites 600-116, 600-270, and 600-271 are all related to Nike missile base operations on

Related Sites/

Structures: the Fitzner-Eberhardt Arid Lands Ecology Reserve.

Waste Type: Demolition and Inert Waste

Waste Description: The majority of the waste consisted of non-hazardous construction and demolition waste, scrap metal and lumber, empty bottles, cans and drums. A summary of the waste found in each of the 6 anomalous areas is described below.

Horseshoe Landfill/A-1 - boulders were encountered at 1.2 meters (4 feet) below ground surface, otherwise there was no evidence of any buried wastes or disturbed soil.

Horseshoe Landfill/A-2 - no evidence of any buried waste or disturbed soil was found.

Horseshoe Landfill/A-3 - abundant surface metal debris, barb wire, miscellaneous scrap metal, miscellaneous building materials; no evidence of any buried wastes or disturbed soil.

Horseshoe Landfill/A-4 - bottles, rusted metal debris, car parts, car chassis, car engine with oil pan missing, 7-208 liter (7-55 gallon) drums ripped open and partially collapsed (empty) were found.

Horseshoe Landfill/A-5 - bottles, pieces of rusted metal, a few animal bones were found.

Horseshoe Landfill/A-6 - no evidence of buried wastes or disturbed soil in three excavations on the west side of A-6 except for copper grounding wire found about 15 centimeters (6 inches) below ground surface. Sheet metal scrap, fence post, wood debris, 0.61 meter (2 foot) diameter washing machine washtub, abundant 2.54 centimeter (1 inch) diameter cable, cement blocks, bottles, metal scrap, 3 ripped and partially collapsed 208 liter (55 gallon) drums, car engine with oil pan missing, wire, some plastic/metal parts, 4-25.4 centimeter (4 10 inch) battery-type containers with screens.

Waste Type: Chemicals

Waste Description: Suspected wastes included solvents, fuels, acids, hydraulic fluid, and paints. Contaminants sampled for were barium, chromium, lead, acetone, bis (2-ethylhexyl) phthalate, butylbenzylphthalate, diethylphthalate, di-n-butylphthalate, phenol, chlordane, DDT, DDE, DDD, Endosulfan B, Endrin, Methyloxychlor, gasoline, diesel, heavy oils, diesel. Based on the results from soil excavated at A-6, the original 16 contaminants (draft ROD) were expanded to include DDT, DDE, and DDD.

Closure Info: Based on findings from similar landfills on the North Slope of the Hanford Site, EPA and Ecology required that limited characterization of the Horseshoe Landfill be carried out. Between July 5 and 12, 1994, Golder Associates (under contract to the USACE) conducted electromagnetic (EM) profiling, magnetics (MAG), and ground-penetrating radar (GPR) surveys at the Horseshoe Landfill. The survey covered an area approximately 152 meters (500 feet) by 183 meters (600 feet). Anomalous EM zones were categorized as low to high depending on the deviation from background levels. Anomalous zones were identified as A-1 through A-6. Full excavation of each anomaly was only required when field screening indicated the possible presence of contaminants.

The ROD (EPA 1993) presented the cleanup goals for 16 contaminants identified as potentially occurring at the IU-1 sites. Though DDT was not one of potential contaminants, Washington State has established a 1 mg/kg criterion for DDT. The cleanup levels for the 16 contaminants of concern were based on the Washington State Model Toxics Control Act (MTCA) Methods A, B, C.

In order to excavate for the presence or absence of hazardous material, each geophysical anomaly was excavated in longitudinal trenches, 1.5 to 3 meters (5 to 10 feet) wide and 1 to 2 meters (3 to 7 feet) deep. Trenching activities for each disposal cell consisted of excavating, inventorying, and segregating any potentially hazardous materials.

Excavated materials were screened visually and by field instruments. Field test kits were onsite and used for field screening when the presence of contaminated materials was suspected. Depending on the suspected presence of contaminated materials, soil samples were collected for

offsite analysis. Contaminated materials found during the excavation and/or by screening methods were inventoried and segregated (by shovel or trackhoe). Large volumes of contaminated materials encountered during excavation were stockpiled near the excavation site on 6-mil visqueen and covered with hay-bale tarps.

Information regarding each excavation was recorded including site activities, excavation dimensions, samples collected, results of onsite field screening, date excavated, location and number of offsite soil samples collected.

Seventeen subsurface soil/debris samples, a background sample, a backfill soil sample, and three duplicate samples were collected as part of the investigation at the Horseshoe Landfill. See field work section related to analytical sampling.

At the Horseshoe Landfill, approximately 1911.5 cubic meters (2,500 cubic yards) of soil contaminated with the pesticide DDT and its breakdown products were discovered. These soils were shipped to the Chemical Waste Management hazardous waste landfill in Arlington, Oregon. No other contaminants were detected above regulatory cleanup levels.

Following cleanup actions, excavations were backfilled, compacted using nonhazardous materials and clean fill, and graded to original conditions.

Code:	600-271	Classification:	Accepted
Names:	600-271; Nike Missile Base Landfill	Reclassification:	Deleted From NPL (9/30/1996)
Type:	Dumping Area	Start Date:	1/1/1950
Status:	Inactive	End Date:	1/1/1970
Description:	The site is a former historical landfill. The site was part of a former Nike missile base consisting of structures which supported missile launch, control, and maintenance functions, living quarters for base personnel, and storage buildings for hazardous substances use in the maintenance of the facilities and missile operations.		
Location:	The site was located on the Fitzner-Eberhardt Arid Lands Ecology Reserve, a.k.a., Arid Lands Ecology (ALE) Reserve. Further the site was located on the northeastern slope of Rattlesnake Mountain about 8 kilometers (5.0 miles) west of the intersection of Highways 240 and 225. This site is about 305 meters (1,000 feet) south of the Horseshoe Landfill Site (600-270).		
Process Description:	During the base's operation, missile maintenance included the use of solvents, fuels, acids, hydraulic fluid, and paints. All wastes generated during operations were disposed of in onsite landfills, or dumped nearby offsite.		
Related Sites/ Structures:	The site is related to other structures that were a part of the Nike Missile Base. See WIDS site 600-116 for an overall description of other structures.		
Waste Type:	Demolition and Inert Waste		
Waste Description:	The majority of the waste consisted of non-hazardous construction and demolition waste, scrap metal, lumber, empty bottles, and cans.		
	Nike Missile Base Landfill/A1 - concrete blocks, bottles, wood, and metal debris. Nike Missile Base Landfill/A2 - surface debris; long metal U-bolts, sheet metal scrap, miscellaneous scrap metal. There was no evidence of any buried waste or disturbed soil. Nike Missile Base Landfill/A3 - There was no evidence of any buried waste or disturbed soil.		
Closure Info:	Based on findings from similar landfills on the North Slope of the Hanford Site, EPA and Ecology required that limited characterization of the Nike Missile Base be carried out. Between		

July 5 and 12, 1994, Golder Associates (under contract to the USACE) conducted electromagnetic (EM) profiling, magnetics (MAG), and ground-penetrating radar (GPR) surveys at the Nike Missile Base Landfill. Over an area of approximately 152 meters (500 feet) by 137 meters (450 feet), 9 separate Electromagnetic anomalies (EM) areas were identified.

Anomalous EM zones were categorized as low to high. A total of three anomalies were excavated (8/17/1994 - 8/18/1994) at the Nike Missile Base Landfill. Anomalies that were excavated consisted of the two high EM anomalies and one moderate EM anomaly located just to the northeast of the northerly EM high. Anomalous zones were identified as A-1 through A-3. Full excavation of each anomaly was only required when field screening indicated the possible presence of contaminants.

The ROD (EPA 1993) presented the cleanup goals for 16 contaminants identified as potentially occurring at the IU-1 sites. Though DDT was not one of potential contaminants, Washington State has established a 1 mg/kg criterion for DDT. The cleanup levels for the 16 contaminants of concern were based on the Washington State Model Toxics Control Act (MTCA) Methods A, B, C.

In order to excavate for the presence or absence of hazardous material, each geophysical anomaly was excavated in longitudinal trenches, 1.5 to 3 meters (5 to 10 feet) wide and 1 to 2 meters (3 to 7 feet) deep. Trenching activities for each disposal cell consisted of excavating, inventorying, and segregating any potentially hazardous materials.

Excavated materials were screened visually and by field instruments. Field test kits were onsite and used for field screening when the presence of contaminated materials was suspected. Depending on the suspected presence of contaminated materials, soil samples were collected for offsite analysis. Contaminated materials found during the excavation and/or by screening methods were inventoried and segregated (by shovel or trackhoe). Contaminated materials encountered during excavation were stockpiled near the excavation site on 6-mil plastic and covered with hay-bale tarps.

Information regarding each excavation was recorded including site activities, excavation dimensions, samples collected, results of onsite field screening, date excavated, location and number of offsite soil samples collected.

A single composite sample was collected from A-1, A-2, and A-3. An aliquot was taken from each anomaly with the exception of the VOC sample, which was taken from A-1. See field work section for sample results. Two soil screening samples from A-1 and A-2 to analyze for hydrocarbons in the soil. No hydrocarbons were detected in either sample.

Following cleanup actions, excavations were backfilled, compacted using nonhazardous materials and clean fill, and graded to original conditions.

Code: 600-272	Classification: Accepted
Names: 600-272; Petroleum-Contaminated Borehole; Well 699-43-2	Reclassification: None
Type: Unplanned Release	Start Date:
Status: Inactive	End Date:
Description: The site is hydrocarbon contamination in well 699-43-2. Well 699-43-2 is a 16.8-centimeter (6-5/8-inch) diameter well with a 10-centimeter (4-inch) PVC liner. Limited information is available about well construction. This well is believed to have been drilled to a depth of 120 meters (390 feet) in 1980 to support geologic studies for reactor citing. The well is currently	

103.4 meters (339 feet) deep. The depth to water is 9 meters (26 feet) below land surface. It is believed that the well is not screened to groundwater and is open at the bottom.

Location: The well is located in a remote part of the 600 area, approximately 1.5 miles south of the former Hanford townsite, and approximately 300 meters (1000 feet) from the nearest vehicle access. Well 699-43-2 is approximately 600 meters (2000 feet) from the Columbia River.

Release Description: While the source of hydrocarbons in well 699-43-2 is unknown, the lack of vehicle tracks adjacent to the well, and the determination that the hydrocarbons were diesel fuel or kerosene derived suggests that contamination may have occurred during drilling.

Waste Type: Oil

Waste Description: The waste is an oil/water matrix. A sample of the water in the well showed 4.5 milligrams/liter (mg/L) of total petroleum hydrocarbons, 12.3 mg/L of oil and grease, and about 360 mg/L (36,000 micrograms per liter) of unknown alkanes. The likely source is diesel fuels or kerosene type materials. The liquid waste matrix will designate as D001 due to its low flash point.

Code: 600-273

Classification: Not Accepted (Proposed)

Names: 600-273; Pile of Red Material at Riverland

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site is a pile of red material about 1.4 meters (4.5 feet) high, 9 meters (30 feet) long, and 5 meters (15 feet) wide. The volume calculated by GPS is 113 cubic meters. The site is near the end of a long berm headed west from the old railroad maintenance yard at Riverlands. Patches of similar colored soil can be seen throughout the area. No vegetation is growing in the upper half of the pile, but cheatgrass and other weeds have established at the bottom, presumably where their roots can reach soil. A magnet will pick up some of the fine particles in the pile, suggesting that the material is a crushed iron ore.

Location: The site is at the far west end of the railroad maintenance facility, about 1.6 kilometers (1 mile) from Highway 24, and 150 meters (500 feet) north of the road to the Midway Substation. It is visible from the Midway Substation road.

Related Sites/Structures: This site is at the far west end of 600-101, the Riverland Rail Yard Maintenance Facility.

Waste Type: Soil

Waste Description: The pile appears to be a pile of iron ore dumped from a hopper car so the car could be worked on at the maintenance facility. Iron ore was used in making the concrete for reactors since it provided additional shielding. A similar mound of material was found at the 100 B/C Area. Samples were taken of that mound. The material at 100 B/C contained 48% iron, 1.5% chromium, and 0.2% aluminum.

Code: 600-278

Classification: Accepted

Names: 600-278; Bioremediation Pad Within Gravel Pit 9; Oil Contaminated Soil

Reclassification: Closed Out (5/4/2004)

Type: Surface Impoundment

Start Date: 1/1/1999

Status: Inactive

End Date:

Description: The bioremediation area is located in the eastern section of Gravel Pit #9.

Location: Pit #9 is located approximately 1.2 kilometers (2 miles) north of 300 Area, east of Route 4S.

Process: The soil was removed from around the 284 fuel oil day tanks and spread onto the ground inside

Process Description: Pit 9 in 1999 to facilitate bioremediation of petroleum contained in the soil. In 2000, the bioremediation area had been posted as an Underground Radioactive Material Area and later a Soil Contamination Area. The posting was the result of the fact that the 300 Area is posted as an Underground Radioactive Material Area, so the removed soil was potentially contaminated. In June 2003, it was determined the radiological postings were not appropriate and were removed.

Related Sites/ Structures: The site is associated with the 384 Day Tanks (300-223) and Gravel Pit #9 (600-246).

Waste Type: Oil

Waste Description: The soil on the bio remediation pad was originally contaminated with petroleum (fuel oil #6 and diesel oil #2) from the excavation of the 384 Day Tanks (sitecode 300-223).

Closure Info: Soil samples were collected in September 2003 and analyzed for petroleum hydrocarbons to check the progress of the bioremediation. Results indicated the levels were below chapter 173-340 of the Washington Administrative Code (WAC) limits. The results were sent to Ecology by RL in a letter entitled "Completion of corrective action for petroleum contaminated soil associated with the 384 powerhouse day tanks," dated March 1, 2004. Once Ecology confirms that the soil meets cleanup standards, it will be used for cover at the inert waste landfill located at Pit 9.

Code: 600-284-PL

Classification: Accepted

Names: 600-284-PL; Cross Site Transfer Pipeline; Lines V360, V361, V362, V363, V364 and V366; Old Cross Site Transfer Line; Original Cross Site Transfer Pipeline; Piping Associated with UPR-600-20, Cross Site Transfer Line

Reclassification: None

Type: Encased Tank Farm Pipeline

Start Date: 1/1/1952

Status: Inactive

End Date: 1/1/1995

Description: The waste site is the underground pipeline that is located beneath the surface stabilized UPR-600-20 soil contamination site. It is posted with Underground Radioactive Material signs.

Location: The encased pipeline runs from 241-UX-154 Diversion Box, adjacent to 221-U inside 200 West Area, to the 241-ER-151 Diversion Box inside 200 East Area.

Release Description: The surface of the buried waste transfer line became contaminated through biological transport of radioactive materials that leaked in the pipeline encasement and windblown particulates from the vent station. In March 1988, while conducting a radiological survey of the 241-EW-151 Vent Station (located approximately mid way between 200 East and 200 West Areas on the transfer line) contamination was identified approximately 100 meters (300 feet) outside the established radiation zone boundaries of the vent station, above the transfer line. The Mobile Surface Contamination Monitor (MSCM) tractor was used to survey the entire surface of the pipeline. Numerous spots of contamination were identified at various locations along the entire length of the transfer line. Contamination levels ranged from a few hundred counts per minute to 750 millirem per hour. To characterize the integrity of the pipeline, eight boreholes were drilled with an auger at four locations along the transfer line. Although no contamination was found to have leaked below the pipeline encasement, contamination was found in sagebrush growing next to the encasement. This indicated that the roots of the sagebrush had penetrated the encasement. The contamination was given an Unplanned Release number UPR-600-20 in 1989.

Process Description: The cross site transfer line was originally constructed in 1952 to support the Uranium Metal Recovery operations. Various process and tank farm waste has been transported between 200

East and 200 West areas through this underground concrete encased group of pipelines. The cross site transfer line consists of six stainless steel pipelines (V360, V361, V362, V363, V364, V366) inside a concrete encasement. The encasement type is known as 6-59, indicating there are six lines inside a 59 inch wide encasement. The concrete encased stainless steel pipelines are buried at depths that range from 1.5 to 4.5 meters (5 to 15 feet). There are 58 encasement test risers (swab risers) spaced regularly along the pipeline that provided access to the encasement void space. This cross site line was replaced with a new pipeline in 1995 (see 600-269).

Related Sites/ Structures: The pipeline is associated with the 241-UX-154 Diversion Box, the 241-ER-151 Diversion Box, 241-EW-151 Vent Station and UPR-600-20.

Code: 600-288 **Classification:** Accepted
Names: 600-288; Soil Corrosion Test Site **Reclassification:** None
Type: Experiment/Test Site **Start Date:** 1/1/1993
Status: Inactive **End Date:**
Description: The waste site is approximately a 4.5 meter (15 foot) diameter circle. The area contains five, 15 centimeter (6 inch) diameter, polyvinyl chloride shafts, one 7.6 centimeter (3 inch) diameter PVC soil moisture access port and one 5 centimeter (2 inch) diameter PVC instrument access shaft. The shafts are set in the ground to a depth of approximately 9 meters (30 feet). Only a few inches of each PVC pipe casing is visible above the ground surface.
Location: The test site is located east of Route 3, northeast of 200 West Area. It is north of the Meteorology Station (622-R) and the south of an abandoned airstrip.
Process Description: The site was used to test the pieces of painted low carbon steel and galvanized drums to assess the effect of corrosion when the material was buried in Hanford soil.

Code: 600-289 **Classification:** Discovery
Names: 600-289; Dumping Area Near Shooting Range **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site consists of scattered empty containers for hazardous materials.
Location: The site is located north of the Patrol Training Academy buildings MO222, MO302, and 661A, just west of 663.

Code: 600-338 **Classification:** Discovery
Names: 600-338; Diesel Spill near 623A Bldg on Rattlesnake Mountain **Reclassification:** None
Type: Unplanned Release **Start Date:** 1/1/2008
Status: Inactive **End Date:** 1/1/2008
Description: The site consisted of a diesel fuel leak near the northwest corner of Building 623A, located on Rattlesnake Mountain. The leak was a result of a leaky fitting on a diesel fuel return line from an emergency power generator. It was repaired September 12, 2008. The leak resulted in an affected surface area of approximately 0.61 meters to 0.91 meters (2-3 feet) wide by 1.52

meters to 1.83 meters (5-6 feet) long. Soil remediation began on September 18, 2008. The area is not marked or posted in the field.

Location: The release was located between a diesel tank and the building, near the northwest corner of Building 623A (Plant Radio Relay Bldg on top of Rattlesnake Mountain).

Process Description: During a routine visit of the 623A building on September 11, 2009, an area of discolored soil was discovered on the west side of the building. Further investigation noted that fittings from the emergency back-up generator near the building had leaked approximately 20 gallons of fuel onto the ground. The leak was in a previously disturbed area. Proper notifications were made and the leaking fittings were repaired on September 12, 2008. Soil excavation was conducted between September 18, 2008 and October 28, 2008. Samples were collected on October 8, October 28, 2008 and November 25, 2008.

Related Sites/ Structures: The spill was associated with the 623A building.

Waste Type: Oil
Waste Description: Diesel fuel oil (number 2) released to the ground via a leaking pipe fitting.

Code: 600-349 **Classification:** Accepted

Names: 600-349; Unexploded Ordnance (UXO) outside of 600-149 **Reclassification:** None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: This site consists of potential Unexploded Ordnance (UXO) in an area bounded by the entire perimeter of the 600-149, Small Arms Range, Rifle and Pistol Range, 661 Complex, 600-54 (See Subsites) waste site extending from the perimeter as far as a fired rifle grenade could travel. The area with the highest potential to contain munitions and explosives of concern includes a portion of Gable Mountain south of Prid Canal.

Related Sites/ Structures: 600-149, Small Arms Range, Rifle and Pistol Range, 661 Complex, 600-54 (See Subsites)

Code: 600-350 **Classification:** Accepted

Names: 600-350; PNL Water Catchment Experiment **Reclassification:** Interim Closed Out (9/14/2011)

Type: Experiment/Test Site **Start Date:**

Status: Inactive **End Date:**

Description: This site consists of two separate fenced areas containing linear soil mounds.

Location: This feature is located approximately 700 meters northwest of the Hanford town site's former high school and 122 meters east of route 2N.

Process Description: The Pacific Northwest Laboratory (PNL) constructed this site to perform rain harvesting experiments. The experiments were done to study the use of water harvesting (the collection and use of rainfall runoff) to restore the vegetative productivity of strip mined lands in arid regions. The study tested the technical and economic feasibility of using partially leveled spoil banks at strip mines as catchment areas to collect and direct runoff to the top soiled valley floor where crops were cultivated. The study was performed from 1976 through 1981 (PNL-4538). The site was modified with a small drag line to resemble the smoothed spoil banks of a coal

mine; cobble alluvium of the Columbia River served as spoil. Seven areas were prepared, three with valleys that ran north to south, and three with valleys that ran east to west; one area was prepared without adjacent slopes to simulate leveled spoil banks. The north-south valleys were protected from the strongest winds in the region, while the east-west valleys were parallel with the strongest winds. The valleys were each 90 m (300 ft) long by 18 m (60 ft) wide at the top of the catchment areas ("spoil banks") and 4 m (13 ft) wide at the surface of the topsoil, with a 33° angle of repose for each slope. The runoff efficiency of the surface was evaluated by applying a pore filling or waterproofing substance to the surface of the spoil banks. Three materials (rubber sheeting, paraffin and asphalt-rubber) were used for slope treatments. The rubber sheeting was 1.59 mm (1/16 in.) thick EPDM (butyl rubber) installed in September 1976 in one NS valley. Paraffin (approximate melting point 53°C) was melted and sprayed at the rate of approximately 1 kg/m² on the cobbled catchment area of a NS valley in May of 1977 and on the smooth catchment area in an EW valley in September 1977. Asphalt-rubber, a mixture of ground rubber and asphalt, is used as a crack sealer on roadways and as a liner for reservoirs. This treatment was applied to catchment areas of an EW valley in September of 1977 at the rate of 4 to 8 l/m². Catchment (slope) treatments at Hanford included: Flat Control - NS oriented area with no adjacent slopes or catchment areas Rubber sheeting - NS valley with rubber sheeting on catchment area Asphalt-rubber - EW valley with asphalt-rubber on catchment area Paraffin NS - NS valley with paraffin on catchment area Paraffin EW - EW valley with paraffin on catchment area Bare surface NS - NS valley with no treatment on catchment area Bare surface EW - EW valley with no treatment on catchment area

Closure Info: Remedial action at the 600-350 waste site took place from March 14 to April 4, 2011, and consisted of removing the asphalt coating from the "V"-shaped area between and on the sides of the mounds. The asphalt debris was directly loaded into containers for disposal at the Environmental Restoration Disposal Facility.

Based on observations during a March 2010 walkdown to support remedial action, it was determined that the asphalt material should be removed and the mounds flattened for aesthetic purposes.

Code: 600-351	Classification: Accepted
Names: 600-351; Stained areas outside of 100-F Area	Reclassification: Interim Closed Out
Type: Unplanned Release	Start Date:
Status: Inactive	End Date:
Description: This site has been remediated. The site contained two stained soil areas. The northern area consisted of stained, crusted soil and no vegetation, measuring 4 meters (13.2 feet) in diameter. The southern area consisted petroleum based material released to the ground. The soil was crusted with no vegetation. It measuring 2 meters (6.6 feet) in diameter. Empty oil cans were scattered around the area	
Location: The areas were located approximately 76 meters (250 feet) south of F Ave. (north). The northern area was located at Easting: 579790.07 Northing: 146715.53. The southern area was located at Easting: 579789.44 Northing: 146706.44.	

Code: 600-352-PL	Classification: Accepted (Proposed)
Names: 600-352-PL; Pipeline from 342 Sump to 310 Facility (300 Area TEDF); 300 Area Retention/Transfer System (RTS) Pipeline	Reclassification: None
Type: Process Sewer	Start Date: 1/1/1994

Status: Active

End Date:

Description: The underground pipeline is constructed of 25 centimeter (10 inch) diameter high density polyethylene pipe.

Location: The majority of the pipeline is located north of the 300 Area. It begins at the 342 waste collection sump and extends northward to the 310 Retention Storage facility. It follows the abandoned rail spur and then parallels Stevens Drive.

Process Description: The 300 Area Retention/Transfer System is a batch release operation. 300 Area effluent is pumped into the 300 Area Retention/Transfer System (RTS) via this pipeline and the 342 waste collection sump. The pipeline terminates at the 310 valve vault. The water is temporarily stored in one of three retention tanks located in the 310 facility complex. After being analyzed, the effluent below regulatory limits is returned to the 300 Area Process Sewer pipeline (see sitecode 300-15).

Related Sites/ Structures: The pipeline is associated with the 342 waste Collection Sump and the 310 Facility (see sitecode 600-117).

Code: 600-353

Classification: Accepted

Names: 600-353; Non-Operational Property Evaluation Zone 1, Areas of Distressed Vegetation and Oil Filter Debris

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: During a Non-Operational Property Evaluation walkdown, an area of concern was located south of Route 11A. One location containing deteriorating crushed oil filters was identified. Another location, west of the oil filters was found to be devoid of vegetation. Each location measured approximately 25 square feet.

Location: The area of concern is located northwest of 200 West Area, south of Route 11A. It is east of the intersection of Route 11A and Route 6.

Code: 600-354

Classification: Accepted

Names: 600-354; Non-Operational Property Evaluation Zone 1, Debris Field West of Army Loop Road

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The 600-354 debris field, located west of Army Loop Road, includes multiple miscellaneous debris items scattered across an area roughly 800 meters long and 500 meters wide. Items identified during Non-Operational Property Evaluation walkdowns include rusty cans, buckets, metal debris, tar, transite and areas of disturbed vegetation. Several large mounds of dirt were noted, but their function is unclear. There is evidence of a trench containing visible surface debris with the potential of containing subsurface debris. A previously identified concrete bottom pit is include in this waste site.

Location: The items associated with 600-354 are located south of the intersection of Route 11A and Route 6, on the west side of Army Loop Road. The area is northwest of 200 West Area.

Code: 600-355

Classification: Accepted

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The elevated area is known as a mound or a ridgeline. Miscellaneous debris is visible at several locations along the ridgeline. Visible debris includes paint cans, tar, transite and hydraulic fuel cans.

Location: The waste site is located south of Route 11A and west of Army Loop Road.

Code: 600-356 **Classification:** Accepted (Proposed)

Names: 600-356; Tar Deposit West of Susie Junction **Reclassification:** None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The waste site contains two areas if pebbles and rocks with visible concentrations of dark, tar material. One area is a large tar deposit. It measures approximately 18 meters by 11 meters. A smaller area of tar, measuring approximately 0.3 meters by 1 meter, is located southeast of the large area.

Location: The areas are located west of the railroad junction known as Susie Junction. The center point coordinates of the large area are N140640.7; E566609.9.

Code: 600-357 **Classification:** Not Accepted

Names: 600-357; Geophysical Testing Pit #2 near 618-10 **Reclassification:** None

Type: Experiment/Test Site **Start Date:**

Status: Inactive **End Date:**

Description: PNNL constructed a geophysical test bed near 618-10 in 1981. The test bed was constructed by excavating the ground to form a depression approximately 61 m (200 ft) long by 15 m (50 ft) wide. The depression was filled to grade with the excavated soils after the targets were buried in the test bed. The surface remained indistinguishable from the surrounding terrain except for the lack of vegetation.

Location: The test bed is approximately 200 meters northeast of the 618-10 burial ground.

Process Description: Forty-four targets were buried at the PNNL Test Bed. They included steel and plastic pipes (with varying diameters and wall thicknesses), empty 55 gallon drums, finned objects, projectiles of various dimensions, aluminum boxes, aluminum cylinders, spheres (Styrofoam and aluminum), a wood box, a steel box, a brass rod and a conductivity probe. Geophysical testing using various instrumentation was performed at the test bed between 1981 and 1984.

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site consists of scattered CERCLA regulated debris identified during the unexploded

ordinance (UXO) characterization and clearance of the 600-149:1 waste site. The debris included a lead battery, a lead chunk, a burn area, a suspect drum or pipe and a 380 meter long asbestos pipe with staging piles of the asbestos pipe previously removed. In October 2011, the asbestos pipeline and staging areas were determined to be Miscellaneous Restoration items.

Location: The site is located north of the east end of Gable Mountain near the Rifle and Pistol Range.

Code: 600-359 **Classification:** Accepted

Names: 600-359; Non-Operational Property Evaluation Zone 2, Location 1 Debris and Distressed Vegetation **Reclassification:** None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: During a Non-operation Property Evaluation walkdown, several rubber shoe covers were identified laying on the ground surface, adjacent to a railroad track. Some evidence of mechanical disturbance was also noted near the shoe covers. A devegetated area, measuring approximately 200 feet by 100 feet, was found. Stained soil, measuring approximately 10 feet by 10 feet, was identified near the railroad switch box.

Location: The area is located approximately 700 meters north of Route 11A and approximately 3000 meters west of Route 4N.

Process Rubber shoe covers have a potential of being contaminated.

Description:

Code: 600-360 **Classification:** Accepted

Names: 600-360; Non-Operational Property Evaluation Zone 2, Location 2 Debris Sites **Reclassification:** None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: During field walkdowns several areas of debris were identified. Debris included cans, drums, wood and a 35 gallon cylinder tank. Some areas of devegetation were also noted.

Location: The area is approximately 1000 meters west of the intersection of Route 11A and Route 4 North. The majority of the area is on the north side of Route 11A, but a portion extends to the south side of Route 11A.

Code: 600-361 **Classification:** Accepted

Names: 600-361; Non-Operational Property Evaluation Zone 2, Location 3 Debris **Reclassification:** None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: During a site walkdown, a considerable amount of debris was identified. The debris included rubber shoe covers, wood, metal cans, drums aerosol cans, oil filters and electrical parts. A mound of asphalt, measuring approximately 300 feet by 150 feet was also noted. A 30 foot diameter area contained stained soil and stressed vegetation.

Location: The area is located about 500 meters north of the intersection of Route 11A and Route 4N. The majority of the area is located on the west side of Route 4N, but a portion is located on the east side of Route 4N.

Code: 600-362 **Classification:** Accepted

Names: 600-362; Non-Operational Property Evaluation Zone 2, Location 4 Debris and Anomalies **Reclassification:** None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: Nine items were identified on the east side of Route 4N, near waste site 600-282. A tar area was estimated to cover approximately 0.01 acres of ground. An irregularly shaped area of distressed vegetation and the remains of a wooden building covered an area measuring approximately 0.06 acres. A small area of stressed vegetation and two oil filters were noted. A depression resembling a trench was identified. The vegetation within the trench was different than the surrounding vegetation. The trench measures approximately 0.04 acres. An area of stressed vegetation, measuring approximately 10 by 10 feet, was noted. An area encompassing approximately 1.5 acres was identified that appeared to have been mechanically disturbed. It contained mounds of soil, distressed vegetation and a pit containing a trash can and tumbleweeds. Another mechanically disturbed area was identified near waste site 600-40. It includes a mound that resembles a loading ramp. A pit was found southwest of the 600-40 site. The pit measured approximately 16.8 meters (55 feet) by 12.2 meters (40 feet). The pit contains aged lumber and a tar-like substance.

Location: The majority of the area is located on the east side of Route 4N. A portion of the area is located on the west side of Route 4N. It is approximately 2500 meters north of the intersection of Route 4 N and Route 11A.

Code: 600-363 **Classification:** Accepted

Names: 600-363; Non-Operational Property Evaluation Zone 2, Location 5 Debris; Walkdown Area 7 **Reclassification:** None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: An area measuring approximately 30 by 30 feet was identified that contains a significant amount of surface debris. The debris includes lumber, roofing material transite, solidified tar and asphalt.

Location: The area is located approximately 1400 meters north of Route 11A and 2000 meters west of Route 2N.

Code: 600-364 **Classification:** Accepted

Names: 600-364; Non-Operational Property Evaluation Zone 2, Location 6, Electrical Parts Debris, Area 24 **Reclassification:** None

Type: Dumping Area **Start Date:**

Status: Inactive **End Date:**

Description: The site encompasses approximately 15 acres. The majority of the debris is related to discarded electrical parts, such as fuses, light bulb tips and foam insulation.

Location: The site is located approximately 1.8 miles east of the intersection of Route 2N and Route 11A

and approximately 800 meters south of Route 11A.

Code: 600-365 **Classification:** Accepted
Names: 600-365; Debris Landfill adjacent to 600-228, H-40 Anti-Aircraft Gun Site debris **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The waste site appears to be a small landfill or dumping area. Old glass bottles and cans were visible.
Location: This site is located southeast of the 200 East Area, on the south side of Route 4 South. The dumping area is located southeast of the H-40 Anti-Aircraft Gun Site.
Related Sites/ Structures: The debris is associated with the H-40 Anti-Aircraft Gun Site.

Code: 600-366 **Classification:** Not Accepted
Names: 600-366; PNNL Geophysical Test Site West of 300 Area **Reclassification:** None
Type: Experiment/Test Site **Start Date:**
Status: Inactive **End Date:**
Description: This feature consists of a subsurface feature containing nine buried inert objects ranging from near surface to 4.2 meters below ground surface and two acoustic boreholes.

Code: 600-367 **Classification:** Accepted
Names: 600-367; Burial Pit near Little Egypt **Reclassification:** None
Type: Burial Ground **Start Date:**
Status: Inactive **End Date:**
Description: The site is a ditch where a trailer and some equipment that burned during a wildfire was buried.
Location: The pit is located approximately 100 meters (328 feet) north of the Hanford Geotechnical Engineering and Development Cold Test Facility (aka Little Egypt), near the test facility access road.

Code: 600-368 **Classification:** Accepted
Names: 600-368; Segment 4 Stained Soil #1 **Reclassification:** None

Classification: Accepted

Names: 600-369:8; Segment 4 Bare Ground and Crusted
Soil Area 8

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The subsite consists of a 10 m (33 ft) diameter area of stressed vegetation and 6 drum lids.

Location: The site is located 118 m (387 ft) north of Route 1 and 440 m (1444 ft) west of Route 2 North.

Process There is no process history associated with this subsite.

Description:

The SubSite is Part Of:

Code: 600-369

Names: 600-369; Segment 4 Bare Ground and Crusted Soil Areas

Code: 600-370

Classification: Accepted

Names: 600-370; Segment 4 Debris Area #1

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: This site consists of a large disturbed area with surface debris consisting of multiple burn sites with burn remnants, transite, insulators, wood and concrete.

Location: The site is located 237 m (778 ft) south of Route 1 and 2.7 Km (1.7 miles) west of Route 2 North, at E577743.13, N145009.07

Code: 600-371

Classification: Accepted

Names: 600-371; Segment 4 Chalky Material Area

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: This site consists of multiple locations having a white chalky substance that resembles either grout or bentonite.

Location: The site is located 1.4 Km (0.9 miles) east of H Avenue and 240 m (787 feet) west of the Columbia River, at E579060.73, N150280.

Process There is no process history associated with the 600-371 waste site.

Description:

Code: 600-372 **Classification:** Accepted
Names: 600-372; Segment 4 Oil Stains and Filter Areas **Reclassification:** None
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**
Description: The 600-372 waste site consists of two areas that have a discarded oil filter and are devoid of vegetation. The site has been divided into two subsites as follows:

600-372:1, Segment 4 Oil Stain and Filter Area #1a,E578666.74, N150323.91
600-372:2, Segment 4 Oil Stain and Filter Area #1b,E578082.80, N578082.80

Location: The site is located northeast of the interstecation of Route 2N and H Avenue.
600-372:1,E578666.74, N150323.91
600-372:2,E578082.80, N578082.80

Process There is no process history associated with the 600-372 waste site.

Names: 600-372:2; Segment 4 Oil Stain and Filter Area #1b

Code: 600-372:1 **Classification:** Accepted
Names: 600-372:1; Segment 4 Oil Stain and Filter Area #1a **Reclassification:** None
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**
Description: The subsite consists of a 3 sq. m. (4 sq. yd) area that has a discarded oil filter and is devoid of vegetation.
Location: The site is located 3 Km (1.8 miles) north of Route 2N and 1 Km (0.6 miles) east of H Avenue, E578666.74, N150323.91

Process There is no process history associated with this subsite.
Description:

The SubSite is Part Of:

Code: 600-372
Names: 600-372; Segment 4 Oil Stains and Filter Areas

Code: 600-372:2 **Classification:** Accepted
Names: 600-372:2; Segment 4 Oil Stain and Filter Area #1b **Reclassification:** None
Type: Unplanned Release **Start Date:**
Status: Inactive **End Date:**
Description: The subsite consists of a 13 sq. m. (15 sq. yd) area that has a discarded oil filter and is devoid of vegetation.

Location: The site is located 2.2 Km (1.4 miles) north of Route 2N and 0.4 Km (0.26 miles) east of H Avenue, E578082.80, N578082.80

Process There is no process history associated with this subsite
Description:

The SubSite is Part Of:

Code: 600-372

Names: 600-372; Segment 4 Oil Stains and Filter Areas

Code: 600-373

Classification: Accepted

Names: 600-373; Segment 4 Bare Ground and White Stain Area

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: This site consists of a 28 square meter (303 square feet) area devoid of vegetation and covered by a white stain and crusted soil/glass debris.

Location: The site is located 2.8 Km (1.7 miles) north of Route 2 N and 0.76 Km (0.47 miles) east of H Avenue, at E578471.14, N150388.87

Process There is no process history associated with the 600-373 waste site.

Description:

Code: 600-374

Classification: Accepted

Names: 600-374; Segment 4 Drum Remnant Area

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: This site consists of an empty 55 gallon drum (crushed) surrounded by a small area devoid of vegetation.

Location: The site is located approximately 1.6 Km (1 mile) northwest of the intersection of Route 2 North and H Avenue. The drum is located at E576207.11, N150290.57.

Process There is no process history associated with the 600-374 waste site.

Description:

Code: 600-375

Classification: Accepted

Names: 600-375; Segment 4 Dry Cell Battery Debris Area #1

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The 600-375 waste site consists of five locations that have dry cell battery debris and stained soil. The site has been divided into five subsites as follows:

600-375:1, Segment 4 Dry Cell Battery Debris Area #1a
600-375:2, Segment 4 Dry Cell Battery Debris Area #1b
600-375:3, Segment 4 Dry Cell Battery Debris Area #1c

600-375:4, Segment 4 Dry Cell Battery Debris Area #1d

600-375:5, Segment 4 Dry Cell Battery Debris Area #1e

Location: The sites are located in Segment 4 west and north of the Central Shops Area (White Bluffs Community).

600-375:1, Segment 4 Dry Cell Battery Debris Area #1aE577208.71, N150162.85

600-375:2, Segment 4 Dry Cell Battery Debris Area #1bE576718.36, N148913.05

Status: Inactive **End Date:**

Description: This subsite consists of small area with battery debris and stained soil.

Location: The site is located 3.2 Km (2.0 miles) north of Route 1 and 1.3 Km (0.8 miles) west of Route 2 North, E576156.50, N148489.60

Process There is no process history associated with this subsite.

Description:

The SubSite is Part Of:

Code: 600-375

Names: 600-375; Segment 4 Dry Cell Battery Debris Area #1

Code: 600-376 **Classification:** Accepted

Names: 600-376; Segment 4 Stained Soil Area #2 **Reclassification:** None

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: The waste site consists of two stained soil areas and two patches of bare ground with a black material covering the ground, glass jar (probable food container) with unknown material, and dried yellow material. The site has been divided into two subsites as follows:

600-376:1, Segment 4 Stained Soil Area #2a

600-376:2, Segment 4 Stained Soil Area #2b

Location: The subsites are located NNW of the intersection of Route 2N and H Avenue.

600-376:1, E575916.56, N150178.99

600-376:2, E576272.73, N149545.31

Process There is no process history associated with the 600-376 waste site.

Description:

This Site has the Following SubSites:

Code: 600-376:1

Names: 600-376:1; Segment 4 Stained Soil Area #2a

Code: 600-376:2

Names: 600-376:2; Segment 4 Stained Soil Area #2b

Code: 600-376:1 **Classification:** Accepted

Names: 600-376:1; Segment 4 Stained Soil Area #2a **Reclassification:** None

Type: Unplanned Release **Start Date:**

Status: Inactive **End Date:**

Description: The subsite consists of two stained soil areas adjacent to the railroad tracks leading to the 100-H Area.

Location: The site is located 200 m (653 ft) north of Route 2 North and 1.75 Km (1.1 miles) west of H Avenue, E575916.56, N150178.99

Process There is no process history associated with this subsite.

Description:

Description:

The SubSite is Part Of:

Code: 600-376

Names: 600-376; Segment 4 Stained Soil Area #2

Code: 600-376:2

Classification: Accepted

Names: 600-376:2; Segment 4 Stained Soil Area #2b

Reclassification: None

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The subsite consists of two patches of bare ground covered with debris including black material, a glass jar (probable food container) with unknown material, and dried yellow material.

Location: The site is located 4.3 Km (2.7 miles) north of Route 1 and 122 m (400 feet) west of Route 2 North, E576272.73, N149545.31

Process There is no process history associated with this subsite.

Description:

The SubSite is Part Of:

Code: 600-376

Names: 600-376; Segment 4 Stained Soil Area #2

Code: 600-377

Classification: Accepted

Names: 600-377; Segment 4 Oil Stain and Filter Area #2

Reclassification: None

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The site consists of a 3 square meter (32 square feet) area devoid of vegetation and containing multiple filters.

Location: The site is located 3 Km (1.9 miles) south of Route 1 and 97 m (318 ft) west of Route 4 North. The area is located between Route 4N and the west end of Gable Mountain.

Process There is no process history associated with the 600-368 waste site.

Description:

Code: 600-378

Classification: Accepted

Names: 600-378; 506 Telephone Exchange Emergency Generator Building Underground Fuel Storage Tank

Reclassification: None

Type: Storage Tank

Start Date:

Status: Inactive

End Date:

Description: This site is the historical location of a 379 L (100 gal) underground storage tank used to store fuel for the 506 telephone exchange emergency generator building (508 bldg).

Location: The 506 Building was located on the south side of the Hanford - Cold Creek Road (Route 11A). The fuel tank is located at E581237.93, N138768.82.

Process The 506 B-Y Telephone Exchange constructed in 1945 handled essentially all of the switching between the inner and outer areas. It also housed the 50 line Hanford exchange and served as

the primary base of operations for telephone maintenance personnel in support of the 100 and 200 Areas (GEH-26434-400). The 508 Building provided emergency power to support the 506 B-Y Telephone Exchange Building in the event of a power outage. An adjacent structure (507 Building) provided storage space and was used for minor repair and maintenance tasks.

Code: 600-379 **Classification:** Accepted
Names: 600-379; Segment 4 Burn Area #1 **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site consists of a burn area with visible remnants.
Location: The site is located 1.2 Km (0.75 miles) south of Route 1 and 5.7 Km (3.5 miles) west of Route 2 North,north of Route 11A.It is also located 648 m (2,126 ft) southwest of the 213-J&K Storage Facility.
Process Description: There is no process history associated with the 600-379 waste site.

Code: 600-380 **Classification:** Accepted
Names: 600-380; Segment 4 Unknown Cylinder **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The site consists of an unknown cylinder located 20 m (64 ft) from a maintained gravel road.
Location: This site is located approximately 0.96 Km (0.60 miles) west of the intersection of H Avenue and the 100H perimeter road.
E576701.265, N151747.148
Process Description: There is no process history associated with the 600-380 waste site.

Code: 600-381 **Classification:** Accepted
Names: 600-381; Segment 4 Underground Structure with **Reclassification:** None
Wooden Air Vents Feature
Type: Depression/Pit (nonspecific) **Start Date:**
Status: Inactive **End Date:**
Description: This site consists of two wooden air vents covered with screening protruding from the ground.This feature is a discovery site because of the possibility of a void under ground space of unknown size.
Location: The site is located 0.8 Km (0.5 miles) south of the Columbia River and 1.3 Km (0.8 miles) west of Hadley Loop (H-Area perimeter road).E575918.008, N153563.985
Process Description: There is no process history associated with the 600-381 waste site.

Code: 600-382 **Classification:** Accepted

Names: 600-382; Segment 4 Oil Stains and Filter Area #3 **Reclassification:** None

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The 600-382 waste site consists of five locations that have discarded oil filters and ground staining devoid of vegetation. The site has been divided into five subsites as follows:
 600-382:1, Segment 4 Oil Stain and Filter Area #3aE576315.892 N150679.753;
 600-382:2, Segment 4 Oil Stain and Filter Area #3bE576286.206 N150613.712;

End Date:

Description: This subsite consists of a 1.5 m (5 ft) diameter area of stained soil.

Location: The site is located 1.1 Km (0.7 miles) north of Route 2 N and 2 Km (1.2 miles) west of H Avenue.E575684.069 N151248.983

Process There is no process history associated with this subsite.

Description:

The SubSite is Part Of:

Code: 600-384

Names: 600-384; Segment 4 Stained Soil Area #3

Code: 600-385

Classification: Accepted

Names: 600-385; Segment 4 Transite, Concrete, and Metal Debris Area

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: The site consists of a 5334 square m (1.3 acres) area with scattered transite, concrete, and metal debris.

Location: This site is located approximately 1.2 Km northwest of the northwest corner 100H perimeter road along the Columbia River.E576211.402 N154182.005

Process There is no process history associated with the 600-385 waste site.

Description:

Code: 600-386

Classification: Accepted

Names: 600-386; Segment 5 Battery Remnant Area #1

Reclassification: None

Type: Dumping Area

Start Date:

Status: Inactive

End Date:

Description: This feature consists of wet cell battery remnants partially buried and some potential related staining visible located approximately 835 meters NNW of the intersection of the 310 building (TEDF) and 13 meters west of Route 4S.

Location: The coordinates for the battery site areE593533.2002, N118226.1146.

Code: 600-387

Classification: Accepted

Names: 600-387; 212-R Railspur Legacy Contamination

Reclassification: None

Type: Unplanned Release

Start Date:

Status: Inactive

End Date:

Description: The waste site is two areas of superficial and subsurface radiological contaminated areas identified following the removal of 16 Railcars located at 200 North Area. Contamination was found on the gravel bed under the railroad ties and was unrelated to the actual D4 Project Activities of the removal of the 16 railcars.

Location: One radiologically contaminated area is on the north side of Deer St. and the other is on the south side of Deer St (aka Railroad Street).

Code: 600-388 **Classification:** Accepted
Names: 600-388; Debris Field South of Army Loop Road **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is surface debris found during the Zone 4 Non Operational Area walkdowns. There is evidence of mechanical ground disturbance, stressed vegetation and indications of potentially buried material.
Location: The area is located south of Army Loop Road, near Beloit Ave. and the Rattlesnake Gate.

Code: 600-389 **Classification:** Accepted
Names: 600-389; Surface Debris near 600-49 **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: The waste site is an area of surface debris identified during the Zone 4 Non-Operational Area walkdowns. The debris includes batteries, paint, metal objects and an oil filter.
Location: The waste site is located south of Army Loop road near waste site 600-49.

Code: 600-390 **Classification:** Accepted
Names: 600-390; Area of Dried Surface Material **Reclassification:** None
Type: Depression/Pit (nonspecific) **Start Date:**
Status: Inactive **End Date:**
Description: During the Non-Operational Area site walkdown of Zone 3, a surface deposit of dried material was identified. The deposit resembles dried resin.
Location: The area is located on the north side of Route 4 South, west of Route 2 South. It is north of the Old Central Landfill waste site.

Code: 600-391 **Classification:** Accepted
Names: 600-391; Dumping Area Southeast of H-40 Gun Site **Reclassification:** None
Type: Dumping Area **Start Date:**
Status: Inactive **End Date:**
Description: During the Zone 8 ground-truth interpretation of LIDAR data, an area of potential contamination was identified. The Non-Operational Property Evaluation walkdown found a significant mechanically disturbed area containing partially buried debris.
Location: The area is located south east of the H-40 Gun Site, south of Route 4 South.
Related Sites/ Structures: The debris area is associated with WIDS site 600-228.

Code: 600-392 **Classification:** Discovery
Names: 600-392; Debris and Radiological Signs West of **Reclassification:** None

212-N

Type: Dumping Area**Start Date:****Status:** Inactive**End Date:****Description:** The waste site is a group of discarded rusty cans, barrels and old metal signs. Some of the signs have words that indicate they were related to safety and radiological control.**Location:** The dumping area is located west of the demolished 212-N facility. The center point coordinates are N140230, E569763.**Code:** 1100-19**Classification:** Accepted**Names:** 1100-19; Tar Flow and Stained Sands Areas**Reclassification:** Deleted From NPL (9/30/1996)**Type:** Unplanned Release**Start Date:****Status:** Inactive**End Date:** 1/1/1995**Description:** This site has been remediated based on the 100 Area Record of Decision. Prior to remediation, the Tar Flow site contained soft, tar like material on the surface. The material appeared to have flowed approximately 45.75 meters (150 feet) to the northeast into a drainage ditch. The Stained Sand Area was located on the east slope of a sand dune. The area had vegetation and the sand appeared to be stained. After remediation, both sites were regraded to a smooth, uniform surface.**Location:** The Tar Flow and Stained Sand sites were located northwest of the 1171 building. The Tar Flow area was located 320 meters (1,050 feet) north of the northwest corner of the 1171 building. The Stained Sand site was located approximately 271 meters (888 feet) north of the northwest corner of the 1171 building.**Waste Type:** Soil**Waste Description:** The waste consisted of petroleum contaminated soil.**Closure Info:** The contaminated soil was removed by the US Army Corp of Engineers on June 26, 1995. 1,600 cubic yards of contaminated soil was excavated and stockpiled. Confirmatory samples indicated the remediation had met the clean-up levels established in the Record of Decision. The contaminated soil was disposed of at the Columbia Ridge Disposal Facility in September 1995.**Code:** UPR-200-E-18**Classification:** Accepted**Names:** UPR-200-E-18; Contamination Release at the 216-A-8 Sampler Pit; UN-200-E-18**Reclassification:** None**Type:** Unplanned Release**Start Date:** 1/1/1959**Status:** Inactive**End Date:****Description:** The sampler pit is a concrete structure with three valves, two vent stacks and one curved bonnet extending from the structure. The structure is surrounded with post and chain with Underground Radioactive Material and Contamination Area signs. The area around the structure is gravel and asphalt.**Location:** The release site is approximately 30 meters (100 feet) east of the 241-A-271 Building, at the 216-A-8 proportional sample pit. It is east of 241-A Tank Farm and west of Canton Ave.**Release Description:** Contaminated moisture dripping from a vent pipe bonnet at the 216-A-8 Proportional Sample Pit contaminated the ground around the cement pad.

Related Sites/ Structures: The release is associated with the 216-A-8 Proportional Sampler Pit (sitecode 200-E-285).

Waste Type: Process Effluent

Waste Description: Low-level fission products dripped onto the ground from the vent pipe bonnet.

Code: UPR-200-E-79 **Classification:** Accepted

Names: UPR-200-E-79; 200-E-264-PL Line Break; 242-B to 207-B Line Break; UN-200-E-79; UN-216-E-7 **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1953

Status: Inactive **End Date:**

Description: The area where the release occurred is delineated by light duty posts and chain measuring approximately 7.6 meters (25 feet) wide and 61 meters (200 feet) long. It is posted with Underground Radioactive Material signs.

Location: The site is located between the 242-B Evaporator and the 207-B Retention Basin, south of 241-B Tank Farm.

Release Description: In June 1953, five leaks were discovered in the waste line that runs from 242-B to 207-B. Contamination levels up to 2,500 counts per minute were measured at the points of emission of water from the ground.

Process Description: The release consisted of a 10 centimeter (4 inch) diameter, cast iron underground pipeline that was found to be leaking in 1953.

Related Sites/ Structures: The site is associated with the 242-B Evaporator and the 207-B basin. The release occurred in the pipeline assigned sitecode 200-E-264-PL.

Waste Type: Process Effluent

Waste Description: The release consisted of approximately of 10 curies Mixed Fission Products (MFP) from the pipeline.

Code: UPR-200-E-99 **Classification:** Accepted

Names: UPR-200-E-99; Contamination Adjacent to 244-CR Vault; UN-200-E-99; UN-216-E-27 **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1980

Status: Inactive **End Date:** 1/1/1980

Description: The previously posted Surface Contamination Area was released from radiation zone status in March 1981. A WIDS single sign had been placed at the approximate center location of the release. This sign was removed in 2010 when support trailers were placed in the area. Other areas with radiological postings are currently visible in this area.

Location: The release was a posted Surface Contamination Area located south of 7th Street, directly south of the 244-CR Vault.

Release Description: The ground surface surrounding the 244-CR Vault became contaminated during the numerous piping changes and activities associated with the vault.

Process: The area south of 7th Street and west of Buffalo Ave. has had numerous areas of radiological

Process
Description: postings over the years due to contamination migration from the 241-C Tank Farm and the 244-A Lift Station.

Related Sites/ Structures: UPR-200-E-99 is associated with the 244-CR Vault and the 241-C Tank Farm.

Waste Type: Soil
Waste Description: The release was associated with the migration of contaminated particulates from the 244-CR Vault onto the surrounding ground surface. The 244-CR Vault was used in the transfer of process waste between facilities.

Code: UPR-200-E-100 **Classification:** Accepted

Names: UPR-200-E-100; Radioactive Contamination Near 244-A Lift Station; UN-200-E-100; UN-216-E-100; UN-216-E-29 **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1985

Status: Inactive **End Date:**

Description: Various radiological postings exist in this vicinity that are associated with the 244-A Lift Station and 241-C Tank Farm contamination migration. A WIDS sign has been placed at the approximate location of the release. Routine radiological surveys of the 244-A Lift Station Area have changed the size and the shape of the posted areas as new contamination specks are identified and remediation attempts occur.

Location: UPR-200-E-100 consisted of radioactive rodent feces and contamination specks located south Seventh Street and west of Buffalo Street, adjacent to the 244-A Lift Station. Due to rodent movement and some contamination migration from wind, the size and the shape of the contaminated area was redefined several times.

Release Description: The release area was determined to be due to windblown particulates and biological transport (rodent feces) from the tank farms and the 244-A Lift Station. Another source of the contamination may be an underground pipeline leak near the 244-A lift station. A waste site number (UN-216-E-29) was assigned to this area on August 18, 1985.

Related Sites/ Structures: UPR-200-E-100 is associated with the 244-A Lift Station, the 241-C Tank Farm, UPR-200-E-143, UPR-200-E-56 and the 216-A-40 Retention Basin.

Waste Type: Animal Waste
Waste Description: The contamination was due to windblown particulates and biological transport (rodent feces) from the 200 East Area tank farms and the 244-A Lift Station.

Code: UPR-200-W-20 **Classification:** Accepted

Names: UPR-200-W-20; Spread of Contamination from a Diversion Box; UN-200-W-20 **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1953

Status: Inactive **End Date:**

Description: A WIDS sign has been placed at the approximate location of the release.

Location: Due to discrepancies in reference documentation, it is not possible to be certain where this release occurred.

Release In January and February 1953 work being done inside a diversion box resulted in extensive

Description: spread of contamination to the ground. An area of about 93 square meters (1000 square feet) around the diversion box was covered with six inches of clean gravel. This area was roped off and posted with radiation zone signs in 1953.

Process Description: The 241-S-151 Diversion Box was used to redirect waste solutions from processing and decontamination operations. Waste quantities were variable depending on the specific plant operations. Leak detection and air monitoring are performed continuously with the 241-S Tank Farm. The unit interconnects the 240-S-151, 241-SX-151, and the 241-S Tank Farm.

Related Sites/ Structures: May be a Duplicate entry - see UPR-200-W-82.

Waste Type: Process Effluent

Waste Description: Specks from the open diversion box caused an area around the diversion box to be contaminated.

Code: UPR-200-W-76 **Classification:** Accepted

Names: UPR-200-W-76; Contamination Found at 241-TX-155; UN-200-W-76 **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1977

Status: Inactive **End Date:**

Description: In 2008, the area surrounding 241-TX-152 Diversion Box, 241-TX-155 Diversion Box and 241-TX-302B catch tank has been covered with a layer of clean gravel. It is posted with Bio-Barrier and Underground Radioactive Material signs. A single white sign with black letters reading "WIDS UPR-200-W-76" is hanging on the chain on the near the south side of the 241-TX-152 Diversion Box.

Location: The site is located east of Camden Ave.. The radiologically posted area surrounds the 241-TX-152 Diversion Box, 241-TX-155 Diversion Box and 241-TX-302B catch tank.

Release Description: On August 24, 1977, contaminated rabbit fecal pellets were found around the 241-TX-155 Diversion Box. A more extensive survey revealed contaminated pellets with readings as high as 100 millirads/hour scattered in an area of about 50 yards (45.72 meters) by 100 yards (91.44 meters) around the diversion box. Two pellets were analyzed for radiological contaminants and found to contain mostly cesium-137. Subsequent surveys found additional spotty contamination extending in a 152 meter (500 foot) radius around the 241-TX-155 diversion box. The source of the contamination was traced to leaks from the 241-TX-155 Diversion Box. The east side of the diversion box had been partially excavated in 1976. The excavation was left open for more than a year, allowing access for animal intrusion.

Process Description: The original Occurrence Report (77-180) described the release as contaminated rabbit feces extending 100 yards (91.44 meters) by 50 yards (45.72 meters) around the 241-TX-155 Diversion Box and additional specks of contamination extending to a 152 meter (500 foot) radius around the 241-TX-155 diversion box.

Related Sites/ Structures: The site is associated with the 241-TX-155 and 241-TX-152 Diversion Boxes.

Waste Type: Animal Waste

Waste Description: Radioisotopic analyses on two individual rabbit pellets revealed: 18.6 microCuries cesium-137 per gram of sample, 0.044 microCuries cesium-134 per gram of sample, 0.093 microCuries

europium-155 per gram of sample, 0.026 microCuries europium-154 per gram of sample, and 2.63 microCuries strontium-90 per gram of sample. Beta-gamma readings up to 100 millirads/hour were found.

Code: UPR-200-W-82 **Classification:** Accepted

Names: UPR-200-W-82; Contamination Spread at 240-S-151; UN-200-W-82 **Reclassification:** None

Type: Unplanned Release **Start Date:** 1/1/1980

Status: Inactive **End Date:** 1/1/1980

Description: The 240-S-151 Diversion Box is posted with radiological warning signs. The contamination spread occurred in the soil adjacent to the diversion box. A WIDS sign has been placed at the approximate location of the release.

Location: The contamination spread occurred on the north and east side of the 240-S-151 Diversion Box and the 240-S-302 Catch Tank, on the north side of the REDOX facility (202-S).

Release Description: A piece of equipment moved in for the 240-S-151 Diversion Box installation, was caught under the late snow cover. Moisture from the melting snow and rain penetrated the plastic wrap, and ran off toward the catch tank area spreading contamination over the areas of run-off. Traffic from daily routine surveillance of the catch tank liquid levels apparently tracked some contamination to the chain boundary and step-off area.

Related Sites/Structures: UPR-200-W-82 was associated with the 240-S-151 Diversion Box and the 240-S-302 Catch Tank. May be a Duplicate entry - see UPR-200-W-20.

Waste Type: Process Effluent

Waste Description: The release consisted of beta/gamma particulates that spread from a contaminated piece of equipment, with readings up to 80,000 counts per minute found outside the radiation zone.
